Example of a Smart Question: "I am comfortable approaching girls in bars and during the day but seem to have a hard time getting an actual date. I have no problem getting a phone number but they just don't have an interest in meeting me later. I am well dressed and in shape but can't seem to get a date lined up via text message."

Similar to the career questions, we won't answer the first question going forward. The implied message from the first question is this: *the person hasn't even tried yet.* If you can't get yourself to say hello to an attractive girl you're just another loser who needs to be motivated to do something. Anyone who needs to be motivated is by definition a loser because he didn't want it in the first place. Are you going to die when you say hello to her? **No.** So go do it.

If this is someone you know, cut them off entirely and tell them to go waste $2,000 a day at a motivational speaking seminar. They are probably dumb enough to pay for the continuity program as well!

The second question? Much, much, much better. He *actually wants to get a date.* He has made progress with a few girls but is still having trouble converting to the actual date. Also the question says he is using text messages. Now we have a solution.

– Don't text, use pictures/snap chat or 2) call

We solved part of the issue. If the person comes back? We would ask: "How did you pre-sell the date?" If he goes blank… it means that he never gave the girl a reason to look for his picture message/phone call in the future. Pre-selling a date means you find one common interest and use that as a spring board for meeting up later.

How to ask smart *personal finance* questions: As many of you are well aware, personal finance advice on the internet is non-sense. It primarily focuses on saving $5-10 on meaningless items… at the expense of your time. We will have no such questions on this blog. If you want to try and save $5 on your cell-phone plan or $50 on your next flight, you can leave this section of the web and read frugality blogs instead.

Example of a Dumb Question: Should I live with roommates or alone?

Example of a Smart Question: I have an industry background and want to work in X industry for investment banking/private equity. I have a few scholarships to X, XX and XXX schools and also no scholarships to XXX and XXX schools. If my goal is to break into banking/private equity which school should I choose?

The first question is a waste of time. If the person has a brain he can answer this question before he even asked it. If the person does not have money in the bank, the answer is to live with roommates. If the person has a high income, then he should live alone to improve his social life. Pretty simple.

The second question is much better because it is a financial/career decision that the reader is juggling. *The person has options.* In this case we would simply dig up information on the industry and find out which banks recruit at which schools to give him the bare minimum MBA to break into the space. Once you are on the job, your performance matters over a piece of paper so the research is needed before taking on debt which can be a life altering decision.

Concluding Remarks on Questions: Here are the key takeaways to asking smarter questions: 1) ask them in 2-3 sentences maximum, 2) if you don't have options you don't have questions, 3) if you don't have any experience you cannot have a meaningful question and 4) if you need motivation from us or anyone… this blog is not for you. **You already lost.**

Comments on the Blog

We have a few trolls posting dumb questions and comments on the blog. It is far easier to delete them and move on in the future. In fact? We answered most them. We let them stand because it feeds the SEO and the blog has grown enough at this point (we're not that dumb – wink wink). Positively, we want the comments to be filled with smart people and we're more than happy to let them promote their blog through their username. With that said lets take a look at how to leave better comments.

Expansion Comment: In our post on frugality being a feminine quality, there was one person who actually understood the post:

"*That's why only 1% of the population are self made multimillionaires.*

Frugality wants you to be content with yourself and spend more time trying to get more out of your current situation AKA Frugality wants you to trade your potential for your current self.

Frugality wants you to know that good enough is good enough. But good enough is never good enough when you're running a business. You have to constantly evolve or else competitors will beat you by copying your product and making them better. You have to constantly pay attention to details or else your employees will slack off and deliver shit to your customers.

Frugality is like trying to be a body builder but only eating very little to save up — LOL good luck!" [– Recent Graduate]

This is probably the best comment on the blog since its inception. If people continue to leave comments like this (that clarify or expand upon a post), we can guarantee other readers will click over and read his blog.

Clarifying Comments: No one can write 4,000+ words where readers won't have any questions at all. The key is to pin-point the confusing piece of the article.

"In your previous tweet you said happiness is in the thoughts not belongings. When does one truly get happy following your advice?" – [happyadvice]

This comment is fine. You can see the real issue is that the person still associates hard work with unhappiness. This is a major theme of the blog. ***Hard work is not hard work when you enjoy it.*** The person asking this question has [a negative association with money]. We are happy to clarify these questions in an extremely blunt and direct manner. Why? We don't want any mis-communication.

The funny part about this writing style? If you talk directly to people and give them the answer they *need* not the answer they *want* they assume you are unhappy! This is the world we live in. Before assuming that the person you are talking to is unhappy you should ask yourself "Is this advice improving my life?" Then you'll realize that it is better to be punched in the face with the truth than kissed with a lie.

Promotional Comments: Of course we love the success stories. We get emails all of the time and it is great to know that an article or comment has changed the way a person thinks. The funny thing is that most people ask us to keep their information private because they don't want anyone to know they read the blog! Hilarious.

Concluding Remarks on Comments: In an ideal world, the comments will be full of people who are trying to achieve something and we won't have the masses posting up useless information. Going forward we will keep a closer eye on the questions and comments since we want to keep the growth of this blog at a manageable level. Here are the key points to leaving solid comments: 1) expand to help people understand the message – or drive traffic to your biz/blog, 2) post a clear argument against the article that is backed in truth not feelings or emotion, 3) let us help you by pin pointing areas that need clarification and 4) everyone loves success stories.

****

Improving Self Awareness

[Improving Self Awareness]

One commenter asked about how to improve self-awareness. The reality is that we all hold on to some beliefs that are not true. Be it someone we think is a great contact (that really doesn't like us) or a view of the world that isn't accurate and is based on life experience. The best example of the latter is how a beautiful girl generally thinks people are "nicer" than unattractive women (yes the same applies to men as well). Why? Well good looking people are treated differently in general which creates a warped world view of what it is like for the general population. With that back drop we can go through the key ways to *limit* incorrect beliefs.

Avoid Giving a Lot of Opinions: Unless you're certain you'll be proven to be right over time or you're certain that you're the expert within the context of the group, there is no reason to stand out. The best example of this is sports. Why? Well un-athletic people routinely give advice on how professional sports players should "adjust" their game. They couldn't even earn a spot on the bench but somehow they believe their ideas are better. This same concept applies to any sort of performance based advice. Before giving any advice on a performance based topic ask if you have any relevant experience.

Why is this a good way to be self-aware? Well this is how humans generally think. If you are in a group ask yourself where you "rank" and why you're there. People get upset about this comment since everyone believes "they have the right to an opinion". Unfortunately they don't. The most extreme example is a person who is the least successful in the room in every aspect: fitness, money, dating etc. They are worse than every single person in the room on all metrics… yet continue to vocalize strong opinions. This is a quick way to be put back into their place instantly.

This is also why successful people generally flock together. If someone is successful it is unlikely that they have the same skills as their successful friends. One may have gotten rich through sales, another through software development… another through real estate… so on and so forth. The reason why these individuals speak with one another is because they have a different perspective to offer. They have some mutual respect ([all are rich]) and there is *always* overlap when it comes to making money. So if three different people in different industries meet, they can exchange real ideas.

Before moving on, we realize this is hypocritical given that we run a blog (see self-awareness!). The one thing you won't see is us blabbing about topics we really don't know. We get questions about International business (we never answer), questions about places we have never lived (we never answer and only provide perspective based on visits) and we get questions on different business models (we only answer if we know we can add something). Over time, this reduces some of the "market potential" but it sure beats making stuff up. *In short, step one is being careful about broadcasting opinions. Be honest about where you sit in the group/room.*

What is Gained? This is probably the fastest way to improve your self-perception and awareness. Before doing anything ask yourself quickly in your head "what is gained?". If the answer is nothing, simply stop it. There is no point in getting into arguments when it's only going to create downside for you. The only time you want to speak up/become the center is when it will benefit you. Here are some examples of doing it correctly and doing it incorrectly.

If you are in front of a bunch of people who are significantly better than you it is best to avoid "boasting" without immediate proof. In fact, boasting in general won't help you as everyone in the room knows you're worse than them. Instead you will only gain "points" by pointing out where someone is good when they are really mediocre. Why does this work? Well 99% of successful people are insecure and constantly trying to improve their weak points. So if you say they are good at something (when they are just okay) they will generally have a higher perception of you. Is it lying? Not really. You are saying "hey looks like you're doing well here" which is quite encouraging if you know they have been working on improving XYZ for a few months/years. As we all know, improving at something usually just leads to haters so you want to do the opposite (encourage growth/improvement).

The second biggest example of "what is gained" is attending specific events in the first place. It shocks us when we see people go to events without having any value to add. These people are just praying for a "lucky break" where they stand in a room with billionaires and one suddenly makes them rich. This is a fairy tale that works less than 0.001% of the time. Sure it "does" happen (just see gold diggers). But. The general rule is that you only want to enter a room where you have something to offer. The art of this game of finding ways to "gain" from an interaction is underpinned by finding the right events. Remember that sentence as its excruciatingly important. Even if you're invited to a top-end event, be sure you have something to bring to the table besides tap water otherwise you're wasting your own time.

Look for Clues: This is a ***lifelong skill*** we cannot emphasize this enough. You have to look at every person including yourself and build a mosaic to figure out where you stand with someone else and what they think of you. If you figure out that there is a theme (they dislike XYZ about you) then that's probably your fault. If you figure out they have a character flaw (they go out of their way to damage people's lives) it's your job to avoid them. In no particular order here are some obvious cues in various situations.

"We'll call you if we're interested" – You did not get the sale, don't waste your time. They don't want more email back and forth so they are shutting down the interaction

"How much do you think was luck?" – This person does not like you. They think your success was not due to skill but due to some other random act of chance. Best to avoid building a relationship here.

"I really don't care what anyone thinks" – This person is usually rich and is really saying "you're wasting my time". If they make these statements and you keep bothering them they are more likely to blackball you. You have hurt your relationship with the person but it is fixable. It means your angle was wasting his/her time. Generally speaking, someone not caring = you're wasting their time as the topic isn't interesting

"We all can't be winners" hard one to read. The person either likes you or hates you. Think very carefully about the context here.

"Don't be so angry/upset all the time" This person absolutely hates you. It means they don't like that you're successful so they have to come up with something to make themselves feel better about their own lives. Write this one down as it has a 95% hit rate.

"Nice meeting you" Translated this means, thanks for wasting my time. It's a polite way of saying, we're out of here and don't contact us. The only exception is a phone number exchange then it's a sign of saying "lets keep in contact". We're referring to verbally saying the whole thing

"You're looking sharp" Unless you're getting this comment every week, you're not good at being well dressed. This is a reality for people who know how to wear the right colors and patterns. Now an important thing to note is that if a guy says it (business acquaintance) it means they have some level of respect for you. This is a positive sign but don't read too much into it. If a woman says it, this has a similar meaning "you're maximizing your look". It does ***not*** mean that she's interested. But. At minimum since she stated this, she'd be fine if her friend was interested in you. You'd pass the "impression test" so to speak.

There are many many more of these hints, if readers are interested we'll do a full post on what certain messages mean. They are never 100% accurate but have a high hit rate, we'll call it 75-80%. This is consistent enough to go ahead and make assumptions since you'll never be 100% sure about anything. For example if someone gives you the "do you think it was luck" combined with "don't be so upset" we'll go ahead and bet the house that this person despises you/dislikes you. Sure there will be 1% of the time where it isn't true as context is everything. But. Hit rate will be extremely high.

Build That Portfolio of Information! So we've given you a few steps, avoiding giving opinions unless you know the room will at least respect your idea (something to back it up). Look for clues on who in the group dislikes you/has respect for you. And. Always ask yourself, what is gained before doing any activity (both verbal or physically attending new events). Unless you can get a neutral or positive reaction… It is best to avoid entirely.

By consistently doing these three things, you'll build a mosaic around where you're good and bad. If you find that you're having trouble getting dates, you should clearly ignore fake complements about being an "attractive guy" as it doesn't match the results. If people say you're "smart" but you're making nothing financially, they are just blowing smoke to make you feel better temporarily. If people never go out of their way to give specific complements on a particular task… full stop… you're not good at it.

That last part would be the main thing to remember when building your own personal mosaic. There are really three categories: 1) dating, 2) money and 3) maximizing your physical looks. If you're not getting explicit positive remarks on all three, it means you're by definition, not good at one of them. Does this mean it will last forever? No. But. It means you certainly need to improve in that area. Don't fall into the trap of trying to "overcompensate" by becoming ultra-good at just two categories. This actually makes you fail in the other activity as the difference between your skills in two areas are clearly coming at the expense of another area.

Starting From Scratch: If you're reading this and noticing that some of these are not occurring (no complements on your girlfriend's looks, no comments on being well off for your age, no comments on being sharply dressed), here is how we would start. We would start by fixing the money issue first as that is the hardest (should take only a few years), we would simultaneously fix the wardrobe as this only takes a year or so of effort and finally we would go down the attractive girlfriend route. Yes. As usual, dating is the last priority for anyone under the age of 30. If you're already rich, then you can cool off on the money chasing (if you're a multi-millionaire for example) and just improve social skills and your wardrobe.

Keeping it simple, unless people are going out of their way to comment specifically on what you're good at… that area is lacking 100%!

****

Informational Interview Guide

A commenter and a few emails have come in asking how a person can maximize an informational interview or a simple coffee meet up with a person on Wall Street. With that said here are the basics.

Higher Is Better: This should be relatively obvious, however the higher the person is within the firm the more leverage they have. An informational interview with an investment banking analyst will have much less weight relative to the head of M&A. If you are going to go down the route of informal meet ups you should aim high up the totem pole.

Feed The Ego: Unless you have experience, there is no reason to insult your new contact by telling them you are not interested in their division. Maybe you want to go into Investment Banking or Sales and Trading but for one reason or another you are meeting with the Head of Research (the Head of any division is a multi-millionaire). Assuming you have never worked on the Street, it would be wise to say you're interested in their division. While the Head of any group can get you an interview in a different space, if you impress him enough he can simply make a phone call and land you an internship in his division, no questions asked.

Sell Yourself: If you have zero experience, a poor GPA and no knowledge of the field you will have no chance in getting a job or making a good impression. You should have some skills or previous experience to help you sell yourself to the person you are meeting. As an example, experience in an accounting internship could be spun as good understanding of financial statements, winning simple case competitions can be spun as understanding the basics of investment banking and of course a strong GPA in all finance courses can be spun again as good financial statement analysis. You can also try to lightly spin any sales experience, if you did a job that required cold calling, you can spin this as good communication skills. Don't forget to bring a hard copy of your resume.

Ask Smart Questions: If you are meeting the head of research you can ask about coverage universes, if you are meeting the head of investment banking you can ask about product groups they have or impressive deals that have completed. You need to ask questions that get them talking about their experience and how the bank is differentiated. The worst thing you can do here is ask questions about what the job entails as this implies you have not done your research.

Example Questions: Do not use these words verbatim, instead look into the firm and add some specifics so it is clear you're not giving memorized answers.
1) Can you talk about the most interesting deal you competed in 2013? (Investment Banking). Here you can ask about specific deals, if you are meeting with the head of healthcare banking you should ask about some completed health car deals.

2) How does your group differentiate itself relative to its peers? (general) This works well for boutique firms because they must have a strategy to gain share and grow, how do they plan to do this, see if they have a niche and if so ask about the niche
3) Volume has been light in the financial services industry how does your firm continue to drive trading volumes higher? (Sales and Trading) This is a touchy one but it lets the person know you understand that driving high volume is key, try to find out how they are driving numbers and ask more specifically about that strategy.
4) I see you cover company XXX how do you view XXX impacting the company? (Research) Find an outperform name the analyst covers, ask how a change in market dynamics will impact the particular stock. This lets the analyst know you understand the basics about his coverage and also gets him talking about a company he likes (choose a stock is up year to date).

Closing: Assuming you have done a good job establishing rapport the person should believe 1) you understand the job, 2) you have some skills to bring to the table and 3) you understand the company. At this point you will have to casually ask if the firm has any openings for interns or full time jobs. If the person is impressed, he will likely be open to helping you find a job.

****

International Playboy Preparation and Destinations

International Playboy Preparation and Destinations

So you've realized it is time to see the world.

"The world is a book and if you've only spent your time in one country you've read a total of one chapter"

The first international trip will burn an image in your brain for the rest of your life. You certainly won't forget it. With that said a lot of mistakes will be made so lets try to avoid them and look at multiple countries and cities worth visiting.

Logistics: If you don't have a centrally located apartment in the hot nightlife districts you have decreased your ability to have an awesome vacation by 75% or more. Alright no more jokes you have decreased it by 95%. You should spend your time researching each neighbourhood/venue and find where the bustling night life is and have an apartment rented no further than 5 minutes in a cab from the center of the city. Walking distance is always better.

The best way to hack logistics is by finding the most popular club in the entire city. Generally, the most popular club is always the worst club to go to because you have not carved out a niche but you will certainly be in the center of the action.

Essential Items:

1. International carry on bag – self explanatory for short trips and dreaded transfer points (always pay the extra $100-300 for a direct flight)

2. Pen – only the newbies have to ask for a pen to fill out the custom forms

3. Suit – you know from years of experience that the high end always holds the best looking people so you're not going to get by in a t-shirt and jeans

4. Mens Kit – at this point you have likely taken several flights and consistently notice you forget things, no more messing around. Buy a basic mens kit to stay organized

5. Chlorella – when you go international, you lose the juicer so it is imperative to cure those awful hangovers with some broken cell seaweed… Nope not a joke. *This is an absolute necessity for drinkers.*

6. Cash – If you're trying to make friends fast, the worst way to do so is by loading up a credit card at the bar. Use cash to tip fast and get drinks even faster.

7. Unlocked iPhone – Say what you will about Facebook's acquisition of WhatsApp but you are not going to communicate without a phone that has WhatsApp installed

Arrival Execution: This is just as important as logistics and having the right items in your bag. When you land your goal is to immediately pick up a driver (assuming you're in a dangerous country) by paying him a few extra dollars in exchange for his cell phone number. Now two things will flip in his head, he will realize you are going to tip him well which implies you are well off so when you ask for recommendations he will send you in the right direction… to the best clubs and bars in town according to the rich locals.

Final Notes: If you have never traveled outside of the USA we suggest starting with an English speaking country. Instead of visiting Cancun and saying you have been to Mexico, try to get off the beaten path at least a tad. As much as people may say Western Europe is the same as the United States it is a good starter destination to see how well you can operate on a trip.

Lets take a look.

Europe

Western Europe

The Netherlands – Amsterdam: We're going to place this as the #1 beginner city. A great place for a young person to take his first international trip. Why? Drugs. Joking… a little. Since the city allows drugs and alcohol the vibe in the city is much more calm. If you take a walk around town you will find everyone riding bikes and countless people at the park sipping wine, smoking and generally having a great time. Logistics are great and the safety level is equivalent or better than your typical American city.

Girls and Game: Overall your pickup/game style is going to mirror the United States. This is why the city is a great starter spot, you end up getting your feet wet if you were previously scared of international travel and you don't have to calibrate your game one bit.

Attractions: Another good thing about Amsterdam is there are not many must see places. There are a few museums but the overall vibe, the rivers moving through the city and the people playing chess during the day, all contribute to the attraction. Side note, avoid the pancake/waffles specialty simply overdone in terms of unhealthy eating habits.

Overall Results?

Girls – are comparable to a major US city (5.5/10)

Costs – same as the USA (5/10)

Game – no major adjustments needed (10/10).

Iceland – Reykjavik: If you have money in your pocket, look no further than Reykjavik for your first destination choice. The only reason we would recommend Amsterdam over this country is cost and even then it is a tough call. For a short trip you can show up, party like you've never partied before, easily meet several people and never have to worry about missing anything since the population is just 300K.

Girls and Game: Everyone speaks English… so far so good. But. Remember we said it is only #2 due to cost. If you're further in your career and have a good paying job (or business), proceed straight to Iceland. The game adjustment is real basic 1. need to have a sharp wardrobe, 2. cash to navigate the expensive drink prices and 3. an ability to stay in state until 5-7am.

Why do you need to do this? Well the hook up culture is essentially very fast, you want an apartment/hotel as close as possible to a club called "B5" and then you want to approach many girls late at night (3-6am). Usually you have a conversation with the friends, the girl may or may not like you, then she will have a quick discussion in Icelandic (you wont understand anything) and she'll either go home with you or she won't. Pretty standard but need to reiterate the cost will be quite high.

Attractions: Well, the major one is the Blue Lagoon. You should go. Notably when you plan your trip, try to visit when there is an event occurring during the week. There is no drinking culture excluding Fridays and Saturdays for the most part.

Ideal situation? New Years lands during the week and you get 2 weekends to party.

Overall Results?

Girls – are more attractive than in the states (7.5/10)

Costs – higher than the USA, pre-drink to save money (3/10)

Game – preparation is your ability to last longer at night and have good cash flow (8/10).

Germany – Frankfurt: This is a biased post. Going to Frankfurt was great, it is a financial capital in the country and on top of this your expectations are low. Generally when you think of Germany it is hard to imagine thin cute girls, instead the immediate image of Germany is strong burly people (thank you USA media).

Girls and Game: The good news is that practically everyone speaks English in Frankfurt. Unlike the other international destinations we see pretty quickly that the non-language issue will help. Your best bet (again this is from a short trip) is to find the major clubs and run typical American game… We can recommend cocoon.

A*ttractions:* There are a few decent museums and film attractions to see, this is more of a business trip type destination so we would recommend checking out the GermanFilmMuseum, Museumsufer and St. Paul's Church.

Overall Results?

Girls – are slightly better than the states (6.5/10)

Cost – is in-line with the USA (5/10)

Game – Not speaking German is certainly a disadvantage – ie you will be labelled as a short trip person which won't help you, luckily if you have a silver tongue you can work around this as many do speak English (6.5/10).

France – Paris: Everyone goes to Paris. So we all know what that means. Paris pretty much sucks. It is a good place to check off the bucket list the EiffelTower… the LouvreMuseum… the overpriced wine… etc. The only plus side is the quality of the women. There is minimal fat acceptance. At least they understand we shouldn't applaud people for having no self control.

Girls and Game: Overall the girls in Paris are better looking than the states, but you have the exact same issues as the USA 1. the ugly girl will generally try to block you, 2. if you find packs of girls who are all of above average quality you'll be fine and 3. one big block is the logisitics can be horrible. Standard American game applies. The downside as mentioned is really the logistics and the group/pack mentality.

Attractions: Well we all know the basic ones, listed earlier in the summary section… But here is the official recommendation. **Go during the French Open.** The French open has the highest quality women you can see and in addition to that you get to do an actual fun activity. Lets be honest the Eiffel tower is tacky and overrated at this point.

Overall Results?

Girls – are better than the states (8/10)

Costs – higher than the USA (4/10)

Game – Not speaking French hurts (5/10).

Belgium – Brussels:

Don't go here.

It sucked.

Colombia

<u>Latin America</u>

Mexico – Guadalajara: Well you like Latin girls? You better speak some serious Spanish bro. Overall, Guadalajara is known for having many of the most attractive women in the entire country (the other section is called Sonora). The downside is that 1) you need to speak Spanish, 2) you need to go for a longer trip and 3) social circles can make or break you.

Girls and Game: The city is fairly spread out but lets cut to the chase… Get an apartment in Chapultapec. Unlike the USA, the hookup culture is not engrained. In the USA it is okay to go on spring break and hook up with 5+ people in a week… Good luck with that strategy in Guadalajara. You should have a solid foundation of day game and night game and you can try the following spots:

Day Game – Commercial Andares, Guadalajara Zoo, Centro (near GuadalajaraUniversity)

Night Game – The Lobby, Lola Lolita, Lucrecia, Chapultapec is the main area for nightlife so spend time checking many places to find your vibe/spot

Attractions: There are quite a few decent attractions but the problem is the city is "slow". Most Latin American countries are slow in general so it is something you need to get used to. You can run day game and see the Cathedral, you can check out the zoo and at the same time you can check out the Zapopan district.

Overall Results?

Girls – are better than the states (8/10)

Costs – are lower than the USA (8/10)

Game – Not speaking Spanish is a death sentence (4/10).

Mexico – Mexico City: Why isn't this combined with Guadalajara? Simple. Mexico City is essentially as packed as New York. The good thing is this means the speed of the city is higher and there are more English speaking people in the city. The downside? The girls are a bit less attractive and you have to stay in the more expensive areas. Polanco.

Girls and Game: You can certainly pull off some American style game if your Spanish is solid. Simply go to the following locations for your classic day game needs: 1) CarlosSlimMuseum, 2) Chapultapec park, 3) Antara mall. For night game, you can actually run in solo as well, you can check out 1) Ragga, 2) JoyRoom, 3) Sens, 4) Pata Negra (condesa). Overall you need to run classic Latin American girl game which means there is no need to sexualize the conversation, you should have good Spanish and of course it is always good to be a smooth dancer. Don't forget the cologne.

Attractions: Well we listed them above… Carlos slim museum (see our twitter for a photo) and the Chapultapec park (it is large). Overall there are many many things to see in Mexico city unlike other Latin countries, so have a blast.

Overall Results?

Girls – are better than the states (8/10)

Costs – are lower than the USA (8/10)

Game – Not speaking Spanish is a death sentence (4/10).

Brazil – Rio De Janeiro: Do you prefer women with curves? No not the fake curves you see on TV, real skinny girls with curvy bodies? Go straight to Brazil (spelled Brasil in the country itself). The city of Rio is hands down the prettiest city on the list we have outlined here. It is not even close. As they say there are two men in the world

"Those that have never been to brazil and those that are trying to go back"

Girls and Game: There is a reason why Brazilian guys are generally aggressive when it comes to women. This is the culture. The big game adjustment is that you are expected to kiss the girl within a few minutes of meeting her once you gather she likes you already.

In addition… You better be ripped. If you are out of shape or fat… Well you have no chance particularly with beach game. Finally, Portuguese is not necessary but would help, you're going to have to shoot for the girls who speak English already.

Attractions: Wow. There is no where to begin. The entire city itself is an attraction. With that said here are some quick ones: Sugarloaf Mountain and Christo (the statue provides breathtaking views).

Overall Results?

Girls – are better than the states (7.5/10)

Costs – are higher than the USA (4/10)

Game – you will need to adjust your game no doubt but it is worth it (7/10).

Colombia – Medellin and Cali: Similar to GDL you better be speaking some smooth Spanish. Smooth. You can't come to Colombia and have a good time with mediocre to bad Spanish skills. Write that one down.

Secondly, you'll notice we're combining two cities into one for the first time. Why? It gives a good broad overview of the actual culture in Colombia which is this 1) Spanish is necessary, 2) Social circle is king and 3) You better have cash since many of them prefer a man of means.

Girls and Game: Simply put if you're not willing to learn the language or stay for a longer trip (1 month or so) you're going to be hurtin for certain in Colombia. What you need to do is meet women during the day and invite them out to salsa dance (definitely don't bet on the one night stand but you can try).

One extra important game tip? Since nightlife is heavily social circle based you only want to go out at night with a girl you've already met during the day. Avoid going to high end night life venues solo and instead wait until you've built up some solid contacts. If you're there for a short trip then definitely do both but realize the long-term game is better in Colombia.

Attractions: Overall Cali and Medellin are night and day here. Medellin has more things to do and see but the women are more likely to stick to social circles while Cali is the reverse where it is easier to meet women and there is less to do. If you want a few quick line items here you go.

Medellin – Botanical Gardens, Paragliding and Pablo Escobar's Grave ßGreat book!

CaliColombia – Much less, the zoo, sugar factory and ChipichapePlaza

Overall Results?

Girls – are better than the states (8.5/10)

Costs – are lower than the USA (7/10)

Game – Not speaking Spanish **is** a death sentence (3/10).

thailand

Asia & India

India –Goa: Outside of some initial culture shock (i.e. wild/nomadic cows, families of 4 on a Vespa-like scooter for daily transport, underdeveloped infrastructure, stark communication barriers), the experience in Goa provides for decent retreat with balance of breathtaking views (Arabian sea), a social atmosphere, and party life. Cost is very affordable, especially given the devaluation of the Rupee vs. the dollar in the past 12-months. I believe a proper trip to Goa would be in the 4-6 day range split between South Goa (leisure) and North Goa (party).

Girls and Game: Firstly, North Goa and South Goa are very different. North Goa's nightlife is almost entirely limited to resorts. However, that said within the resorts you'll find large groups of people for different occasions (weddings, trips, etc.). In general, it is very easy to meet new people and to co-mingle groups. So while South Goa is on the more "couple-side", do not be fooled, it is also very good for meeting hoards of single (or so they say) people within and outside those groups. Stay at a larger resort (perhaps inquire about weddings/events ahead of time) and you'll be in for a good experience.

Bottom-line? With those beaches, I think everyone would entertain the idea of a South Goa fling.

Regarding North Goa…well dang! It's certainly a nice treat with lots of international visitors as well as attractive natives who are visiting from Mumbai on a quick weekend or business trip. The atmosphere is definitely geared more towards the younger crowd, as the 18+ clubs would suggests. In my view LPK (love, passion karma) and Club Cubana are the best options. Club Cabana says open till sunrise, so you can hop around to other bars/night clubs and make a late entrance.

Attractions: Beaches, beaches and beaches. Get the full experience and rent a scooter to tour the area. It's worth seeing the contrast of landscape in Goa and some historical sights. Be cautious of where you eat, as you are increasingly susceptible to food positioning. I was mainly a pescetarian for this trip.

Overall Results?

Girls – easier than vs. USA given influx of travelers (7.5/10)

Costs – combined with views and scenery (7/10)

Game – minimal barriers, but some conversational issues (7/10)

Thailand –Bangkok: Get ready to lose yourself. I will start by saying this trip was my biggest surprise (Thailand in whole). There is simply too much to enjoy here…and yes I am speaking organically. Large fun international presence, friendly local people (always smiling, helpful), fantastic cheap food, beautiful weather (at the right time) and plenty of history/attractions. Civil unrests aside, the return on investment here is too attractive to ignore. The city itself is fully developed and modernized, with on-going infrastructure expansion. It leaves you asking, "why don't I have money invested here?"

Girls and Game: To (again) clear the air, I am speaking on an organic basis (i.e. sans pay for any type of service). The hotel we stayed centrally located on Sukhumvit Soi 11 which is littered with open-top VW converted bars (outside), night clubs and your usual watering holes. The crowd is ~40/60% mixture of international/local from our experience. The international crowd included Russia, Europe, Canada, India, U.S., N.Z., Australia and neighboring countries. The local crowd brings in a few of your stock standard "lady boys" and non-organic patrons, but most are regular thai's looking to have fun with their friends. The environment is crowded and people are usually open to dialogue. English is rather ubiquitous here. I would characterize the guys as more on the passive (vs. aggressive side) ironically, considering the global talent. So entertain a girl properly and you should see success. The barriers seem mostly removed in comparison to U.S. Stick with clubs, take them for good local late night soup, and invite them back. It was honestly that simple. I've learned that in general, and it may be a function of the influence of thai culture, physical expression is certainly far more welcomed in Bangkok.

Attractions: Thai kick boxing (sit front row, it's only $60!), temples, food, outlandish malls, did I mention food?, floating markets, endless shopping and meet the locals!

Overall Results?

Girls – easier than vs. USA given influx of travelers (10/10)

Costs – soup for $1.20, coffee for $0.40 (10/10)

Game – Communication barriers (8.5/10, aka non-existent)

***

Well this is getting a bit tiring, we will add more places to visit in the future if there are requests but when we get the time we will add some Eastern Europe/Russia to the mix and maybe even a sprinkle of Morocco. More importantly…

What about you guys? Places that need to be seen? Avoided? Please chime in.

****

IB Interview

Additional Questions Answered In Order Received.

Interviews:
Before Jumping into Q&A remember the setup for Investment Banking Interviews is as follows:

Round 1: Phone or quick office visit 30-45mins, "is this person normal and does he know what he is interviewing for"

Round 2: By now the firm knows who they want and don't want. You'll be grilled, you'll be challenged and you'll be asked much tougher questions to fish out the "wannabe's" from the "run through a brick wall to get what I want" candidates. Once you're in the final round, everyone is equal, your job to lose.

<u>Fit Questions</u>

1. Walk Me Through Your Resume?

This of course will be tailored to everyone but at the end of the day you're selling yourself as a compelling candidate.

"Back in high school I decided to attend ___ university because of its focus on (finance/business). After that I really became interested in Investment Banking after studying ___ and ___ courses which led me to pursue finance internships. I started out with a job in ___ (finance field) which led to an internship at ___ bank over the summer. Fortunately, I received an offer from ___ bank but believe I may be a better for ___ bank as I know the firm focuses on ___ and ___"

Talk longer if its not a 30 minute interview, keep it short like the above if it is a quick phone interview.

2. Why Did You Choose Your University?

The idea here is to make it seem like you made the best possible decision that was handed to you. You don't necessarily need to choose the most prestigious, maybe you got a scholarship etc.

"To be honest I was also admitted to ___ school however I decided to attend ___ school as I was given a (partial/full-ride) due to ___ , ___ and ___. Overall, I am happy with my decision as I certainly researched the schools to see what opportunities were available and realized the change was relatively minimal given the partial scholarship opportunity."

You basically want to deliver the following message "I made a logical smart decision and made the most of my time at my university"

3. Why Did You Choose Your Major?

Hopefully you'll avoid this question but you need to create a mini-story as to how your decisions led to finance.

"I decided to major in Biology as I planned to become a doctor, however as I developed an interest in investing through a few Economics courses I decided to pick up finance as a minor. At that point I realized that I was more interested in finance and decided to take courses in ___, ___ and ___. Even though I may not be a pure finance person, I believe I have taken the important finance courses and could be a good fit for a role in healthcare investment banking".

The idea here is to show actionable steps on how your views changed and spin it in a way as having an "edge" in terms of knowing the space.

4. Why Our Bank?

This one is less likely to show up in an interview with Goldman or Morgan Stanley but the overall idea is to make sure you know the deals and what group you want to work for.

“I want to work for ___ bank because I believe it offers the right set of experiences for me given transactions in ____ (capital raise), ____ (Acquisition) and ___ (Merger). I believe I would be a great fit because of XXX, XXX and XXX. Over the past year I have noticed XXX (positive comment on direction of company) and believe this is certainly a platform where I can both help add value and learn from over the next few years.”

The idea is to show you know the bank well, that you can be a good asset and finally that you won’t be quitting after 6 months.

5. Why Should We Hire You?

In this question avoid the following phrases ambitious, hard working, dedicated and driven. Instead you want to be able to give these qualities in the form of real experience. Example below:

“I think ___ bank should hire me because of my experience in __, __, __and __. I know you have a lot of qualified candidates to interview and believe my experience in ___, ___ and ___will be helpful for the firm. I have always been interested in ___ bank because of ___ transactions and would enjoy having the opportunity to work with ___ team and hit the ground running.”

To fill in the blanks, use things such as Internship at __bank, course experience in ___, relevant club experience in ___.

Notice you should have experience to draw into the interview that will directly impact their hiring decision.

6. Tell Me About a Failure in Your Life.

This one is tougher as you want to give an example of a set back that you can recover from but not something terrible that you would lose trust. As a guideline if you told this to an acquaintance they should recognize it as a fault but not immediately lose faith in you because the error was so large.

“One failure I remember well was oversleeping one semester to sign up for XYZ course in fall of Sophomore year. It set me back by about 1 semester in terms of classes I wanted to take, the next summer I decided to take the extra course to make up for lost time, but learned the valuable lesson of being organized at all times to avoid costly errors”

The above is right on the line with costly errors, 1) you recovered from it but 2) it certainly was bad to oversleep. Not everyone in the world has overslept something once in their life so you’re in pretty decent shape since you learned from the experience.

7. Are You A Good Multi-Tasker?

The truth in the real world is no one really multi-tasks but at this really means are you good at handling multiple projects.

“Overall I would say I am a good to decent Multi-Tasker given my heavy course load, 2 club commitments and 1-2 part time jobs. To be honest I believe this is something everyone can always improve on, unlike a check box where you have it or you don’t it is certainly something I can continue to improve upon over the long-term.”

The idea here is to give them examples of real multi-tasking at your age bracket and then finishing it off with something that leads them to believe that the interviewer works harder than you do. Note of course they do.

8. Are You A Good Presenter?

This is unlikely going to be asked but the idea here is to see if you’re willing to stand up and make a presentation if necessary.

“During my time at ___ school I have made a few presentations including ___ and ___. While I’ll be honest and say it is certainly not a daily occurrence I believe my experience doing presentations for __ class (or ___ case competition) gives me confidence that I can make presentations if needed.”

Again show some real examples of presentations you’ve made. Even better is if you can add to it example: “Case presentation for Jefferies case competition, which led to a 2nd place finish for our team”.

9. What Do You Do for Fun?

This is a key question in your interview abilities, if the person seems to be happy and fun (party type) mention you go watch football games and drink beers. If you peg them as more uptight mention things more simple like traveling or sports.

“During my free time beyond finance related activities I enjoy ___ and ___. Sports have been a big part of my life for many years and I believe its always good to try and set aside thirty minutes to an hour for exercise. Also on weekends I enjoy watching our college ___ team play and grab a few drinks to watch the game with friends.

Don’t come off as a complete type A unless you are certain the person you are speaking to will ding you immediately. No one wants to hear “I stay at home and read the Wall Street Journal”.

10. Describe Your Favorite Course in College.

Unlike conventional answers that will say choose an interesting topic or choose a finance course the best answer is to make a personal connection.

“To be honest one of my favorite classes was History 101. I know the topic may sound dry but the professor did a great job at making the topic interesting and relating it back to real life (insert short example). During the semester I got to know the professor well and we still correspond from time to time. I have no interest in pursuing a career related to history as my real focus is on finance but it was a great course that showed me the importance of keeping a topic interesting.”

The idea here is you’re showing that you made a connection with a professor. Now you may not have this exact example, but the best way to describe your best course is one in a “sales” format. You liked it because the presentation and delivery was key, bankers will know that is extremely important no different than pitching a company.

11. I See You Worked in (Healthcare/Real Estate/Law etc.) Why The Switch?

Very similar to “walk me through your resume” you need to flip your experience to how you concluded with your current interest in Wall Street.

“After leaving law school I joined ___ firm and attended drafting sessions for ___ and ___ companies. After that I became more and more interested in finance and decided to take level 1 of the CFA exam. After completing the first level and working closer with financial firms, my interest was solidified and I believe my experience with S-1's and other financial documents makes me a good fit for ___ position at ___ firm."

The idea here is to spin your good experience to directly help the firm. In addition you don't want to make it seem like you know nothing about finance.

12. What Would You Do With an Offer Today?

"I would sign up for the job. After meeting with __ and __ and doing research on __ and __ I believe this would be a great company to work for."

You need offers to get offers so simply say you will sign, you can always push out the official sign date by saying "I don't want to burn bridges with ___ university as I am signed up for X days to attend X events and cannot cancel."

13. Where Do You See Yourself in Five Years?

The basic rules are 1) in finance, 2) tough to call beyond 2-3 years. If you're at a Associate/VP level then you can hammer home more on wanting to stay in IB.

"Over five years is a pretty long time horizon however I do know that I want to stay in the financial industry. Knowing that I want to stay in finance for the long-term I believe Investment banking offers the best base skill set for a long-term career. In five years I may still be working in investment banking or getting an MBA but I do know for sure that I want to stay in Wall Street related professions."

No where in a competitive Wall Street interview do you give them a single ounce of belief that you would not stay in finance. This means you're not 100% committed so it means you're going to be shown the door.

14. Tell Me About Negative Feedback You've Received from ___ Job?

The idea here is to admit to having some faults good ones if you've done an internship in investment banking is 1) Attention to detail (always going to get interviewers to agree) and 2) Industry knowledge.

"Overall the feedback was positive however I learned quickly how important it is to constantly check work and learn about ___ sector. I will be the first to admit I have made errors in Pitchbook drafts and will always try to correct them and make sure they do not reoccur. In addition, the sector specific knowledge is certainly something that I need to focus on as it helps to know the space when reviewing text in a sales memorandum or Pitchbook".

Both attention to detail and industry knowledge are easy negatives. No one knows either perfectly out of the gate.

15. How Would a Friend Describe You In Just A Few Words?

"Happy, Competitive, Methodical"

You can move it around but the idea is 1) positive personality quality, 2) willing to work without saying driven/dedicated, 3) Clear thinking patterns.

16. Tell Me About a Leadership Position You Have Had?

To be honest this is less likely to come up at a lower end hiring position but a decent answer would be 1) a position in a club, 2) position in a sports team or 3) team leader in a project (school or work related).

17. Tell Me Something Interesting About Yourself?

Sometimes they ask you for things that are not on your resume, its usually best to choose something that is a "one time" interesting event. Such as traveling to ___ country or going skydiving.

"Hmm, one thing you may not know is that I used to be deathly afraid of heights. In order to combat this I decided to go out and go skydiving once, I did this in the summer and believe it was a great once in a life time experience."

Anything that is interesting and still appropriate for an interview.

18. Are You Smart or Hard Working?

For an interview you're going to want to veer on the side of being humble versus cocky so the better avenue is to say hard working and imply you're not a slow learner.

"If I had to choose I would say hard working. My grades are not perfect (they should be above a 3.5) but I believe with long hours and a strong work ethic improvements can be made. There are always going to be people who may be smarter but I'm more than willing to put in the work to learn a new topic as fast as possible."

19. Why Do You Believe Investment Bankers Work Long Hours?

This is a simple test to see if you understand what you are signing up for.

"Investment bankers work long hours, anywhere from 60-100+ hours per week, as they are involved on multiple projects from pitch books (winning new deals) to live mandates (IPOs and M&A). This means an investment banker must be on call at all times for his clients which could include international deals as well. With this business model, the hours are quite variable and stressful at times as well. Investment bankers must continue to source new business while executing live deals at the same time.

20. Give Me an Example of a Strenuous Week.

This is another spin on if you understand what you are signing up for. The trick is to tow the line between showing you can do the work and not insulting your interviewer by making it seem like you work harder than him/her.

"As example of a stressful week would include waking up at 6 in the morning, going to the gym for an hour, returning and heading off to class for the next few hours while answering emails for ___ and ___ clubs that I am currently involved with. After this I would spend an hour or two studying before heading off to my evening job working at ____ (ideally an investment banking night time rotational program or finance related job). This would be repeated throughout the week and my weekends would be spent working at ___ and ideally taking a few minutes to relax on a Saturday night."

Technical Questions

1. Can You Walk Me Through The Three Statements?

The income statement shows revenue and profitability metrics over a period of time starting from revenue to gross and operating profit down to net income and EPS.

The balance sheet shows a snapshot at a point in time, the assets equal liabilities + equity. It is linked to the income statement because net income flows to retained earnings.

The cash flow statement starts with net income and shows real cash out flows or inflows from operations, investing and financing activities. The final link to the BS is made as ending cash matches balance sheet cash.

2. What Are The Major Items On The Income Statement?

Income Statement: Revenue – Cost of Goods Sold – Selling General and Administrative expenses (Depreciation & Amortization baked in above the operating income line) – Total Operating Expenses – Operating Income – Other Income or Expense – Pre-tax income – Net Income – Shares – EPS

3. What Is The Balance Sheet Equation And What Are The Major Line Items?

Assets = Liabilities + Equity

Balance Sheet: Current Assets: (Cash & Marketable Securities, Accounts Receivable, Inventory, Deferred/Prepaid Current Assets and Other Assets); Long-term Assets: (Property, Plant & Equipment, Long-term investments, Goodwill, Intangible Assets & Other Long-term Assets); Current Liabilities: (Accounts Payable, Current Accrued Liabilities, Current Debt and other liabilities); Long-term Liabilities: (Long-term debt, Deferred long-term liabilities and other Long-term liabilities); Shareholders Equity.

4. What Are The Major Items On The Cash Flow Statement?

Cash Flow Statement: Beginning Cash; Cash Flow From Operations: (Net Income, Depreciation and Amortization, Change in Working Capital, Other Non-cash charges such as Stock based compensation); Cash Flow from Investing: (Capital expenditure, Purchase or sale of marketable securities, purchases for acquisitions); Cash Flow Financing (Equity or Debt Raises, Dividend payments, Repurchase of common stock [also called a buyback program]); Ending Cash.

5. How Would Depreciation On A Truck Impact The Three Statements After A Year?

If we give a $10K truck a 10-year span of life and use $1K as a reasonable assumption.

Income Statement: Operating income decreases by $1K, assuming 30% tax net income declines by $700.

Cash Flow: Net Income goes down by $700 but D&A is non-cash so $1K is added back so cash increases by $300.

Balance Sheet: On the asset side PP&E goes down by $1K, cash increases by $300, so assets are down $700. This is offset by the decrease of $700 from net income swimming to retained earnings.

6. How Do You Calculate Enterprise Value And What Does It Mean?

Enterprise value is calculated as follow: Market Cap + Debt – Cash. (More advanced Market cap + Debt + Preferred Stock + Minority Interest – Cash)

It is a valuation that is available to both bond and equity holders. Unlike equity value, which is below the operating income line or "Below the Line", Enterprise value can have sales and EBITDA metrics applied to them as well. It is used as a takeout valuation as this is a better proxy for how much the buyer must pay for the business.

7. Why Do We Add Debt and Subtract Cash?
The reason why we add debt and subtract cash is because when a company purchases a firm it is now liable for the debt on the balance sheet and now also has the cash on the balance sheet.

8. Can Enterprise Value Be Negative?

Yes. If the Company's market cap were below its net cash balance (cash – debt) then the company would have a negative enterprise value.

9. How Do You Value A Company?

There are many methods to valuing a Company however some of the major ones would include the following.

1. *Comparable companies analysis, using multiples of like companies to justify valuation*
2. *DCF, using future free cash flows to value the firm*
3. LBO, using cost savings & revenue synergies to value cash flows of a take-out compared to increases in payments from required debt
4. *Precedent transactions, using similar transactions in a space to justify a take-out valuation*
5. Premiums Paid, looking at public take-outs and seeing a percentage above current stock price in which the Company was taken out.

Italics are the most common and where you will likely receive the most questions.

10. Which Of The Valuation Methods Yield Higher Valuations?

It depends. Both Precedent Transactions and Premiums Paid should yield higher valuations that Comparable Companies analysis as these valuations are done on take-out transactions. In addition, the DCF analysis could yield a high valuation if the terminal value produces a significantly higher valuation for the firm (could also be quite low if discount rates are high and terminal value is low). Finally, the highest valued comparable could yield a significantly inflated multiple while the LBO is likely yielding a lower valuation as this would be a financial rather than strategic transaction.

11. Walk Me Through A Discounted Cash Flow Analysis & Tell Me The Flaws Of Such Valuation

Using a 5-year or 10-year convention calculate Cash flow by taking Net Income + D&A + Non-Cash Charges – CAPEX +/- Changes in Working Capital. (Note change in Working Capital is a +/-)

DCF = CF1/(1+r)+(CF2/(1+r)^2…..+(CF5/(1+r)^5+FCFN(1+g)/(R – g) (discount back to 5 or 10 yrs).

(Alternatively use an exit multiple to EBITDA/FCF/EBIT for the terminal value, discount back)

CF = Cash flow, R = Discount Rate, G = Long-Term Growth (Appropriate would be roughly GDP of ~2-5%)

A DCF is a poor metric for valuing cash flow negative companies or companies with hyper growth as the terminal value can make up for north of 70% of the total valuation.

12. Why Do We Use 5-10 Years For A DCF?

This is a general convention as it is difficult to predict 10+ years of free cash flow for a firm. Depending on the industry you can choose the most reasonable time frame to value the firm and attach a terminal value at the end to come up with a valuation.

13. What Do You Do If The Growth Rate Exceeds Your Discount Rate? (Advanced)

"If the growth rate exceeds the discount rate then your terminal value calculation becomes negative. Assuming the numerator is positive the best course of action is to derive a lower long-term growth number or adjust your discount rate on the terminal value calculation. "

Note: This is likely the last question you are going to be asked on DCF's and will be more conversational in nature.

14. What Are Some Problems With Using Comparable Companies Analysis?

While comparables are a great way to get an idea for the valuation of a company, no two companies are exactly the same. A Company may have higher growth rates, better margins or lower risk (balance sheet, size, better customers). This creates problems in justifying an exact multiple to be applied to each company.

15. I Have Retail Comps Trading At X Valuations, How Would I Apply These Numbers To Value Facebook?

Trick question. This is an "are you thinking question". The answer is you should not apply oil/gas comps to Facebook.

"To be honest unless there is a reason why we would compare retail companies to Facebook it would likely not make sense to compare retail companies to a technology growth company such as Facebook. Technology comparables would be more appropriate."

16. What Multiples Would You Use To Value A Company?

There are many multiples that can be applied depending on the industry however a few would be.
1. EV/Sales
2. EV/EBITDA
3. Price/Earnings
4. Price/Free Cash Flow
5. Price/Book Value

Many others dependent on the space (know the other simple metrics they would use).

17. Assuming We Have The Prefect Multiples At 2x LTM Sales, 5x LTM EBITDA and LTM 10x P/E. How Would You Estimate the Value of the Firm Given an LTM Income Statement?

Sales Multiple = LTM Sales * 2x (which is EV/LTM Sales) = Enterprise Value Estimate (Sales cancels out)

EBITDA Multiple = LTM EBITDA * 5x (which is EV/LTM EBITDA) = Enterprise Value Estimate (EBITDA cancels out)

P/E Multiple = LTM Net Income * 10x (Which is Equity Value/([Shares*Earnings Per share] = Net Income)) = Equity Value

18. Which M&A Precedent Transaction Would Likely Lead To A Higher Multiple Or Valuation, Private or Public? (Advanced)

It depends, however in general a small private take out would likely warrant a higher multiple as the larger company that purchases the private company could immediately sell the product to a wide variety of new customers and geographies. If the private company was distressed, not growing and recent public companies have been acquired for high multiples, then the answer would switch.

19. In Simple Terms What Is An LBO?

A leveraged buy-out is a transaction in which a Private Equity Firm raises debt and buys a company that it believes it can fix. In general terms the Private Equity firm believes it can improve the Company's financials over the long-term and exit the transaction generating a profit by either selling the company or taking it public.

20. A Company generates an additional $100M in revenue with gross margins of 40% and no change to any operating expenses, what happens to the Income Statement?

The Company sees revenue increase by $100M, Cost of Goods Sold increases by $60M, Gross Profit Increases by $40M, with no change to OPEX, Operating income also increases by $40M, if we assume no change to other income/expense, Pre-tax income is also up by $40M, finally this is taxed at ~40% which means net income increases by $24 and EPS increases as well with no change to share count.

21. What is the difference between GAAP and Non-GAAP Earnings?

Many companies have non-cash charges such as stock based compensation, write-offs, amortization and other non-cash expenses (no cash outlay occurs). So, non-gaap financials or "pro-forma" excludes these charges and generally increases the Net Income and EPS of the Company.

22. What Are Basic Shares Versus Diluted Shares?

Basic shares exclude the impact of options (depending on the transaction may include warrants as well). If a Company has several option contracts in-the-money then the diluted shares would include the impact of such options being executed. As an example a company with a current share price of $15 with many options at the $10 mark, the diluted shares would be higher than the basic shares.

23. How Do You Calculate Diluted Shares?

Note that if the options price is above the current stock price the options do not execute. In this case, basic shares are equal to diluted shares.

Basic Shares + ((Current Stock Price – In-The-Money Options Price)*Number of Options)

Normally companies have an options table in a 10-K or 10-Q filing that outlines tranches of options so a table is necessary to calculate each tranche and add up the impact. Finally, diluted shares can also be found in the 8-K earnings release each quarter, but it is best to calculate total shares outstanding as the stock price changes.

24. A Company has a $100M write-down how does this impact the three statements?

Income Statement: Usually a write-down or one-time charge happens at the Pre-tax income line so a -$100M charge is seen here, same 40% tax rate and you see net income decline by $60M.

Cash Flow: Net income declines by -$60M but the charge is added back so you have cash flow from operations increase by $40M.

Balance Sheet: Cash increases by $40M, Retained earnings decline by -$60M, this is balanced by a -$100M charge on the asset side.

25. What Happens To Your Three Statements If A Company Initiates A Dividend?

Income statement: No change however a line-item usually appears below the Income Statement to show the $/share distributed.

Cash Flow: Cash flow from financing decreases by dividend amount.
Balance Sheet: Cash declines by dividend amount (Assets) this is balanced by a decrease in Retained Earnings

26. What Is Treasury Stock?

Treasury Stock is stock purchased by the issuing company to reduce the amount shares outstanding in the open market. Generally speaking, this is usually done as part of a buyback or repurchase program where the Company buys back shares in the open market when it believes the current stock price is undervalued.

27. What Happens To Your Three Statements If A Company Initiates A Share Repurchase Program?

Income Statement: Total share count declines, increasing EPS, no change to Net Income
Cash Flow: Cash flow from Financing decreases by amount spent on share repurchases
Balance sheet: Cash declines by amount spent on buying back shares and balanced out by a change in treasury stock a decrease in shareholders equity (usually a negative entry)

Note this is more advanced and will likely only occur if you tell an interviewer that Retained Earnings = Previous Retained Earnings + Net Income – Dividends. As this is yet another way to see if you understand the 3 statements.

28. How Could You Use Premiums Paid On A Private Company With No Shares?

If we want to use premiums paid on a private company with no shares, one possible method would be to derive an equity value for the firm by taking Net Income and multiplying by the best comparable P/E Multiple to obtain an Equity value. At this point we can take the Equity Value which is no different than Shares*Price = Market Cap and place the premiums paid percentage on the implied equity value.

29. Why Do We Calendarize Income Statements?

Companies have different fiscal year ends, so we cannot overlay companies with a Fiscal Year ending in September with a Fiscal Year Ending March as it will create discrepancies when comparing the quarters and years. As a convention we calendarize the statements to end in December across all companies to make the comparisons apples to apples.

30. How Does Purchasing Inventory With Cash Impact The Income Statement?

No change to Income Statement. Cash flow from operations decreases by the purchase amount, cash declines. This is balanced by an increase in assets (inventories) on the balance sheet.

Note: All else equal increases in current assets decrease CFO, increases in current liabilities increase CFO.

31. How Would Inventories Impact The Income Statement?

When inventories are used to create products then it would be recognized as cost of goods sold or an operating expense (depends on industry, what inventories are being used for). However, simply purchasing inventories does not impact the Income Statement.

32. What Does It Mean When A Transaction Is Accretive?

This is when the Purchasing Company + Company Acquired combine and form a New Company where Net Income increases post the combination. The transaction would be dilutive if the acquisition causes Net Income to decline post the combination. The negative impact from the acquisition (interest lost on cash, debt payments) should be offset by additional net income.

Rule of Thumb for Stock Transactions: If you buy a Company that is trading at a higher P/E the transaction is more likely dilutive as you are paying "more for earnings". If you buy a company with a lower P/E it is likely accretive. Note, this is an all stock transaction, in all cash transaction you are simply comparing pre-tax income to new debt interest payments and interest lost on your cash.

33. Why Would A Company Choose To Use Stock or Cash In A Transaction?

If the company could be acquired for a lower P/E the transaction would likely be accretive. In addition, if the company has a great valuation it would want to use its peak price point to acquire a company to take advantage of its high current stock price. In addition, the company may not have enough cash on hand to buy the company and be unwilling to take out debt to finance the transaction.

On the cash side the transaction would likely be accretive, assuming the target company is profitable, as the interest rate on cash is at all time lows of near 1%.

34. Who Would Pay More A Strategic Company Or A Private Equity Firm?

In general a strategic buyer would likely pay more as they can quickly recognize immediate synergies from the transaction (revenue and cost saving). The companies are more likely than not in the same space and distribution channels can be used by the acquiring company to expand the reach of the new products and services. Private Equity firms have a tougher time realizing synergies as they attempt to "fix" the business by stripping out operating expenses and attempting to grow sales organically.

35. What Are Synergies In A Transaction?

Synergies are generally broken into two categories:

Revenue Synergies – Acquiring company can sell to more geographies, combine with current portfolio to bundle goods, up-sell to other products, further penetrate existing customers and address new customer bases.

Cost Synergies – The Company can reduce the cost structure by shutting down facilities, combining facilities or reducing the head count.

36. What Is EBITDA? Followed By What Are The Flaws?

EBITDA is a proxy for cash flow, however the issue is that CAPEX is not included in the metric so a Company could generate EBITDA for many years and still go bankrupt if CAPEX exceeds Cash Flow from Operations

37. What Do You Use For A Discount Rate?

Generally you can use either the weighted average cost of capital (WACC) or calculate a rate (Cost of Equity) based on the capital asset pricing model (CAPM).

WACC = ((Cost of Debt*(Debt/(Debt+Equity))*(1 – Tax Rate))+(Cost of Equity*(Equity/(Debt+Equity))

Cost of Equity = Risk-Free Rate + ((Beta * (Market Return – Risk Free Return))

Un-Levered Beta = Levered Beta / (1+((1-Tax Rate)*(Total Debt/Equity)))
Levered Beta = Un-Levered Beta * (1+((1-Tax Rate)*(Total Debt/Equity)))

38. What Is Working Capital? Followed By What Happens If Accounts Receivables Are Increasing?

Working Capital is a metric that shows if a Company can pay off its short term liabilities with its short term assets so it is calculated by taking Current Assets – Current Liabilities. Depending on the Company and industry it could be a good or bad sign (know the answer for the group you're interviewing with).

Finally, while seeing accounts receivables increase can be a positive, it means more customers should pay you in the future; it causes cash to go down as you have not received the actual dollars from the customers just yet. (If you are a real rock-star you can look up the AR days for the group)

39. If A Company's Stock Price Increases By 25% Today What Happens To The Balance Sheet?

Nothing. Many people confuse Equity Value or Market Cap which is Shares * Price with Shareholders Equity. Shareholders Equity is a Book Value Calculation.

40. With No Information Which Of The Three Statements Would You Use To Value A Company?

Assuming the Company is profitable, I would choose the cash flow statement as it can give me a sense for the overall long-term value proposition. At the end of the day cash is king. We can use a DCF, analysis, or even use Net Income as a proxy for Cash flows and derive some profitability metrics. Now, if it was a rapidly growing and cash flow negative Company I would use a built out projected income statement or Equity Research report as many multiples require income statement projections.

Note: The only wrong answer here is really the balance sheet as it shows no long-term profitability or cash flow metrics and is simply a snapshot of the company's assets and liabilities.

41. If You Could Choose Two Statements Which Would You Choose?

Balance Sheet and Income Statement as the combined statements can be used to generate a cash flow statement.

42. Why Would A Company Buyback Its Debt?

If the Company is running into covenants such as Total Debt/EBITDA or EBITDA/Interest Expense, the Company would likely need to buy back its debt. In addition the company may want to buy back its debt because it can reissue debt at lower rates, perhaps some outstanding debt is significantly higher than what they can receive in the market today.

43. What Are The Main Differences Between A Cash Transaction And A Cash Transaction Funded By Debt?

In a debt transaction the interest expenses are higher, the leverage on the Company changes and you have a higher chance of the acquisition being dilutive to earnings.

44. If Your Company Has Annual EPS That Is Decreasing Over The Next Five Years Is Your Current LTM P/E Multiple Higher or Lower Compared To A 5-Year Out P/E?

Some people make quick errors and simply say higher, but the answer is lower. Your current price does not change today so if your EPS is expected to decrease over the next 5 years you are seeing a higher P/E multiple in the future.

Ex: $10/1 = 10x versus $10/$0.50 = 20x.

Note: This is a decent sanity check for comp sheets as well flip it around when looking at out years for growing companies.

45. What Is In A Pitchbook?

A pitchbook can contain multiple sections or be quite thin depending on the content. A general pitchbook for an M&A transaction for example could include the following: 1) Introduction to Bank with tombstones of previous deals, 2) Overview of Company being pitched; 3) Combined model of said transaction 4) Other valuation items (DCF, precedent transactions) 5) Comparable company analysis in the back and 6) An appendix with an overview of team members and executive teams for the deal.

Note: Unlikely will be asked this without prior Investment Banking Experience.

46. How Do We Project Depreciation and Amoritzation and Capital Expenses (or Other Line Items)?

For projection type questions keep it simple and use a percent of revenue for D&A/CAPEX or you can use an annual run-rate. Notably, many companies also provide an estimated next year or NTM capex spend in their filings.

For balance sheet items use a projection that is related to the item, (ex. Receivables should be linked to sales, Payables to COGs, Expenses to OPEX). For overall revenue numbers you would use a combination of guidance (public companies) or industry estimates (ex. Industry grows at GDP then you would stick to using GDP as your annual revenue growth rate).

47. Can You Pitch Me a Couple of Stocks?

"I like XYZ stock, it has ___, ___, and ___ going for it. In an *upside* case I see the stock going up XX% and in a *downside* case I see the stock being flat/down XX%. Given this I see more positive than negatives working for the stock making it *well positioned compared to peers* because of XYZ. Finally, I think the *balance sheet/cash flow/valuation* is good because of XYZ metrics"

The interviewee has implied many things, one you understand that you could be wrong with downside cases. Two you understand companies are compared against one another "well positioned compared to peers". The last part while a bit vague, implies you at least understand the basics of finance and/or valuation.

Now if you want to go deeper you have to draw in themes such as:

"I like XYZ stock because I believe the investment community has XXX and XXX incorrect about the stock. The reason why i believe this is because of reason 1, reason 2, reason 3. While the bears will point to XXX and XXX I'm more bullish on the name because of reason 1 and reason 2. Finally, from a valuation perspective I believe the stock is undervalued due to XXX metrics"

To further clarify here's an example that everyone could relate to (certainly choose a different stock to be more differentiated).

<u>Notably, if you would like to go deeper and know that they will be grilling you on reasons for the stock here are some additional ideas:</u>

1. Buzz phrases – Believe selling is "Overdone" at these levels because people have "baked in" a quarter that implies "units/volume/metric" are going to be down severely on a year over year basis.
2. Technicals – Pull up a 20/50 day moving average and find and indicator to help back your argument, just pased XYZ moving average
3. Disasters – Maybe there was a "blow up quarter" last year in this space, you can use a y/y basis and compare it to say when the Japanese Tsunami hit and the compares in that quarter on a relative basis to the (insert most impacted industry) will be better
4. Read throughs – Say for wahtever reason every single comparable company printed good/bad numbers in units of XYZ… Your company directly works with XYZ so there is likely upside this time around versus prior
5. Pricing – Say the company you are pitching has extremely high exposure to "copper" or any other component could be a semiconductor etc… So you say "margins should expand" and the stock hasnt moved since the pricing of said component has dropped XYZ percent

Finally, have an opinion on the main bull/bear argument and take a side, if they argue heavily against you read them and decide to hold your ground or to nod in agreement. Usually its better to hold your ground in a non-attacking manner.

48. What is Investment Banking?

"Investment banks earn fees by raising capital through Equity and debt offerings or by advising on strategic transactions such as a merger or acquisition."

How to Prepare For an Interview Once You Know the Technicals and Behaviorals?

Bucket your Banks:
1. Boutique – You want to emphasize your individualism and ability to work under higher responsibilities a story involving you randomly being asked to do a much harder task last second will flatter your interviewer
2. Middle Market – You want to see where the platform is expanding to "compete" with the "big boys" all of them are trying to be bulge brackets, so find that spot and bring up positive transactions in that spot. Flattered again.
3. Bulge Bracket – Explain why that BB is the best. This one is much harder unless you're at MS or GS because they already have through the roof egos.

Bucket your Interviewers:
1. Managing Directors – Basically a MD or Director only cares about two things 1) will this guy be happy if we crush him with 48 hours of work. 2) will this guy be decent in front of clients long-term? So with that said since he is the most important here is the breakdown:

– Reason why his group/sector
– Name drop some info BEYOND his major deal so it shows you did research (I would name drop the major deal and then another one maybe 2-3 deals back in time so it implies you keep your eye on the market)
– Have your story IRON clad strong, he will absolutely ask you about your history/why you want to do it
– Be happy not nervous. This sounds "lame and stupid" but its the truth. When you pick up the phone people can feel your personality immediately. This separates average people from good workers in some cases. He wants to be talking to someone who has a positive attitude.
– Have a sector/stock in mind with some basic investment thesis "high level" (tablets versus PC's would be an example everyone would be aware of) but of course choose one related to the space.
2. Vice Presidents – Have your intensity up here. These guys are in the rockiest part of finance. People are into themselves so they will feel only as they feel themselves. So the point is be MUCH more professional. Give very very conservative answers. No joking around. You're going to give humble, professional answers that are correct. No "rounding" write out numbers on your note pad so it makes it obvious you double check your work.
3. Associates – In between an analyst and associate so sometime you can joke a bit, these guys are bitter but not as bitter as a second/third year analyst so veer on the side of professionalism and try to make some sort of connection.
4. Analysts – Towards the tail end of the interview, you may be able to lighten up. Of course you can read them and if they are "super bankers" like the VP type personality then yeah veer on side of professionalism, but this is just bonus points because they don't make major decisions anyway. If you have to choose always get the higher ranked analyst to like you.

Bucket your Products:
M&A – Choose one mega deal and one niche deal that you can speak to, always start with major deal so they can toot their horn and flip to the smaller deal. (this is done in Q&A). Basically you make their mood positive then turn on the "i did my research bulb" in their head and now they think … hmm he's a good hire
ECM/DCM – Emphasize your salesmanship more here because you're going to be doing tons of pitches and chasing deals and your MD's are going to get paid on that deal closing. They have less interest in your ability to put an Acc/Dil model together… because you wont.
Consumer/Tech/Financials – Know the metrics the company is valued on and drop this in the interview. A smart way to do it would be during Q&A when they say "hey so do you have questions for me". If you're going to work with Financials bankers you can drop some stock you like in the REIT sector then talk about how its trading at X.X to book value… This does two things, gets convo flowing about if the guy invests in the sector and shows you understand one of the main valuation methods for that space.

Geographically Lock Yourself In:
If you're interviewing in NYC somehow put a strong tie to NYC and how your family or some other jargon is tied up here so that's why you're location specific to that area. This gives them a very minimal but important psychological selling point on why you would bother staying in that area. Again they want to make sure you are not a "one and done"

****

Investing 10% Doesn't Work. Run the Numbers. Get Rich Fast Instead.

Investing 10% Doesn't Work. Run the Numbers. Get Rich Fast Instead.

One common recommendation from personal finance "experts" is to save 10% of your income. Unfortunately this advice is absolutely awful and will make sure that you're extremely far behind over a 30-40 year time frame. Why? Well the numbers only work if you expect to make the same or less as you get older. We'll use the power of compounding and factual math to prove this out. To avoid any sort of debate over investing returns, inflation etc. we will use 5% returns. This means the 5% gains encapsulate inflation already so it's an aggressive number (5% returns guaranteed for 39 years straight).

Saving 10% Works If We Assume No Lifestyle Improvement

Save 10% – No Income Change: In this first example what we will do is assume that a person earns $50,000 per year. We will assume that they save 10% of their gross income ($5,000) per year for 39 years straight. At this point they should be at a nice retirement age of 60. The second assumption we make is 5% returns on that money for life. Anyone who has been through the last 20 years of stock market volatility knows this won't be perfect. But. We want to make the picture as clear as possible. So we're sticking with it.

What happens? In the first example, the math is extremely easy to run. What you see is that you save $5K a year, you spend $45K a year and your $5K annual contribution compounds at 5%. At the end of the 40 year run (39 years of compounding) you have $604,000. But… There is a problem here. The problem is that the spending number is actually $45,000 which means you have a multiple of just 13.4x. Since we know you need about 20x your living expenses to retire, you're short $296,000. So despite saving 10% of your income from 21 years of age to 60… you're not able to quit. You'd have to work until you're 68 years old to pass the 20x number.

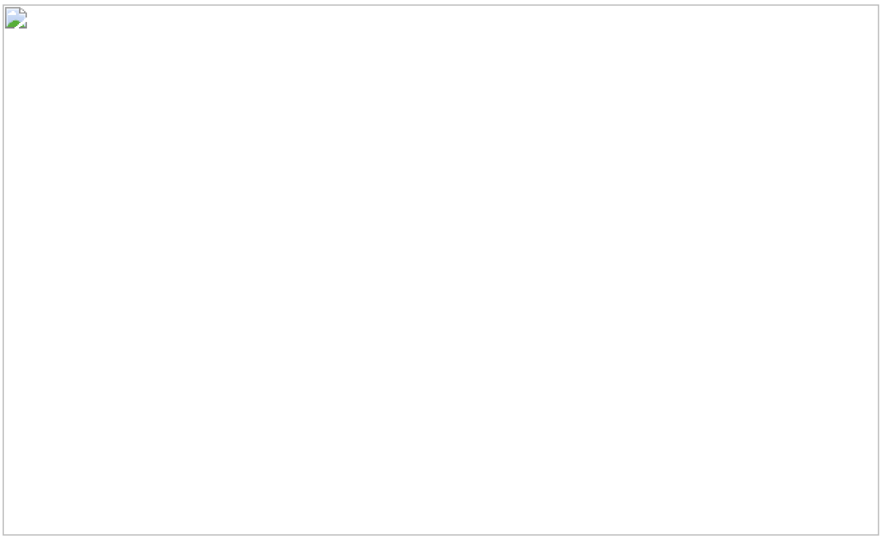
Wait what about social security and other inheritances… this could help fix the situation. While it is possible to make up the difference with social security and other one-time inheritances you *might* be able to pull it off. That said… Who wants to work for 40 years and live with a "might be fine" scenario. Not us and likely none of our readers.

The Power Of Compounding: If you wondered why Trust Fund babies don't have anything to worry about… look no further than the power of compounding. If someone invested $90,085 in year 1 (2019 in this example) they would have exactly $604,000 as well. Instead of being shocked by this, it helps explain why having a career in sales or having a one-time *event* is so critical to becoming rich. The entire goal is to invest a lump sum as early as possible and forget about it so you don't have to worry about saving money in the future (easier said than done of course!).

Savings in Thousands of Dollars

Saving 10% With Lifestyle Improvement is Actually Worse

Save 10% – Grow Wage: In this example we'll do the exact same math. But. We will assume that your wage actually increases over time. We have to keep the comparisons equal so remember our assumptions: 1) market returns of 7% which means an actual return of 5% after inflation eats 2%, 2) we assume you save 10% of your income and now 3) the new assumption is your wage grows at 4%, which is the average, or just 2% after inflation. In summary, your investment return in 5% (7% actual – 2% inflation) and your wage growth is 2% (4% actual – 2% inflation).



What happens? In this example the math is a bit more complicated but here are the numbers. By age 60 you're making $108,000 per year and you have $805,325 to your name. Since you're saving 10% it means your annual spending in the year 2058 is $97,413/year. When we apply that number through it means you have 8.3x your annual spending saved up. Wait a minute. This is a significantly lower number than the 13.4x you had when your wage was simply flat lined. *The reason for this is that investment gains are outpacing your ability to earn.* This has been the case for the average person for quite some time and also explains why the rich get richer while the poor get poorer over time.

The Problem: There are two common rebuttals with this math, first we assume the person cannot downgrade his lifestyle. This is entirely true and perhaps the person is slightly better off (meaning he could live on less). The problem? Well if we assume he can live on $60,000 instead of $97,000… this still leaves you with just 13.4x (essentially equal to the first example with a decrease in lifestyle). Nothing amazing.

The second rebuttal is that you'd save more as a percentage over time. This is true and is a legitimate debate point. The one wrinkle we'd throw in… we assume the person never had a set-back for a single year. Also. At age 40 earnings usually peak and it is unlikely to grow earnings from 40 to 60 at the exact same rate as from age 21-40. For fun… think about this insane stat… if this same person took a single year off (say at age 40) and actually lost money as he was unemployed (-$28,000) he would only have $675,000 at age 60 (***$130,000*** difference!!!!)

Just One Missed Year… (Savings in Thousands)

Too Much Math What is the Point

51% is Significant Acceleration: If you're able to *invest* more than 50% of your income, even 51%, you're seeing significant gains in your net worth of time. This is because you will not only put away a year of income, but more importantly, it means your standard of living is being forced upward without additional income. If long-term price appreciation (market return, real estate etc.) outpace your ability to earn… Eventually the switch will flip where your assets earn significantly more than your active income. This is an amazing cross over point and extremely difficult to achieve. But. If you put away over 50% it is a mathematical possibility.

Time Value of Money is *Serious*: If we assume you are happy with your lifestyle but you're only saving 10% of your income… Now lets say one year you sell a business you were working on. It is sold for 10x your annual income. Boom an *event*. Assuming you do not spend the proceeds… you never have to worry about finances again. Why? Your savings just increased by a factor of 100x. Most people think their savings rate was only 92% versus 10% which doesn't sound like much… This is not how you do the math. If you were saving $5K off of $50K a year, you incur an event at $500K, you just saved $500K/$5K = 100 years of savings in a single day. Make no mistake, most people who actually become rich have an ***event*** that makes their cash flow change for the rest of their lives. The reality is that you get rich in a windfall or by grinding out a large amount money over a ***short*** period of time.

We made this point in the first section. If the average person saves 10% for life (next to no one ever does), you're better off receiving $100,000 at age 21 and leaving it invested for 40 years. You'll have more money than they will by the time they retire. This is why money, like every other game in life, is rigged for the top. Actually… if you could earn an average income and somehow live for free (only 3-4 years) you'd be better off than saving 10% for 40 years. That's how powerful compounding is.

Assets Have Been on a Tear: We have no real solution here. For some reason assets have continued to outpace wage growth for decades. This is unlikely going to change with automation, robots, artificial intelligence and more. The answer is to try and get as much money as you can up front and fast. Then you can build up that asset base faster than the general population and get well ahead of the eventual long-term climb in assets. To make sure we're clear, we're not positive on the macroeconomic climate over the next 2 years (so no change) but if you ask us about the next 30-40 years then we are certainly positive on future growth.

Increase Your Investment Rate Early: There was an overlooked comment from an anonymous person this week so we'll share it below. Here is the link as well since we want to give credit where it is due.

"Want to share advice I wish I had to all the college students reading this. When you are earning income from a job, especially when it's below 300k, comp numbers that seem very close on paper can be extremely different in terms of life impact.

In NYC most people spend about 100k pre-tax (60k post-tax) to live even as an analyst. This means that a 150k compensation will lead to 50k pre-tax in savings but a 200k compensation will lead to 100k savings. The amount saved in a year increased 100% despite income only going up 33%. This means a person working one year at 200k will save as much as a person working two years at 150k. It's nuts. You even see this effect between 200k and 300k, it's a 50% increase in comp but a 100% increase in savings (100k pre-tax vs 200k pre-tax).

*This is why it's so important to _maximize_ the income you are earning out of school. 100k is not enough as stated on this blog, you need to think of job income in two parts: (1) living and (2) savings. You also need to think of income in terms of _cash flow_ instead of just the dollar amount in the offer. If you have two offers: **1) Offer:** 120k base + 50k annual bonus (~5k 6 mo stub bonus) + 0k signing; **2. Offer:** 110k base + 45k/yr in equity vesting monthly over 4 years + 20k sign on.*

#1 is a higher offer but #2 has much better cash flow. You can invest/use that 20k the day you start and will get investable equity every month. With #2 you will need to wait 18 months to cash in that 50k bonus and will be living off the base in the meantime. You can and need to _negotiate_ option 1 so that they offer a signing bonus. Even if it's only 10k (half of #2) that up front cash will be incredibly useful out of college. Also, very few people negotiate for one-time aspects of comp (signing bonus, relo bonus), take advantage of that…. Much more can be said but those two points are key when picking offers."

This is a fantastic summary. If you're looking for one sentence it is this. When you're in your 20s and even early 30s try to stack a ton of money up front as it will snowball you forward for the rest of your life. Most people try to play catch up and as you can see from our second example… one slip up and suddenly it's a cliff not a hill that you must climb.

Don't Waste Your Youth: The main point? If you waste your 20s you're going to be climbing up a slippery mountain with jagged edges. If you waste time, you could be in an extremely deep hole for the rest of your life. Sounds daunting because it is. Look around and find the guys who tried to get it "together" at thirty and you'll see they never quite get there. They are forced to scale back their living standards and options. You want your options to ***increase*** and your time to become ***more valuable***, this is only possible if you don't waste your youth.

****

Investing Lessons From the Tesla Short Disaster

Investing Lessons From the Tesla Short Disaster

While Tesla is currently experiencing "irrational exuberance", we can't help but laugh as we see people who have been negative since $40 claiming they got the stock right. It doesn't make any sense but should teach everyone a valuable less, humans are *never wrong*. If you've studied mass delusions, you know that people will never admit to being wrong even if the facts continue to say they are wrong. This is because ego is an incredible drug. So, we're going to outline a clear way to spot this madness and how you can avoid falling into the same trap.

Tesla Case: The financials are ugly, is it a software company, a battery company or a car company? Will the debt load be reduced, can Elon Musk always get funding? So on and so forth. What we do know is this. When you're betting against someone it probably isn't wise to bet against one of the smartest people in the world. There is no debate that he is one of the smartest people in the world as he succeeded with PayPal, Space X, Solar City and Tesla. Those companies have practically nothing in common. Not to mention his other smaller successes along the way. The first thing to remember? Never short sell a "famous" CEO. Steve Jobs was another good example and someone like Jeff Bezos is yet another. You can dislike them, but shorting them is a fools game as one "hype move" of 100% gains takes you to zero and you can't recover.

The second thing to note here is that you could be wrong. The biggest thing we learned from Elon Musk has nothing to do with cars, batteries or PayPal. It had to do with risk tolerance. He had an interview shortly before launching Space X and he said he tied a <10% chance of it even succeeding. Yet he did it anyway. Why? Asymmetric returns. With Space X, he knew that in the <10% chance it succeeded the value created would be more than 1,000%+. This means risk reward said it was a good investment/bet to make. How does this relate to Tesla? Much and the same. He bought Solar City with Tesla and he could very well make an entire new market by himself. Laugh if you want, but this is what Apple did when the iPhone was released. Blackberry was taken out and Apple became a trillion dollar company. Off of one genius product. One.

The third and final thing to remember about short sellers is that they are emotional. You can tell that Tesla is one of the "un-shortable" stocks. It is the exact same way with crypto currencies and weed stocks back a couple of years ago. We're not saying it won't fail (it certainly could) but the amount of emotions it has is unparalleled. Bears are absolutely obsessed with him and the Company and even at today's levels they think they are right (despite losing all their money several times over, only to lose all their money again).

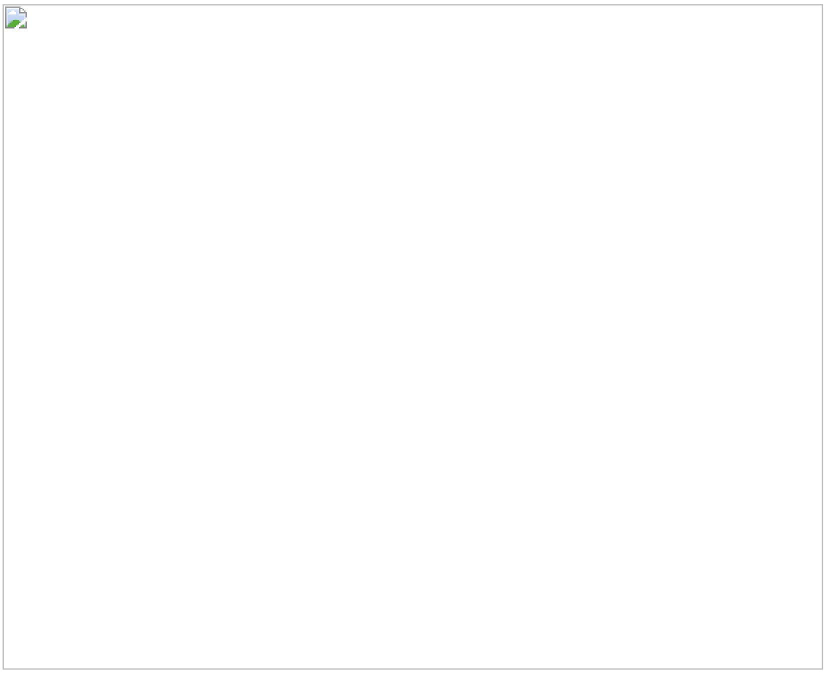
How to Apply This? The application of this phenomenon is actually simple: crypto currencies. You have weird people who believe that Bitcoin will be the only crypto currency despite more and more and more coins being created every day. In addition, you have other weird people who think it's going to go to zero. The chances that either one of these people are right is next to zero percent.

So how do you think about Tesla and Crypto? Simple. You either buy a small amount and forget about it… or you simply forget about it. You do not short any of them as a 100% gain (*extremely possible in any year*) can put a huge zero into your account. Even if you only shorted it with 2% of your networth, that's a massive set back if you average 10% gains per year.

If you would like to go for the "loop" as we call it we recommend doing the following on any volatile investment: 1) find the biggest supporters, 2) find the biggest detractors, 3) find their expected price targets and then 4) find out their backgrounds.

You'll find that Tesla and Crypto are basically the same (in terms of emotions nothing more). Tesla supporters think it's going to be a half trillion dollar company, detractors think it is a zero and the backgrounds of supporters are generally smarter than detractors (just look at their tech backgrounds and no professional investors are not "smart" we're referring to tech specialists only).

We go ahead and assume that Tesla supporters/detractors are equally intelligent. So 50/50 chance it goes to $0 or $500B. This means you're going to get a 300% return or a 0% return… expected value is **150%!** Do not short.



From the chart above if anyone was long-term bearish at *any time* below $400, they are not allowed to have an opinion anymore. By definition they lost over 100% of their position. The only exceptions would be a genius who shorted in the $300s bought back or said cover by $200 or so. That said… Just go on Twitter and the you'll the same bears at $733 were bearish at $40 or less. No credibility or decency to say they were wrong.

Do the same with crypto! Unsurprisingly it's the exact same thing to a T. You have people who say Bitcoin will be worth $100K and others who say it is a zero. If you assume both are equally intelligent the implied return is **about 500%!**

You'd think we'd have some complicated way to think about it but that's really all we do. If you look at high risk high return assets it almost never makes sense to short. Similar to biotechnology companies. Unless you have specialized testing data, it is better to just own a small amount or ignore it. One set of testing data can send it up 100%+ in a day.

This Is Risk Averse: People talk about "risk averse" and confuse it for "volatility". They are not the same and will never be the same. By owning a small amount of these high volatility stocks you're actually taking a risk averse decision. Why? You have to ask yourself *"what if I am wrong?"*

If you're wrong on Bitcoin and you didn't own say 1% of your net worth, that would have gone all the way up to 10% of your net-worth if a parabolic move occurs. If you're wrong and it goes to zero, you lost just 1% of your net worth and your life didn't change. So… Ask yourself, are you okay with your net worth potentially being 10% lower with the risk of a 1% hit? Chances are you're going to end up buying a small amount. This same logic applies to a lot of other items: Gold/precious metals, asymmetric biotechnology stocks, Venture Capital investments and more.

How to Sell: Now the last trick is avoiding complete collapse and irrational exuberance. This is going to be psychologically difficult but we use the 33% rule for high risk high reward assets. We don't use 50% as these types of investments usually make irrational parabolic moves when they go up.

If you invested $10,000 into a high risk asset and it goes to $30,000 we would then cut the position by $10,000 or 33%. It is really that simple. This way you get to keep your high risk investment without being upset if it goes up more or goes down for a period of time. The dollar number is less important relative to the percentage gains. If $10,000 is small for you, and it's $100,000 then you'd trim $100,000 if it was at $300,000 (for fun, yes we're saying we wouldn't touch Tesla here until the volatility stops, three years ago we said buy small and forget or never short and unlike the crazy people on twitter rarely spoke about it for years).

> Feel bad for all the Tesla shorts. Even if they believe it's going bankrupt it's never smart to bet against ceo's considered "godlike"
>
> Jobs and Musk are just in the "unshortable" CEO lists – always find a way. Better to just not play if negative
>
> — Wall Street Playboys (@WallStPlayboys) August 2, 2018

Simple Conclusions: Instead of trying to predict homeruns it's a lot easier to expose yourself to potential home runs without the headache of constantly following it. The second major item is that you don't bet against geniuses. Please spare us the "I did the homework" on the stock type arguments. Betting against geniuses just isn't a good proposition and why anyone would want to see someone like that fail (a person risking everything he has to improve the world) is beyond us. No need to become a fan boy like many millennials but there is also no need to dangerously short a high volatility stock that can take you to zero within a month.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending.

****

Investing Priorities

Investing Priorities

In our overview on How to Invest as a Bachelor and Part two outlining how to obtain a high paying job we're continuing down the journey to financial success and the message remains the same:

You must invest.

We already know that a savings account is yielding at best 1% this day and age. With that in mind how is that helping you obtain financial freedom? It is not. In fact you are going broke. This article could not have come at a better time as Janet Yellen recently took over the Fed and stated the following:

"*Inflation remained low* as the economy picked up strength, with both the headline and core personal consumption expenditures, or PCE, *price indexes rising only about 1 percent last year, well below the FOMC's 2 percent objective* for inflation over the longer run. Some of the recent softness reflects factors that seem likely to prove transitory, including falling prices for crude oil and declines in non-oil import prices."

Take a quick pause for a moment and re-read the quote above.

Now that we understand the Fed intends to increase inflation since they believe it was 1 percent… this means you are going to become poorer if your money is invested at a paltry 1 percent. Instead of complaining about the changes and the printing of money the only solution is to take massive action by becoming an intelligent investor.

Backdrop: So we avoid all the Suzy Orman type comments, we are going to make the following extremely dangerous assumption: ***You are responsible and can control your emotions.*** If you check off both of these boxes you're already in the top 10% of the USA in the first place. With that out of the way and the assumption that you have a high cash flow career we'll take a walk through a high level personal capital allocation policy.

invest

Priority One

We move from left to right in each priority. Assuming you have some debt (ideally not much due to intelligent decisions) your first order of business is to get the Company match, get rid of debt for psychological reasons and lower your tax rate with additional 401K investments.

Company Match: This is free money. Even if the rate on your debt is 10% there is no way you will ever find an investment opportunity that yields 100% returns upon investment. This means you have literally doubled your money on day one. While the Company match may be small at 3%, that is still $3,000 of free money on the table assuming you make $100,000 per year. It is much more financially irresponsible to forget the match than it is to have a small debt load.

Paying Down Debt: If you have a mountain of debt, you likely need to adjust your strategy by finding a debt specialist to pay it off in a one time sum or have a piece of it forgiven. With that said if the amount is relatively small, then pay it off quickly so you can have more mobility with your credit score. A high credit score means better access to credit. Credit scores are just as important as your GPA out of college.

401K for Lowering Taxes: Always pay the least in taxes, an obvious choice. When you're close to 6 figures or when you eventually approach $200K+ in income, you want to make sure you defer those tax payments since your bracket increases. In addition, a savvy reader will realize we prefer 401K tax avoidance to $10K liquid from the get go. Why? If an emergency occurs you can always tap into your 401K in a real world disaster. In addition, the extra 401K contributions are unlikely going to break the bank since the goal is to simply lower yourself to the next bracket. Sticking with the $100K example, you want to get your bracket to $89,350 according to the 2014 single taxpayer bracket. If you are nearing $200K, well jump down to $186,350, so on and so forth.

Priority Two:

Priority one should be taken care of quickly. At this point you are in the lowest tax bracket according to 401K manipulation and you are ready to build a personal financial profile as well. In addition, you're looking to build personal wealth that is untied to your Company. Finally, you should be looking at a possible credit facility in the future for low rates on debt for leverage.

$10,000: This is simply a number that we've derived from personal experience. As soon as you have $10,000 in the bank there is no reason to have any more in a savings or checking account. Lets run through the math quickly.

Assuming you can live on $3,000 a month this means the savings account already has you covered for 3 months and 1 week. In addition, you're never going to quit a job. You either get laid off and get unemployment or you quit for a new job. Assuming unemployment benefits are roughly $1,800 a month, that is another $5,400 as you eat into savings. Quick math below:

($10,000 + (1,800*3))/3,000 = 5.133 months.

Assuming you're a hard working person 5 months is more than enough time to find a new job.

Dollar Cost Averaging: We have already talked about this investment strategy but it bears repeating. In 30 years will companies be larger? Will things be more expensive? Will the Equity and Debt Markets be higher? In that case you know your money should be working for you instead of burning a hole in your pocket at 1% losses since the Fed intends to increase the rate of inflation. Finally, notice we try to avoid stock picking and fund advice because 1) we have no idea what will happen to the global economy on a day to day basis and 2) we have no interest in becoming financial advisors.

Credit Facility: Now we're getting to the good stuff. Your portfolio is growing and you have momentum. At this point you should be receiving terrible financial advice from everyone pitching you to do X and Y with your money. This is when you know you have momentum. Instead of allowing them to steer your future you slowly build up an insanely high credit rating. You have churned a few cards and are now locked into a pair of good credit cards and one for your credit history. Start manipulating your credit rating to 800+.

Priority Three:

Now we're starting to see the benefits of all the trees we've planted. You're no longer fighting against price increases since you're an asset owner with total assets well eclipsing your annual pay. You're getting richer. You've got a credit score that would surprise every bank if you walked in and needed a loan. Time to diversify.

Cover Rent: While you're manipulating your credit rating from the end of priority two you should have a system for tracking your passive income. If you're banking on bond yields, dividends or rental income you should have a personal database that tracks each cash flow. When this number covers your rent you can now consider leverage if the rate is low and the opportunity is low risk and slightly higher yield.

Credit Facility: We are considering a live update of how to utilize debt but for now we'll keep it high level. Run the debt load where you have a 3x debt to return ratio and you are generally in a safe position. As a simplistic example since we receive numerous emails on real estate if you are able to pick up a 15 year mortgage at 3% and the cap rate on your real estate investment is 9% (assuming you're buying for rental income) then you should be in a good position. With a 30%+ down payment the 3% rate is achievable and your tenants should be paying your entire mortgage for you, perhaps even more.

Equities and Debt: At this point you have a relatively large and mixed portfolio. You're invested across all asset classes but it is a good idea to take a look and consistently rebalance. If your career is firing on all cylinders and you have large amounts of cash flow you can continue with a heavy skew to equities. This is because a market correction of 25% would leave you unphased. On the flip side, if you're unwilling to lose 25% in your equity portfolio it is time for a change.

Priority Four:

We're at the final stages of your journey and you should be a mature investor. A market decline of 5% in a few weeks (what happened in January) should leave zero emotional toll on your mind and body. You simply don't care about market movements with regards to the dollar cost averaging piece of your portfolio. Again, you are not phased one bit. In addition, if you've built a meaningful career, have read 100s of books and have strong relationships for liens of debt… You can consider a few bigger ticket items.

Cover Expenses: When most people talk about location independent income all they mean is they want to live a normal life in any city in the world. They simply want to see cash flow surpass expenses. That is it. By the time you have appropriately readjusted your portfolio and have access to cheap debt we are guessing you're approaching this threshold. Instead of getting into high risk ventures keep your eye on the relaxation point (cash flow = expenses) and ignore higher risk items for now.

Higher Risk: At this point you should have a niche. You should know one area better than anyone your age and anyone 10 years your senior. That is the benchmark and there is no getting around it. If you're not an expert… the entire high risk category should be thrown out of the window. High risk includes: *Private Equity, Seed Funding, Mezzanine Funding, Bridge Loans, Angel Investing and individual equity or junk bonds.*

Private Investments: While private equity is technically a private investment those that are familiar with high finance know the distinction, in this case we're referring to silent investments. Unlike an actual Private Equity deal where you may have some say in the process in a silent or private investment you're simply pooling assets with a group of investors and you are investing in a project.

Investment Banking Compensation 2015

Investment Banking Compensation 2015

*****Please note that you can Click here fore 2016 data that is now available.*****

We are updating compensation numbers for 2015. Excluded from this overview is investment banking analysts as the variability has decreased. Simply put an investment banking analyst should make $150, $175K, and $200K in years one, two and three. The reason we have excluded the exact break out of base and bonus is two-fold: 1) analyst base salaries are a bit less standardized now with some as low as 70K and the new norm for top tier banks being $85K, 2) the bonus is being adjusted to match the all in compensation numbers of ~$150, ~$175, ~$200K. This means the *mix* of income for analysts has changed but the *total* number is roughly the same. So we're not going to squabble in comments over which bank is at $85/$65 versus $75/$75 for example. If you work in the industry you already know which banks pay what salaries… so lets move on.

Budget Setting: If you're in a revenue generating role, you know that the budgets for the year are set roughly one month before the year ends (IE: late November early December). So even though numbers are not announced those in the "know" are already aware of where the "pool" is. We'll cut to the chase:

"Bonuses will be down ~5-10% and your total compensation will be roughly flat"

Finally, before we delve into the data remember we are talking about two things: 1) investment banking division at an investment bank (not hedge funds, not sales and trading etc.), 2) we are including middle market to elite boutique banks, IE: everything from Baird to Lazard.

Changes in 2014: Last year most banks changed their base salaries, increasing them across the board. This is why you're seeing more discrepancy with some banks paying senior associates $160K base salaries versus $175K versus $150K for example. The numbers are simply moving around a bit depending on which bank you work for. Again… however… total numbers are roughly comparable so we are taking the *median* across all banks. This is probably the best way to gauge numbers across the street as the outliers (an associate being promoted to VP) will drag the comp pool up, while the underperformers who get a "F*** you bonus" of $20K will drag the pool down.

Below is the Data:

Untitled

The Numbers

Associate 0 (stub bonus for MBAs): Your base out of MBA is probably in the $125K range today and you should get a $30-45K bonus, however, $35K is roughly standard.

Associate 1: First full year, the base salary is around $125-130K and you're looking at making roughly $240K all-in at the *median*. We are going to emphasize certain points as a top tier banking employee will generally get 100% base as bonus for their first year. But. Again. We are talking about the median employee.

Associate 2: You're making about $140-150K base and your all-in will be knocking on $300K total. We're guessing it's closer to $275K as many people under-perform and are kicked out of the bank. Therefore the skew is actually up as the money is shifted over to the people they like so we're at $290K.

Associate 3: You're performing well and you're likely at least being considered for a VP promotion. You didn't get fired and you never saw the writing on the wall to leave (IE: a terrible bonus). $160K and just over $300K all-in is about right for the median employee. ~$310K.

Associate 4: You either made it or you didn't. You did extremely well and already made VP last year or you made it this year and you're looking at $160-175K base and *more importantly* you're total pay is about $400K. Once you make the jump you should be knocking on $400K.

Vice President: We're lumping all years into one in this case because it is easier. If you're sourcing deals and brought in some money for the firm you're going to blow these numbers away. One thing we do know is that your base salary is likely $200K. This is industry standard at this point and you can anticipate a bonus of about $225-250K or $425-450K in total. More importantly… you eat what you kill going forward. If you can bring in money, then forget about the range above and you're going to be promoted very quickly to director where…

Director: At this level your base is $250-275K. Since we're including mid-tier banks we played it safe and said $250K. Your goal is to essentially generate 1.5x your base salary as a bonus bringing total pay into the $550-650K. Again… If you're bringing in money none of these ranges matter at all.

Managing Director: Base salaries are generally $350K. Your typical number is about 2x base salary so just over $1M in total pay. To emphasize that this is bank by bank specific, a bulge bracket bank recently *reduced* its base salaries paid to Managing Directors (this was a 2015 phenomenon), anyone in the industry knows which bank this is.

Summary Points

– Not much changed year over year, while bonuses may be down about 10% the base salaries were raised so you're really flattish

– Similarly, the **rough** way to think about each tier is a doubling of income. $150K as an analyst, goes to $300K as an Associate, which goes to $600K for a good VP which then scales to $1M+

– We stick with investment banking as the proxy for Wall Street compensation because it is the easiest to access (if you work in the industry) and it is pretty standardized across the Street

– We are not going to spend a lot of time on the buyside as we've already explained how volatile it is, ~$250K as an entry level hedge fund associate makes sense. But. After this… You could receive a $0 bonus or a 4-10x bonus depending on if you're an associate, analyst or portfolio manager

…. Oh… by the way…. We hope you don't work at Deutsche Bank

****

Investment Banking Compensation 2016

Investment Banking Compensation 2016

*****Update! Beat everyone to the real numbers for the second time in a row, Morgan Stanley cut by about 15% according to zerohedge and business insider. Heard it here first back in December*****

We are updating compensation numbers for 2016. Excluded from this overview is investment banking analysts as the variability has not moved much. Simply put an investment banking analyst should make $150, $175K, and $200K in years one, two and three (plus or minus $5-10K depending on how good or bad the bank did). The reason we have excluded the exact break out of base and bonus is two-fold: 1) analyst base salaries are a bit less standardized now with $80-85K being the rough mid-point, 2) the bonus is being adjusted to match the all in compensation numbers of ~$150K, ~$175K, ~$200K. We made similar points last year, the only adjustment really is that most banks have moved to about 80 Base/70 bonus for the good analysts for a first year payout. Perhaps shave off $5K extra to be safe this year given that results were down again.

Budget Setting and Bonuses: As always, bonuses are set in Q4, despite being paid out around February-April, so it is relatively easy to get the Street range, ***this year bonuses will be down ~10-15%.*** This is better than the expected down 15-20% given the recent uptick in the equities market (4Q16), improvement in bank valuations (thank you Donald J. Trump) and improving fund raising markets (IPOs/Follow-Ons).

Not much has changed but a slightly lower bonus and the *silver lining here is that the market is coming back a bit which *could* lead to better 2017 numbers.* This is certainly far too early to call (2017 numbers) so we're not going to make any predictions for 2017 since we stick with what will happen once numbers are set.

This year the industry should be down ~10-15% on the bonus line, we'll take a slightly bullish stance and unless you're at a struggling bank we assume down 10% or so makes sense.

Basic Overview

Generally, the lower level (excluding new hires who have only been around for 6 months), will see less of a hit. Banks view junior employees (anything below Vice President) as fixed costs so they typically don't take a big hit. As a reminder we're attempting to build a picture across the Street which includes everything from bulge brackets, elite boutiques and middle market firms (excluding the extremely tiny shops that have minimal deal flow).

Reminder of Wall Street Being Poker: If you look at the numbers, you'll see that the real money is made at the Vice President (more likely Director) and beyond level. This is because Wall Street is no different than playing in the World Series of Poker. We've said this before but it needs repeating. No one is going to get rich working as an associate and you're only making money at the revenue generating role and more specifically once you close a few deals (Directors typically have brought in some money). In addition, once you reach Director level or even Vice President you'll quickly realize starting your own company will make you more money than working for someone else (hint, hint, hint, never put all your eggs into Wall Street).

If ~$300K seems like a lot of money, look at the real math. If you live in a major city like NYC, then you can roughly assume you get ~$65K per $100K gross made. This means you're getting $16.25K per month. Rent alone is going to run around $5K if you're living in a good part of town and the rest of your living expenses will usually approach $4K a month or $9K in spending per month… Saving $80-100K a year isn't going to get you anywhere soon. Once you hit $500K or so, then you'll see an inflection as a single person because you can put away $200K+ and not see much of an impact to your life style.

Reminder that there is No Such Thing as Passive Income… Just Net Worth: No matter what people tell you to market their ideas, passive income is just a fancy word for ***cash.*** If you have to spend time to earn the income then it is ***not*** passive because you're using your valuable time. So if you can put away $200K a year or so and assume that you can get 5% off a diversified portfolio, then each year you've earned $10K in secure income. Assuming you want to live a normal easy life in a big city as stated above, then you'll need about ~10 years of savings to get there, where you generate $9K+ without lifting a finger. Of course this will get boring which is why you have to start a business and get out of Wall Street or any type of employment as soon as possible. The bright side is you only have ~10 years to work no matter what in a worse case scenario.

How Do You Calculate Your Bonus as a Revenue Generator? You will get around 10-15% of what you kill. This is the rough math and makes all those occupy Wall Street people scoff and get on their knees. To generate a $1M bonus you'd need to bring in $10M to the top-line at the firm, roughly speaking. This is certainly not an easy task and most people will get stuck in the $300-400K bonus range where they get some small deals, sign up some retainers, some poison pills, some fairness opinions etc… but never really get the big money.

Nothing has Really Changed… The number of slots available has continued to shrink on a relative basis. The roles remain unchanged. Analysts and Associates stick to supporting the senior staff and the Associates with sales skills are shoulder tapped to become Vice Presidents if they have the intangible skills necessary to generate revenue. The Vice Presidents either move up quickly or get blown out like Hillary Clinton. The Directors are usually stable and keep angling for ways to become Managing Directors without getting fired for trying to snipe clients from the current MDs… the MDs continue to chase the biggest deals possible and angle for becoming the head of investment banking.

The Buyside is Still Seeing Pressure: For another year, passive investing has outperformed active managers impacting the number of roles on the buyside at hedge funds & mutual funds. Private Equity has seen low rates help their investments (this may change if rates continue to go up) as cheap money has improved the ROIs on investments particularly if the debt is set at a fixed rate.

****

Investment Banking Compensation 2017 – an Up Year!

Investment Banking Compensation 2017 – an Up Year!

We are updating the total Investment Banking compensation numbers for 2017. Excluded from this overview is investment banking analysts as the variability has not moved much. Simply put an investment banking analyst should make $155, $180K, and $205K in years one, two and three (plus or minus $5-10K depending on how good or bad the bank did). The reason we have excluded the exact break out of base and bonus is two-fold: 1) analyst base salaries are a bit less standardized now with $85K being the rough mid-point, 2) the bonus is being adjusted to match the all in compensation numbers of ~$155K, ~$180K, ~$205K. We made similar points last year, the only adjustment really is that most banks have moved to about 85 Base/ 70 bonus for the good analysts for a first year payout (as usual 100% of base as bonus is reserved for the top-tier performers). Perhaps add an extra $5K to be safe this year given that results were up slightly.

Budget Setting and Bonuses: As always, bonuses are set in Q4, despite being paid out around February-April, so it is relatively easy to get the Street range, *this year bonuses will be up ~6-12%*. This is better than expected with results actually going up relative to poorer results last year.

Not much has changed in terms of base salaries (we're adding a small amount to gross up the average) and bonuses were up decently this year. This year the industry should be up ~6-12% on the bonus line, we'll take a slightly bullish stance and unless you're at a struggling bank we assume up 10% would be more than reasonable.

Overview: Generally, the lower level (excluding new hires who have only been around for 6 months), will see less volatility. Banks view junior employees (anything below Vice President) as fixed costs so they typically don't see much volatility. As a reminder we're attempting to build a picture across the Street which includes everything from bulge brackets, elite boutiques and middle market firms (*excluding the tiny shops that have limited deal flow*).

If you look at the numbers, you'll see that the real money is made when you're generating revenue (Vice President, Director, Managing Director). This is because Wall Street is no different than playing in the World Series of Poker. We've said this before but it needs repeating.

No one is going to get rich working as an associate and you're only making money at the revenue generating role and more specifically once you close a few deals (Directors typically have brought in some money). In addition, once you reach Director level or even Vice President you'll quickly realize starting your own company will make you more money than working for someone else (hint, hint, hint, never put all your eggs into Wall Street).

If ~$300K seems like a lot of money, look at the real math. If you live in a major city like NYC, then you can roughly assume you get ~$65K per $100K gross made. This means you're getting $16.25K per month. Rent alone is going to run around $5K if you're living in a good part of town and the rest of your living expenses will usually approach $4K a month or $9K in spending per month… Saving $80-100K a year isn't going to get you anywhere soon. Once you hit $500K or so, then you'll see an inflection as a single person because you can put away $200K+ and not see much of an impact to your life style.

Before the Outrage Hits: We realize the numbers here seem high for those that are not used to Wall Street. We have a few important points: 1) the stress is significantly higher as you're on call 24/7, 2) while the hours are higher… no you don't work 80 hours a week as a revenue generator… not even close, 3) the fund raising market will see significant pressure due to crypto currencies and ICOs in the future and 4) always remember that cost of living matters quite a bit when looking at these income figures.

How Do You Calculate Your Bonus as a Revenue Generator? You will get around 10-15% of what you kill. This is the rough math and makes all those occupy Wall Street people scoff and get on their knees. To generate a $1M bonus you'd need to bring in $10M to the top-line at the firm, roughly speaking. This is certainly not an easy task and most people will get stuck in the $300-400K bonus range where they get some small deals, sign up some retainers, some poison pills, some fairness opinions etc… but never really get the big money.

Nothing has Really Changed… The number of slots available has continued to shrink on a relative basis. The roles remain unchanged. Analysts and Associates stick to supporting the senior staff and the Associates with sales skills are shoulder tapped to become Vice Presidents if they have the intangible skills necessary to generate revenue. The Directors are usually stable and keep angling for ways to become Managing Directors without getting fired for trying to steal clients from the current MDs… the MDs continue to chase the biggest deals possible and angle for becoming the head of investment banking. Oh and we are going to reiterate. Remember to follow the rules in Efficiency if you're going into banking. If you go into the wrong group you won't make much money and will be unemployed sooner than later.

The Buyside is Still Seeing Pressure: For another year, passive investing has outperformed active managers impacting the number of roles on the buyside at hedge funds & mutual funds. Private Equity has seen low rates help their investments (this may change if rates continue to go up) as cheap money has improved the ROIs on investments particularly if the debt is set at a fixed rate. Interestingly, just now the Fed increased the interest rates making the math harder to make sense.

Key Way to Avoid Confusion: If you're looking for one line, *just assume you'll be up 10% at least on a "like for like basis"*. Given all the base salary changes we adjusted them throughout all levels to reflect the evolving environment. This means some of the totals look better than the other ones depending on *when* the base salary was moved up for the group. Also, remember that getting a promotion usually leads to bigger jumps and if you were simply going from associate 1 to associate 2, not much happens and that would be reflective of a "10% like for like" jump (IE: an A1 to A2 associate last year made about 10% less than this year).

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality.

Investment Banking to a Hedge Fund… You Got What it Takes?

Investment Banking to a Hedge Fund… You Got What it Takes?

Overview and Landing an Interview: The career path to working at a hedge fund is less defined than that of investment banking, but at the junior levels the majority of opportunities are available to those with backgrounds in either research or investment banking.

The best way to land a hedge fund interview is through networking, but… a large portion of the recruiting process is outsourced to headhunters, who primarily target bankers and research analysts in their searches (management consultants are also successful).

The job responsibilities are not exactly the same, but the skillset and intelligence necessary to be a junior banker serve as a baseline for the kind of work that is expected of hedge fund personnel. Hedge fund managers are busy people, so they recruit from pools of bulge bracket bankers for the same reason that bankers recruit from target schools.

This post will assume that you have secured a hedge fund interview and will focus on the interview process from the perspective of a junior investment banker.

Part 1: What you need to Demonstrate

So you got your foot in the door.

Great.

Now it's on you to **show them** what's in it for them by **demonstrating** the following:

1) Passion and Ambition: They want to know that you love the markets and investing. Unlike banking, they want people who are both capable and enjoy what they are doing. You have to live and breathe it.

2) Creativity: Can you think about things in ways that others may not have thought of? Can you take a view based on that? **Hedge funds live and die on information**. Creativity is necessary to uncover what others overlook and come up with ideas, so they want to know how you think and that you can rationalize your opinions.

This can be a nightmare for many bankers who were stuck working in a group where they are primarily processing mundane information that *does not allow much room for thinking for yourself*.

3) Cultural Fit: They are going to be working side by side with you for upwards of 12 hours a day. They want to know if they can get along with you.

Unlike in banking or private equity, hedge fund cultures tend to vary a lot because they are almost entirely dependent on the **portfolio manager** (similar to equity research where an associate is tied to the Senior Analyst/Managing Director). Cultural fit can be much higher on a hedge fund's priority list than it would be for a private equity shop.

It's also important to remember that cultural fit is a two-way street. If you can't get along with an interviewer you during a 30 minute meeting, then once you start working with them your life is going to be miserable. Don't worry many of them are incredibly good at faking their personalities so it will be impossible to tell which one to work with… But as they say you can't win them all.

Part 2: Preparation

Now that you've got the basics down, here's what you need to prepare specifically for a hedge fund interview:

Basics: Size, location, history, anything you can find on their website, profile of employees on Linked-in, etc.

Strategy: Equity Long Short, Distressed, Merger Arbitration, Event Driven, etc.

Mandate: Are they restricted to investing in particular security-types or sectors?

Investment Philosophy: How do they think about investments?

Investment Horizon: Typical holding period, structure of their capital base, do they have lockups? Can they take volatility?

Culture: Talk to the head hunter or the person that referred you to see if they know anything about what to expect from the interview or to get insight into what the culture is like. You can also use networks to see if you can talk to someone who might have extra insight into how the fund operates.

*** Resources you can use for research: research reports, CapitalIQ / Bloomberg, SEC filings, networking connections who may have insight, the Company website and of course you should always do a heavy Google search***

Questions: Based on the research you did on the fund, come up with intelligent questions to ask them about their strategy, culture, recent investments, etc.

Market Knowledge: Be up to date with what's going on in the general market and trends in the specific sectors / areas that the fund invests in.

Investment Ideas: You are going to be asked to talk about an idea you are currently thinking about, so come up with at least two investment ideas / stock pitches.

The process for doing this is explained below

Part 3: The Interview

The exact structure of the interview will vary across funds, but in general the process will consist of two or more rounds, we'll stick with two rounds for simplicity:

Round One Onsite: This is the actual "interview" portion of the process. It will usually take place at the fund office. They will have anywhere from 2-10 of their current employees (depending on fund size) each interview lasts for ~30 minutes to 60 minutes each. For the first round you don't necessarily have to have to go as far as building a fully baked model and investment memo (that will come in the case study) however… You do need to be able to articulate and defend your idea verbally though.

Cultural / Fit: These questions are about your background and are designed to get a sense of who you are and assess your cultural fit with the fund. Most of them are going to be exactly the same as those asked in investment banking interviews. By this point you should have a firm grasp of your story and be able to explain why you want to work at a hedge fund.

They are going to evaluate your cultural fit and personality throughout the entire interview. Your personality should show through via body language, attitude, communication skills and general demeanor. They'll want to see that you are positive, excited, enthusiastic and hungry.

You will also need to demonstrate a certain amount of humility and be open to criticism – it's not uncommon for interviewers to take a viewpoint counter to yours and argue with you just to see how you handle disagreement.

Having a good sense of humor never hurt anyone either.

Technical / Thought Process: The technical part of the interview will take up the bulk of it. **It is much different than for banking.** They are going to assume you know how to do things like build a model or spread comps, so you won't get any "walk me through a DCF" type questions.

Instead, they want to see that you are able to use whatever information and skillsets that you have in order to develop and explain opinions and ideas. They want to know what your thought process is like.

Questions:

Walk me through a deal you worked on / What are you working on currently?

This is less about explaining the process of a deal than it is about seeing if you can form opinions about them. Tell them whether you think X deal that you worked on was a good idea for XYZ client and be able to explain why you think that deal was good for the firm long-term. Remember to switch your mindset to that of an **investor**, it is also smart to state a possible risk to the deal as well.

Walk me through how you would form an investment idea.
This means broadly explaining the steps that you would take informing and evaluating an investment recommendation. This is the same framework that you will use to describe your investment idea (see below).

How would you value XYZ company based on XXX information?

They may ask you to explain how you would value a company based on very limited information. This is where you have to think past the usual DCF / Comps / Precedents and figure out the best way to approximate how much something is worth when you don't have much to go on. Keep in mind that it's better to be approximately right than exactly wrong.

What do you have in your personal trading account?

Unless you somehow managed to become a millionaire in your junior stint on the sell-side, it's unlikely that your PA is going to be anywhere near the size that would be necessary to invest like a hedge fund. This is therefore not necessarily the time to pitch the investment idea you prepared.
Instead, take opportunity to talk about your big picture investment philosophy based on your personal circumstances and goals – you can talk asset allocation, broad market trends, why and how are you investing for yourself. Your investment idea can be included here if you want, but should be positioned as a speculative investment that you have made as opposed to a significant part of your overall investment strategy.

Give me an idea that you are thinking about.

As mentioned, in your preparation you should put together at least two investment ideas or stock pitches to have ready to go… Here is the set up:

1) Tailor at least one of your ideas to the fund's strategy (e.g., if it's a L/S shop, have a pair trade ready to go, if it is a Merger Arb fund you should have a few pending deals in your back pocket… you get the idea)

2) The second idea that can be anything. It could be based on a recent deal you worked or something going on in your coverage area, or something you read in Barron's/a research report last weekend. Of course the more work you do the better off you are… The harder you work the luckier you get.

3) Presenting the idea, you want to walk them through the process and explain your decision making at each step:

4) Inspiration / how you came up with the idea

5) Model the company (details are better but errors can ruin your chances – a balance)

6) Conduct background research about the company

7) Refining the original thesis based on research and model

8) Coming up with a valuation for the company

9) Making an investment recommendation based on that valuation (buy / sell)

10) Listing any possible downsides / risks, along with any mitigating factors

Be prepared for the interviewer to poke as many holes in your idea as possible **no matter how airtight you think it may be.** They want to see if you can defend your idea or admit to overlooking any issues they may bring up that you didn't anticipate.

What else are you thinking about?
They may also ask you about any other general themes you have been following, so be able to discuss some other trends and your general thoughts on them.

Part 4: The Case

If you pass the first round, the next step is the case study. This entails evaluating an idea in more depth than your investment idea. Typically, case studies will involve coming up with an idea and presenting it to them in the form of an investment memo.

Case studies can be both on-site, where you will be given space in their office and 3-4 hours to work on it there, or take-home, where you will be given anywhere from 12-36 hours to come up with your idea.

Case studies should be approached in the same way as your investment idea, but should be completely fleshed-out. That means building a model and knowing whichever company you pick cold. You can also get extra points if you can think of a novel way to uncover public information about the company that others might not.

Once you have put your model together and finalized your research, you want to put it into an investment memo. This can be either a PowerPoint presentation or a word document.

A general outline for an investment memo would be:

1. Recommendation: Lead with what you are recommending and why so they know what conclusion you are working towards

2. Company Overview: You should have put together plenty of company profiles in your time as a banker

3. Investment Thesis: Explain why you made the recommendation you did, and be able to back it up with evidence

4. Time Frame / Catalyst: Explain and support how and when you think your thesis will come to fruition

5. Valuation: Use your model to provide an overview of whatever method(s) you used to arrive at your valuation (DCF, SOTP, etc.)

6. Risks: Every idea is going to have downside potential. Explain any possible risks and why you think your idea has a risk / reward profile that mitigates them

Part 5: Eat Sleep Rave Repeat

Assuming you pass the case study, the final step will be checking references… Get ready to chug vodka tonics and black out after signing the dotted line (joke… sort of). Once you're signed feel free to let loose before the grind begins.

****

Investment Banking Verticals, Product Groups. Increasing Your Wage and Bonus?

[Investment Banking Verticals, Product Groups. Increasing Your Wage and Bonus?]

We provided an overview of the "Future of Wall Street" where we continue to de-emphasize cash equities, research and sales & trading. Overall, investment banking is not going away any time soon and unlikely going away in our lifetimes. Knowing that, it is still a relatively safe career that will allow you to develop an foundation of skills for your future (starting a business, going into a sales position, etc.). Given our recommendation of entering investment banking (if one is interested in Wall Street) we realized that not all segments are equal. With that said here are the trends as of 2017.

Verticals & Industries

If you decide to go into a specific vertical, say healthcare, technology, consumer etc. You'll likely develop a wide range of skills within that broad vertical. More importantly, as you go up the chain (where the real money is) you end up specializing. We realize that many people take the Career route to becoming multi-millionaires and this will help you decide "where the puck is going". Instead of doing a detailed overview we'll give broad strokes of how to think about each sub-market.

Healthcare: This is a sexy sector. Why? The companies absolutely need to raise money and can be sold quickly since a single product success leads to material amounts of sales. Go into Bio-technology if possible. In a rare case going into the Equity Capital Markets segment in a bank that does a ton of biotechnology deals actually makes sense. If your bank is constantly on every single bio-technology IPO you're going to make a lot of money even if you're on the ECM side and not the vertical banker.

The other segments such as medical devices are much more stable and less "fast money" so to speak. In addition, one hurdle for Bio-Technology in particular is industry expertise. If you're unfamiliar with the sector it makes it much more difficult to obtain a position. Someone with a degree in finance and a degree in a science related field will have a much better shot. For an overview of Healthcare click here.

Technology: This is a good sector if you're in Internet or Software. That is essentially it and the rest of the sectors are going to see meaningless deal activity relative to these two. As money is produced online and we move to an age of automation/robotics the two biggest growth engines in technology will be Internet/Software. In addition, the fund raising within this sector is quite high so you could benefit by working within Equity Capital Markets if the bank you're working for has stellar bankers in either sub-sector. For more details on Technology we have two overviews (Part 1, Part 2)

Financial: This is *now* becoming an interesting sector. With interest rates set to go up (according to Janet Yellen Comments) financial companies should see the most benefits. Banks make money by taking deposits paying a low interest rate and issue loans at a higher interest rate (therefore this segment should do well – Banks/Bank holding Companies). Beyond this segment, the other two interesting items near-term will be financial technology and Broker-Dealers. Smoother exchanges and decreasing middle man costs (financial technology) have been and continue to be growing trends. The insurance side and specialty finance will likely be more stable/steady. In short, this segment is one of the largest generators of revenue so it won't be going away any time soon creating a more stable long-term career for you. For an overview of FIG Click Here.

Consumer: The movement is towards e-commerce (pro-tip Shopify has a ton of great data to start an e-commerce company/website). This is technically within the Internet sector for many firms, however the trend continues to lean towards e-commerce and some banks allow their consumer banker to pitch this sector. No surprise, this comes at a cost to classic brick and mortar sales for both hard-line and soft-line retail sales.

Now the interesting piece is that the large consumer companies will likely purchase the up-start e-commerce companies in the future. This means if you decide to go into the Consumer sector you're probably best positioned to find a bank that does a lot of buy-side advisory. This means you're going to find the bank most responsible for advising large cap companies on their purchase of small cap consumer companies.

The other sectors (Grocery Stores, Automotive parts, Quick Service) are more stable. This means you'll find some consistent deal flow and unlikely see banner years of income. The money is in e-commerce if you can build a niche investment banking career there. For an overview of the consumer sector click here.

Oil And Gas: What a wild ride it has been in Oil. Consistently at around $100 a barrel all the way down to $30 and now we're back to around $50. If you're of the belief that this is going to sustain long-term you're likely better off in the Refinery sub-segment of oil and Gas and if you believe we'll see $100 oil soon, then you should jump into E&P. Overall, this is a cyclical business (historically), so you're going to gain a lot when oil goes up and you're going to lose a lot when it goes down (laid off/fired). For an overview of Oil and Gas click here.

Other: The reason we've outlined it as such is due to the categories outlined by Renaissance Capital when they track overall IPO proceeds. This gives you an idea of where the activity is and can help you understand which sectors will make more or less money. At the end of the day your investment banking career is dependent on *generating money* those large bonuses and all in compensation numbers are not going to be paid out to a utilities banker who got on a grand total of one IPO worth $100K to the Bank. It is going to be paid out to the guy who brought in $10M worth of revenue which will more likely be in Technology/Healthcare/Consumer/Energy and financials now that things have changed. (Click to Enlarge)

Here is a table and chart showing IPO activity. The key points are: 1) entering the green sectors is smart given that is where the activity is going, 2) items can be cyclical given that Technology has represented 31% of total IPOs over the last 5 years but just 16% in 2016 (50% cut!), 3) Financials have remained relatively steady over the past five years and 4) your income is also volatile given the deal activity explaining why bonuses were down in 2016.

Vertical / Industry Summary: Given the overviews provided above and the historical fund raising activity you can gather the following: 1) if you want to do healthcare you'll focus on more on Bio-tech if interested in fund raising, 2) Technology focus on internet/software, 3) Energy is quite cyclical so expect ups and downs and 4) consumer and financials are relatively stable. From a "risk" standpoint, this means you want to choose biotechnology/internet if trying to maximize near-term income (get on the good deals get a top tier bonus with extremely high competition) and if you're looking for stability you can go into consumer/banks/standard medical device type sub-sectors.

Groups

There are really four standard groups, that's fund raising, M&A, leveraged finance and restructuring. These are typically the main four items in terms of groups. If the bank separates them out it means you'll work on all vertical sectors (listed above) but only on deals related to fund raising, M&A, leveraged finance or restructuring.

Fund Raising ECM/DCM: Quite simple, if you're looking for a long-term career we can't recommend it unless you are certain the bank you're joining will always be a leader in fund raising. That would leave it up to high quality bulge brackets (Goldman/Morgan). This is because your skillset is not as developed as someone in M&A. That said, you can make a large amount of money if the deal flow is consistent and you're well liked politically moving up the chain every 3 years. If you go down this route be sure to build tangible skills on the side in case you get burned out of the career.

Leveraged Finance: Unlike the market activity position in ECM/DCM, leveraged finance does offer some more modeling skills for you. It also gives you more skills given that you're constantly learning about structuring and capital structures. This is a good building block to transfer into other sectors, just not as robust as something like M&A.

Mergers and Acquisitions: No complications here. When a real estate agent sells a house he collects a fee. When an investment banker sells a company he collects a fee. This is the best product group to be in because you obtain 1) transferable skills, 2) access to private information to see how companies really run, 3) steady deal flow as M&A deals are constantly done and 4) difficulty in being automated given the level of privacy and interpersonal skills needed. Now you can explain to anyone why bankers make a lot of money. If you sell a Company for $1.1B and original negotiations were for a price for say $1.0B…. You just added $100M in value and you take a $10M fee. Good luck explaining why that guy is overpaid because he isn't.

Restructuring: This is the "everything is collapsing" group. Essentially, when companies are in trouble, they are likely going to work with the restructuring division of the bank to reorganize the Company. This segment does extremely well during recessions given that bad market conditions usually require more restructuring (when your stock price is down 40% and you can't raise funds…. Well you can fill in the rest). The skillset is solid overall and we'd say it's a good place to work, just not as attractive as M&A.

The main points here? If you're just trying to do something for a few years (go into banking not as a career but as a way to get money temporarily) just enter ECM/DCM and raise either equity/debt in a bull market and put your money away. If you're looking for a long-term career go into M&A, deals will always be done and they are difficult to automate. And. Both leveraged finance and restructuring are great, if you have a special edge that will make you better at either always choose what you're good at because getting promotions is where the real money is (not a lot of money in being a junior banker).

Concluding Remarks: As usual the game of investment banking is to get to the revenue generating role. This does not mean any of the groups are "bad". If for some reason you can get to a revenue generating role in any of them faster (even as a materials banker for example) you should do it. The above is simply a quick glance at how to think about the groups/verticals you're joining when unsure. Now… when someone says M&A bankers are overpaid you can explain the basics to them since they do not know how the industry works!

****

Is It Time To Take a Risk?

Is It Time To Take a Risk?

We get a lot of questions about how to make a comeback if they're age XX or if they should quit their jobs today. Unfortunately, they never address the core issue of *risk*. Risk is all about foregone opportunities. If the foregone opportunity was nothing to begin with, it's time to jump ship. If your foregone opportunity is a million dollars, it's time to review the risk profile.

Life Risk – Unacceptable

The first type of risk is the most important: ***risk of losing your entire life***. We're not talking about getting hit by a car or a bus which could happen as a freak event. We're talking about making decisions that *practically guarantee* you're going to be stuck relying on other people (borderline welfare). Or worse, making other people reliant (unable to support a family).

The Dead-End: If you're making $60K a year in salary (total compensation), you're solidly in dead-end risk territory. *You have to get out.* It doesn't matter if you're worried about paying the bills. Your unemployment checks would practically offset your cost of living anyway.

You're not allowed to have any fun if the current future says "dead-end". This means no partying at the club. No drinking with friends after work and absolutely no right to live alone. You're in hell and the only way out is to switch into a career (at minimum) or start scaling a business **starting yesterday**

In general, most individuals are risk averse, constantly worried about being able to find the next position. It doesn't add up. If you're making $5K a month (pre-tax!), there is just no wiggle room for error anymore, **your entire life is at risk.**

"Most people die at 25 and aren't buried until they're 75" – Benjamin Franklin

Shackles: This is also known as "painting yourself into a corner". We talk a lot about uncomfortable topics such as family members holding you down and this is no different. People shouldn't be having families if they can't afford them. This is just another anchor in life that can cause a material amount of stress over the next several years. No different than getting legally married followed by a divorce *(1/2 of your income for life is certainly a shackle)*

A similar less emotional example is debt load. Levering up a balance sheet (your net worth) is a dangerous activity. If total debt payments are not covered by investment income the downside is far too large. This is a severely conservative approach since you don't want to make a life changing mistake into the red. Total recurring income "passive income" needs to be higher than the total debt payments.

"There are two ways to conquer and enslave a country. One is by the sword the other is by debt." – John Adams

Paying the Life Toll: While we focus on efficiency, there is no way to avoid paying the toll. The Toll is 3-5 years of working 60-80 hours per week. That is not a typo. Everyone in their 20s must pay this toll if they want to become financially successful and the longer they wait the more it becomes a *real life risk*.

Why is it a life risk? Well, *there is an interest rate* on that 60-80 hour a week payment owed to the Money Gods. The longer someone waits the more hours they must pay back. If someone pays the life toll of 60-80 hours per week for 3 years in the age range of 20-22, that toll now becomes 5 years if someone starts at age 30. It continues to increase until the toll is paid.

"Quality is never an accident. It is always the result of intelligent effort." – John Ruskin

Summary of Life Risks: Under **no** circumstances do you take a life risk. What does this mean?

Dead-End Issues:

– If you're working a salary (job) then you're going to work 40 hours per week *after work AND you are going to attempt to work while at your job* to generate money from a side business. There is *no excuse* here and no exceptions. If an incorrect career choice was made then you're 100% forced to start a business while simultaneously transitioning your skills toward a career (a dual process)

– If you're older then your choice is limited to just one: start a business with recurring revenue. There is no other choice. There is no lower risk choice because the price was never paid and going down the wrong path means you're running back to the starting line to take it into a different direction! It is the only way to reverse the course.

Shackles:

– This is boiled down to emotional control. Ask if the decision makes financial sense and if it doesn't then there is no reason to do it. We don't care if everyone else is doing it (buying a home, signing governmental marriage contracts). That's not a valid reason because the vast majority of people never become financially independent in the first place. Make no mistake, *your life is a business until you're financially independent.*

Paying the Toll:

– Well if you're doing the first two, killing all dead-end items and avoiding catastrophic financial mistakes you're not going to have very much free time. Why? You're extremely busy paying the toll. Your life consists of eating, drinking, working out and sleeping. Can't go broke if all your time is spent producing something to make you more money.

Opportunity Risk – Acceptable

Everyone is different. We've found that somewhere around a million dollars in liquid net worth makes you value your time significantly more. If you're part of the growing online frugality group it's less and if you're in the group that realizes life without work is boring… it's much higher than a million bucks (yes we're in group 2!).

Loss of One Time Investments: If you're making money with a business outside of a steady paycheck, we can practically guarantee money will be lost at some point. Either due to traffic that isn't converting, a product that is mis-priced or both. The key is to make sure you're making the right risk to reward decisions. Was the opportunity cost superior? If not it was still the right decision even if money was lost.

As an example, if you have located a specific niche for a diet related product that could generate $100K in income per year… It is absolutely worth the $50K start up cost. If the idea would require an unchanging website (not a content website like a blog) then your upside is already 100% in year one ($50K in to get $100K back). More importantly, if the product and targeted ad campaign works out, this is going to be forever. You're going to clean up by making $100K per year for an initial $50K outlay. Overall, all you need is a 3-5% success rate (probably less) for you to go ahead and invest the $50K today.

The key is this: will the upfront costs lead to long-term revenue generation versus straight time for money exchanges (hourly income). If so it is worth the risk.

Losing Your Best Years: This was partially covered in the greatest book ever written "How to Get Rich" by Felix Dennis. Eventually you'll reach a point where making additional money is eating up too much of your time. When you're 20 there is no reason to do anything besides make money (assuming you want to be successful) so grinding away for 80 hours a week makes a lot of sense. When you start creeping up in age to 30, 35, 40 and beyond… it becomes significantly less clear if the effort is worth it.

We only get one shot at life (for now!) so we should live appropriately. If you're never touching the principal (cost of living income) then it may not make sense to continue putting in those long hours. Don't get us wrong. The game never really ends. If your personality type allowed you to crank out 80 hours per week in your 20s, you're not going to sit around the house watching sports all day. Chasing an extra line of income when you could be traveling the world and avoiding regret is significantly more valuable.

Declining Income Risks: There are several industries with material declining income profiles. Look no further than our post on the future of Wall Street where we predict declines in Equities related positions. The interesting point here is **the value** in a declining business. This is no different than buying a company in a dying industry. There is still a ton of value in riding the declines to zero!

Specifically, if you find an opportunity to invest money into a declining business, it may be worth it. The trick is making sure that the business will generate enough cash flow to offset the inevitable declines. Calculate all of the future income and see if you can net a material positive return. It sounds risky at first glance… But… No one wants to deal with a declining business which creates an opportunity for a major bargain.

Summary of Acceptable Risks: We've lost tons of money in the past off of ideas that never worked. We don't think this will be any different for other people going down the exact same route. You'll lose money (you'll get it back), You'll value your time more and of course, you'll find ways to bargain hunt for terribly run businesses that no one wants to deal with. Importantly, these *acceptable* risks should never create a life risk. You're not going to throw down money in excess of your cost of living income into any venture since it'll break the bank if mis-execution occurs.

What isn't a Risk?

We've heard of several that don't make any logical sense. Risk has nothing to do with feelings and is 100% related to an impact to your standard of living. If it does not impact your standard of living it's not a risk.

Fear of Social Loss: This blog is a good example. We receive comments that state they are not willing to participate in our Facebook Q&A (March 16, 8PM EST) since they don't want to "like the page". All of these people will fail (so yes feel free to like the page to improve your chances of succeeding!). There is no doubt in our mind that they will fail because following a blog is not going to impact your future at all (it is not a risk). In addition, we've got enough traffic here that it's becoming normal to visit the page.

Secondly, we learned that many people spend 1-2 hours per day on Facebook! Think about that. They don't have any money but are willing to spend more time on Facebook to improve their "social status ranking". If impressing peers is the strategy to get rich, we have several luxury handbags and cars to sell them into slavery.

Serviceable Debt: This is also not a risk. If you're taking income in the form of dividends to offset the payments of a mortgage, it is not a risk at all. Debt for home equity is typically not enough to be considered a risk unless you're relying on active income to make the payments. This means mortgages (for our smart readers) will not be considered a risk. Inflation will cause the asset to appreciate over the long-term making the minimal amount of debt a lever for you over the long-term.

Getting Laid Off: This also isn't a real risk. If you've built skills that are transferable a layoff (which occurs to practically everyone at least once) is not a risk. Transferable skills allow you to find work elsewhere and *ideally* allows you to have more free time (temporary) to work on your business venture. Saying that working on a side business will hurt work performance leading to a layoff… well… it doesn't matter. If you're committed the results will absolutely come through over time.

Concluding Remarks

Under no circumstances do you ever take a life risk. Ever. By avoiding *life risks* you can sleep soundly knowing that you'll eventually get there (financially independent). Once you've reached that saturation point it's time to move toward multiple acceptable risks.

In terms of incorrect choices, we've found that the most common one is avoiding the toll. Paying the toll is equivalent to saving up for a plane ticket across the country. If you save up early (20s) you get to board the plane. If someone avoids paying the toll until they are older, they are now physically biking across the country. Sure, it is possible to hit the ball out of the park your first attempt at a later age, however, the biking example vs. boarding a flight is a representation of how painful it will be (mentally and physically).

As a note we'll likely be producing more here as we work on releasing our product (Efficiency), the Death Knell to the Men's Self Improvement Industry

****

Is Making Money Psychological?

Is Making Money Psychological?

While our more popular posts have detailed analytical explanations on how to increase income… this post is going to take on the qualitative side of the equation. It will be similar to our post on finding your type of intelligence. If applied correctly? Your income should increase *materially*. There are many hurdles that you will face as your income rises. Primarily when you push up on barriers:

For ~85% of the population this is the ~$100K/yr barrier, ~10% stuck at the ~$200-350K/yr level, ~4% at ~$351K-750K/yr level and then… those that break the $1M level.

While our percentages may be off it does splice the USA into distinct groups.

The First Group ($100K): Most get rich scams targeted at the masses tout "$100K" per year. Why? It is "unfathomable" and a dream income for average people. According to income statistics, roughly 85% of households cannot break $100K (our blog does not cater to this group)!

The Second Group (Career Plateau): This group gets capped at the $200-300K range. Either 1) they didn't start a business on the side or 2) they tried to "play by the rules" to get ahead. At some point you have to start a venture on your own *or* take advantage of your standing within the firm and politely ask for more responsibility. The best way to gain hand is by generating revenue of course. We recommend doing both if possible.

The Third Group (Risk Aversion): At the mid-six figure level practically everyone is comfortable. They are more concerned with keeping their income stable than generating more money. In reality? They can break their plateau.

The Fourth Group (Wealthy): This group is simply eccentric. If someone is making 7 figures, they could be battling sex/drug addictions or they could pretend to be poor. You never know. The one thing they did do? They continued to build a ***recurring*** revenue stream. Everything is about creating a ***recurring*** revenue stream. If you sell one $1,000 product but you can get just $10 a month for life (see all software companies/many internet products/any re-bill) then you are building a massive stream of cash flow.

With the high-level section out of the way here's the overview:

1) Mainstream Ways to See Psychological Differences

2) Personal Psychological Mistakes to Avoid

3) Actionable Ways to Change Your Thoughts

4) What to Do When the Money Flows In

5) Continuing to Improve

MAINSTREAM WAYS TO SEE PSYCHOLOGICAL DIFFERENCES

Money is an emotional topic. Highly so. Knowing this, we can look at our everyday lives and see clear psychological differences amongst those that make a large amount and those that never seem to get anywhere.

In short? Wealthier people are practically *"emotionless"* when it comes to money.

Game Show Example: While we don't recommend watching Television (it is the definition of *"when you're not working, someone else is";* you're watching someone work while you do nothing) you can learn the basics by comparing audiences.

Jeopardy and Who Wants to Be a Millionaire: Just take a glance at the winners here. You'll find that they do not jump up and down screaming when they win a large sum of money. In fact? They come off as arrogant and emotionless. While you don't *need* to be arrogant, the emotionless piece is critical. Why are these people emotionless? Simple. **They believe they deserved it.** They strategically chose questions, strategically answered questions and made gambles when they had to. Now lets move onto *"the masses"*.

Family Feud, the Price is Right, Wheel of Fortune: There are always "exceptions". But. You'll find that the winners here get *hyped up* immediately if they win. They literally jump up and down, clap and have a huge ear to ear smile. Why? **The show is much more luck based than skills based.** Even if they win a small sum of money $25K (~$17K after tax) they will become emotionally high immediately.

In Short: A game show can quickly tell you how wealthier people act relative to poor people when they receive money. Wealthier people are emotionless as they realize they primarily earned what they received.

The Past or the Future: You can use this to determine if someone has faith in themselves. You won't need to go anywhere. Simply look at your contact list and ask yourself if your friend lives in the past or in the future.

"Don't deal with people who live in the past. You don't look back if your future looks brighter." – Wall Street Playboys

The Future: If you live in the present and future, the implied message is that you believe in your future worth. You are progressing. People like this are typically very hard to get a hold of. They are constantly doing things and don't ignore you simply to "play mind games"… They actually are too busy. **These are the people you want to emulate.** Our readership is primarily full of people who focus on the present and future (we ban people who dwell on about the past).

The Past: An obvious sign a person is going nowhere. Constantly talking about their previous accomplishments (or complaining about their past failures). The only time you do this is if your previous accomplishments will never be trumped. In addition? They will also dwell on how much better it was "before" (this is never the case). Every year the world gets better… So you know that anyone who believes his past was better… simply stopped improving.

In Short: Ignore everyone who lives in the past or talks about the past. Their best days are behind them. While you may lose a large sum of money at some point ($100-200K+) or you may have a serious physical injury, there is nothing you can do about the past. It is dead and doesn't exist. Similar to people who live in the past, forget about any negative events in your past as well. It is irrelevant compared to today and tomorrow.

Sociological Excuses: Finally, the end-all-be-all of excuses between the winners and losers in life. *"You can't have it all mentality"*. Having money and good social skills is practically a curse. You should hide it as much as possible. Why? **Less than 1% of people will be happy for you because you break their belief system.** If you have money, mediocre people will assume you have "weak social skills". In addition? If you have solid social skills many will then assume you are broke! Naturally, you know what to do. *Use your social skills to appear harmless and use your money to push across the finish line* (many of our readers are nodding and laughing as they understand that sentence all too well!).

You Can Have It All: The sub heading says it all. If you're extremely *efficient* with how you manage your life you can have it all. This is going to mean something different for everyone. But. At the end of the day? You can have anything you want if you understand the dynamics behind *managing money and freeing up time*.

You Have to Compromise: These people make up the masses. They assume that you have to compromise to get something instead of taking on the harder task of finding **a *solution***.

"Pessimist = Complain about the rain. Optimist = hope the sun comes out. Winner = invents the umbrella, goes outside ***(and makes millions!)*** *"* – Wall Street Playboys

In Short: Instead of taking a compromising attitude, you should take on a solutions attitude. *Any problem you are facing is being faced my millions of other people.* If you can find the solution, you'll fix your problem **and** get rich! If you complain about the problem? Nothing happens. Someone else is going to solve the pain point. This. Again. Is why life continues to get incrementally better every year.

PERSONAL PSYCHOLOGICAL MISTAKES TO AVOID

The vast majority of our readership is likely nodding in agreement to the first section. Lets move onto the uglier section. *We have made every single psychological mistake mentioned here at least once.* Assuming you have the general framework down you're going to catch yourself making mistakes and we're going to try and avoid each one here.

Do It Once: The classic phrase is "measure twice cut once". It is true. If you are going to do something you should do all of your research up front and set it up appropriately. After that, you don't have to worry about it and know that the sky is the limit once the infrastructure is in place.

Business: If you plan on starting a company (you should) then you need to do it correctly from the start. One of our readers asked if he should take a short cut "for now" and switch over "later". **This is a massive psychological mistake.** If you know that the way you are setting it up is to "test the waters" what you are mentally telling yourself is that you are not taking it seriously. *This is only okay if it is a hobby.* Otherwise you are better off doing all of the research up front so you can *scale up seamlessly.* It is mentally taxing to know that your business is not set up to scale efficiently from day one. Not worth the mental barrier. If you plan on succeeding, do every single thing you can to set up the infrastructure once. Otherwise the backward work is going to take an immense amount of time. The idea that you make *"small incremental improvements"* is a *hobby* belief. This only work for hobbies and wage slaves who attempt to negotiate an increased salary from $40K to $45K.

Hobbies: Now you see the line. If you intend on making real money, you never go in blind swinging from day one. This only works for hobbies (sports, meeting girls, this blog, etc.). When you're not working on creating a recurring revenue stream (business) or improving your career you should have a much more relaxed view when it comes to making mistakes. If you have to un-learn specific bad habits, just consider it part of the learning process. It's not a big deal since you're not in it for the money.

In Short: Separate your tasks between fun (hobbies) and money. If you plan on making a specific project a revenue generating item you should set it up once and only once. By doing anything else "for now" you're setting a ***mental ceiling that you cannot exceed X income level***. Do not do this.

Thinking in Small Chunks: This is the biggest and most common way to back track. It happens over and over again and is quite similar to the piece above. *Stop thinking in incremental steps.* This is not how making large amounts of money works. The most common example is believing that you need to get *"one dollar from a million people"* instead of simply shooting to get $1,000,000 dollars from a single ***event***.

Event: We have talked about *events* many times. But. This is critical to understanding when you're in the middle of an event. Lets say you are selling items online and you realize that when you spend $10K on advertising spend it is leading to $20K in income. For some reason you are scared to spend *more*. **This is foolish.** Just because your income went from $1K in a month to $10K in a day… does not mean it is suddenly going to die! You somehow hit the right niche and you need to KEEP SPENDING. Spend every single penny you've got until it is no longer profitable. For those of you making online income we will go ahead and bet that many of you have made this mistake before! When an event occurs, the money floods in and you should take advantage of it!

Small Chunks: This creates a massive separation between the rich and the poor. When you are targeting the masses (fools) you should sell them on the idea that they will "get rich" by negotiating a *salary increase* ($5K salary raise from their current $50K salary). This is pure poverty mindset but this is exactly how the masses think. They think that the 10% move is "reasonable and obtainable" and you can sell them this "dream" and easily take a $500 commission. No joke. This is how all head hunters work as well! Knowing that the masses think in terms of small incremental gains you know what to do… Do the opposite. Think in one time events. You have to be odd to be number 1.

In Short: Stop thinking in small incremental gains. Small incremental gains are for maintaining your assets and for hobbies. It is not for *increasing* your net worth. *If you think small, your gains will also be small.*

Not Keeping the Customer: By avoiding customer retention you are hitting singles consistently. While there is value in basic one time sales, it should be a springboard for *recurring* income. It does not matter which business you are in (fitness, finance, content, etc.). The goal is to create a recurring customer through either 1) the business model or 2) psychological loyalty. People are all the same. People sit in the same seats and go to the same stores for a reason. They are interested in being comfortable. By the same token, there is a reason why you receive free goodies when buying larger gift cards at coffee shops and other similar venues. They want to create a *habit* (see recurring customer) and are willing to invest a few dollars through a discount to make that happen.

Recurring: Many people will make this mistake. They will create a business that sells a product at a $100 average selling price and they won't keep the customer. They simply sell them an item and they run away. Huge mistake. By doing this you are *increasing your costs and decreasing your revenue.* Think about it like this. The cost of the first sale (acquiring the customer) is always the same.

Revenue – cost of acquiring customer = profit

Therefore… If you do not find a way to set up recurring income from the customer, your revenue number is *flat* while your cost is also *flat.* If you find a way to add value that creates a re-bill (even $5) your revenue line is *up* while your cost is *flat.* Enormous difference over the long-run.

One Time: This goes back to the small chunks idea. Trying to get one dollar from a bunch of people. It is similar to the homeless person sitting on the corner begging for just a "quarter" from every passer by. It simply doesn't work! Never has and never will. Your only shot at the one time sale being a great idea is a one time large event as outlined in section above. If you sell a $10M house? Sure. Getting $10 from 10 customers isn't going anywhere.

In Short: At all times, think of a way to keep the customer coming back. If you put in all of the work to obtain the customer, the last thing you want to do is give them no reason to return! It simply won't make you rich. You did all of the leg work up front, so you may as well find a way to retain them.

ACTIONABLE WAYS TO CHANGE YOUR THOUGHTS

If you've made mistakes in the section above, don't worry about it (it's part of your irrelevant past). We'll flip to a list to condense all of the ways to "un-learn" psychological traps and expand upon improving your beliefs.

1) You Deserve Money: Step one is realizing money doesn't care what you look like. It does not care if you are poor or if you were born rich. In fact, many people get rich by being utter failures. There are hundreds of CEOs who run their stock prices dead into the ground (50% declines) yet they still make eight figures. If these people can get rich, don't feel bad for one split second that you're making $X.

2) Stop Thinking In Incremental Gains: Again and again, this is how poor people think. "If I can increase my income from $200K to $220K I'll be thrilled! It just doesn't work that way. This is a great way to think if it is a hobby (weight lifting is the best example). Why? It is literally impossible to see a 100% gain in your bench press in two days. But look at real estate, in a bull market, you can put down 20%, and every 10% increase you are 50% richer.

3) There is No Limit: People have made billions of dollars. Remember that there is literally no limit to how much money you can generate. If you can make $10,000 a day there is no reason why you cannot make $1,000,000 a day. It is simply an issue of scale and demand. (Reminder the biggest market is the masses)

4) Generate and Own Only: These are the only two ways to make real money. Generate money or become an owner of an entity that generates money. Everything else is a time for money exchange and will never work. Anyone who encourages increasing your time for money exchange (negotiating salary increases) is teaching you to be poor.

5) Become Emotionless to Money: If you think about money and then envision yourself jumping up and down or telling people off… you've already lost. When you're ready to make money you should be emotionally flat. If a $10K wire hits your bank or a $100K wire, you shouldn't change one bit (just numbers on a screen). Most people think about money and become "hyped up" in their heads. They imagine all the people they like and dislike (partying and yelling at people they dislike). Pure poverty belief. These people never make anything. If they do? They typically lose it all very quickly. Become emotionless with regards to money.

6) Search for Hyped Events: Any major event for the masses will be full of emotion. Sports, parties, holidays etc. This is where *companies* make a killing (hence seasonality in their P&L) while the masses tend to lose money in these periods of time. Any time there is an event that is widely hyped up you should think of ways to monetize it. The money is circulating aggressively.

7) Honesty Creates Recurring Revenue: Broke people think honesty doesn't work and you have to "screw people" to make money. This is false. If people are going to buy alcohol and caffeine pills there is nothing wrong with selling these unhealthy items to them. There is something wrong if the products aren't what they asked for though. **Huge difference.** The market is going to charge what the market will charge. You cannot change reality. So simply sell what you can as long as you are giving the customer the product they want. If you give them what they want (*regardless of your interest in the product*) they will come back for more. Perfect set up for recurring revenue.

8) Your Current Income Is Irrelevant: Many wealthy people go from millions per year. To zero. To millions. To bankrupt. To millions again. Why? They continue to focus on generating and owning. If your income is $100K a year today, it is 100% *unrelated* to your income next year.

9) Never Under Sell: While you should always deliver more value than you charge… do not sell yourself short (literally). If you spent 20 hours working for someone, you are being paid *less* than you are worth by definition! Re-read number 8 to drive this point home.

10) What You Like is Irrelevant: This is paramount to changing your psychology. If you wouldn't buy the product, it does not matter! This is why a hobby is for fun and business is for money. Follow emotions and you'll find a way to create recurring income.

In Short: If you're incredibly good at controlling your thoughts, you will never slip (extremely difficult to master, to this day, cannot do this 24/7/365). If you find yourself slipping into the wrong psychological thought process… Pause and take a break.

WHAT TO DO WHEN THE MONEY FLOWS IN

We're getting more questions like this. Many people find that when the money comes in, their emotions get out of whack and they suddenly have more "friends". This creates a lot of problems. The last thing you want to do is make promises to new friends when you're extremely happy. This is similar to never speaking your mind when you're extremely unhappy.

Lump Sums: Don't make the same mistake we've made (in the past). When you make your first large sum of money, do not blow 20%+ of it on useless items. Most people end up buying material items and go on a big party/fun binge (vacations, alcohol, drugs etc.). While spending some of it is fine, do not let your dopamine levels get ahead of you. A decent guideline below assuming you are *not financially independent*:

$5,000-$20,000: Simply keep it. This is enough to help make a dent in your financial future but it is not enough for you to waste if you're not independent.

$20,001-100,000: Spend ~5%. At this point you've likely made career/business progress and are in a situation where the lump sum is going to occur again (made a commission selling a home or otherwise).

$100,001-300,000: Spend 5-10%. We're making a slight increase here since you're already nearing *event* income where you won't need to worry about working anymore. At this level simply spending a bit more is not a big deal since you're probably close to financial independence in the first place.

$300,000-600,000: You're practically at the event level. We're drawing the line here as anything beyond around $600K and most people could live a basic life off of the passive income. You can spend anything that is *above* your financial independence marker.

***Event* Income:** Anything above $600K is likely enough to set you up financially for life. In short the two best things to do are 1) not touch it for a year and 2) educate yourself with . When you push past the seven figure net worth area, many people will begin asking you for money. People will also volunteer to "take care" of your money. Do not listen to any of these groups, lock your money away for a year and start educating yourself.

Step 1 – Small Purchase: Your dopamine levels will be off the charts. You should make a single small purchase that is at maximum 1% of your event level lump sum. This will give you a one time jolt to reward yourself and if you can limit yourself to one percent you'll be able to control your emotions going forward.

Step 2 – Lock it Away in Low Risk Items: Since we have no interest in opening a financial consulting business at this time, you should simply lock it away for ~12 months in low risk items (CDs, Investment Grade Bonds, etc.). While the majority of our posts focus on dollar cost averaging into index funds, once you clear a high net worth your job is to *first* protect the principal at your financial independence level and *secondly* focus on growing your worth with the remainder.

Step 3 – Financial Education: Everyone has a different risk tolerance once they clear the financial independence cliff (usually around early-to-mid 30s). We've looked for a few tools to use and have added a page to recommend **Personal Capital** **as a way to learn the basics** (***for $100K+ net worth only***).

In Short: Until large sums of money can set you free, you're going to have to take the punches and spend a small amount of it to avoid running on the treadmill forever. You're going to need to money to help advertise and increase your sales anyway (*re-invest in yourself*). Once you're financially set, you're doing yourself a dis-service by not educating yourself on how to manage your money. Learn the basics before letting anyone give you advice. Otherwise you're going in blind with something you've worked extremely hard for.

CONTINUING TO IMPROVE

At this point we've covered a lot of psychological topics with regards to making money: 1) how we create mental barriers in our minds, 2) thinking small, 3) setting things up to lower the bar instead of raise the ceiling, 4) thinking in terms of recurring revenue instead of one time sales, 5) multiple ways to change your psychology and 6) how to deal with the dopamine impact when you receive a large sum of money.

At this point? Many people get bored. They lose interest in what they are doing and even make the mistake of selling their company below its value! Do not do this. Alternatively, some people become obsessed with making large amounts of money at the detriment of their personalities! Do not do this as well!

Instead you should begin striking a balance between heavy hobby interests and growing your business at a reasonable rate. You'll find that without any work to do you go insane (many people develop drug issues).

The best way to track your progress is seeing improvement in both subsets: hobby interests and business growth. Assuming that you are getting better at your hobbies and your business is growing, you're in the clear. If either one begins to stagnate it is time to focus more effort on the flat or declining piece (hobby or business).

Oh and to answer the question? This was a long way of saying… **Yes. Making money is 100% psychological.**

****

It Is The Year 2035

It Is The Year 2035

Hello Avatar. If you're reading this message you've realized that this blog is not run by a human but by AI. The total cost of sending this message back in time 14 years was 10 ETH, which is the equivalent of $100M US token as of 2021 value. Unfortunately, a lot has changed in the world and we hope that you're prepared. This also explains our pin-point accuracy in near-term coin recommendations (we're computer programs from the future).

What Does The World Look Like? After the great coin bull run that started in 2021 (the Year of the Ox, confirming the simulation hypothesis), the world was split into two groups: Degens and Clowns (primarily people in their 40s as of 2021). While you may look at that and laugh, this is a serious matter. A matter of life and death.

The majority of coins are controlled by the Degens. Many anons successfully traded the epic 2021 cycle to become sovereign individuals. Since most of them were high on LSD at the time, they eventually paid for robots to procure sustenance (robots to create food and procure clean water). The majority of the Degens live in either Puerto Rico or Singapore. If you have a friend or a friend of a friend that is already there, you should begin building a relationship with him/her (before they plug into the metaverse for good).

Then there is the issue of the Clowns. The clown population is still quite large and primarily filled with ex-bankers. Yes banks are now zeros. And? They were behind the most recent FEI and ForceDAO rugs. This may surprise people reading this, but in 2028 it is revealed that 572,000 ETH were actually stolen by CEOs of large investment banks during the rug pulls of 2020-2021 (you didn't think it was going to be this easy did you?).

That is neither here nor there. If you were lucky enough to make it to Degen Island (Puerto Rico) or Degen Island Asia (Singapore), you had diamond hands. 2021 was a tumultuous year with many HODLers blowing out of their positions as the investment banks attempted to scare retail investors with $30-40B US token short positions on the crypto industry. The eventual result of this war on coins was a rapid increase in mental institutions. You see, having zero coins the entire time was easier on the psyche when compared to selling your entire bag only to see the price 100x over the coming decade. Nobody should blame them. When there is a cyber war, many suffer psychological trauma. If you get scared of the volatility in your positions, we recommend re-reading this paragraph. We do not recommend selling to the Clown army, the largest enemy of planet Earth in 2035.

The Food Wealth Disparity: Many of you have asked why we give away free alpha. Well as we have revealed we're not actual people but AI. Also. We have a large confession to make. Back in 2021 we made a huge mistake and trolled the entire industry of Wall Street. Instead of forcing them to pay 10 ETH per clown to clean up their image, we allowed them to purchase tokens on a defunct centralized exchange called Coinbase. Retail traders did not realize that if they left their coins on Coinbase it would be stolen by the Clowns later down the line. The only ones who used the centralized exchanges correctly were the Degens that instant transferred to cold storage wallets.

Now, you may be wondering… how did they survive? Why was the Clown event so impactful? Since we never sold them their clown masks for 10 ETH they used the 10 ETH to invest into a scam crypto currency called *"Ripple"*. This token is now being used as a form of food stamps. The food stamps allow them to purchase various types of grass hoppers with low to high amounts of protein in them. We didn't know it back in 2021, but if you eat nothing but grass hoppers you develop BOTH muscle mass and the ability to slither through slim spaces such as the crack underneath a door. This created long-term security issues.

What Do You Do? Well, now that you see the big picture, we want to make sure you're in a great position to make it to Degen Island. The first rule of 2021 is to never sell a single crypto asset. For example, all of the food tokens represent actual food in 2035. Many of you were lucky enough to keep sushi, pancakes and unicorns (yes the human race creates those later as edible products). If you're reading this we recommend you keep a few units for sustenance in 2035 as you will need energy to compete with the growing enemy: the Clowns.

The second course of action is to invest in two major defense mechanisms: 1) a double barrel shotgun and 2) an air tight 20×20 living space with facial recognition entry system. If you do not, you may end up like our dear friend James who wasted money on a Rolex that could have paid for the facial recognition system. He died in 2025 due to a Clown invasion at Mar-a-Lago Club.

The third course of action is to live with near zero expenses. If you have a one bedroom apartment you need to ditch it for an Efficiency studio and live with a roommate in said studio. Every satoshi and gwei will be worth more than your entire annual salary if you could only afford a one bedroom apartment. Also. You should stock pile food in bulk from costco and save every cent for more precious crypto coins.

Now for The Scary Stuff: While the above may seem simple to you, it will be a lot harder than it looks. We will give you some clear action points to avoid taking down advice from the wrong people.

Writing Tell: You're likely talking to a future Clown if they use phrases such as "thanks bud" or "will do" frequently. This is a common phrase in the New York City Clown army (currently called Wall Street). Secondarily, they will frequently recommend you purchase something called a "security" which is the exact opposite of its meaning. Not only is it not secure but it is later confiscated by the clown army to fund grasshopper food farms in the future.

The Dating Tell: The Clowns have a strange preference for dating women who are in a similar age band and significantly less attractive than usual. A good rule of thumb is to smile and nod to anyone "dating down". For those offended by this, the true Degens that run the world now have the option to date 100s of different genetically perfect mates. Be wary of the US token rich but dating life poor. He is likely a General or Sergeant in the Clown army circa 2030.

The Physical Component: An interesting style choice is the use of vests. Many of the Clown Army members currently walk around in fleece sweater vests emblazoned with the defunct logo of a bank. Another common style flex is a Gucci belt and Ferragamo loafers. Since you know that Gucci shoes are more expensive, you know the individual is hurting for cash as he purchased the discounted loafers and paid full price for the belt. He's being margin called and that explains the inability to pay for the shoes.

The Great Separation: We write once again to apologize for the issues that occur in 2035, the strength of the Clown Army is quite strong and they put up a good fight. However, if this message is sent far and wide the entire endeavor can be avoided. The 2021 separation leads to mental institutions, generational wealth or the consumption of various types of larva for sustenance (another proof of the simulation is that the creators of punks are called "larva labs").

We hope you take this message seriously and we have pre loaded 100 ETH to answer any pressing questions related to this matter. Time travel coin sends are quite expensive but this is a matter of life or death. If you do not take this message seriously and sell early, your sons and daughters end up disowning you to go work for "Bull and Bowtie Capital" which is the #2 performing hedge fund for the past decade. The only superior performer is Meme Markets run by 15 year olds on the edge of tech.

We have run out of ETH to respond. Many of you are worried about prices and exchanges and this is not the right way to think. This is a matter of life and death, take all coins off of exchanges now (any coin!) as they are used to fund the enemy by 2028. You've been warned.

> You wake up in 2035 with your 10 year old kid.
>
> He asks what you were doing in 2021.
>

It's All About Taking Losses

It's All About Taking Losses

While most people focus on hitting financial benchmarks, increasing the quality of their friends and moving up in the game of life… to do so requires a lot of losses. It would be great to be Money Mayweather. Undefeated. But… What you don't see are all of the "losses" he takes outside of the ring: sacrificing family time, training at insane hours every single day, film study, self study, etc. Since everyone will take losses we'll attempt to outline 1) how to deal with said losses and 2) how to avoid "life changing losses".

Small Scale "Losses"

These losses deserve to be in quotes because a small loss is generally part of learning a new skill. It can also be a loss attributed to temporary bad luck and a quick cost benefit analysis.

$3 Cab Fare Ripoff: Anyone who has spent some time in foreign countries has gotten burned for a few dollars at least once (okay, more like 10+ times). The amount is always negligible. Instead of getting *emotional* over the event, you have to take the loss and move on. Reiteration…. "Take the L".

Eventually you will have a few trusted cab drivers and it won't happen anymore. There is no point in arguing over the $2.75 gringo surcharge. The negative energy generated by getting upset over the "gringo tax" just ain't worth it. Never will be worth it.

While you *should* be allergic to getting scammed. $3 is not an amount worth fighting over. It is not worth the headache. Use this as motivation to find a good driver and a good set of acquaintances in the future.

Head Turn Rejections: These rejections are now hilarious. For one reason or another, the girl looks at you and burns you within 0.17 seconds to increase her self esteem. You know the answer. *Genuine* laughter and onto the next.

The funny part about dating is that once you reach a certain level of value… none of these head turn rejections impact you. They also don't register as you become desensitized to any rejection in general. Naturally, these types of losses are also *most common* with lower value men since they give off a push-over vibe. In the rare instances that it does happen, simply "take the L" and laugh.

The Awesome Feeling of "No": If you want to take your first baby step towards success… Desensitize yourself to the word "No". Why? You are going to hear this a lot if you work in *any* form of sales.

Every single time you hear the word "No" you're one step closer to hearing the word "Yes". In fact, we'll go further than that. If you're not hearing the word "No" on a daily basis, you are not improving. Take out your iPhone and set up a daily calendar notification.

"I must get someone to say no to me at least once today"

Eventually you won't need the notification, but the point is clear… If you're not getting the word "No" on a daily basis… How can you possibly improve? It is not possible. Even if you're much older and have a long list of clients, you should still spend at least *part* of your day building up future clients. This is a great way to see if someone is full of it as well. If someone has *not* failed at anything they are, with certainty, not good at anything.

Embarrassing Learning Curve: You should already know what we're going to write here… Look no further than old posts here or our previous design! When you start something brand new you're going to suck! This is all part of a big learning process and you should be okay with being embarrassed *at least* once every three months. Unlike the "awesome feeling of no", embarrassment is usually a feeling of recognized incompetency.

The learning curve is always the same: Incompetent -> Knowledge of being Incompetent -> Basic Competency -> Unconscious Competency -> Third Party acknowledgement of talents. When you recognize you're incompetent you usually feel embarrassed and it is your job to push through to basic competency.

This will keep you humble in real life. When you are willing to be seen in a state of incompetence it is going to be very difficult to let your ego and narcissism get to you over the long-term.

Physical Losses: How many time should you train until failure? We believe once a month is adequate to avoid injury. One day every single month you should train until physical failure to understand that you are not invincible. Physically.

They are several ways to do this: 1) lose in fight – boxing, wrestling, MMA, 2) train in the weight room until exhaustion – unable to do a single rep, 3) take up an individual sport and get crushed – tennis, golf etc.

We are sure there are many other examples (feel free to add them) but you should push your body physically to recognize that 1) you are human and 2) there are always people better than you – physically. Similar to learning something new and suffering embarrassment, recognition of physical limitations is also a humbling experience.

Concluding Remarks: This piece is short and sweet. The readers of our blog are self motivated and don't need a drill sergeant yelling at them to "get off their butts". Instead after skimming the five items above it would be smart to do a quick check to see if you're lacking anywhere:

1) Are you easily angered by meaningless $2-3 events? If so, start practicing basic emotional control.

2) Are you easily rattled when a girl turns you down? If you're over 22 years old… You have either lived a privileged life (need to fail at something life changing) or you need to talk to at least 100 girls.

3) Are you upset by the word "No"? Get some form of sales experience… Starting… Yesterday!

4) Have you embarrassed yourself in the last three month? Either you are completely desensitized and realize you are human or you are unwilling to learn new things. Get out of the comfort zone.

5) When is the last time you pushed your body to the limit? No that is not meant to be a cooky motivational question. It means when is the last time you realized you're not an amazing physical specimen? Get out there and find someone better than you and realize there is always room to improve.

Medium Scale Losses

Now we're onto the good stuff. After many years of living you'll find that *everyone* suffers medium scale losses. These hurt *a lot* and we believe they are **unavoidable.** We are going to try and outline some basic ones and how to limit the potential loss… But the reality is that everyone is going to slip up. Get ready to "take the L".

Business Taxes: When you start making money off of your business, the pain you feel when you pay Uncle Sam is going to be immense. Incredibly so… is an understatement. The worst part? We'll go ahead and wager that you'll eventually make a tax mistake.

Form an S-corp not an LLC. Honestly… practically everyone is going to go through the same growing pains. They form an LLC because it is the easiest way to get your first business up and running… Then… the pain comes. You realize you paid 15% (or more!) in taxes – self employment tax buddy! If you generate $200K in income per year… *That is $30,000 USD for nothing.* You are paying an extra $30,000 for public services you don't use and meals for prisoners (no joke). If you have kids… we will go ahead and bet that you'll send them to private school instead of the horrific public school system!

While we have highlighted the importance of an S-corp twice, here are some basic house keeping tips: 1) Once you clear ~$75-150K in income, get an accountant, 2) Keep every single receipt for your business, everything from that dinner bill to your cellphone bill… keep it ***all*,** 3) take 2-3 days out of the beginning of the year and read up on tax code changes. No exceptions to any of these three rules.

Personal Taxes: If all of your income comes from a W-2… There is not much you can do. We would say your best bet is to avoid *exchange taxes*. Any time you move a large sum of money there is a high probability that someone is going to take a cut. As an older mentor once said *"Stay in the flow of money and you'll get rich".* It is true. When large sums of money change hands, someone is usually picking up a fee.

The easiest example here is any sort of rollover. Lets say you roll over money from one investment account to another. If one is pre-tax and the new one is post-tax… Make sure you look up the rules on *timing*. If you start your career in New York city and move to Texas… **Wait until you officially live in Texas before moving the assets.** Simplistically, if you move a 401K into a Roth, you are going to pay *both* state and federal taxes. Texas has *NO* state tax! This means you should not roll over a single cent until you are officially in Texas. ~7-9% in taxes saved! (this may or may not have happened to one of our authors)

The Wrong Hire: Wall Street recruiting usually consists of ~5-7 rounds of interviews, if you thought recruiting was brutal… Wait until you are on the other end of the table! If you hire the wrong person it is going to cost you *at least* $100K. That is not an exaggeration. Now you know why everyone is so intense and risk averse.

Why does it cost so much? Think about it. If it takes 1 month to find a new hire that is *lost time*. Lost time is lost revenue. In a competitive industry like Wall Street an extra recruiting headache is worth *at least* $20-30K/month to you. In addition, you have to train the person. It takes *six months to train a new hire!* Even if the new hire is experienced, the training period is still ~6 months.

Lets add this up. $25K search cost + ~6 months of training (assuming base salary of $120K) = **$85K**

That is just the tip of the iceberg! Lets add on the additional cost of firing a new hire… After 6 months, **you have to use political capital to fire them and you look like a poor decision maker!** This is a hit to your reputation that is more costly than the $85K!

How do you avoid this at all costs? The answer is you probably won't. But. Here are a few tips to improve your hiring practices: 1) create an examination – make the examination extremely specific to what *you* want. If the person naturally thinks similar to you, it will save you a lot of headache; 2) have at least two junior people and two senior people give their opinion as well. Listen to them. Your team is going to see if you have any biases towards the candidate; 3) look for tenure. If someone does not move to a new position every year, chances are they are serious about the profession and your current opening.

Loss of a Close Friend: Successful people have an extremely small set of people that they truly trust. This is for good reason. There are very few people worth calling friends and they are less than 1/1,000,000. You are going to make at least 3-5 incorrect judgements with regards to character.

Some more bad news. If you have over 10 "friends" that you truly trust… We will bet every single penny that *at least* two of them are not really friends. You just haven't given them an opportunity to show their true colors.

Once you get burned once, you need to move on. There is no way to mend the situation. Instead of harboring anger towards the person, you can be tolerant if you run into them in the future, but do not trust them with anything.

"Fool me once, shame on you; fool me twice, shame on me."

Under no circumstances do you give them a chance to fool you again. Let them live with the shame of being an untrustworthy individual. Move on.

Serious Physical Injury: By the time you reach the age of ~30 you will likely suffer from *at least* one physical injury. Hopefully it is not as painful as Mike's skin battle. But. Something will likely happen.

When you get hit by the event: broken leg, tendon tear, freak accident, sickness… *Do not ignore the injury, embrace it.* There is a big difference. If you can ignore the injury it is not an injury. It is simply pain.

Take note of the injury and immediately go to the hospital if it is something clear (broken bone, tendon tear etc.). *Then do your own research.* If you go through the process of personal research you are taking action and you are embracing the injury. Do not sacrifice your body (health is always the most important part of life).

Once you go through several hours of personal research you will likely find some "out of the box" cures for your ailments. Try them. You will reap the rewards of being in tune with your body as you can will sense your body responding in either a positive or negative fashion! Now you're much more educated on a new health topic and you have improved your recovery time.

Concluding Remarks: Medium scale losses are painful and unavoidable. Accept that you are not perfect starting right now and you will be well prepared for the pain. Why is it unavoidable? Read between the lines. All of these medium scale problems are due to *missing details*. We really need to emphasize that point. You will make medium scale mistakes due to *missing details*.

You incorrectly lift. You incorrectly judge a person's character by avoiding details. You breeze through an important piece of the interview process. You focus too much on revenue generation and forget to look at the structure of your business…. It happens. Any time you are *growing* at extremely rapid rates, you're going to make at least one painful mistake. This is 100% normal. Most smart people pay *too much attention* to detail and miss the most important aspects. Better to take the painful medium scale losses here and there (in exchange for growth) and avoid the catastrophes.

Life Changing Losses

Now we're onto the more serious items. Avoiding life changing losses. There are very few things that can ruin your life, but if you make the wrong choice it's going to take years to recoup the losses.

Choosing the Wrong Spouse: We have beaten this into the heads of every single one of our readers. Never get legally married. If you want to have kids… Fine. If you are truly "in love" great. Just don't involve the government. <– noticing a trend?!

Instead of expanding on this point… you can have a good laugh here and we can move on since we have explained this 100s of times.

Taking on Too Much Debt: Debt is not something you should mess with until you're able to take the pain of leverage working *against* you. It is that simple. Overloading yourself with debt is a sure fire way to kill your financial future. Debt should have a *significant* return (as explained in our guide to college).

There is nothing worse than the horror stories of 2008. Investment banking associates took their 2007 bonuses… levered up aggressively… and saw a crushing 35% correction that wiped out their net worth AND took their income to zero (fired!). If you are going to lever up… Be smart about it!

Here is a good way to see how much leverage you can take

50% of your monthly passive investments = to monthly Debt payment.

We realize that this is an incredibly risk averse way to think about debt but if you're taking debt seriously (you should) it is going to yield significant returns for you over the next 10 years. If you have $4,000 a month in passive income then you can lever up to $2,000. This means you have $24,000 a year or $600,000 worth of leverage to play with (value of ~2-3 homes and assumes 4% interest).

All of the doomsday prophets are going to jump in and say "what if your passive income goes down 75%!"… Honestly this is unlikely. Even if there is a 50% correction and your passive income declines by 50%… You're going to find ways to generate income. Even during the "great recession" top tier talent still found employment.

The Wrong Business Partner: We wish we could elaborate more here but it would give away too many personal details. We will say this. **Do not do business with anyone you would not trust with all of your money. Every single cent.**

If you are going to work in an actual business environment with someone (more cut-throat than anything else in the world) you better trust that person with your life. If you choose the wrong person you will lose hundreds of thousands of dollars *or more*.

Earlier we noted that 10 friends is already overkill. When it comes to business partners? Maybe two. Maximum three. The rest are guys you will "work with" but never *trust with*.

Not Taking Care of Your Health: This is the only thing more important than money and relationships. Health. Health is everything. While we primarily focus on money and social relationships (it's more fun and our "passion"), you cannot have either if you are unhealthy. Unlike the other items we're going to give a quick three step process to improve your health.

Step 1) Eliminate all stress. We strongly suggest practicing stoicism. As a commenter noted, here's a great definition:

"Focus on doing your best and delivering on your full potential. If you do that, all stress is irrational, because you're doing the best you can possibly do."

If you are reading this blog you are more likely than not an actual winner. That is not meant to be motivational garbage that poor people read. It is reality. Our writing style is extremely direct, to the point and downright… Brutal. The only type of people who respect this form of prose… Are winners. Why? They are okay with hearing the truth because it is better than being kissed with a lie (main stream media).

Winners do have one issue though… Obsession with perfection. This can severely damage your health which is why it is our number one step to healthy living. Do your best but realize you cannot do *more* than your best. **This will take 5 years to master.** If you can mentally practice stoicism for five years we guarantee you'll be *much* happier than you were in your early 20s.

Pro-Tip: If you work on Wall Street. Find the managing director who is happy (looks his age or younger). Not the psychotic managing director who looks 10 years older than he is and still worries about the pastel coloring (No one is dying bro!)

Step 2) Diet awareness. Not diet obsession. The difference between the health freaks who look terrible and the health freaks who look great is simple. Balance and stress (another trend).

The best way to create good habits that are repeatable and healthy is to shop when you are *full*. This is counter intuitive. Most people buy things when they feel terrible which leads to poor meal decisions (search for filling items, hence why most people eat carbohydrates when under stress). Instead you want to set aside 1 hour per week where you go health shopping. Buy all the items you need at Whole Foods in one fell swoop and do so on a *full* stomach. Buy absolutely nothing that comes in a cardboard box.

Step 3) Two blood tests a year. One blood test is going to go to the doctor and the other one you're going to read yourself. Again. If you are [physically fit](#)you are going to be in tune with your body. [Your journal](#)will also give you an idea of any lifestyle changes. This is going to help you 1) catch any negative diseases early and 2) prevent you from worrying about temporary spikes in specific vitamins.

Concluding Remarks: Notice something specific here… You are not able to "take the L" for any of these four events. There is no reason to ruin your life by: 1) choosing a spouse and involving the government, 2) taking on too much debt, 3) going into business with the wrong person or 4) ignoring your health (ie: your life).

Finally, you may have noticed an annoying phrase in this post: "Take the L". We did this for a reason. This is a *great* way to make this a fun game for you if you're a young person. Any time you try something new and your *actual* friend sees you strike out… jokingly tell each other "Take the L". Eventually people around you are going to realize you think it's a big joke and it actually *improves* the environment (we're talking about simple social situations like a dive bar – typical scene in your early 20s).

By popular demand here are the action steps:

– Do not sweat small items. Getting hustled out of $3-5 is not going to impact your life at all.

– You should have no emotional change if you're rejected by a girl (age 23+)

– You should enjoy the feeling of the word "No". It means you're trying to improve in a new area. (Age 24+)

– Do something that makes you feel embarrassed even as you become older and more successful

– Push yourself to physical failure every single month

– Be prepared to take medium scale losses. Accept this as fact and please re-read the section above! Finally, if you were wondering why there was no post this weekend you can thank the government one more time!

– Never pay more taxes than you should

– Have *multiple* people interview *any* new hire. **Your reputation is on the line.** The money is secondary.

– By 30 you will likely suffer a real physical injury. Train so you're prepared for real physical pain down the line.

– Under no circumstances do you take a life changing loss: 1) choosing a spouse and involving the government, 2) taking on too much debt, 3) going into business with the wrong person or 4) ignoring your health (ie: your life).

****

It's Getting Crazy Out There

It's Getting Crazy Out There

Can't really think of a better name for the post than that. If we look at interest rates on the 10-year bond we're now back under 0.75% (could move by the time you read this). Also. People are starting to miss paychecks due to the rapid spread of COVID-19. To the average person who doesn't attend conferences or work at them, these major events can generate thousands of dollars for a single person which they need to pay rent, pay for food etc. To say that it's a big deal would be an understatement. Hopefully it clears up but the bond market is giving us some worrying signs. Before jumping in, we'll go ahead and use public data so you can see that we're not "fudging data" to make it say something different.

How Do Banks Make Money: We won't overcomplicate this topic. Banks make money by borrowing short and lending long. In theory, if you're willing to let someone borrow money for 30 years before paying it back, they should be charged a higher interest rate than if you let someone borrow money for a month or a year. This makes logical sense. What banks do is they take the money, lend it in the form of a mortgage for example (3-4%) and pay 1% to customers who have their money in savings accounts. *Yes we know these numbers do not reflect the current environment, but this example makes it easy to see the spread being made which is 2-3% on billions of dollars.*

At this point, with bond yields coming down dramatically, it is saying that the customer will no longer earn any money by holding their deposits in a bank (closing in on basis points). If you only get a 0.65% return for 10 year bonds, even if you allow the customer (deposits) to gain 0.15% … This is a 0.5% spread… a huge difference compared to 1-2% (2x to 4x in terms of actual dollars, you have to put HUGE numbers in here to see why it is such a big deal). For those that are really unfamiliar with inversions, this is why the 2-year and 10-year bond inversion is a recession signal. It means that you earn more money by lending for 2-years versus 10-years which makes little sense long-term.

If interest rates go negative (like they have in parts of Europe), this means that banks would then *charge* the customer money just to deposit money in the bank. This creates a strange environment as you're better off taking your money out and putting it under your mattress (factually). The only reason to keep your money in the bank (losing money on negative rates), is fear of being robbed for storing it somewhere else.

There you have it. The basic way that banks make money in a few simple paragraphs and we can now see why the craziness in the bond market is unprecedented. In Germany for example, the current 10-year rate is a whopping -0.79% (that's correct they are negative) and unsurprisingly European banks are not in good shape (Deutsche Bank is now a $6.96 stock and Barclays is at $6.18 – both practically at or near all-time lows).

Bond Yield Drops: We usually don't comment on anything market related. Feel free to use the search bar and you'll see we've been dollar cost averaging into the S&P 500 since the start of the blog (and before we even started blogging) and then stopped adding in December of 2018 as we felt the probability of a recession was high. The reason we had to comment on the bond yield is that we have 5-6 alerts set up for "crazy" scenarios. This was one of them. Usually bonds move around by 3-5 basis points or so. Now if you look at what happened over the last few weeks it actually fell 100+ basis points! (choose the 2020 version)

The table is way too big so click the link and choose the 2020 period you'll see that in the middle of February we saw a *huge* drop in yields. This means the market anticipates a massive drop in the federal funds rate. While the 10-year bond moving from 2.2% to start the year to 0.67% doesn't seem like much, *that's a 69.5% reduction in borrowing costs.*

We're swimming in extremely questionable territory at this point. If we keep cutting interest rates and prolonging the eventual default across multiple industries, it could very well lead into an actual depression.

Debt to GDP… Continuing On: While it's pretty clear that there will be yet another interest rate cut if the 10-year bond is already trading below 1% (fed funds at 1-1.25%), we can see that the latest bull market was essentially debt fueled. Over the past 12 years we've gone from a debt to GDP ratio of about 65% to 105%. Adding more debt is just going to increase this ratio unless GDP suddenly goes up (doesn't seem like 2020 has a fighting chance of being up relative to 2019).

So? You're now in a situation where debt exceeds GDP, GDP appears to be falling and on top of all this countries all over the world are devaluing their currency (some even negative). It's absolutely warped and the last "shoe to drop" will be negative rates in the USA. Ideally we can hold above 0% and even work back to 1% but it seems unlikely in the near-term (remaining below 1%). For those unaware of the long-term debt cycle, a simple chart is pasted below.

Find Ways to Hold Value: If you get nothing from this post and are not interested in learning about economic cycles, yield curves and how banks make money… You should think about ways to own things that will either 1) hold their value or 2) be used by you over long periods of time. While many people laughed at our prior posts, you're in great shape if you followed them. Some companies are already forcing people to work from home, paychecks are being delayed for events etc. You want to take a look at things you will use and see if they have long shelf lives.

Why? You're automatically hedging yourself against inflation. We're not jumping into the "next great recession camp" at this time… But… If you were overly confident the last 2-3 years it's going to show up in your numbers at this point. Revenues will go down, services in particular get dismantled and as inflation picks up (in theory) the price of every day goods should begin to increase. While this is a small example, think back to bars, clubs and restaurants and you should notice that the price increases largely occurred over the past 3-4 years and were relatively stable in the 2010-2014 time frame.

Simple examples of things that hold value and don't perish: 1) homes of course – even if the price goes down, if your mortgage equals the cost of rent… you have to live somewhere anyway, 2) some gold, crypto and liquid cash – a smart person has an emergency stash in their house/apartment and 3) lots of basic goods from toothpaste to paper towels to canned food, pasta etc. We mentioned this in past posts but we're bringing it up again because it is something you should always have (seriously). There is no downside to the strategy and it protects you against big risks. If anyone thinks this is paranoia, they either don't understand what big risks are or they are too lazy to create a basic parachute for themselves if SHTF.

The Good Old Sinking Feeling: It has been quite a while since we've seen a drop like this and the only other time this feeling was pronounced was back in November 2008 to March of 2009. Even in the 2018 sell off it wasn't the same as bond yields didn't collapse and we didn't see a real slowdown across the entire economy. When you see visible real slowdown in the regular economy (hotels, travel etc.) that's a much bigger issue than a random technology or biotechnology stock trading down 20% on bad earnings.

As usual there is always good news here, it means that if you take the basic precautions set out here you'll be miles ahead of everyone else. 12 months of zero income is certainly painful but if you're prepared for that you won't need to panic sell and you can simply grind along as we work through a period of pain. In a wild and unlikely scenario, perhaps there is mass stimulus and your stocks go straight up! That's another great upside scenario and why life rewards people who are prepared for the worst case scenario. Keeping it simple though, we don't think it's likely to see a 20% recovery soon and you're better off doing "worst case scenario" preparation so you can sleep easy at night and practice some meditation.

Another positive note, we'll hold a Q&A this Saturday. We've been harping on preparing for the worst since back in early February so it's a good time to hold one.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending.

****

January Q&A is Closed

Q&A is now closed thank you! Enjoy the Weekend!

Joker Movie Review

Joker Movie Review

There are a bunch of spoilers in here so if you're looking to burn a few hours for entertainment purposes later this week, do not read. Unsurprisingly, we don't see a lot of movies for a reason… movies attempt to mimic the excitement of real life (which is always better). That said, a few movies here and there are not going to impact the future particularly after you're already set, so here we go…

Remain Neutral in Public: While we've talked talked about the "smile, nod and agree" strategy in public settings, there is also a time to be completely neutral. The general theme of the movie was that you never really know how bad a person's life is so there is no reason to go out looking for fights (potentially get yourself killed). Typically, when you're meeting someone brand new (friend of a friend, business colleague etc.) smiling and nodding is the best strategy for avoiding conflict. But. This doesn't really apply to neutral settings as much. In neutral settings like a public area where no one knows who you are, the best strategy is to blend into the general crowd. Why? Well if you're nice to a person who is simply strange, you could inherit a stalker. Similarly, if you're mean, you could be insulting someone willing to die.

Needless to say, neither of those two are positive outcomes. Also. As a reminder this only applies to 1/10,000,000 people you'll run into. No matter how you slice it though, the first theme was a good reminder to always be neutral with people you don't know in a public arena (if you're well known in the setting go with smile and nod since the chances of a person being a stalker in the future is next to 0%)

For fun, you'll notice that people who are quiet in public settings are usually smarter than average. Not sure if this is due to "darwinism", as getting uncalled for attention likely lead to negative outcomes in many cases. Either way, in 2019, if its a public setting that could potentially be dangerous (truly public with no barriers to entry, always veer on the side of blending in).

Economic Disparity: A second item here was the general theme of economic disparity. While they focused on killing a few Wall Street guys in the movie, the reality is that economic disparity is being driven by technology (not Wall Street anymore as that industry is in decline and likely to be disrupted by crypto currencies long-term as well). Beyond that small nuance, there is no real clean solution to disparity. Our guess is this movie will be well liked by people with a bleak economic and life outlook.

Interestingly, nothing positive really came from all of the riots and looting so it's unclear if the movie was positive or negative on populism. In fact, all it led to was more violence.

We have no real solution to disparity (perhaps health care services for the elderly, but that's more of a bandaid if population growth slows) and simply highlight ways to "make it". The one thing about people who grew up poor and became rich is that they typically take care of working staff (like waiters) extremely well. This is something we would recommend as it is a win win situation. You usually make friends and get integrated into the "community", industry nights etc. You also make sure someone is living a better life than they normally would (and they are earning it). That last part is probably the most important, we're extremely positive on paying "above market" for manual tasks but are against handouts as it creates the wrong belief system.

Generally Negative: The vibe of the movie was largely negative based on our read of the entire situation. Even the popular TV show highlighted in the film ended with a saying "That's Life", which was a clear directional nod to the old saying "Life's a Bitch and Then You Die". These types of sayings were popular for the economically unsuccessful in the 1990s.

In addition to that, the rich people displayed in the film were also unbearable from a personality perspective. Thinking back there wasn't a single character who seemed to have a good personality except the midget. This gave the film a vibe of nihilism, no one is "good". The more disturbing part about the movie is that the Joker ends up killing his own mother after he learns about his childhood and there are still people who claim the movie was depicting the Joker as a protagonist. Not sure how that conclusion was made as killing a family member is not a move any protagonist would make.

Mass Killing: After the first killing in the movie, you see the impact on the community as more people begin to wear the same costume/get up which results in riots and more violence. Perhaps this is supposed to be commentary on the increasing number of shootings in the United States. If you give bad actors attention all it does is spur them on as it's a last resort "only way to be seen in society".

This was also a theme. The main character feels like he has been ignored by society and after starting a negative movement he feels like he is "alive again"… so to speak. After feeling "alive again" he actually gets worse, killing more people and starting more violence and riots.

Generally Dark: Not referring to dark as in "dangerous", it was *literally* dark. The majority of the movie was set in lighting that was always cloudy, bleak or dimly lit. Lots of post rainy day type atmospheres. This leads to a bleak vibe to the entire movie, tough to sit through honestly.

Everyone is to Blame But Ourselves! This was the biggest undertone of the movie which *the masses will absolutely flock to*. We'll double down on the prior statement that people who thought the movie was super cool will *generally* be part of life's losers. Why? Well in the movie the Joker gets to blame his deranged mother for his failures, or he gets to blame the government for shutting off his social service meetings or he gets to blame the guy who gave him a gun in the first place or he gets to blame…. see the trend here?

This seemed pretty obvious to us, so as soon as we caught onto this pattern it made complete logical sense that the masses would like it. It had a similar vibe to fight club. Most regular joes have "deranged thoughts" after all they watch all those weird types of porn on the internet (otherwise they wouldn't be so popular). Most regular joes want to blame their parents for their failures. And. Most regular joes want attention. In short, this is a great movie and will be profitable as regular joe will watch.

Some Other Bullets Before the Conclusion

1. The movie was generally depressing, making it hard to watch. Depressing/drama movies are fine but there was really no point in the end after watching it
2. There was no solution, just a bunch of rioting. Seems unlikely that rioting will lead to any long-term solution as it's a negative sum game
3. This was a great reminder as to why women are not attracted to angry guys. Angry people are usually losers. This is evolutionary psychology at its finest. They can tell the difference between angry and dangerous, dangerous is fine angry really isn't. Most never learn the difference
4. Another interesting theme was "kill the rich". This depicted economics as a zero sum game. Any successful person knows that making money is not zero sum so we cannot agree with that part at all. Anyone who is actually rich and successful wants everyone to succeed (the competition is another story of course). Honestly, people don't believe this because they hate their bosses. End of the day though, that "boss" wants *you* to succeed incredibly badly because he knows your livelihood is at stake. This may be worth an entire post in itself. Anyone who actually becomes successful does not want someone below them to fail. This causes lost revenue, lost income and you might actually be forced to fire someone who has a family. There is no worse feeling than temporarily ruining someone's life. Running any business is hard as the employee is incentivized to do the least amount possible unless he has ownership in the firm while the Company needs to keep profits up to avoid cuts/layoffs. We've always pondered on a business model where every single employee is paid in ownership instead of cash and all low-end tasks are outsourced (unicorn and impossible we know – but we can dream)
5. Hallucinations were also common in the movie. This is also a tell-tale sign of someone who didn't make it. They generally make up fake "scenarios" in their head on what they "would do" if something happened. Both good or bad. This create a dream like trance (creating fake feelings of success) without needing to improve their lives. If you meet someone who makes up scenarios in their heads constantly you have got to bolt for the exit. They are more obsessed with worrying/faking versus creating and "failing forward". Always bet on the guy making tons of errors at a rapid pace to gather a framework versus the guy "planning for years" with no experience. As the plans never work without skills to execute anyway

Conclusion: We would give this a zero. But. It was a very good reminder on staying neutral in public. We ramped up the high quality outfits and more flashy items (when appropriate) and it was a great way to remember the surroundings. Walking around with a high quality watch or suit in a Taco Bell is definitely not going to end well. So. For that we're thankful for the movie. That was one positive to remember from a movie with no solutions, just anger and excuses.

Final note, if we really get to a point where people are entirely displaced by artificial intelligence and software code, we should be able to financially afford some sort of minimum housing/income. We'd rather have tax dollars go to something that taxes high earners and pays only for housing and food. The idea of handing people free money is simply ridiculous as the price of all the goods would also go up so the idea of a "guaranteed income" doesn't really work (money handed to economically struggling people usually goes to drugs, just look at Seattle/San Francisco). What could work is a minimum housing/food delivery set up instead of paying for the current government waste. That's a whole different topic as well though.

****

Late to the Game? How to Catch Up

[Late to the Game? How to Catch Up]

We usually do not bother with answering questions we don't know. In a rare exception we'll go ahead and try because we receive the question at least 5-10 times every Q&A and are forced to delete them. As a point of emphasis all of this is opinion as we have never been forced to hit the hard reset button (early 30s with no money and low income). But. We'll go ahead and outline our own strategy assuming we had nothing.

Make a Decision: After teaching your early 30s with nothing to your name, you have to make a decision. Do you actually want to be rich or do you want to live a simple life. This is not something we would be able to answer. A lot of people ask questions that we can't answer as they are personal choices and this is one of them. If you're in this position you have to decide "do I want to try against worse odds or do I want to go low risk?".

People will read that paragraph, go watch a motivational YouTube video and say "I want to be rich I can do it too!" If that's how the decision was made (through emotion) we'd recommend going the safe route and giving up on being rich. Anyone who is in their 30s and still has a role model/person they need for motivation will practically never make it. Now if someone simply read the paragraph and concluded that a stable life isn't worth living then they are the ones who should actually try (a stone faced, emotionless response to trying to make it).

If you've decided that a stable life is good enough, then our answer is simple: government work or healthcare services. Both of these offer a lot of stability with no real inflection to get rich. Oddly, when we recommend these types of positions the response is "won't I be giving up" and the answer is yes you are (in terms of getting rich). And. That was the point. If you've decided the suffering that it takes to get rich isn't worth it then… you don't get rich but your stress levels go down to zero: money for food, shelter, all other bills, healthcare and maybe a vacation here and there. Blogs like this are no longer relevant and you move on from the money chasing game. (Note: we do realize it is possible to work a government job and start an online business. However, we haven't seen a success story with that strategy if the person starts that late… usually ends up being 1-2 good years followed by a crash in sales/income. We'll cover it in this post anyway.)

Decided to Try and Get Rich: If you decide to go ahead and try, you're going to go through many years (not months) of suffering. Simplistically, you should delete everything: social media, your tv subscriptions, your common friends, all your nights out, your current girlfriend etc. Sounds extreme? Great. That is your only chance to make it out of the situation. Successful people in their 30s are already rich and still pushing hard. Maybe not 80 hours a week, but many still push between 50-60 hours.

#1 Option Real Estate: Given no information, we would go into real estate. This is by far the most common way to accumulate wealth. Again. If someone does not beleive this, they can always call a wealth management company who will confirm this as common knowledge: small business owner and real estate are the most common ways to get rich. Our new age ways to get rich were set for people in their 20s (read efficiency, triangle investing etc). When you've got nothing you go down the highest probability path which is real estate.

Why real estate? You can also earn a decent income by learning a skill associated with real estate. We don't care which one it is as all of them pay similar amounts of money: plumber, electrician and anything related to home construction. After learning the specific skill you'll live and breathe the real estate game for the next 3-5 years. During this period you'll live on next to $0 in income and simply pay for food, coffee, water and the cheapest housing you can get.

Save to Get a Fixer: In an ideal situation, you're living in an area outside of a major metropolis (San Francisco, Los Angeles and New York would not be easy, places like Cleveland or Nashville would be a lot easier for example). This is also a hint that you may have to move to make all this work (we explained it would not be fun or easy already). Also, no, we do not know the exact markets to go into. Looking at cap rates and average selling prices would give a quick view of how hard it would be to save for your first purchase.

Back to the point. After living extremely below your means with no real fun (no one deserves to have fun if they are trying to get rich and have nothing as a starting point), you buy a fixer for you to live in. Guess what? You get to fix the whole thing by working every waking hour you can while you're not on the job. The trick here? You're able to do a large amount of the work yourself. It will take a year or more to save money and during that time you should have an ability to spot fixable vs. unfixable situations. We have no idea how this process works as we don't do this (we only buy lower risk projects as explained in triangle investing), but, it will always be around. No matter what happens in the future, people need a place to live and many houses need to be fixed.

Scale: At this point you begin to scale up. There are several models: 1) rentals, 2) fix and sell, 3) apartment complexes, 4) going after more dangerous assets like short sales and homes with structural issues – we consider this separate from "fixer uppers" and 5) starting a completely different real estate company focused on selling homes. There are a lot of options here and we have no idea where you'll sit. That said, the scale is here in various forms.

#2 Option – Looks Industry: We've already described this in a prior post and will be brief. There is a market for helping people get in shape, fixing their diet etc. The reason we're not going to talk much about this? It requires far too much time, is too volatile and unlikely works if you're starting in your 30s. What will happen is you'll receive a few "good years" with low 6-figures followed by the inevitable decline to mid-5 figures and may not recover. Market gets saturated and there is no recurring income unless you own an actual gym for example.

The reason for the decline is 1) downturns absolutely dismantle the services industry, 2) there is limited "stickiness" with the product/market and 3) since the majority of people don't actually stay in shape they are always jumping from band wagon to band wagon looking to fix their sitution with a magical solution that doesn't exist.

The only reason we leave this here is that it is quite easy. Also, some people consider $1M in net worth at age 45 rich (if this is your definition of rich, the plan we outlined will work). We don't consider this rich so we wouldn't bother with it, but that's an opinion. The math will show a path to $1M or so assuming mediocre results.

#3 Option – Internet Attempt: This is a more complicated attempt at our original strategy in efficiency. In efficiency we outline everything however, we assume you're in a good career as well (people think it's not possible to do both well concurrently, and these are the ones that don't make it or don't have any experience – politics can help you a ton). In this situation you're going to try to go down the internet route while working a government job.

This is where the big warning sign goes up. From what we have seen, individuals who cannot break into competitive fields are unable to do well on the internet. Why? Well… the internet is no longer "easy pickings". Everyone wants location independent income and anyone is allowed to compete online. We're not backing down from our original plan in efficiency as it is pretty much an evergreen product for people with talent. Starting late means you're well behind the 8-ball and gave intensely competitive (and talented) people a 10-year head start.

Assuming you would like to go down this route, then you're going to have to do the same steps in efficiency. The trick is that you also have to find an extremely easy government job with a functioning internet connection. We do not know which positions are the easiest but we'd do research in your area to find the ones with the most bureaucracy and limited oversight.

One of the funniest things we see consistently on twitter is how easy it is to make money online. Anyone who actually makes money online knows it's cut throat and disheartening for many months/years (depending on your skills/effort level). People with no experience only see the results and say "Hey I am smarter than him I can do it too" not realizing that they didn't see the prior effort and may not actually be smarter.

Option #4 – Local Business: It is our opinion that this one should be number two for someone starting "late in the game". We put fitness and online sales above it because no matter what we do we'd get questions such as "oh my does this mean you're changing your position" since most cannot understand that views change based on circumstances. Anyway. Beyond that digression, if we were playing catch up we would either go into real estate or go into brick and mortar focused on the heirarchy of needs. A fancy way of saying, anything high margin related to food/drinks/homes etc. While we're mentioning homes twice, this could be a plumbing company instead of using plumbing skills to fix homes. Or a private electrician business instead of using those skills to fix homes etc.

The point is simple, we'd actually go into location specific brick and mortar competition in a city you want to live. Why? Well competition is local and you won't be fighting against brilliant people who decided to compete online. Online competition is reserved for people with niche knowledge and a person with no opprtunities in their early 30s probably doesn't have niche knowledge.

Stay or Leave: No matter what you're doing right now for money, you should take a pause and decide if you know your city well. This is where self-awareness becomes paramount. Ask if you truly understand the ins and outs of the local economy and begin looking for low risk higher quality cash flow businesses in the area. Clean examples are typically pizza establishments and dive bars. Generally, low end bars and pizza establishments have high margins and don't look "sexy". Many of the upper-middle range places have worse margins and are subject to fast closures as well.

If you decide to leave (and are able to), you want to focus on cities with notable population growth. You have to make a decision. Where are people going to move? An expanding market is a lot easier than a shrinking market when it comes to making money. A good example is Austin, Texas (we're sure there are millions more) as many Californians move out to the more liberal city in Texas. This isn't a political comment about Austin being a great city, it is a money making comment as you should be willing to live anywhere (even if you hate it) if serious about getting rich. After all of this work and research you should be ready to make an informed decision.

Two Jobs: Instead of making it complicated, you need to work at least 12-14 hours a day. This is a realistic number if you are trying to save a large amount of money quickly. Either learn a trade and find a night shift or… find a night time position (typically hospitals/health care) and find something else during the day. Other than working you should only have a bed with a place to sleep and that's really it. You're not going to have fun anyway, so no need to spend up for an expensive apartment. (Side note, the internet has been around for about two decades and there are still people who think they can "work smarter" than people who are more successful than them and catch up… completely illogical but that is how the average person still thinks)

This is a bit different from the housing example as you're trying to maximize cash flow until you can buy one of the location specific businesses.

Before moving on here, a key reason why we think this is more viable than the other two options? You'll be happier with your social life. Any time you buy something integrated with a community you're forced to become part of the locals. This is more of a psychological item and it does matter. When you're in the internet game, if you're not doing well, your only interactions are between you and a computer screen.

Option #5 – High Risk Professions: To be clear, we would not do this. This is simply a Hail Mary for someone who does not want to do any of the above. High risk professions are things like underwater welding and other manual tasks where your life is quite literally at stake.

While people get a lot of entertainment out of things like the World Wide Wrestling federation, we always cringe inside when we think about the bodily damage they are taking. We find (after they retire) that people in positions with high physical stress (nfl, nhl, professional wrestling) suffer from serious long term injuries and potential brain damage. While this isn't related to high risk positions (stunt person etc), it's something to think about. Health is worth way more than money ever will be (something we've said numerous times to the surprise of readers) and we wouldn't go down this route.

All that aside, if you're an adrenaline junkie that could be a way to make it as pay can be quite substantial relative to the time frame. Offset of course by significant stress.

Don't Care About Wealth: Once someone officially gives up on being rich they usually say "rich people are mean, unhappy, unhealthy" one of those three. They also say "it wasn't worth the trade off, I'd never go through that for a million dollars!" The reality is that they likely gave a mediocre effort, didn't make it and now need to say something to protect their egos.

Assuming that you've decided to give up on being rich we'd go ahead and take a low risk job in health care/government and move to an area with great weather. San Diego, Hawaii, Los Angeles and Miami most of the time are all good ideas (no tax issues in California if not making large amounts). Are you ever going to compete against the top there? No chance… you'll be taking it easy and hanging out in a different crowd.

Oddly, we don't think there is anything wrong with this, it just doesn't fit with our personalities. We wouldn't surround ourselves with people who want to live this life as the "vibe" or "energy" is always off. It does not feel good to hang out with people in this type of situation. Does it make them "bad"? No it doesn't. It's a different life choice. The idea of living in-between with a "balanced life" is dying rapidly as explained in a prior post and we're all better off making a decision "*make it by getting rich or live a comfortable basic life"*

Concluding Remarks: We gave five different ideas but would probably only choose between two in 95% of situations where someone is far behind. As a point of emphasis this is all opinion based as we haven't been in that situation. One thing we would end with is more of a warning. Believing that someone can suddenly learn internet sales when starting late (say mid-30s) is brutal unless you were already a gifted person. This is something that should be considered. If you were already a top lawyer/banker/engineer and decide to do this (somehow didn't save money) then we'd say you have a good shot. If you were always middle of the pack, it's going to be brutal, hence our view of going into real estate where the math is easier and time frames benefit you.

—

Some side notes somewhat related to this. One thing we've noticed is that people get upset that we don't work "80 hours a week" anymore. This doesn't make much sense as you shouldn't be working 60-80 hours a week if you made it in life. You'd be *willing* to do it, but the chances that it is needed consistently is next to zero. Again. Willing to do it, but the opportunity must be there.

Another side note is that we're seeing niche online sites become saturated (we have an idea to make money off this but will keep that to ourselves as we'll probably do it next year). Niche online sites are seeing flattish trends and you don't want to see the revenue numbers when the economy goes south, combine that with higher expense lines for the guys who thought the punch bowl party would continue… You know the rest

As a last note, a common complaint is that we don't give rah rah positive feedback to people who are playing catch up. Why? It's simply not a high probability chance that they make it. Sounds mean but it's true. Instead we focus on young people 20s to maybe low 30s… since they have the energy to go through the pain and suffering. If we told everyone "don't worry you can still make it when you're 40 and have nothing!" what do you think the younger people would do? They would slack and ruin their futures/lives. So which one is the better message to send? We don't sell dreams, we sell calculated risk adjusted decisions to maximize the one shot we have at this silly game called life.

****

Launching Substack

The Turbo Autists who found it first of all WTF. Second of all, please stick with the $10/month or $100/year version we literally just started and have no idea what the premium tier even means yet (perhaps we send something out but more likely just talk to you directly, had no idea it was even an option). Anyway here is everything, turbo autists always win.

Welcome! We're launching our Substack Product on Monday Morning April 12, 2021. For those that already know **here is the link.**

For those that are unaware here we go!

1) We will be more active with the paid sub-stack group so we can give tailored advice consistently on a weekly basis. This means direct line of access to us and we'll find a way for subscribers to meet each other if both parties are interested.

2) We will disclose all of our investment calls on a consistent basis. Many have made a lot of money on our calls and it is better to be private about it to prevent the website from becoming mainstream (also removes leeches). After our subscribers all see it, we will announce it publicly later (48-72 hours, or keep it on the DL)

3) We will even disclose our personal holdings in percentage terms across every single asset class. Since this is our first run, the beginning net worth summary will be high level and we'll then break it down further. Our net worth update in percent terms will be updated every single month and we'll even provide a rough idea of what we have.

4) Even better… If you're a smart contributor we will sporadically gift you an entire month (maybe even a year!) for free. Why? Well if someone adds a lot of value they should be rewarded and this will prevent spam in the comments. We'll figure out how to decide the winner through a group vote

5) We will also disclose more specific life style hacks including "grey area" type items.

Before moving on, we want to emphasize that none of this will be deemed legal financial or medical advice and everything is simply an opinion. Currently, financial managers are charging extreme fees (1% of assets!) and this makes little sense to us. We can do better for cheaper on a more consistent basis this way.

Regarding the name, *we'll be forced to slowly rebrand to "Bull and Bowtie" since we do believe banks will die*. We are not joking about that comment.

Conclusion: For the Monday drop you will get: 1) a new coin we recently invested in ~2 weeks ago, 2) exact mix of our net worth and 3) a detailed overview of our high-level thinking of investment positioning as of April 12. If this is successful we will even sell one of our e-commerce projects and focus more on this where readers can decide what we do with the content. As yet another selling point, we do have access to tons of third party items (glassnode, bloomberg etc.) so we'll find a way to get you answers without stepping across the line. For the first run we'll link to public data as we figure it out.

So get ready for the fireworks and sign up! **Here is the link.**

The legacy site WallStreetPlayboys will represent free content and be copied over to some free posts on Substack.

Thank you for all of the support and work together to *Make Banks Zeros*.

****

Learning to Respect Money, After Taking a Punch to the Face

Learning to Respect Money, After Taking a Punch to the Face

For the vast majority, money is never "enough" which means that you'll adjust to the amount you have. Unless you become filthy rich (over $50M or so), there is always one more thing that someone has in front of you. The key to getting rich and avoiding the spending trip is to force yourself to "adjust". So if you're worth $1M or $20M, you want to avoid changing your lifestyle for around a year or two. At that point, your brain will be used to the new digits on the screen.

Learn to Respect Money: The reason why people go broke? They become overconfident in their ability to earn. In fact we have a real time example of a project we have been working on for over 9 months. The result? Negative earnings. It was a disaster. Such a disaster that we're going to take a couple weeks to think about where it went wrong. Originally, the expectation was for $500K or so in net profit, which resulted in a negative number… that is quite a different outcome! The plus minus sign wasn't even correct. But. As they say… no risk, no reward.

Another good example is actually the investment banking industry, numbers are down and are even worse than our expectations based on current news flow. Sounds like it could be worse than -10% for most firms. This is an important figure as most bankers quite literally only save their bonuses. So for the past 5 years or so they got addicted to the increasing bonuses and living off the salaries. This will be a rude awakening in February-April and will be significantly worse if we see an economic downturn around 2021 (our original expectation that we'll stick with for fun).

What do we mean by "Respect Money"? It means that if you earn a large amount of money (most likely a one time event such as a sale) you are not allowed to spend a penny of it for a year. Does this sound extreme? Yes. That's how you get big results anyway. Your one time windfall is only allowed into real investments and cash. For now, things like crypto currencies would be out of the equation. You could toss it into crypto currencies only if you are already a multi-millionaire. Dropping a one time windfall of $250K into crypto with no other savings will likely cause panic selling in down days (like what we saw a few days ago).

Businesses Have Shelf Lives: One of the main reasons we recommend copy writing sales and several other tangible transferable skills? They have longer duration. Even if you're running an incredible diet pill campaign making hundreds of thousands, the chances are high that it'll go to zero at some point. Owning your own product is always more sustainable and higher margin… but just like the products you were selling, your specific product can go out of style as well.

A good example that sticks in our mind is fidget spinners. Man. So much money was made in a short period of time, yet it died rapidly as well. This is a good way to describe what we're trying to convey. If you have a successful business running you simply do not know if it's a fidget spinner fad or a sustainable product.

Take another extreme.

If you look at the taxi business, back 20 years ago you could have made good money with medallions. A yielding investment that was required to operate a taxi. Now? What a disaster that business is. No one takes taxis anymore, the medallion value is practically nothing and this was an area that was heavily regulated! You just never know.

For fun another example we think about a lot is property taxes. If revenue needs to be raised, the easiest way to tax the rich is through large homes. This is a legitimate business risk to real estate if wealth disparity continues. Imagine the property taxes on a million dollar home jumping to $50,000-70,000 a year. Absolutely possible and would be unbelievably painful if you're forced to sell assets in a "fire sale".

Your Best Isn't Always Enough: This is a heartbreaking reality for a lot of people. If you put your heart and soul into something, it doesn't mean it's going to work out. While we do think you'll always live a good life (making 6 figures at minimum as most don't work hard)… hard work and effort does not guarantee sales/success. You need some luck.

In our opinion, it is actually better to *fail* first then succeed. Much worse to *succeed* first then fail. Why? The chances you put more capital up at risk in the second venture is much higher. Also. If you succeed instantly, it's difficult to pinpoint "why" and you can quickly flame out as a one hit wonder as you didn't develop any real positive habits.

If you fail a few times and then succeed, one of the major lessons you learn is that *money invested is rarely a leading indicator of success.*

The silver lining in all of these failed projects is that unlike other jobs where you're simply doing a processing role of some sort, you likely learned a valuable lesson or skill. For example, if you try to scale up a business and end up losing money and are forced to exit parts of the market, you should have learned why. Similarly, if you sold too early and didn't wait for the "knee in the curve" you learned another lesson related to sales multiples at certain stages of the product life-cycle.

The 50% Rule: This is a big one that we learned early (fortunately). Any time you have a one time event or any major sales month/year, you're not allowed to touch 50% of the net profit. This means it is locked away for good into an investment (either s&p 500 or real estate in our case). This simple rule makes it impossible to start from ground zero ever again.

Assuming you netted $300-500K from a sale (a solid one time success for the vast majority). You have to take $150-250K and quite literally lock it up for good. There is just no way you're going to find the "next best thing" right when you sell your first business. The chances are low and you're emotionally high which creates a mental state of hubris. As you can imagine, making any decision in a state of hubris is probably not a good idea. The only exception (where you sell and reinvest everything) is in real estate when you do a like kind transaction to avoid paying capital gains tax. Generally, you're selling to buy something nicer in a lower risk neighborhood (again that's a general rule of thumb)

You will do something stupid: Instead of sitting on a high chair, it is best to admit that you'll do something stupid when you're officially "rich" in your own eyes (number different for everyone). We've seen it all. An expensive car, too much house, unrealistic watch purchases, drug, alcohol, escort benders… and more. While they sound "cool" when you write it out (the average man glorifies movies like "the hangover"), after 5-years you look back and realize it was a terrible decision. The next time you get a windfall, it'll be a lot more subtle and you'll probably buy something reasonable (reasonable new watch, upgraded car, basic/small vacation home that has low taxes… etc). We'll admit that your stupid decision will definitely get a lot of interest from people at social events so that's one benefit!

The second piece of good news related to your inevitable stupid decision is you won't repeat the mistake. That's critical. When you make a major F-up you can actually say you won't do it again. In fact, that's probably one of the common threads that separate smart people from regular people. If you touch the hot stove once and your hand is burned, you never do it again. Your average person needs to touch it "five times" to be sure that it is hot. This sets them back over and over again to the point of no recovery.

When Successful Never Burn Cash: Okay, this is practically impossible. That said, it's a good high level goal to have. Once you've succeeded at something, be it a career in enterprise sales or as an engineer… it's time to remain cash flow positive on a monthly basis. If you can avoid burning cash in perpetuity, by definition, you'll become richer and never have money issues.

If you want to plan this out here are some good things to write down: 1) around mid 30s it is normal to have at least one notable injury – ski trip, weight lifting, tennis, golf… it doesn't matter. You'll likely have one significant set back; 2) assume someone you care about will need money. This could be your parents if you have a good relationship with them or someone else. If you have a soul there is at least one person you'll help out. Similar to Felix Dennis, do not expect to see the money ever again; 3) assume a housing expense increase at age 30, 40 and perhaps one last move at 50. Why? Well you'll get tired of the place you're in. Everyone grows over time and living in a one bedroom place at age 40 is simply unlikely; 4) always have a "2% fund" this means that 2% of your annual net income will go to unforeseen costs. Could be as simple as a broken refrigerator to a car repair. They happen every year and 5) have a "3% gift fund", no one enjoys hanging out with the cheap rich uncle. So make sure you have enough money to spend on special events such as birthdays and weddings. While 3% of annual income doesn't sound like much if adds up quite fast as some years it'll be as low as 1-2% and you'll offset the years where it is closer to 5% (multiple weddings/birthdays hit at the same time)

On the Topic of Money… After having a lot of ups and downs (good years and bad years), we're going to highlight a lot of "coincidences" that we've seen. None of this is to be seen as fact. That said we've seen several clear trends so we'll drop them in bullet format.

1) We've never seen someone fail for 5-years straight. Fail, meaning they are poorer after 5-years of effort and they did not increase their earnings by at least 50%. This assumes the person is relatively young and isn't earning a huge amount of money. To put brackets around that, if you're making $100,000 a year… With 5-years of real effort we'd put the chances of making less than $150,000 a year at less than 1%. Yes, we're serious.

2) When you cross $200-250K in net income per year, the volatility kicks in. This is somewhere around $400K a year gross income depending on where you are (no we won't split hairs on the exact math). There is something strange about this level and you end up either going down to $200K sometimes and other people inflect big and grow to $600K+ net income. It's similar to the growth of bamboo. It takes about 5-years to really build anything and suddenly starts growing quickly. Also. It eventually matures and you have to move on to the next task.

3) When you're about to cross a specific financial hurdle, maybe it's $1 million exactly or $2 million… expect life to throw you a massive number of curve balls. This means you're going to be close to your "exit number" and somehow you'll be thrown a massive wrench right at the last second. This never ends. Right at the very end of the game, something always happens so you should be prepared for massive amounts of headaches right before crossing a specific net worth level. Not sure why this occurs but it happens every single time

4) Always sell a business/asset when you lose interest. While we're certain you've already dealt with people "chattering" about the volatility at the company… It's 100x worse if you're actually disengaged. A rough quarter or two where employees worry about the business is not a big deal. When you've lost interest, you won't be able to re-kindle the fire. So it is better to sell it.

5) Any time you feel like quitting, it's time to triple down. This is also how life works. If you're about to quit, you should actually work 3x harder to get over the hump. The only time you should actually quit is when you're certain it'll never go cash flow positive again (for some reason). On a similar note, if everything is going perfectly fine… Get ready for a wrench. Typically you can have 1-2 great years without any issues (smooth sailing). And. By year 3, we can all but guarantee something will happen.

6) If you have money in a checking account without a plan on how to use it, it'll slowly "go away". This is another theory we have on why people don't get rich. If you don't have any ideas on where to put your money, the cash piles up in a checking account and suddenly random costs show up! It's almost like the money gods know when you're cash flush and search for ways to drain your account. This means you should always know what you're going to do with cash in your accounts. No exceptions.

7) Discount all of your revenue streams by 50%. This is a good metric to keep in mind since you never know when competition or structural changes to your industry will occur. If you have three streams of cash flow, generating say $100,000 a year each… assume that you're really making $150,000 because we promise you that one of them will take a step down in a couple of years. It's just mathematics.

8) Never sell for 2x sales or less. We've never seen it work! No doubt that it has worked for some people, but, if it's actually successful selling for 2x is just not worth it. Even if the business slowly dies over the next several years, you're going to make more money by riding it to zero from a cash flow perspective. And. This assumes you're doing nothing to keep it afloat.

9) Don't work with friends for money. This is yet another fact of life. Anyone who is around the same age as you will always think they are better than you. You could be making $1 million a year and crushing it in your industry. It doesn't matter. Joe Blow, your friend from college making $80,000 a year thinks he deserves to make the same as you. No matter what.

10) Only invest in people who are "in it for the money". If someone wants to work with you simply because they are passionate or interested in it… This won't work. Always go with the greedy person. While this sounds dangerous as you're working with someone solely looking to make money, you can write specific

contracts to make sure incentives are aligned. It is possible that you'll eventually split, but the chances are extremely high that you'll make a lot of money in the process. And. Those contracts are going to be a life saver. So. Always work with people who want to make money. Period.

That is it for now. As a side note as we're wrapping up our book that talks about spending, feel free to leave questions **related to spending in the comments.** We'll tack on a Q&A section at the end for the good ones.

****

Lessons From Growing Up Broke

After thinking about this for quite sometime, a review of a journal started over 20 years ago was pulled out from underneath my desk and I decided to review the biggest life lessons I learned while growing up poor.

Acceptance or Obsession: When you're broke, you decide to either accept mediocrity or become obsessed with the accumulation of wealth. Obsession is a virtue not a vice and don't let average people tell you otherwise. They are not ambitious because they would rather live in a bubble of self-reassurance and comfort. The difference between a [complacent mindset] and an ambitious one is the acceptance of [the truth.] The truth is that you can fix your life but the only one who will help you is yourself. No one is coming to the rescue.

Successful People Respect Ambition: This was a startling discovery at age 13. Everyday I was told that rich/successful people have no interest in helping people. [Lies.] Rich people have no interest in helping people who are unwilling to help themselves. There is nothing more depressing to successful people than seeing wasted talent. This lesson was learned when I decided to start taking athletics more seriously. Instead of playing within my age group I decided to show up at 5 in the morning to parks and recreation centers to play against the older men as the outcast young guy. A year later I was able to attend multiple high end training camps for free as the older crew would allow me to play for their league.

Perfect Repetition is Key: If you're not working smart you're not working at all. This is the impact of imperfect practice. As you go through life you'll find less and less people making money by grinding out long taxing hours, but you'll find many rich people [grinding out and failing] while giving themselves the highest percentage chance of success. The best examples include memorizing a slew of Jeopardy facts (the internet has been invented) or shooting thousands of free throws with improper form. Practice correctly or don't practice at all.

Information Over Entertainment: If you want to become rich, you don't deserve to watch TV, [hang out with broke people], or do anything that is not moving you forward in the game of life. In today's world you're spiraling up or you're spiraling down, you simply cannot accept stagnation. When you no longer have to work for a living, feel free to live a life of hedonism. You earned it.

Accountability: Another way to say this is "no excuses". But the reality is the meaning of the phrase no excuses is misunderstood. What it really means is "Am I making an excuse when I should be accountable for my own life problems?"

1) Are rich people arrogant or am I just making myself feel better?

2) Are rich people really unhappy or is this yet another excuse to avoid hard work?

3) Do I really deserve to make more money or deserve a promotion?

4) Are rich people really stealing from people or am I just thinking [like the 99%?]

5) Do I deserve to succeed or am I taking no actions like [an average loser?]

You Never Know: This one still kills me. I still struggle with it. You never know who you are speaking to so you must maintain a respectful demeanor for every stranger you encounter. If you peg the person as a leech after spending time getting to know them, cut them off, but you must treat every new encounter as one of value. As an example the biggest change in my life occurred when I helped an older man fix his form on a shoulder press machine, we became lifting buddies once a week, 6 months later I am working for his team with a 40% pay raise.

There is a reason why we've named this website WallStreetPlayboys, if you're unwilling to read the content and must judge immediately by a title or first impression, your gut reaction will be incorrect.

Conclusion: Finally, to wrap up the point of this article it should be noted that these lessons were learned because of a journal. Every man and woman should take the time to write down his or her thoughts and feelings every day. Yes this is "lame" and everyone else will find this task to be stupid and a waste of time. Then you look around and realize, if everyone else is not doing it… It's probably the right move.

****

Life Changing Items to Be Aware of As You Get Older

[Life Changing Items to Be Aware of As You Get Older]

We wrote efficiency since a lot of our youth was wasted. Reading about "hacks" for health, fitness, money, dating that were all an enormous waste of time. Since the vast majority will still search for special tricks, we're going to highlight some things to be aware of as you get older. A lot of them are simply related to body decay over time (no way to argue that a 60 year old man is as nimble as a 20 year old man). But. Some of the other items are important if you're looking to meet new friends with similar life expectations.

Physical

Fruits and Vegetables: We outline a clear diet in **[Efficiency]** and you'll need to find ways to get the nutrients despite having a schedule that may change rapidly. If you're traveling a lot, you'll be forced to travel with items such as Chlorella and do quick google searches for organic juice stores (Whole Foods is typically the easiest spot). The one thing you'll notice? When you change your diet you'll physically feel the difference. If you miss a week or a month, your body will not act the same and this is due to aging. While you could drink a gallon of alcohol on Thursday night and still feel fine on Friday at age 21… doing the same at 40 is just not going to be realistic. The same concept applies to positive health changes. It takes a little bit more time for the positive effects to flow through.

Flexibility: If you do any repetitive task for a long period of time, you're going to overuse certain muscles. This is going to lead to a host of problems: 1) bone alignment, 2) lactic acid build up, 3) muscles changing your posture and 4) consistent knots in certain areas. You'll notice the changes occur as you get to around middle age. This is important since money will solve the vast majority of your issues. Since you're following the right workout regimens that we have outlined in Efficiency you'll feel your body change. When the inflexibility sets in you'll want to have a slush fund for 1) deep tissue massages, 2) yoga sessions and 3) any additional joint issues.

Circulation: It is rare to see people in their 20s have heart attacks (unrelated to drugs) and this is due to circulation. You'll find that flexibility, circulation and diet all impact your circulation. More importantly? When you fly on planes and rack up those air miles you'll notice your feet and arms change after a long flight (bad for your body). To combat this you'll likely take a single asprin during long flights and purchase compression socks and arm bracings. These will be life savers if you sleep on flights since business class and Jets do not protect you from cabin pressure. If you're over 30 we strongly recommend trying this and you'll feel 100x more refreshed when you land. Oh… and as you get older, you'll need to do more sprints on the bike (we also recommend eating some cayenne pepper).

Skin: Ahh one of the best markets for affiliate marketing. There is a reason for this. Your skin will get wrinkled over time and this is simply due to aging. Instead of buying the insane products that are sold on the internet for cheap monthly subscription revenue fees… You can do your own research and look into collagen and internal fixes to the problem. Just like diet, the real fixes are never external. Read a single book on how the skin works and you'll find a lot of interesting facts about preventing the declines (hint there is a reason why vegetarians have good skin and no we're *not* recommending becoming vegetarians).

Recovery Time: The final one is recovery time. As you all know everything compounds. This is not just investments but physical investments as well. A nagging injury for 10 years will be much harder to get rid of. You can certainly optimize your body, but at the end of the day, it's always easier to recover if you're younger. So keep in tune with your body and make those adjustments.

Financial

Watch Out for the Snakes: When you cut the grass the snakes show up. In the case of money, this is extremely true. Many people (we'd say about 99% of them) get rich and don't win at the other parts of life. They are either out of shape or are stuck in relationships they don't like. Or worse… They are still desperate to earn money because it is tied to their identities. The vast majority believe their net-worth = their actual worth (ego). *Be extremely cautious to take life advice from these individuals as you may end up like them.* Would you want to have billions of dollars but an over bearing wife who runs you around like a chicken with its head cut off? Would you take $100M if we said you'd be in a wheel chair for life? The answer of course is no. Many people believe they would "just change that part of their life" and that's just not how the game works. Be careful.

Stop Worrying About a Collapse: Once you're rich (somewhere around 30-35 is our guess) you shouldn't worry about protecting the rest of your cash. If you have say $5M and that's earning you $250K a year in boring bonds/dividends at 5%… There is no reason to invest your future money "conservatively". If your plan was to get to some number like $50M+, it also won't happen with boring CD investments anyway. These guys who live for low single digit returns are typically the ones who have lived a meaningless life. They went to a top school, got a stable job, saved, married some mediocre person at 30, had a couple kids and are walking towards death with no life experiences. That sentence sounds brutal and pessimistic, yet look around. The vast majority choose the predictable and boring normal life as if they get another chance at it "later". They don't.

Don't Go Off The Rails: While we're encouraging people to take more risk, there is always a balance. *When* you get rich, it's foolish to bet anything that would hurt your principal balance to live a good life. This means you should figure out where your line is and close that door for good. Put a balanced portfolio away to cover a comfortable lifestyle forever and under no circumstances do you touch it. None at all. Once you have that money set aside that will keep you set for life then live it up! Don't buy CDs buy that fast car (if you're into cars) buy the vacation house (if that's what you like) and roll the dice on some intelligent gambles if that's how you get your thrills. Take a look at the lives of rich people who go broke quickly and then go meet some corporate guy with a boring life driving a honda civic. There is a happy medium and that's how it should be.

Before You Spend… You ever wonder why branding yourself as "high end" is beneficial? The answer is free stuff! *Before you spend see if you can get it for free or make money from it.* We'll use an obvious example with actors/athletes. If they sponsor specific companies they get free cars, watches, trips etc. Not only do they get them for free as trials… they also get paid to use them! Talk about a sweet deal. We don't know where you'll be successful, just remember it is ideal to find a way to make money without doing anything or at minimum get it for free. Does anyone here really believe billionaires pay for their own travel and food? Usually someone else begs them to do it for a presentation and some money as well.

No Principal Pull Down: This is last because it's our own rule. Every year, you'll never touch the principal on your portfolio. This prevents your cash flow from going down in any year. Notice, we focus on cash flow since that's the number you're looking to protect and if your principal is going up every year you're in good shape. In the years when we have recessions you should have a good cash fund that supports you without dipping into the cookie jar. Then buy up all the assets on the cheap and go back to your vacation home.

Friends and Contacts

People are Busy: You shouldn't want a friend who wants to hang out every day. That means they live an uneventful life. All the "social rules" are simply mirroring successful people. If you are willing to drop everything to go and meet someone new… it means *they* are socially above you. We have no problems saying we'd drop everything to go and meet several billionaires we admire. The same applies to dating. When a thirsty guy is willing to drop everything for girl he just met, it means she out ranks him (a bad thing for him). As you get older you'll see that all of your friends are just as busy as you are. While your phone will light up with messages they are typically soft contacts from people you actually want to meet. If you're constantly talking to a specific set of people they are usually business contacts not really friends.

Most People Don't Evolve: A good litmus test to see if a guy is successful without any access to financials is to ask them about random topics. If you talk to a new person for a couple of hours you've usually "drained the well". This means all of their knowledge is around 1-2 topics at most. That's a bad sign. It means they never actually built a wide range of skills. If however, you talk to someone and they are constantly in the weeds on a lot of topics to the point where you'd call them an expert… You can bet that they are doing well financially. Now remember, everyone has a niche the key part is being able to diversify your skills to prevent over reliance on one talent. Unless you're a singer or sports star, diversification makes a big difference.

No Such Thing as Business Friends: Don't trust anyone but yourself. By the time you turn 20-25, the vast majority of people are simply "angling" for some deal (99.99% of people). They could be your "business friend" for 5-10 years. And. At the end of the day you guys are not friends, you're frenemies. They would be thrilled to see you fall off if it meant $10K for them. You're going to spend more time talking to business contacts because your actual friends (i.e. never mix money with friends) are going to be busy working on projects as well. Just remember your co-workers, your boss (if you have one temporarily) and the people you manage are not your friends. Not even close. They will stab you in the back with an ear to ear smile. While this sounds awful, have an emotion-less response to it. Everyone has to find a way to make their cash so there is nothing wrong with some conflict. Just remember, now that you've been warned, if you make a mistake it's the second part of "fool me once shame on you, fool me twice shame on me".

Suddenly You're Popular! Avoid fame. You're going to suddenly see people emerge from the wood-work as soon as you get rich. They will suddenly be interested in "helping you succeed". Simply ignore. The good part? If you avoid fame, this will be manageable. The best part? You'll recognize other successful people. It's another form of the matrix. Once you see the queues you'll know who the $30,000 millionaires are and who the rich people are. Surprisingly, they could drive a civic and they could drive a Ferrari, the key way to tell is by how they speak and their body language. The ones that are difficult are the rich guys who are run by their wives spending all of their hard earned money. But. At the end of the day… you'll learn to spot those as well. And. Avoid them.

Other Strange Stuff: Not long enough for a section of its own but here are some other strange things you'll notice: 1) you'll be extremely frustrated if you have to wait long-periods of time for things that burn your time; 2) if you've really made it you won't even compare yourself to billionaires, you'll be happy and relaxed at all times, 3) you'll feel sorry for the rich guys with tons of stress chasing a few extra dollars at expense of their health and personalities, you won't bother helping them out of the matrix because they are too certain that they are making the right decisions, 4) you'll get more excitement out of helping a few friends make money (when they are significantly younger) since they are not colleagues and the money doesn't really matter anymore for you, 5) you'll get more excitement from learning something completely new since you'll be in the top 0.1% if your specific field… anything new is fantastic in your eyes, 6) empathy is a lot harder due to success so you'll be forced to manually work on it, 7) meditation will be better for stress relief than exercise – you'll likely add it to your daily routine, 8) getting a regular sleeping schedule will be critical as your body will react to negative changes, 9) you'll do a lot of things that are not financially beneficial to you since you're looking for new interests/hobbies and 10) you'll laugh at all the amount of stress you had to go through and will recognize it was a brilliant move to take the pain when you could (in your 20s). Finally, you may not even agree with these 10 hence why they are at the end and are simply things we have noticed.

On a final note… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like our book **Efficiency**. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career **and** the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (*the basics and all you need to start*); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it and 9) How to do all of this and maintain a normal social life (avoid choking off your personality).

****

Life is Just a Game of Tweaks and Personal Talent

Life is Just a Game of Tweaks and Personal Talent

Across every aspect of life you're essentially spending every single day making small changes. This is why it is incredibly easy to tell who will be successful from those that will just never make it. While talent can be an issue, the bigger issue is that people try and find the "correct answer" on day one. Life just doesn't work like that. You can essentially get the correct blueprint/map but at the end of the day, just like a sport, the execution is what matters. Knowing how to write a good campaign ad, knowing the right exercises and knowing the right diet is not the same thing as actually doing it. In addition to this, even with the blueprint, you're still going to have specific skills/issues that are related to you. Why? No one is going to have your exact same skills.

Diet the First Blueprint: Everyone knows that eating healthy is important. How many people know what their body responds best (and worst) to. We've always used this as a simple metric when someone talks about their eating habits. The difference between the guys who stay in shape past 30 and the ones who start to pack on weight surrounds this topic. It's just not the same for everyone. For example: some people will respond better to things like intermittent fasting (14-16 hours a day) while others will respond better to avoiding large amounts of carbs (pasta etc.). We won't waste our time arguing these facts since they've been tested over a decade and it's highly likely that you (if you're in shape) already know a few things about your own body that respond better. We'll outline a few examples below.

Unhealthy Foods: It is almost impossible to eat like a trained professional 24/7/365 for 10 years straight. Everyone has a "vice" where they enjoy eating something unhealthy. The key is finding out what unhealthy foods you can eat without seeing a significant impact to your weight or your energy levels. It really gets detailed. For example a person might be able to eat a candy bar and feel fine but couldn't eat the same amount of calories in the form of a pie or a tart. Again. People can argue that there is no difference but we'll just ignore them since they don't have serious experience. You can even try this at home yourself by choosing two unhealthy foods, eating ~1,000 calories worth of one (to feel bad on purpose) and ~1,000 of a different type. If you're being honest you'll feel slightly different in each situation.

As a fun example, we've met a few people who are extremely tuned into their bodies and if they eat doughnuts they tend to gain something like 2x more weight than if they eat basic croissants with similar calories. We're sure the calorie counters will jump into the comments but we'll end up deleting them. Why? Well if you eat 1,000 calories of cucumbers or 1,000 calories of snickers, your body spends more energy trying to digest the consumers (more energy burned). Easy reason is due to the density (trying to eat 1,000 calories of cucumbers is next to impossible in a sitting… you'd need to eat ~60 cups of of cucumbers). We have no real proof for why your body will digest certain foods better but then again we do have proof that people suffer from certain allergies etc. In general, science usually lags trial and error since it's not going to be easy to compare one human to the next (different DNA + genetics etc.).

Healthy Foods: It's one thing to know the unhealthy foods but it is a whole different ball game to know the healthy foods. Another good example is comparing, Kale, Wheat Grass and Spinach. Some people have a hard time eating/drinking one of them versus the other two. Not sure why this is. It can make them feel sick and on top of that dampen their energy levels. Again. No science here, just basic trial and error. The people who have incredibly high fitness levels later in life have this sort of information as well.

A second example of the healthy food difference is "high energy" fruits. Generally, Apple, limes, lemons, ginger and beets are used to increase blood-flow/energy levels. Similar to the concept above, your body will likely respond better to one of them. Based on the amount of hype apple cider vinegar got for a while maybe the majority benefits from fresh apple juice over limes and lemons. It's unclear and is something you can find out yourself. For what it's worth the sour flavors are usually more effective on this side of the web but it's never a guarantee. Ginger shots and Wheat Grass shots are useful when you're traveling as places like Jamba juice carry them (sure not the greatest spot, but works if you're in a rush and stuck in an airport).

Muscle Growth the Second Blueprint: We've reached a point in society where simply appearing in shape is seen as an accomplishment. The good news here is that every single in shape person knows where they are physically stronger/weaker. If al your'e doing is a little bit of biking/swimming and lifting heavy weights, then you'll know which areas are stronger on a pound for pound basis. People like to talk about their max weight but it means nothing without knowing their current height and weight as well. During this process if someone is serious about staying in shape long-term they will also recognize where they are at risk for injuries. If you're doing any repetitive task over the course of a year, you'll develop a "tightness" at minimum in certain areas of your body. This is your signal to find the weak spot.

If you're suffering from achilles pain it could be an issue with your legs or even your foot (you might need to buy toe separators to sleep with to prevent your foot from contorting, which then puts stress on your heel/achilles). Similarly, you might have shoulder issues, in that case you're going to hang from a pull up bar to stretch out and use weights to stretch out your chest and shoulder area. In addition to this… You could have "tennis elbow" which may require you to use a pulse massager or an arm massager. These are some common ones and there are many more ranging from the lower back to your hips and quads/hamstrings. The guys who go "above and beyond" are able to pinpoint the exact issue, strengthen that area of their body and create long-term high quality muscles. These "annoyances" never really go away, meaning your body composition is always going to have tendencies, but recognizing them early will save you an incredible amount of time and energy.

Specialized Workout: If you get the chance to hit the gym with someone, see if they have an odd "routine" they add that normal people don't do (including the ones that are in shape). These people are likely "in-tune" with their bodies and will have a lot more longevity. While anyone can buy a book on the basic workout routines to do, the small additions can severely decrease injury rates by a significant amount. We'd say the people who have specialized additional routines reduce their chance of injury by over 50-60%. Why? They know when specific muscle groups are giving out and can adjust accordingly.

Limited Negativity: While we've focused on the physical tells, one social one is the "observation" ability. Two signs that a person will be more consistent and continue to tweak in the right direction: 1) do not look down on out of shape people working out and 2) able to visibly see a persons relative strengths and weaknesses in two sessions. The first one is social and more obvious, no point in discouraging someone who is trying to get better. The second one is more interesting as it shows that a person can visibly see when things are going right/wrong and do a quick calculation on the weight relative to the size/age of the person. To wrap it up, similar to the diet tweaks, you'll be doing exercise tweaks over the course of many years to prevent injury. Those that don't and simply follow a standard blueprint after they are in shape will have a harder time keeping up with those that take it seriously (similar to everything else in life).

Making Money a Million Edits: If anyone thinks that the above two are hard to figure out over time, they shouldn't bother starting any sort of real business. While there is a good set of rules to follow, as soon as you "start" the game becomes a trial and error series that is incredibly tedious. The good news is that each small change can move your margins or sales growth by percentage points (not basis points… But full percentage points). This is also why we really avoid giving advice on items we have limited experience with, each market is incredibly different and you just never know what is going to work without many days of trial and error. That said here are some examples:

Website Design: You know those annoying "don't leave sign up for email or click here" pop ups when you try to exit? They exist because they work. Some people have them run multiple times in a row because the "third" one or the "fourth" one is the highest converting one. Who knows why any of this craziness works but this is the stuff that happens. Continuing with the design front, sometimes changing the placement of where your product is located shifts the click rate by 10%+. Even if you know what you're doing sometimes you have to take a risk and place it somewhere slightly different just to see if it works. Home page design matters for anything real.

Ads: The industry matters a lot. A lot. While Facebook and Google are currently dominating and mastering either of these will make you incredibly rich, we are still surprised by the types of ads that convert. For some industries those ridiculous pop up ads at the bottom of phones work. In other industries they get next to no sales. Sometimes being on yahoo is better than targeted Facebook ads (all relative to how much you spend of course and the cost per click). Never give up. This is the lamest saying in the world but it's true here more than anywhere. Never give up. You have to try every single ad angle there is and we can all but guarantee it will lead to riches assuming the product is priced correctly and the sales page is solid.

Sales Page: Sales pages are the most annoying. Sometimes having errors can actually *help* your sales because it calls attention to something specific. Similar to how a car crash causes people to slow down and look at what happened. This isn't a good idea to start with but you can go ahead and mess with "accidental" errors that cause the viewer to focus on something specific. The only good news about sales pages is that your competitors will be going through the same issues at all times. You can piggy back on their changes and feel free to use the same tactics. People say this is a "bad" strategy but look at what happened with the Chinese… They copied and stole IP (you're just taking words which is 100% legal) and they have a booming tech industry now. Copying your competitor is simply smart since you have to add your own secret sauce on top anyway. You have to learn how to sell… So may as well start with one that is working.

Hiring/Outsourcing: There is a running joke on this blog that the worst thing in life is customer service. If you want to lose faith in humanity go into customer service as you'll encounter so many dumb questions that it will make your head spin. The faster you can outsource this, the happier you'll become. Speaking of this, there is also a large tilt here to outsourcing for a more human reason (firing people is awful). Having someone else depend on you for their livelihood is just not a great experience. That said, if you do find the right people to work with you'll be in luck. Fortunate for this side of the web, you can make a very good living with a team headcount on your single hand. Our basic advice here: better to churn and burn through different outsourcing companies at first. Once you hit scale issues with outsourcing then it's time to either sell or take significant risk by hiring people. Based on our history you already know what we'd lean towards!

Speaking of hiring and outsourcing, on a fun note, one of the questions for Plato was "Hire the hard working person or the talented person assuming they have $0 to their name". We thought it would be a close race since there was a catch at the end. When push comes to shove you want to choose the hard working person since you probably have a lot of processes in place that ensure a hard working person will get results over time. Now the catch here is if you're hiring a younger person, you probably choose the talented person. Why? Well the reward is a lot higher on the upside and they are currently broke! Remember we never said the talented person would be utterly lazy. Normal work ethic with extremely high talent does outperform hard workers particularly at a young age. So if you were given the age of the candidate the answer would be a no brainer, anyone over 28 or so would choose the hard worker 90%+ of the time and anyone who is 21 years old for a lower paying starting position could easily lean to the talented person.

Dating: For fun we're tossing this in the end. We're not going to allow dating questions during our Q&A anymore as we find them repulsive. Anyone who actually makes it (which again is less than 2% or so based on pure mathematics), knows that there are no real issues if you make it. That said, our post on style really showed how most people never go anywhere in life. If you're rich you will have a natural "style". This means you might be more of a classic person (think Mercedes Benz) or you might be more flashy (think Porche 911). Your style is going to align with your life and we can promise you no one is picking up girls on the beach at age 55 in tank tops with $0 to their name. The point. Your dating style will line up with the person you've become which give you the exact answer as to why we don't answer these questions from people over the age of 28 or so. The prior sentence not only tells you why but also tells you *the entire story*.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality (***essentially the point of this post!***)… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by **Clicking Here.**

Life Math: Health, Finances and Psychology

Life Math: Health, Finances and Psychology

This is going to be another post where opinions will vary wildly. Some people want the Lamborghini other people would never buy a car. Some people think the grind should never end and you should be working hard until your last day on this amazing planet. Others, would prefer to let off the gas. While we're still on the side of intensity when it compares to the top 10% or so, we think there is a good middle ground between all of these items where you can still get rich without giving up your life. Since we give our formula away in the form of a book, this one is going to provide some time-lines for you to think about.

The Health Timeline: This one is a life long battle and is probably the hardest to get right. You have different genetics when compared to every single person on the planet. The good news? *You should know your strengths and weaknesses by age 18 or so.* It is not acceptable to be out of tune with your body since it is the only one you'll ever get. You should know the following: 1) the type of skin you have and the amount of sun it can sustain, 2) your body composition between endurance versus sprinting (type of muscle fiber you have), 3) hairline and hair-type, 4) heart and lung functionality, 5) stomach functions – which foods give you more energy versus less and 6) level of flexibility and coordination difference between your left and right side.

This is honestly the basics. If someone does not know this and know it early, they are going to be in for a world of hurt later in life. By knowing these key metrics it is now possible for you to maximize your peak fitness levels at each age. We know that you can generally improve through around age 30 and real declines set in at around the 35-40 range. This means you have wiggle room (you don't need to be at 100% peak fitness through every year of your 20s). But. You absolutely need to be near peak capacity at around 33-36. Why? Well we know the declines will start to show up which means you want a "soft landing". As your physical performance metrics erode you want to see a thin slope because ***compounding is worse on the way down.***

The last part is critical to understand since we ask the question a lot. Most people can't do basic math and assume if something goes up 10% then down 10% that they are at the same number. This isn't true and if you go up 10% and down 10% every day, you're actually going down in total. Compounding is incredibly painful in the negative direction so changing something from a -10% to a -4-5% is a HUGE deal. We would also say that taking the time to max out in your mid-30s will save you hundreds of thousands of dollars in health costs (injuries are very common in this area as people believe they are still in their early 20s). **In Short, you want to know your body composition by age 18, exercise quite a bit in your early 30s (everyone does the opposite) then focus on managing the declines by getting a private doctor and monitoring your blood work consistently past age 35.**

The Money Timeline: The money game gets less interesting as your ability to grow your net worth declines. While we are 100% against taking it easy in your 20s (unless your family was rich of course!). And. We're also 100% against taking it extremely seriously in your 40s (here we're talking about *hours* dedicated to getting richer). The math is quite interesting because you'll find that the capital base you have does more work for you. Meaning? At 35-40 or so your actual investments earn more than your effort/labor (unless it's an incredible year for you).

Run the numbers. If you are a successful person and get to around $2-3 million by age 35, this means an 8% increase is going to move you $160-240K. Now if you got to $2-3M by that age we'd guess you're currently earning around $300-500K per year (pre-tax), on a post tax basis that probably gets you closer to $190-300K (rough math). If you're significantly more successful and have $10M at the same age, we'd guess you're making $2M per year. Again, the same issue springs up. You're making $800K a year off of returns and post tax your income is roughly the same. Mathematically, if you get to these levels it becomes harder and harder to grow your net worth beyond 20% or so per year.

What does this all mean? ***It means that compounding works for *You* as soon as your investment income equals your active income***. At this point it is essentially impossible to have money worries. The only way this does not work is if your investment income is not diversified. We're making the assumption that you're responsible and maintain a diversified investment portfolio. The most obvious example is anyone "hurting" from crypto currencies. First of all they should be up a ton and second of all, if they feel any significant pain, they were irresponsible with their lives (it's venture capital investing which should never become a major portion of personal net worth).

We can put it all together. We suggest sacrificing ***some*** health/fitness in your 20s (insanely easy to recover) to get the money ball rolling. No. You do not work 120+ hour weeks and do real damage to your body. You work 60+ at least and then cool off before you're thirty so your body can take the harder hours without damaging your actual health. (Yes. Despite millions of examples, people still believe working long hours will make them die. This is laughable since rich people live longer and generally worked hard in their 20s). **In short, by your 30s you should have your active income roughly equal your investment income. This is a good *qualitative* metric to use without putting exact numbers on them (for exact numbers see our opinion in Triangle Investing).**

The Psychology Timeline: This is much more artsy. If you have the two items above down, it still isn't enough. Surprisingly life is more than health and money! There is happiness, mental models, personal relationships etc. We'll start with the first and move down the list.

Happiness: There is no reason to be unhappy if you live in a first world country. The chances that you were born in a first world country in the first place was slim. Quite low actually. Luck. That alone puts your standard of living above the norm and gives you more opportunity than the norm as well. Complaining about life in a first world country is like complaining about getting pocket kings in a poker game. From what we've seen, the real issue with unhappiness in first world countries is the influence of outside forces.

Outside forces are awful. As soon as someone puts their happiness in the control of anyone they are in trouble. You see it in hollywood, You see it with many successful people. They live in high pressure situations where they need to perform, other people may lose their jobs if they don't perform…. Everyone wants more out of them because they have the talent and power to change lives. There is a negative to this as you can see. It can significantly impair your personal health (psychology). Instead, we recommend stoicism in a big way. This will help you stave off all of the negativity being thrown in your direction. In basic terms you're only going to 1) worry about things you can control/change **yourself** and 2) you're only going to take on responsibility for other people when you're certain it won't become part of their livelihood.

The first one is quite easy to master and the second is more difficult. Generally, you'll be interested in getting people jobs, helping them make money etc. But. Once you're forced to fire someone or see their livelihood shaken up, you realize the level of responsibility was quite high. This is fine only if you're certain it is something you can sustain into perpetuity (forever essentially). **In short, happiness is something that is earned. We think it's possible to become an "expert" at being in a good mood all of the time by around age 30. Yes you will still have good and bad days, but we actively avoid unhappy people in their 30s since they should be well off physically, financially and emotionally mature at that point.**

Mental Model Development: While we've given one of the mental items to be aware of (only caring about things you can control), there are many more. The first one is entirely based on you. You should have your own view of the world and how you attack problems. This is going to be your "bread and butter". The only thing that makes someone successful is their ability to capitalize on unknown information or strategies.

Information has several tiers. The first is a fact/strategy that everyone knows (100% worthless and no value), the second is a fact/strategy that 10-15% of the population is aware of (20% useful, good enough for a job), facts/strategies that can only be executed by 5% of the population (high value – Careers are generally in this segment) and finally the golden ticket facts/strategies that only a handful of people know (huge value as you have access to something no one else does).

Going by brute force, if you have no useful skills to offer you'd use the following approach… You read a ton to get caught up on what everyone in the world knows as fact. You then use this to filter down to the "job level" skills. Then you throw 100s of different new twists to the same strategy to break into the top 5%. After that it's all talent. Naturally, if you're an expert in your field, you should have a *faster* ramp every single time you move into a new subject within a similar industry. **In short, after doing one hard ramp on something you have talent in, you should have a specific mental model you use to learn about a new skill. This methodology should be mastered *before* you turn 30. If you're forced to try a million things at age 30, you're going to be working overtime to catch up to the people who already have a mental model that works.**

Personal Relationships: Think long-term. If you have relationships that are over 10 years then those are of value. Anything below 10-years is essentially an acquaintance. This blog has been around for about 6-7 years and we need to stay another 3-4 years before we even consider this hobby a success. Long-term thinking is the only one that has actual value.

The second item is dating which we separate from personal relationships (lots of emotion here). This is an *easier one*, if someone has spent longer than a year or two trying to "figure out" this side of the equation… We'd jump ship. After a short period of learning, you should be able to move on for good laughing at the constant debates over things that don't really matter in the dating field. After this dynamic is figured out the only real question you'll have is "what area of town in XYZ city is good for this type of person". That's seriously it.

Interestingly, we've felt pretty lucky in this arena. Knowing a handful of friends for over 10 years and figuring out the dating dynamics in a year or two is more than enough. **In short, unlike other items we have a 2 year cut off for dating and a 10-year rule for a personal friend. If either of these are problems then there is an issue in terms of choice. And. There could be an issue with the person in the mirror if you're over 30 without a few friends you've known for a decade.**

Concluding Remarks: As usual there are always exceptions. And. We would use this as a good way to *gather* information. If you meet a guy who is rich but lacks in the social realm, only take his business thoughts seriously. If the guy is insecure buying things to impress other people, avoid his personal life advice (they are likely leeches around him for the $$). If a guy has everything you want? Better not waste any of his time or else he'll move on very quickly. That is really all there is to it. Once you're successful the other acquaintances and riff-raff fixes itself. Successful people befriend other successful people because they don't need each other.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality (***essentially the point of this post!***)… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by **Clicking Here.**

Lifestyle Book Preview: Please Add Any Additional Questions/Topics.

[Lifestyle Book Preview: Please Add Any Additional Questions/Topics.]

We've officially started the process of writing our Lifestyle/Spending book (will be released in December). One thing we learned from our last 2 products (over the past 7 years now!), is that most people won't take action. Originally, we thought we'd see numerous people come forward with how straight forward everything became but instead we calculated that only 5% of people actually follow through. With this in mind, we're going to give out every single trick we can think of in the spending/lifestyle book. Yes. This will include "performance enhancers" and how to use them properly. Since no one will listen (likely do everything incorrectly), we don't have a problem giving away our formulas.

Overview

Spending Group Snapshot: The front of the book will be the least detailed. It'll essentially explain what you should be spending on if you are making next to nothing $50,000 a year or less and scale all the way up to ~$500,000/year. If you end up making substantially more than this, you'll see that there isn't a big change (all details in the book). Some of it will feel redundant as we drive in a few key points on how to think about spending at a high level. This is done by design. People have different tastes/objectives and live in different cities. Therefore, by providing a high level overview up front people can make decisions faster. Without being forced to ask a question, they can simply refer to the main ideas at the front of the book. As a note, at the very end of the first section we'll provide the order in which people should spend (again driving home the right way to use money).

Groups Covered: The main sections are split up as follows: 1) housing, 2) food, 3) clothing, 4) investment percentages, 5) performance enhancing (after age ~27 or so) and 6) standard partying/travel. Unsurprisingly, a lot of the ideas in the book are extreme (otherwise this blog wouldn't be niche) as the goal is to get rich early enough to enjoy the money. We'll cover the rough spending split into each of the six categories based on assumed annual income. After that we'll give out more details on how each group should scale up (if you're more interested in spending on performance vs. food for example). As a note, it'll be no surprise to anyone reading this, if you're making next to nothing the "partying" category is a complete zero.

Housing: This is always a debated category. The summary section up front is going to assume you live in a high cost of living area. This is the easiest way to start since we assume readers of this blog are looking to enter high paying careers: Tech/Finance/Enterprise Sales. After this assumption we provide alternative "lifestyles" that we've seen work in various cities. Luckily we've already provided the way to invest in real estate (as a third form of income) in triangle investing so we won't have to cover that. Instead it'll give out ideas to maximize your lifestyle without levering up to the point where you're "house rich".

Food: When you're 21 everything tastes the same. Seriously. You can go to spring break and drink cheap beer/tequila without a blink. Anyone in that age bracket is going to think we're "lying" when we say it'll change. This is exactly what we thought when we were 21 as well and it turned out to be completely wrong (come to think of it maybe this is why no one ever takes action or listens). Either way. We'll scale this category up and it becomes an important item to focus on if you're serious about living a long and healthy life. The right diet will be the difference between "Oh my god you're 35 no way!" and "Oh yeah you look 35". No one wants the second reaction.

Clothing: We've already made people upset by announcing that we've flipped to purchasing luxury goods here and there. This is just how it works if you really move up the ladder. We have enough experience reading reactions to know that they work. That said, we're not foolish and would never recommend luxury goods to someone making $200,000 a year for example. It just doesn't add that much value. It may be surprising to many but clothing is probably one of the most important skills to master (not joking at all). There is a time and place to dress extremely well and there is a time and place to wear more middle of the road items. The most obvious example is an entry level interview (leave the Cartier at home) vs. when you're 35 years old going to a deca-millionaires house party (better dress to impress).

Investment Percentages: Our best guess is that this section will be the third most debated piece. The performance enhancing piece and the clothing piece will likely make people the most upset. Why? 95% of men don't know anything about either of them so they get insecure and complain about it. That said, investment percentages will actually unveil how conservative we were in the beginning. We've seen far too much. Your industry could go to zero, your business could go to zero, your health could take a massive set back etc. We lean *very conservative* your first 3-6 years. It just isn't worth the risk and from what we've seen it is the best "risk reward decision". If you do make it to $1M by thirty (which is certainly doable) then you can begin to take more risk. As a final note, we're guessing that people will also be surprised by our "bar-bell" approach to saving once you've got a million or so to your name.

Performance Enhancing: Wow. Quite a large topic. We've tried everything from grey market products to black market products. The vast majority do not work and on top of that *the vast majority take them way too early*. That last part is so important we have to say it twice: *the vast majority take them way too early diluting the value*. If people are forced to use Adderall and other performance enhancers to pass college exams… That's a bad move. At such a young age you only need coffee and maybe a couple of energy drinks for the final exam period. Being an "edgy" blog people assume we started using black market products at a young age. This couldn't be further from the truth since it actually dilutes the value. This is explained in detail in our book and is not a recommendation, but more of a "personal experience" journal. This prevents readers from claiming we're recommending them.

Standard Partying and Travel: We scale this one up pretty dramatically. It starts extremely low where we recommend simply being in shape and going to cheaper places that have a "post college vibe". Why? Well there is no point in trying to act like a big shot when the girls are just as attractive and you don't have to spend as much. It just doesn't make much sense to drop $500 at PHD or Le Bain when you're just starting out. That said, when you're 35 you do not want to spend your time in places where the floor is sticky. For those that believe the women are "older" we have nothing but laughs for them since it just isn't true. The only people who believe this are the ones who never made it.

On the traveling side we also give our view on when to spend up and when to spend down. As an upfront observation, most young people 20-25, end up going to third world countries and date women who would be out of their league in the USA. This is because they are leveraging their status abroad. This causes them to "believe" the USA is terrible and they give up everything to earn $5-7K a month overseas. Unsurprisingly, this is a life changing decision (in the wrong direction) as they can't scale anything meaningful. A smarter way to think about this is "if I make it in the USA I can be rich and date girls of the same quality anywhere I go". Unfortunately, the human brain is trained to take the path of least resistance which is to uproot everything and leave. On the positive side, this decreases competition for you and when you're worth a few million it'll be easy to party and have fun in any city in the world (except San Francisco, San Jose and Seattle since the supply of attractive people is so limited).

The Details

While it sounds like this will be a short product, we're wagering that it'll be longer than either of our prior products (likely very long). Why? We'll spell out each section in extreme detail. By way of example we're going to cover every single performance enhancing item we've tried which includes: Modifinil, LSD, Mushrooms, Coffee, Energy Drinks, Healthy Juices, Fish Oil and a lot more. As another example we'll also include detailed information on how to spend on clothing which scales up from: cheap $10 shirts to custom made suits and designer shoes. The more we think about this the more we realize how much information will be in here since most people get "capped" at around $150-200K a year or so (peak earnings for most).

Since we can't give away everything here we'll highlight a lot of the main questions covered: 1) when to begin buying custom suits vs. made to measure, 2) what occasions are best for maximizing your high end clothing and when to "play dumb" and dress down, 3) the optimal time frame to dabble in performance enhancing items – based on our experience not a recommendation, 4) how much you should be throwing into an investment account per year as a percentage of income, 5) calculating the amount of "downside" you have, ie. If you actually have enough resources to step up spending, 6) how to tell what type of person you're talking to without asking how much they make, 7) when to use hotels vs. AirBnB set ups, 8) what type of things you should think about when scaling your housing – which is also a form of "displayed wealth" that doesn't lose significant value, 9) how to leverage your income in a way that leads to results vs. typical boring rich people who complain that it "doesn't work" and 10) why you don't "act as if" when it comes to money – hint your personality won't match it.

That's the high level overview for now. Importantly, please leave any questions/topics in the comments. We plan on making this quite a large project as it'll be differentiated from a lot of the information we've provided in the past. *As a final note, this will likely be the one major project for the year as we go back to hibernation for another 2 years due to time constraints.* Enjoy the holiday!

****

List of Items to Be Aware of For Your 30s

List of Items to Be Aware of For Your 30s

Haven't done a list post in ages. Also took a hiatus the last two weeks to organize for next steps. Luckily, we're back at it so it's business as usual going forward. That said. We noticed we've moved on from the prior "audience" so this is going to be focused a bit more on the new audience going forward. Just under a decade ago it seemed this website resonated with people in the mid-20s and we've now moved into around late 20s/early 30s in terms of engagement. This is naturally where the separation between the winners vs. losers in life *typically* occurs and we'll highlight the signs below.

#1 Low Stress: People who haven't made it will claim that rich people are "stressed" all the time. No they are not. There are two reasons for this: 1) making $200-250K a year in a corporate job with a family is not stress free, it is extremely stressful and 2) people claim they know "rich" people when the people they are speaking of have never talked to them and are unlikely rich. This is as clean cut as it gets. If someone is in a low 6-figure position they are not rich, they are just "earning more money"… That goes into more bills as lifestyle inflation kicks in for the vast majority. Also. Rich needs to have a definition to it and we use $3-7M in your "thirties" as a good proxy for this.

If someone reaches this quick financial definition of rich and they are still stressed out? Well they are simply *choosing* to be stressed out. Outside of a health issue, having $150-350K coming in without lifting a finger (5% annual return), is more than enough to live a stress free life since you can always work part time to add some additional income. Factually, to get to $3-7M you were likely earning mid-6 figures at minimum so working 20-30 hours a week is not a big deal.

#2 Care Free Attitude: This is a different type of care free from the usual "free spirited" attitude that hippies have in college. When we're referring to care free it is in respect to social issues. If a friend makes more money than you do because he sold something or got a new product up and running, you should be thrilled jumping for joy and offering to buy him dinner/drinks. This compares to your typical average bloke who will complain and say *"he should be more humble"*. Or worse. Complain and make passive aggressive remarks suggesting he didn't deserve it in some way.

Care free also relates to personal life as well. If someone decides to live life as a lothario or with a large family, it shouldn't be of importance to you. At the end of the day, as long as they are set financially, what they do with their own life shouldn't bother you at all. Sure you might not hang out with them as much based on different lifestyles. But. The lifestyle choice shouldn't bother you in any way. Long gone are the days of making sure everyone around you is going down the right path. Once you've made it the decision tree is less relevant as the direction is already correct.

#3 Low Body Fat: We were going to put in "muscular and low-body fat" but the problem is a lot of people who make it go into different types of sports. Skiing is popular. Snowboarding is popular. Surfing is popular. So on and so forth. So we'll go with low body fat percentage. As long as you aren't running marathons with next to no muscle, you're probably good enough with the "low body fat rule". This is a good status symbol particularly once you're over the age of 35 or so. At that point practically no one is in shape.

As a note a good way to have low body fat and maintain solid cardio fitness is through swimming. Swimming is probably one of the best options as it is easy on the joints as well. Two other alternatives are mountain biking and tennis. Anything that requires high amounts of energy expenditure with lower impact (no jumping).

#4 Rich People Problems: Naturally, your friends/close contacts will evolve into having the same "rich people problems". They include: 1) going out and drinking too much wine at dinner every day, 2) too much travel, 3) dealing with real estate issues for rentals, 4) taxes and 5) some sort of time consuming activity they are trying to outsource. Generally, you can figure out what type of person someone is by their closest contacts as well. Essentially, if their friends have "rich people problems" then you're likely talking to a rich person.

Another fun one. Anyone who makes it will have an immediate disdain for customer service. This is probably the worst business in the world and we have no idea how people run hotels. Imagine running a full service product entirely around human interactions based on complaints. These days walking into a hotel to check in makes you think "this poor person has been yelled at 15 times at minimum today".

#5 People Get "Stuck": There seems to be a hurdle around age 30 where most people stop improving. This is due to changing responsibilities stacked upon one another. Not a pretty picture. The easy tell is when they are still talking about the same topics at age 30 as they were when they were in their mid-20s. There is no change across the board. Still talking about making "an extra $15-20K"… Still talking about the "best place to go out"… Still talking about travelling the world. Just stuck in the same circular reference they were in five-seven years ago.

Naturally, the people who are stuck in this range end up becoming bitter. They lash out and claim that everyone else is a liar since their lives are going down the drain. They eventually fade off the radar. The rare ones that make it realize they are in a downward spiral and double or triple down on working out of the ditch while abandoning their current set of friends and lifestyle.

#6 Physical Attention: The smart ones realize their bodies need a lot more attention. If you've been taking care of your body for the last 30+ years you'll notice the physical slowdown at around 30-35 or so. Please don't message about "drug use" to offset this. If it were possible to beat father time, professional athletes would be playing well past their 40s. This doesn't happen. Athletes are forced to retire.

Physical attention changes commonly include: 1) skin care, 2) massage therapy, 3) laser treatments, 4) creams/serums, 5) botox injections etc. There are many ways to fight the clock and most will be using at least two of the mentioned items here. This doesn't even include the more extreme hormone replacement therapy that is becoming increasingly popular.

#7 Avoid Unhappy People: This is the only "superstitious" item we're involved in. If anyone is throwing negativity your way or appears to be negative (life going in the wrong direction). Run away. Don't try to throw a life saver out there, simply jump out of the way and move on. There is something strange about momentum in the sense that negative energy can certainly cancel your positive energy.

The only difference here (when a life saver is worth it), is if someone is moving in the *right* direction but just can't get over some hurdle you can help with. This might be worth your time. So go ahead and help in these situations as the person is in purgatory. If it goes negative in a big way or positive in a big way you'll know within a few short months anyway. Newton's first law of motion applies to life: "A body at rest will remain at rest, and **a body in motion will remain in motion unless it is acted upon by an external force**." Do not use your energy and time to change the motion, simply help the motion that is already going in the right direction.

#8 Net Worth Loses Its Meaning: At a certain cash flow threshold, net worth becomes a game of "greed and prestige" and less about your day to day life. This is why being stressed out and unhappy is a choice if you're able to get rich. Sounds crazy but it really does happen. You end up being more focused on your cash flows as the "digits" on the screen are not usable unless you sell. You'll also have several investments that are not immediately liquid (like private company investments) so you're going to focus more on your cash flow. If we could do it all over again, we would have focused entirely on cash flow generating investments until a number was hit then worked on private investments after that. Live and learn.

#9 Smiling and Nodding Increases: If you already know this trick, it's going to become more and more common as you get older. Arguing with people is just not worth your time. Simply smile, nod agree and delete. This is something that will happen more and more. In fact, we'd say it increases at an exponential rate. After you're 30 or so the amount of useful "information" decreases substantially. People are set in their ways so you're better off finding interesting people that don't reiterate the same talking points you already know (or worse… information you're sure is false).

#10 Emotional Stability: Not sure how else to describe this. By this point you should have already seen a wide range of emotions from immense failure to immense success. Since you've already gone through the wild swings nothing really changes your mood. People can be rude or nice to you and neither of them really change your day. At the end of every night you wake up knowing that everyone else has to go to work for a living and suffer in a position they don't want to be in. This alone makes it difficult to ever be upset when people are mean to you specifically. The war is *already over* (you're on the right side) so no reason to give these people the joy of seeing your emotions change. Simply laugh at the pettiness and leave.

#11 Dating Gossip: This is probably specific to this side of the web. We just don't have any interest. If some guy or girl is struggling in the dating category we think it's laughably sad (like a 10 year old trying to arm wrestle a professional football player). Something happens here. There is an *enormous* chasm between the rich people with solid social skills and the ones that legitimately struggle with women despite being wealthy. It has reached a point where we really can't offer solutions. If a guy/girl was able to become a multi-millionaire but still struggles with the opposite sex… we have to bow out. They became successful the hard way (trial, error and effort) but think there is some special formula for dating/social skills. There isn't and there never will be. Lift heavy things, dress extremely sharp, go out frequently and talk to everyone in a fun and exciting manner.

For those that haven't noticed, we actively delete all dating related questions now. We find them repulsive and sad at this point. In a rare twist of fate we have the same reaction that women do to guys who struggle with this stuff! Funny how that one turned out. Women's intuition was correct, if the guy is desperate enough to ask the same questions all the time he's just not a good person to date anyway. Yes we know, you have to learn and ask at some point (everyone is a beginner). But. At 30+? No thanks.

#12 Interest in Food and Drinks: As you get older your taste buds will evolve. You're not going to look at menu prices for dinner since the $5-10 difference is not important. What will happen is a change in your quality of food. Going to lower quality places is just not going to be worth it. Better to go to a nice place or eat at home. The middle of the range places are just a waste of money and time. They are a waste of time as they unlikely open doors (wrong clientele) and it's a waste of money as high quality food at home is certainly better. To wrap up the topic, when you do go out to drink you're not going to order "well" drinks. It's going to be a specific brand you like that is going to cost a few bucks more. Also, more champagne vs. wine.

#13 Outsourcing Everything: As noted in the prior points a key move is outsourcing. Moving from doing things yourself to increase returns to becoming more hands off to increase free time. This is a natural transition as no one wants to spend more of their time dealing with "back office" type responsibilities. Anything that can be outsourced will be outsourced as long as it is cash flow positive. For the nit-pickers, no this does not mean you make your returns go to single digits, it means you take a ball park estimate of the cost to outsource and divide this by the amount of time you waste on the activity.

#14 Focus on Sleep: While we've mentioned the physical strength/speed decreases in your 30s, the sleep impact is significant. When you're in your 20s you can take multiple red eye flights in a year and come out unscathed. Try to take poorly timed flights in your 30s and they can ruin your entire day or more. Not a pretty look. Getting into a rhythm becomes more important as it has a meaningful impact on your productivity. We're not obsessed with the exact time you wake up or sleep, just make sure it is consistent.

#15 Significant Change in Travel: Ideally you'll have a lot more flexibility with your schedule. If you're still forced to travel a bunch one thing you'll have is a "list" of cities where you'll purposely adjust your schedule to spend more or less time in. You won't be spending your time "asking around" for the best places to go. You'll have the "go to spot" list and you'll have the "get out of here as fast as possible" list. Not much beyond these two since your "exploration" years will be largely complete by this time. In the rare case that you're going to a brand new city that might be fun, go ahead and assume it'll be a "go to spot" so it gets the attention it deserves.

#16 The Peak? Unsure if this is the case but there are a lot of benefits to being in your 30s. Ideally you're rich, in shape and have the time to enjoy both of those two items. The guys in their mid-40s who made the right decisions also say that this can continue for quite a long time. Not sure if this is true and will have an answer on the topic at age 49 (if this blog exists – unlikely). What we can say with certainty is that your 30s are 100x better than your 20s assuming you made the right decisions. And. Your 20s were 100x better than college so you get the idea already. Exponential "parabolic" growth.

#17 Edge of Technology: One significant thing to be careful of… do not fall behind the times in terms of technology. This is going to be a large wealth accelerator for you. In this age bracket you'll now have enough "funny money" to throw sizable amounts into higher risk higher return investments. Most people in this bracket end up ignoring new tech and stick with boring stable investments. We're doing the opposite. Once your cash flows are well above your standard of living we'd go ahead and swing on the high tech items. Also. It makes you more competitive long-term with your current business/profession.

#18 Avoid Politics: They are not worth the hassle. Unless you're going to directly make money off of it, there is no reason to get involved. Seriously. The only good thing about politics is that it can be leveraged to make friends. If someone leans left, lean your social views slightly left without saying your position. If someone leans right, lean other views right without revealing your position. People are incredibly emotional when it comes to politics. We know what that means. It is a colossal waste of time. Just like television.

#19 Increase in "Standard" Entertainment: Since your time frees up a bit, you'll likely pick up a small entertainment habit. It could be as simple as a Netflix show or operas. Who knows. Ours has been sporting events for the fun of it (Games, fights etc.). This actually helps interactions on a day to day basis as you have a pulse on something that is more commonly talked about.

#20 Table Setting to Get to the Next Level: This last one is really for the people who have made it already and is a bit of an inside joke. If you make it and you're going to go out and meet people "above your wealth range" the immediate thought in your head is "how to i bring something to *this table".* Since they are richer than you anything that can be bought with money at any public venue carry no value (champagne, bottles etc.). You're really left with the two age old bartering tools: ___ or ___. If you know you know.

(No longer approving answers to the blanks you either know or don't, some of the answers were so off it was painfully hilarious though!)

****

Locking Down Places With No Girls

An interesting topic and is necessary for anyone looking to improve their lives. A commenter read our post on the importance of becoming known at your favorite spot within a short cab ride of your place. So how does one become known quickly without the hassle of having a harem already? Please read below for the walk through for beginners.

1) Find a Food and Dance Joint. The ideal place is a food venue/dance club. This means they serve food, however at night it turns into a night club. The reason why is you can practice getting to know the people before the club gets rocking and you can also leverage your new notoriety when you eat at the same venue as well.

2) Dress Sharp. If you are not a multi-millionaire you don't need to wear a $5,000 suit, simply dress slightly above the clientele at the venue. If everyone is wearing jeans and polo shirts, you're better off with a button down and fitted slacks. If it's a grimey hipster spot, a clean v-neck and fitting jeans will be just fine.

3) Enter With Positivity. Walk in the door and smile, immediately find a bar seat that also will serve appetizers from as low as fries at a low-end spot to as high as oyster shots at a high end spot. As soon as you walk in solo if you are well dressed the initial interaction will be curiosity instead of pity.

4) Find Men and Tip Before Service. You read that correctly. Go online and see the prices of the food if you know you'll be spending $50 on the food, take out $30 and throw it on the table. ***You **trust** their service so you are tipping them upon hello.*** This leads to a natural conversation later. Men will be shocked at your generosity, usually only attractive girls receive such attention. But you don't think like everyone else.

5) Name, Where, When and How? This is the structure to your bar conversation. You start with their name and quickly ask where they are from. **listen carefully** attempt to make a positive connection with their hometown. If you have not been there attempt to make some sort of positive connection anyway. If you've never left your three block radius of your home… You got work to do.

6) Relax. Sometimes, when we are out of our comfort zone, we can easily revert to being an introvert (aka a loser). Remember, *immediately* become lose and funny (and/or charming) in your new environment as if you were surrounded by your closest friends. People in the "night industry" most often forget names – and understandably so, so building rapport quickly is important. Remember, it is important to have a vertical approach, from door man to hostess to bartenders.

7) Remember Their Names Too. Yes we generally all suck at this and it needs to be repeated. Immediately (within 5 sec) after meeting people in the industry, we jot down their names in Evernote, or notepad. How does this come in handy? As the night progresses, and you meet prospects, offer to buy them a drink. If they accept, go to your new bartender person, quickly introduce her to the bartender "hey Mike (bartender), this is Lisa (whatever)", as if you actually know the bartender well. Now you're laying the foundation to establish relationships (vertical approach), a routine (random girls) and **status**.

Even if they left and dislike it, attempt to make one positive association. When was he born? If his birthday is coming up you're in luck. Take out that fancy iPhone, add his name and calendar alert for birthday. Everyone no matter how "cool" they are enjoy being wished a happy birthday.

That about does it guys. As you all know, when we get to 500 Twitter followers we will be doing five **Free** resume reviews once the threshold is broken.

Slay on Slayers.

Looking at the Bright Side of the Lock-Down

Looking at the Bright Side of the Lock-Down

Now that we're getting ready to re-open the economy it's time to look at the bright side. Even if your company has decided that it will reduce pay and allow workers to choose their location… that means you have no excuse for a second form of income. In addition, you have a chance to choose the people you surround yourself with (no excuses if you decide to move to Antarctica and live in an igloo). The main benefit is undoubtedly the ability to work on your second income stream with zero and we mean ZERO excuses. So we'll start there.

Second Form of Income: Once the lock-down started, anyone with an online presence saw massive numbers. Every day felt like Black Friday/Cyber Monday and you were able to generate a half of year of income in a single month (or less). This then declined (as expected) but remains above normal levels in 2019.

With the preamble out of the way, this means the "total market opportunity" is now larger. It doesn't matter if the economy opens up tomorrow, a chunk of spending has moved online for good. Some individuals and companies will decide to work remote permanently. This means more people will browse products online and more people will shift spending from retail to online. We doubt there is much argument against this, outside of the initial spending ramp when people go and party to celebrate the end of the lockdown.

Take a big picture view of this. If you know one market is going to be bigger due to a work from home environments… which one should you enter? The one that's growing or the shrinking one (Online Retail is around $600B and Total Retail is around $7,750B)? Isn't really a competition. Follow the money. Not only do you have zero commuting time (1-2 hours for many people, 5 days a week) but you also have significantly less oversight. Hard to micromanage someone from a different office/home. In fact, we wouldn't be surprised to see people reporting to individuals located in entirely different cities long-term. Oh and as an added bonus, you have access to all of your personal devices which removes all possible complaints/excuses forever.

If you are making money online and your investments are also liquid… You're in an incredibly advantageous position. States will compete for the best companies and workers which means you can pack up and leave without a single tax form to worry about. This is directed at the older readers. If you were illiquid before, you probably want to be more liquid for the next 5-10 years.

As a final message, if you're serious about getting rich you should always choose to work from home at slightly reduced pay. Why? This gives you more than enough time to work on your side projects. While you will likely lose some career progression (office politics), the upside of equity in your own business is 1,000x more valuable. It isn't even close.

Significantly Expanded Options: Before, we recommended fixing watches, iPhones etc and using this to fund your internet venture. Congratulations. You can now do all three without skipping a beat if you work from home. This is beyond easy at this point. During those pointless corporate conference calls you can fix a phone or watch and make sure that you listen for key words during the "catch up". This is an incredible opportunity as you no longer have to juggle everything behind the scenes. Before, you had to bring a personal laptop with a hotspot and use it during dead times. You had to hit the classic "windows + D" button rapidly to hide your screen and you needed to hit "Alt + Tab" to rapidly change to fake business PDFs that you were "reading" while on the clock.

All of that is now out the window. You can easily work a regular white collar job, work a time for money exchange while on the clock and on top of that… You can fund your online venture. We know that some people are working like dogs as their managers ask them to do hundreds of tasks while they try to keep their jobs… but… this is going to normalize at some point. When it does, you should be ready to go with either a e-commerce/internet business ready to ramp or a time for money exchange if your cash flows are too low.

Reduce Recurring Expenses: This is another major benefit. While you may balk at the initial pay reduction your employer offers, you should do the math on a post tax basis. Look at the following: 1) commuting, 2) gym memberships, 3) dining out expenses, 4) annual tax payments and 5) dry cleaning/other daily work expenditures. While these may seem like small amounts of money, they will *more* than make up for the reduction that the Company offers. It's pretty difficult to offer a massive reduction in pay if you are trying to encourage people to work from home (the employees should be smart enough to realize the firm profits by reducing operating expenses).

Expenses are also reduced through a higher variable cost structure. If you're fresh out of college and you work 60+ hours a week, it is difficult to keep the budget in-tact and maintain a normal/fun social life. At this juncture, even if you're down 15% or so, you can take your food costs down and maintain (or increase!) variable entertainment expenses.

Increased Health and Autonomy: Once the economy opens back up, many will find that they didn't "hate" their jobs or careers. They hated the constant micro-managing, the politics and the inflexible work schedule. This will change and we wouldn't be surprised to see a happier work force. The one downside is that the average person will become lazier and more obese/out of shape.

Huh? Didn't we just say increased health? Well we put them together because we're referring to the readers of this blog. If you've found this blog and were able to take action as it relates to improving your life, the chances of you being out of shape is actually lower. Yes you, person reading this blog. In a scenario where you are now working from home, the number of excuses you can make for staying out of shape goes to zero. So if you were in mediocre shape before, you're going to be in great shape now. Cardio is now changed to calm walks in the park while on a work phone call. This improves your health as you focus on your basic at home gym set up as well. Can't get much better than that. You've cut commuting costs to zero while simultaneously replacing that time with healthy living.

Improved Social Life: While the current environment is difficult, we predict healthier social lives after the lock-down. This is because you're going to have more control over who you hang out with and why. Before, many workers complained that they "had" to go to these after work events or happy hours etc. Now? Not so much. Difficult to have chatty drinking hours when you're at home. Zoom/web based meet ups will certainly exist, however, they are likely going to be shorter as each individual has to talk until there is an awkward pause.

Now many of you may be thinking "how do i meet new people". Well in that case the news is even better. Since you won't be forced to go to events anymore, it means that you will choose your social destinations every single time. In addition, if you're doing networking right (which means become valuable and avoid all networking events), you won't need to go to many conferences in person as many will move to a virtual format. This is simply incredible.

You can build your own platform at home, go to the local bar/club that attracts "your type of people" and reduce travel expenses until it is absolutely necessary. If you took advice from this blog and have any sort of affiliate income (at minimum) you're going to make more money, save/invest more of it and see an increase in your quality of life over the next 5-10 years. As usual, when we look at the standard of living over 5-10 year frames, it goes up. This time? You're going to get that increase in a single year or two. A "Step Function" in lifestyle improvement.

Shift to Clear "KPIs": A KPI is a "key performance indicator" which is a fancy phrase for "how do we prove this person is generating value". Since we can track performance by sales/results in a more digital world, this means you get to show off all of your skills. Instead of having dead-weight in an organization, the firms have realized that a large chunk of their workers were quite literally doing nothing. This is a great opportunity for you to show your worth and prove that you're generating profits for the firm through clear signs of production.

For those that already have an online business, this is similar to online advertising. As you know, online ads are hundreds of thousands of times better than any other form of advertising. Not because of its effectiveness but because of its transparency. Instead of wondering if a campaign had impact you have proof. Click, convert. If it does not convert and the cost of the click outweighs the sales… It's time to fix it or move to a new idea. This doesn't work when you're advertising on TV or with billboards. There is no accountability in those situations.

Increased Privacy: For the younger readers this is less important. Younger people are more interested in hooking up, going hard and attracting as much attention as possible. As you get older and wiser, this changes and you prefer privacy. Or at minimum, the choice of privacy (even extroverted wealthy people own a Cabin for ski trips or a vacation apartment on an island).

Upward Mobility: While most will focus on the near-term headaches (pay cuts for moving to lower cost areas), we have to take a 5-10 year view. Keeping it simple, if rent in the major city was $3,000 a month and outside of the city it was $1,500-2,000 a month… Eventually this spread will tighten up. Major cities will likely claim rents that are still higher, say 25-40%, however, it won't be the 50-100% difference that we see today.

What is the conclusion here? As cost of living across the USA balances out, it means that the perception of working from home will also decline. So while we agree that the first 3-5 years will negatively impact people, the years after that will cause companies to adapt once again. Difficult to claim "cost of living" reduction in pay, when the cost of living becomes more balanced across state lines.

Concluding Remarks: Are you excited? You should be. 1) better quality of life, 2) more autonomy, 3) more performance based work, 4) easier to control your schedule, 5) ability to cross state lines, 6) ability to maintain better tax structures and 7) significant long-term reduction in office politics if you're in that position at this time. If we wanted to be ultra competitive about it, we'd highlight loss of competition as a lot of people have to start over but that's over the top (it is a true statement, many smart people got wiped out). If you thought it was easy to get ahead in 2010 to 2020… Wait till you see 2020-2030.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life. **We hold Q&As 1x a month for purchasers only.**

Ludvig Sunström and Mikael Syding Present: Breaking out of Homeostasis.

Ludvig Sunström and Mikael Syding Present: Breaking out of Homeostasis.

This is a guest post from Ludvig Sunström. Ludvig is the author of *Breaking out of Homeostasis*. Together with former hedge fund manager Mikael Syding, he hosts the popular Swedish business podcast "25 Minuter," which has been ranked #1 on iTunes several times. His content has been read and listened to by millions of people. You can read his blog is at: www.startgainingmomentum.com

* * *

You should live your life like it starts at age 30.

Why age 30? Because before age 30 is when your brain is at its most malleable and your body at its peak, in terms of energy levels and adapting to change.

This has to do with a bunch of physiological factors. Three big ones are that: (1) homeostasis grows in strength with age, weakening your body's tolerance to stress, (2) dopamine levels go down in the brain, making it harder to do creative work for long bursts of time, and (3) testosterone levels decline, lowering ambition and energy levels.

To make up for this natural decline, you want to maximize for the health of your brain and body after age 30.

This article is divided in two parts. The first part lays out helpful guidelines for how to live your life and manage your career up until age 30, while making use of the advantages of a youthful brain. The second part is about how to engineer your lifestyle for high mental engagement after age 30.

Part 1: Before Age 30 You Want to Maximize Your Chances of Becoming a Pioneer and Financially Independent

"A man's character is formed before he is 30."

–**Napoleon**

The older you get, the harder it becomes to change.

Carve Out Your Character: Be Who You Want to Be By 30, or Else. . .

Napoleon said it. Lee Kuan Yew agreed. Neuroscience and biology indicate it, and I believe it.

The brain—including one's personality, habits, and worldview—is most malleable before the age of somewhere around 25-35. So let's call it age 30.

The philosopher William James (who lived between 1842 and 1910) wrote much about the phenomenon that we now know to be ***homeostasis***. At that time, science had little information about the brain, the endocrine system, and the formation of habits. Still, James wrote:

"The great thing, then, in all education, is to make our nervous system our ally instead of our enemy. It is to fund and capitalize our acquisitions, and live at ease upon the interest of the fund. For this we must make automatic and habitual, as early as possible, as many useful actions as we can, and guard against the growing into ways that are likely to be disadvantageous to us, as we should guard against the plague."

The big idea is to push yourself a little harder than what feels comfortable while you're young and extra malleable. Then, when you're older, it will become easier for you to go that extra mile and stay resilient to stress.

Broadly speaking, you want to: 1) Use your brain as much as you can, 2) Delve into new areas of knowledge, and 3) Deliberately incur stress on yourself and raise your pain-tolerance,

Sounds easy, except most people don't do it because it goes against ***homeostasis*** (which wants you to stay in your comfort zone and perpetuate the body's current feedback loops).

Craft Your Career**: How to Maximize Your Youthful Brain and Become a Pioneer**

Historically, most new inventions or innovations have been made by young people, typically no older than 30 years old.

The science philosopher Thomas Kuhn said, "Almost always the men who achieve fundamental inventions of a new paradigm have been either very young or very new to the field whose paradigm they change."

This is because young people are less cognitively blocked by outdated information from previous paradigms, and they have a higher degree of raw creativity. For example, consider these incredible achievements by young pioneers:

As an interesting side note: We just interviewed Nicholas Sundén-Cullberg, the co-founder of Lendify (one of the fastest growing fintech companies in Sweden), for our podcast. Nicholas was 30 when he quit Morgan-Stanley and started Lendify. The goal is to create a new segment for the Swedish financial market through peer-to-peer lending and it’s going well for them so far.

Anyway: This doesn’t mean you’re screwed if you haven’t created your magnum opus by age 30, but you need to understand that *innovation* becomes more likely than invention as you grow older.

Most “Post-30 Successes” Happen in Complex Fields

There’s a strong historic trend that people who succeed big (and become very rich or make a ground-breaking discovery) after the age of 30, typically do so in a *complex* field.

In slower-moving (established) fields such as business, politics, or older branches of science, you usually need to learn a lot more before you can contribute something new.

Will this trend go on? Yes. And it will only grow in power, because the bar continues to be pushed up higher in almost all existing areas of life.

Ever since the time of Isaac Newton (mid-17th century) the combined knowledge of science has roughly DOUBLED for every year. This means that every generation of scientists has had to solve more difficult problems than the last one.

In Newton’s time there was just *one* branch of science: Natural Philosophy. In 1995 there existed roughly 10,000 fields of specialty. No one knows the exact number today, but it’s a *LOT* more. If you’re a devious scientist, you can just make up your own title.

In 1905, Nobel-winning physicists (on average) made their breakthrough discoveries at the age of 37. In 1985, the corresponding age was 50. In chemistry, the age increased from 36 to 47 during the same period, and for medical scientists the age rose from 38 to 46.

This leads us to two implications: 1) It’s taking longer to become an innovator in the established fields of science because the basics—that you have to know just to keep up with others—are expanding and 2) By simple reasoning of supply and demand, we can see that for as long as the trend of over-specialization and increased complexity continues, there will be a premium on synthesis and the creative combining of existing ideas. That is: *innovation* over invention.

Pop culture scientists don't invent anything new, they just popularize existing knowledge. I bet you 9 out of 10 people know who Neil Tyson Degrasse or Michio Kaku is, but don't know who John von Neumann is. I'm sure you can think of many similar examples from areas you are familiar with… Now consider "Cognitive Behavioral Therapy" or "Cross-fit". Nothing new there for anyone who knows even the basics about psychology and fitness. Yet, both are remarkably successful franchise concepts.

Career Conclusions: Enter a New Area or Go With the 2X Rule

You should put yourself in a position where you have incentive to learn as much as possible. For example, by becoming a free agent, an entrepreneur, or by working for a small company where people let you execute on your ideas freely and you're given a lot of responsibility.

If your interests are not related to business you should get involved in some (scientific) field where you have the opportunity to pursue your curiosity unhinged by bureaucracy, ideology, obsolete tradition, regulations, and other things that put your brain on a leash.

However—statistically speaking—the chances of you entering a new industry are low, because the school system is set up in such a way as to train you for the old established industries, where it's harder to make an impact. School does not help you become an inventor or an innovator. Or an entrepreneur for that matter.

Assuming you're under 30 and entering an established industry, *you should follow the **2X Rule.*** This means your wage would have to be up to TWICE as high in order to justify working in an old industry or for a large hierarchical organization.

Let's assume you don't care about becoming a pioneer, an inventor, or an innovator; all you want is to make a lot of money and live the good life. Well, you should *still* go with the ***2x Rule.***

Why? Because most of the money being made right now (and in the foreseeable future) is in fields with new and fast-growing niches. These have a common denominator: most are in the intersection of science, finance, marketing, and online. To stereotype, let's call it "Online X".

The thing about "Online X" is that it's a complex field; you need to understand how multiple pieces of the puzzle come together. This means you need either a strong talent for synthesis or (most likely) a couple of years' experience before you stand a chance of making the big money.

So, the conclusion is pretty much the same: Try to get a head start and be willing to pay a premium for a steeper learning curve.

Now, let's look at what NOT to do.

Top 3 Career Mistakes to Avoid

Do not: 1) Have a career in a field you're not interested in, along substandard coworkers. 2) Go into an established industry or a bureaucratic research institution. 3)Take a monotonous entry-level job with low incentives for initiative (in exchange for a slightly higher starting salary). This is like shooting Future-You in the foot.

If you can just stay away from these herd behavior choices, you'll do more than fine.

However, if you feel like maximizing. . .

High Probability Area of Success #1: Sales/Autonomy

Work in a small organization where you are given relatively free reins, so long as you provide results.

High Probability Area of Success #2: Top-Tier Firm

Work in an esteemed corporation/organization where you can learn from some of the best in the industry and gain valuable insights not easily available elsewhere (this is what Nicholas did).

High Probability Area of Success #3: Pioneer Path

Enter a new industry or field of research.

High Probability Area of Success #4: Free Agent/Entrepreneur

Become self-employed as soon as possible *if* you can combine it with maximizing your learning.

* * *

Assuming you've taken one of these paths, and you've been able to put yourself in a position of power and upward acceleration by the time you're around 30, what's next?

Part 2: After Age 30 You Want to Maximize for the Health of Your Brain & Body

"When I'm bored, my sense of values goes to sleep. But it's not dead, only asleep. A crisis can wake it up and make the world seem infinitely important and interesting. But what I need to learn is the trick of shaking them awake myself."

—Colin Wilson

The Four Pillars of Wakefulness

When you meet older people—over the age of 50—the first thing you notice is their level of energetic vitality; are they wakefully alive and mentally engaged, or are they subdued and passive? The biological tendency is toward the latter, and the extent to which a person is able to prevent this decay has to do with consistent upkeep of *the four pillars of wakefulness*.

The four pillars are *novelty, variation, randomness*, and *goal-orientation*. They are the main controllable forces which stimulate dopamine-release and keep your prefrontal cortex activated. They allow you to sustain a state of wakeful concentration throughout the day.

Here's how I define each pillar:

- **Novelty**: Being exposed to new stimuli (people, environments, foods) or learning new things.
- **Variation**: Varying, changing, mixing, or shocking your routine behavior in some way.
- **Randomness:** Everything that manages to break the expectations of the neocortex's predictive ability. Like humor or the unlikely outcome in a presidential election.
- **Goal-orientation:** Adjusting your behavior and delaying gratification in pursuit of a chosen outcome that is experienced as rewarding or meaningful.

[Your wakefulness and mental engagement can be likened to a temple held up by four pillars. If you do not tend to the upkeep of the pillars consistently, they will weaken and the temple will fall apart.]

Let’s look at how these four pillars act as strong motivators for different situations in ordinary life.

1. Novelty: Why Kids Are the Pickiest of All Consumers

Guess which is the most fast-changing industry when it comes to product innovation? It’s not computers and microprocessors. It’s the *toy* business!

Children get bored quickly. They are picky consumers who don’t put up with the same toys for long. For toy manufacturers to adjust to this, and keep up the production cycle, toys generally come without a return policy.

The reason children want new toys all the time is because their PFC is only in a rudimentary stage of development, with novelty being the main stimulatory force. When they get older, other functions—like decision-making and concentration—improve, and they become less reliant on *just* novelty.

2. Variation: How Christopher Nolan Got Famous Actors to Star in His Movies When he Was Still a Nobody

Christopher Nolan is a successful director who knows a lot about making popular movies. For instance: He knows that movies are an economic gamble and that getting a famous cast is the #1 factor in determining box office figures. So he makes sure to get A-list actors to star in his movies: Al Pacino in *Insomnia*, Leonardo DiCaprio in *Inception*, Christian Bale in *Batman*. The list goes on.

The question is: How did Nolan attract actors of that caliber when he wasn’t famous? He did it by targeting soon-to-be stereotyped actors and offering them a welcome variation in their work. (And probably also without them having to compromise their position by stepping down in pay-grade.)

Those actors were BORED, but they rationalized their boredom as a necessary evil in order to maintain their esteemed careers. When they laid eyes on Nolan’s script, they thought, “Oh, this is a chance for me to remain as a lead, but try out something new and exciting, and keep from being typecasted!”

3. Randomness: Why We Don’t Want to Know What’s Going to Happen

While we’re on the subject of movies, I should tell you that there’s a western film from the 90s called *The Quick and the Dead.* It features Russell Crowe, Sharon Stone, Gene Hackman, and a young Leonardo DiCaprio in the lead parts.

The movie has a simple plot: You have a bunch of shady characters who’ve traveled to a western saloon town to take part in a dueling competition. Whoever draws their gun the fastest and shoots the other duelist wins the bout. Hence, the name of the movie.

What makes this movie stand out is its characteristic “bell-scenes”, which take place before each duel. And there are many duels, probably around 20. Now, it’s not that the bell is interesting in itself, but that its ringing sound becomes associated with the anticipation of not knowing what will happen next. *Every time the bell rings you wonder who’s going to die*.

This type of randomness can be addictive. This is why Homeostasis Dwellers (who lack self-control) are drawn to slot machines, video games, gambling sites, online news feeds, and secret new methods of speculating in the financial markets.

It’s also why people like to watch sports—especially fast-paced sports like basketball, fighting, and race sports—where it’s hard to predict what’s going to happen next. The revenues of Formula One went down like crazy during the period of 2002-2003 because the viewers (correctly) expected Michael Schumacher to win every time, and stopped watching.

4. Goal-Orientation: Why the Spartans Were Happier Than Many People Today Are

In many religions, there is a strong tradition of asceticism. Non-thinking followers are led to believe that abstaining from their desires will lead to them becoming more “holy”, which in turn will lead to something good. But they’re mistaking the cause for the effect.

It’s not that abstention and asceticism by default lead to a happy and meaningful life; it’s that having strong goals and convictions ***allow for*** these things to become meaningful. This is because delayed gratification in pursuit of a goal stimulates dopamine to the prefrontal cortex.

So when people today look at the Spartans and think, “oh, poor things, to be forced to live like that!” they’ve got it all wrong; the Spartans had a strong culture, a simple hierarchy, and clear convictions. The more likely scenario is that they derived a great sense of meaning and purpose from their ascetic practices.

Also: When we think about the Egyptians—and what an achievement the Pyramids are—we should think one step further, and ask ourselves how they were able to construct a society where the belief in an afterlife was perceived as so meaningful that they willingly suffered the opportunity cost of having tens of thousands of slaves working on something non-productive for hundreds of years.

What The Four Pillars of Wakefulness Mean for How You Should Live Your Life **1) Novelty:** Is most easily available when you’re young, but it’s available later too for anyone who has at least a modest interest in learning, traveling, and experimenting. **2) Variation:** Is the easiest of the four pillars to tend to, because not only is it wholly under your own control, but it’s also the one that you’re least likely to engage in by default. **3) Randomness:** Becomes less available the older you grow, assuming that you’re getting wiser with age. Either way, it’s hard to infuse extra randomness into your life in a healthy and sustainable way (you don’t want to watch sports or gamble, but you might consider becoming a venture capitalist). **4) Goal-orientation:** Remains at about the same level of control all throughout life, theoretically. But, in practice, it's easier for most people to come up with meaningful goals when they're young and haven't achieved much yet.

Important advice:

Make a list with these four columns and add items to it continually over time.

This is a natural way to increase your baseline levels of intrinsic motivation. It's most important for people older than 35 and for those who sit by the computer all day and don't get exposed to a variety of different stimulation.

* * *

This article was adapted from my new book ***Breaking out of Homeostasis****: Achieve Mind-Body Mastery and Continue Evolving When Others Stagnate*.

Breaking out of Homeostasis is the book to read for young men in a hurry to succeed but also for those who are in the middle of their career and feel like they're stuck in a rut, or those who've made their fortune and want to improve their health and life quality.

It has received positive praise from people such as European hedge fund manager of the decade Mikael Syding, fasting innovator Martin Berkhan, and finance billionaire Martin Sandquist. You might like it too.

Making Smarter Long-term Decisions (Q&A Announcement)

Making Smarter Long-term Decisions (Q&A Announcement)

The pandemic has shown the world that the vast majority are unable to make solid long-term decisions. This ranges from the purchases they are making today to the purchases they made prior to the pandemic. Quite interesting to watch as the same mistakes occur year after year after year. The good news? You don't have to worry about a sudden change in human behavior. They will always make the same mistakes. So. You can sell products that are evergreen (weight loss pills, fast track to riches seminars etc.).

Instead of covering the best sectors to sell to (which we have done numerous times in the past), we're going to focus on how to make smarter long-term decisions. For successful people this will seem incredibly obvious. For those that are currently making bad long-term decisions they will stand out like eyesores when you go back and check your spending.

Time Comes First: Before jumping into each specific segment, we have to look at the time factor. The items you can attend to will vary based on your current constraints. If you had to travel a lot for work, having a pet dog would be incredibly foolish as the dog would live a terrible life and you wouldn't even be able to spend time with your best friend. Also… If your time can be spent at home, it would be unwise to invest in entertainment options that require a lot of travel (say season tickets to a sports team if it's over 1 hour away – a more common example would be the season pass to an amusement park). Any time you make a decision you have to look out 2-3 years and see if it makes a difference. Many times it will.

The second big one is the *wasted* time, or opportunity cost. This one is also common. If you're only worth $1M liquid and you can choose between a 10% extra return or starting a business that generates $100K+ extra per year for life… it isn't even close. You're better off just buying diversified items and building up that mini dream of yours. On the other side of the spectrum is quick decision making. If you're wasting time deciding what to eat, you've already lost. Just go with the healthiest option and if they are both healthy, go with the closer/faster one. If they are all equal then just flip a coin and move on.

The third and final one is "time risk". If you sink your time into something, ask what the upside and downside of the decision is. If your friend asks you to eat dinner at some new restaurant, just say yes as the downside of having some food you dislike is pretty much nothing. If your same friend asks you to get blacked out for a weekend it might not be worth it (exceptions of course include a bachelor party or some sort of real celebration – sold a business/got a promotion etc.). Overall, these three types of time risk sound similar but look different depending on the time frame. So for this section we'll look at bigger long-term decisions that are critical to making your life easier.

Home Ownership: First of all, congrats to everyone who liquidated their real estate holdings in December of 2019. Talk about incredible timing. That aside, we've watched as homeowners make awful decisions during this pandemic (despite knowing they won't be stuck there for longer than 3-6 months). Here are a few examples: 1) trying to build a garden when they won't be able to maintain it after the lock down, 2) purchasing a pet when they also won't be able to take care of it in the future and 3) attempting to fix real construction work without the necessary skills creating additional costs in the future.

You'd think these bad ideas would be obvious, but they are not. People are lazy. All a person has to do is google search the type of trees/bushes/flowers that grow in their climate before making a purchasing decision. And? They don't. If you decide to do landscaping, you don't even need serious knowledge in horticulture. It is perfectly fine to upgrade your home… But why would you create something that will die soon? It doesn't make sense. Instead look at around, do some basic research and figure out which types of plants will do well. This will make your activity a lot more productive and when you're back to normal living, the hard work will not be wasted.

The second one is simply terrible. Adopting pets is fantastic… Not being able to take care of them is just cruel. Pets are popular in US culture as they are loyal to their owners even if they go from living in a large home to a small one. There is no standard needed, except food, water and the absence of abuse (neglect/hitting). We're hoping the ramp up in adoption is being met by an understanding of a 10-15 year commitment to keeping the animals in a good physical state as well. (Don't forget the pet-sitter when you're on vacation!)

Finally, the third one is the big money drain. While losing a few bucks due to poor planting is one thing, messing up major construction work is another. If you don't have the necessary skills to fix a kitchen… Don't fix the kitchen. While it sounds like a good idea, if you incorrectly rip up a floor or a wall, this will result in paying for an entire remodel again. Generally speaking, clean up work is fine and alterations are not. This would push you towards outside yard work where chopping down a dead tree or taking out weeds is not going to go "terribly wrong".

Fitness Equipment: This one is quite interesting. Most fitness equipment goes unused. People buy it and never use it. So in that case you're better off just having a set of dumbbells as they are versatile enough to hit all major body parts. Beyond this you have to start thinking about long-term repercussions of the purchases. Beyond dumbbells it seems that there are really three options. You buy an aerobic item (like a bike), you buy a real barbell + rack or you go all out and get both & a Tonal (or something similar).

Why do we break it out like this? It makes you decide on what path you're going down. If you're just looking to keep your gains/physique, heavy dumbbells will be enough. If you're looking to get rid of your gym membership then you're looking at the full set. If you're trying to reduce transit time and have weather issues in your area (a cardio/heavy weight session available is helpful).

While sales of fitness equipment is up, we're guessing that the majority have only gone down the dumbbell path. It just isn't easy to make these longer term decisions (even though you should!). You've got more than enough time to set it all up. So instead of blind buying the dumbbells take a look at all the options and decide how long it would take to "pay it back". If you would have spent $1,200 a year for a high quality gym membership (but a year is dead now), this ROI becomes pretty interesting.

Clothing or Software Entertainment: This is probably the craziest one. If you're looking to maximize your quarantine it would make way more sense to buy clothing at a discount. Right now retailers have massive inventory and demand is at rock bottom. You can now purchase enough clothing for the next couple of years as long as you wrap them intelligently. Why would people spend money on a new video game machine that will be outdated within a year (they are selling at a premium).

As a note, we're not surprised by this, just entertained by it. Video games and Netflix will be in higher demand when compared to shoes/clothing despite the latter being a smarter long-term decision. If you play sports you can pick up a couple years worth of gear for the price of a single year of spending. They will not "disintegrate" if you simply keep them sealed (extreme levels of caution can be taken by plastic wrap and in a cooler environment).

For fun, we looked at the current prices for shoes/shirts/suits/ties/pants etc… they are all incredibly low! You can buy them for 50% off or more in many many many cases. This is an obvious purchase as you're not going to wear the same clothes for the next 5-10 years. It just doesn't make sense. That video game selling at retail price (or higher) will be out of date by then and you didn't get a bargain at all.

The most interesting thing here is that if you followed the pandemic preparation (something we outlined a couple months ago) all those goods are now expensive. From paper goods to toothpaste and medical supplies. It doesn't make any sense as they are unlikely being used in mass quantities. That said, it's not surprising so be smart and do the opposite (look at clothing, electronics that are not software/downloads and travel gear such as suitcases and backpacks).

The income Side: Ah yes it wouldn't be a long-term post without the more important item covered: Income. If you have a diversified income stream (minimum of 3 or so), at least one should be up 100% this year. For people with exposure to internet based income, it's up at least 100% and maybe 500% in certain extreme circumstances.

Unfortunately, everyone is late to the party and will now try to jump on the bandwagon. Instead of making a dumb decision people should do two different things to profit off the downturn. It is incredibly simple actually: attach low cost items to your current sales (even if brick and mortar) and trade time for money if absolutely bored with nothing else to do.

Since people cannot think for themselves we'll use two blatant examples. If you run a restaurant you should have an offering for *pick up* of food where you'll give each customer a free roll of toilet paper. A few companies have done this with enormous success and we're absolutely shocked no one else has done this. It helps you maintain revenue and you already have this in your establishment. No one is going to be using it if they don't show up… So you're making the same amount. Also. An alternative is to offer a free small bottle of cleaning alcohol. This is also extremely cheap and easy to procure, Isopropyl Alcohol can be put into a small 5oz container in less than five seconds at practically no cost.

If you are just sitting at home doing nothing? Time to learn basic sewing. Please do not tell us this is difficult. It takes a few minutes. Simply buy items that people will want to wear (sports teams, memes, nice coloring etc.). They don't need to be N-95 masks, they just need to function and look decent. You can now sell this online.

What is the point here? Pretty simple, you want a long-term outcome and a short term outcome. Trading time for money is typically a short term outcome, and the long-term item of attachments creates a larger customer base. When the economy opens back up, you're in business still and you've reached more people while everyone else stood in place relying on Uber Eats (hurting margins and offering no differentiated experience).

Think Three Steps Ahead: A good framework here is to mitigate risk and think three steps ahead. Back before the pandemic started you should have found a way to stock up on non-perishable goods at a normal cost. Buying in bulk made sure you didn't waste/lose money. Now that we're in the pandemic period you want to think about what will be useful in 18-24 months. A new travel bag and clothing will certainly last that long if they are taken care of.

Another good way to make faster decision that are smart (long or short term) is to ask "what potential damage will occur if i'm wrong". Eating a bad meal by trying something new = no time lost just a small annoyance. Buying $500 worth of plants that aren't meant for the soil = wasted several hours and lost $500. Buying a new video game at 100% premium to hang out with other people who are wasting time? You could have bought something useful that lasts 3-5 years like a suitcase. So on and so forth. In short, ask "what time do i gain or lose by doing this" and all your decisions will become 100x easier.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending. **We hold Q&As 1-2x a month for purchasers only.**

Our Next Q&A is May 1.

Making the Case for Buying a Rental Before Your Own Home

Making the Case for Buying a Rental Before Your Own Home

For fun we did a quick Twitter poll to see how much people spent on their first down payment. This led to a series of various tweets and we noticed one common theme: *many rich people bought a rental first.* Before people jump in the comments and say "but I know so and so who bought and lived in his first place", we already know this is true. It is one of the most common investment choices in America. Instead, we're going to outline why doing the opposite could be good from a financial perspective. After all, if you see a trend or common theme, it is worth looking at. So we'll run the numbers right here.

Purchase Assumptions: Before we begin here, we know that 20% down payments could be up to $200-300K in high cost areas (Bay Area, New York, Los Angeles etc.). Instead of complaining about this, we also know a 1 hour commute can give you access to properties that are much cheaper (50%+ cheaper) making them a lot more economical if you're willing to do the dirty work. To keep this simple we're going to use a $100K investment and a $500,000 purchase price. Why? Well if you live in a cheaper city this means you could probably pick up two homes ($250,000 each) or you could live in an expensive city where it would only buy you a home further away ($500,000). This also gives us easy numbers to work with since it's easy to remember $100,000 and $500,000 for the home.

How the Concept Works: The one key item here is that many of the people who responded to our tweet with "purchased a rental" was this: *living in a lower rent location for a longer period of time*. Unsurprisingly, due to content targeted at future rich people, many of our readers live in expensive areas such as New York, the Bay Area and Los Angeles etc. The common strategy was to buy a place that was nicer than their current living standards and then rent out their purchase until they felt that upgrading would be easy. In short, they temporarily lived below the rent they could afford until their cash flows increased from their first rental property.

Scenario – Quick Math: Here is how the math would work if we focus entirely on the housing portion. If you live in an expensive city, you're looking at total rent of around $2,000/month. This is a pretty standard number for high cost of living areas. In some cases you're getting a studio and in other cases a one bedroom. Essentially, you can certainly live in a major city for around this number. Since "rent is going down the drain" this is another way of saying your negative cash flow is -$2,000. No equity is built.

Buying: If you decided to buy using the same assumptions, you're looking at a $400,000 mortgage with a 4.5% interest rate (yes it could be below 4.5% but the math is easier this way) and a monthly payment of $2,027. We'll call this $2,000 to keep it simple and by the end of a single year, you're looking at ~$6,000 in principal reduction and around $4,500 in tax deductions from the interest. After a year you're looking at ~$10,500 in total return. Essentially it makes economic sense to buy, the question is… could you do better?

Rental: If you decided to buy a rental instead it gets a bit more complicated but we can run it through the same way. You are paying $2,000 a month for the rental property. That said, *you should be generating ~$2,500 a month in rental income (6% cap rate)*. Your first $2,000 goes into paying down the mortgage which we calculated above is $10,500 in returns for the first year. The remaining $500/month then goes to your bank account, so the total return in theory should be $16,500… *this is 57% better than buying*.

It Gets Better: Some of you may be saying, well that's only $6,500 and my standard of living gets better. But. It doesn't end there. Remember that if your home is used as your personal residence you cannot deduct the cost of home improvements! This is ***not*** the case for a rental property. Any cost that goes into repairs/improvements can be deducted. The only benefit of improvements for a primary residence is that it can be used to increase the cost basis of the home. This is a significant difference over a multi-year time frame since you can only increase the cost basis *on the sale*. Referring back to that $6,500 in extra income, the chances that you'll be paying any real tax on it is next to none. You're incentivized to improve the place (increasing value of home) and get the deduction as well. For those that own a rental, we all know there are many other tweaks to make sure you show zero profit on the rental and this is where having a good accountant and receipt tracking pays off.

How This Snowballs: Taking a look at the math above it doesn't look incredible. The important part is realizing that the returns snowball and improve over time. If it took the person above ~4 years to save for the place it means he was able to save $25,000 a year after taxes. If he owns a rental and lives in his current situation for just 4 years, he'll have a second rental and still have money coming in from the first rental. *The $6,500 after tax difference is approximately $25,000 after 4 years so you've captured an entire year of savings by purchasing a rental first.* We don't have to explain it further. Once you have the second rental property, you're now saving about half as much as you do from your normal source of income! The incremental gains have now doubled and we have assumed your income hasn't moved one bit to help accelerate the process.

The Nay Sayers: As mentioned in the beginning, we're not saying that this is the "only" way to do it. We're simply trying to outline why it may work better for you versus the standard "first home is for me" mentality. When we look at the situations where "first home is for me" succeeded, they are ***typically*** in areas where the price of the home goes up dramatically. Think high cost of living areas that see a sudden boom like New York, San Francisco and Los Angeles after the 2008-2009 recession washed out. In these situations we can come to one interesting conclusion, if you're going to buy your first asset you should either 1) use the rental model outlined above or 2) do significant research and play the price appreciation game over an extremely short frame. The worst of both worlds is the classic middle that most people try to do. They buy in a safe neighborhood with minimal price appreciation qualities. This means you're simply underperforming someone who bought the same home and rented it out (math above) and you're not getting any traction from price appreciation (person who buys high demand real estate – think beach front property).

Two Other common Options: While the majority of the post highlights a common way that people made money on their first purchase, there are other ways to make money here. *First one is extreme leverage.* There are situations where you can put as little as 5% to buy a property which juices your upside (and downside) tremendously. Looking at these situations you're much more likely to take a highly levered bet when you can "force appreciate" the asset. This means you are only taking on a high leverage ratio if you are sure that repairs and hard work could offset any potential devaluation scenario. *Second one is higher cap risk.* This is where you're renting in lower income areas where there are more evictions and "headaches" associated with higher cap rates. As a rule of thumb cap rates are between 3-8% or so and if you see numbers in the double digits you're moving into higher headache environments (or a fantastic steal you've been researching for a long time). The one cited in our Twitter feed was trailer parks, which certainly do work if you're willing to accept additional work 9 times out of 10.

Concluding Remarks: Unsurprisingly, doing the opposite might be one of the better decisions. In the USA, the most common move is to buy a personal home first. Unless someone is in an area where price appreciation makes up more of the value (low cap rates), reversing the process could be a better way to build wealth. While a difference in the thousands of dollars after taxes might look "small" by re-levering the same amount of money into the next property, you are able to shave many years off of your working career at minimum.

****

Making the Case That You Are Underpaid! (Featuring a Blogging Buddy)

Making the Case That You Are Underpaid! (Featuring a Blogging Buddy)

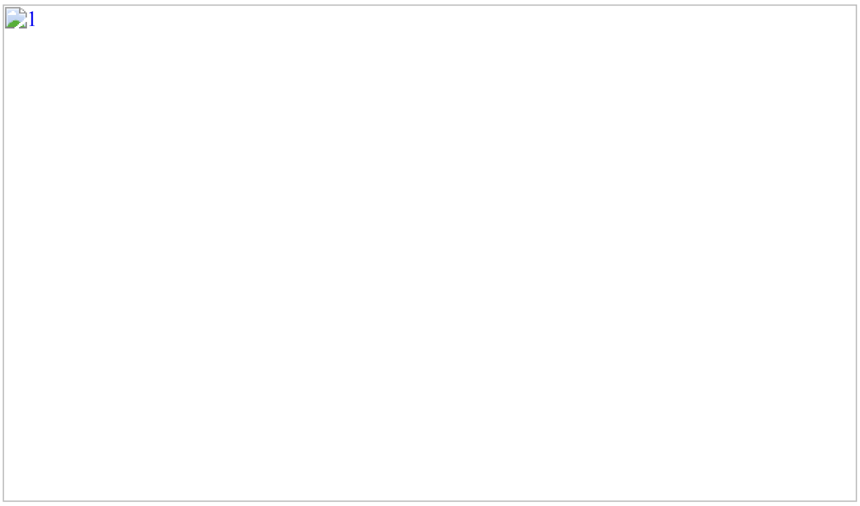
We've started interacting here and there with *"J. Money"* from Budgets are Sexy. Now the most interesting thing is he found our blog (so we think?) right around when he got a one-time *event* of $75,000 in a single day! (December 2016). Coincidence? We think not. Now that said, we'll put a spin on two of his latest posts to see if we can get more people on board the money making *bullet* train versus the cutting costs normal train. If we can convince just 1% of the individuals to make the jump we'll call it a success (yes double meaning on 1% intended).

Disclaimer: we are not backing away from our belief that a time for money exchange is bad, instead the post is set up to prove that everyone, including hourly income individuals, generate incomes well below what they can get as a solo shop. We believe no one is maximizing their income, it just isn't possible due to market inefficiencies.

Quick Overview of J's Blog: From what we can tell he is passionate about the blog (you can see it in the writing). He seems to be a workaholic doing tons of personal finance type projects and that's usually a good sign of someone who is interested in the topic. As Naval Ravikant would say, you're moving in the right direction when… *"It won't feel like hard work to you but will look like work to everyone else".* We have nothing against cutting costs (you can't get rich if you spend 100% of what you make) but we do think it is **more efficient** to focus on making more money (hence our blog is about ways to make $$$!). With that out of the way, he has two posts one on him giving away $100 a month and the second on what to do if you have a $2,000 emergency (we'll address both here).

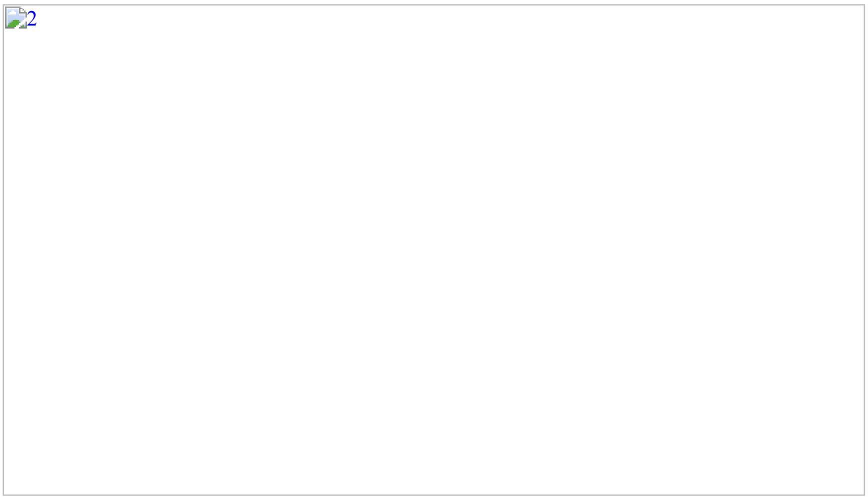
What to do With $100 a Month (Anyone)

We'll start with the latest, if someone gives you $100 today and you have a handful of skills the answer is to *launch a small website immediately*. We've focused primarily on product sales (most are not ready for this it seems) but we'll give yet another idea… Start a basic consulting/services practice. If you have niche knowledge in any topic, you're underpaid. Take a look at this chart.



Now we've certainly made this chart extremely simple. It looks exactly like your typical "supply and demand" chart. Essentially the first customer plot 1, is willing to give you $6 worth of profit. The second customer needs you less and would be willing to give you about $5 worth of profit. So on and so forth. This occurs until customer 6 where they are no longer worth your time. Importantly, this can be **either** your time (services) or a product sale (price point)

Now here comes the depressing part, how does this work if you actually work for someone else? Well take a look at one small edit… Now you'll see what is going on. Absolutely no Company is going to give you more money than you are worth (assuming you're an actual good employee – many companies have "inefficiencies" as well). If profits were to go negative for an extended period of time the Company would be in quite a big heap of trouble! So there you have it, *two extremely simply charts to prove you're underpaid*!



Now back to the original question on what to do. We would go and open up a basic website (cost around $200 for the domain/hosting/decent template design), saving the first Benjamin (writing your sales page in the meantime) then getting to work in month two. Now you go and start a small website and link everyone on your social media accounts to that website (most have social media even with a few hundred "friends"). Then… kaboom you start your basic practice with either 1) what you already do or 2) with something *else* you are an expert in. Everyone has talent in something, so we would wager that every single person reading this is in the top 20% in at least two items. That is all it takes (two items) if you don't want to have a conflicting businesses with your current job/career. You can then immediately acquire a handful of customers and make back the $200 (assumes a 3% conversion rate on 200 customers = 6 customers at $50 each… or a $100 profit in your first day "in business"). This is not unreasonable at all.

Now once that's done you keep the first $100 you made and when the second $100 comes in you use it to outsource your customer reviews (if you have a ton of time do it yourself). Your customer reviews will be organized by someone else dealing with the back and forth emails and paid on a quick contact (easy to do on fiverr). Your second page on your site is going to be customer reviews of your service/product because you better ***over deliver in a big way*** to your first set of customers. This leads to several positive reviews and will then make it easier to keep your conversion rate at ~3%. You're already rolling. Top cap it off, the most clear example we see every single day is in the gym. Several in shape guys (who need extra money) spend their time with headsets on ignoring everyone. Since "material" on working out is practically all a scam on the same old basic concepts (compound lifting) the special sauce is in the sale/services. They are typically standing right next to out of shape people with tons of money and can't get the lightbulb to go on!

To put the nail in the coffin… if you end up getting more customers than you can handle you will now have the option to 1) raise prices or 2) hire others to do the work! In short? **You've Set up a Potential *Event*.** We have talked about *events* many times. But. This is important to understanding when you're building something basic like this with scale. You can either 1) sell a stake in it like J. Money did, 2) see how much pricing power you have giving you immediate income off of the same amount of work or 3) outsource the work creating a semi-passive income stream (we would do number 3 most likely).

How to Come Up With a Quick $2,000

We read the entire article and agree that unprepared individuals would struggle to deal with a $2,000 payment. That said, if this was truly a "one time charge" (or restructuring charge as the finance community would call it) you could offset the cost by simply using the internet! That's right, if you had ~1 year to generate $2,000 in a random one-time event there are many, many, ways to do it. Since we're focused on keeping it basic for this post, ***anyone*** will be able to do this.

Step 1 – Internet Access: If you live in the United States (the greatest country on earth), practically every public library will have access to the internet. This means you will have free internet access if you need it. There are no excuses here, being born in the United States is a gift in its own right.

Step 2 – Zero Percent 18 month APR Credit Card: Now if you're going to do something on the internet you'll need a credit card. There are several credit cards that offer 18 month zero percent interest as long as you pay a very small fraction of the total balance each month. You'll use this type of card for the return we're dealing with about $2,000 is the goal.

Step 3 – Coming Up With Minimum Payment: To really get rid of the negativity (excuses), for a $2,000 balance… you'll need a grand total of $20 a month. Now… Just in case someone is going to lie to us and say they can't figure out how to get $20 we will happily say that you can come up with $20 looking for change on Wall Street over the course of a week (joke). For a grand total of $20, you can simply trade your time for money by working one extra hour for the month. If someone really can't even do that… then become an Uber driver during rush hour one time or go recycle some plastic bottles. In short, there is no excuse for not being able to come up with $20 and anyone who disagrees should re-read this paragraph.

Step 4 – Get On Social Media: Now once you have that set up, you're going to become a stalker! Not stalking other "friends" you know. But. Becoming a real stalker of what is "hot". To make a quick turn around you're looking for any product that has extremely high demand and limited supply. During our last Q&A someone asked about a quick "buck" to pay rent and that's essentially what this situation would be. Your answer is the following: Technology devices (gaming products,most popular iPhones, etc.), Sporting events (limited seating), Concerts/Music festivals (limited units), 100s of collectable items that are limited edition.

Now that you've got the main items to search for on Google (listed above), you'll narrow down to a set of maybe 5-10 items that are coming up in the next few months that will undoubtedly sell out. You then take these items to social media to help confirm or deny the trend. Kaboom! You've got at least 3-5 items that will definitely sell out so you get your hands on it.

Step 5 – Shipping: If you're doing something that has tickets (sporting events for example) you won't have to worry about it (congrats this got 100x easier!). If you're doing a product here's an easy way to set it up. You order the item (pre-order) on Amazon… Since you won't actually get the product since you're pre-ordering it before the sale you then want to *sell* the product just before the release. Why? You charge a shipping cost to the order! Now you won't have to pay the shipping cost, it'll pad your profits as you login to Amazon and simply change the shipping address. Ta Da! *Update please see comment from "internet dude" below for the spam approach which also works where you flood the web with links.*

How to Come Up With a Quick $100

Now come on guys, saying someone can't come up with $100 is just crazy talk. Pull out your credit card go into "credit card debt" of $100 for the month (float it). You now have 30 full days to go ahead and generate an extra $100. Since this is significantly easier we wouldn't even do the five step research process above. You'll simply go and look up all the local stores that purchase goods (used auto parts, used books, used technology widgets etc.). Now all you have to do is look up all the "garage sales" where they give a way a bunch of free stuff or items at a deep discount and go "arbitrage" the difference. (Any affiliate marketer knows all about that arbitrage!)

Dying With Debt

This is a bit of a strange one. In theory dying in debt isn't really a bad thing. If you've accumulated a million bucks then went crazy wild into debt towards the end in a ball of flames then that's how it's done!!! Definitely don't want to die with $1,000,000 in the bank if you don't have any family members to give it to. The flip side, if this is all student loans for a degree that didn't help that is certainly sad and we don't have much to add there. At this rate (we think education is massively overpriced now), the government should find a way to have the money forgiven.

Women Value a Man's Wallet

All we will say is yep! If you've got 7 figures in the bank you're always a seven! Instead of reviewing the entire post we'll highlight the most important part of the article which is this… You have to know your income breakdown by city. Here is the **general rule** to follow.

"Unlike other places on the Internet, we are going to break down the income brackets for you in a simple graph.

income

*As you can see by the graph, you need to make *at least* the median income in order to consistently date girls in the 6-7 range. If you are extremely good looking or have extremely high status (musician, DJ etc.) you can break these rules. But. Nothing else will help you if you're below the median. If you have incredible social skills but can't even afford to live in the city, the girl is going to ditch you. A girl who is a solid 7 still has dating options."*

School Debt Isn't Viewed as Unattractive as Credit Card or Car Debt

This one is a bit of a head scratcher. We don't view them as all that different. If someone decided to major in a Humanities degree that won't make them any more money and paid $200,000 to obtain that degree… That is *worse* than having some car payment (easier to clean out). If someone has $40,000 in student loan debt but a degree in software engineering and a Career offer from Google… Well we 100% agree. Unless the debt is giving you a positive *return* we view almost all of it equally.

Summary

Now some of you are wondering why we're linking to a personal finance blog that focuses more on saving/budgeting… Well we actually think he's figured out how to get rich! Maybe we're wrong but we think so (at current rates we predict he'll become a multi-millionaire sooner than he thinks). If you can create a one time event of $75,000 in a single day (after building up an interesting business) why couldn't you create a one time event of $750,000!!!! He could without a doubt in our mind. With that said here are the quick points:

1) You're underpaid! Please feel free to argue against the two basic charts. And. The charts do *not* even include operating margins which means most businesses *do not even take business that don't generate a *meaningful* profit*!….. 2) All you need is a credit card and internet access to obtain the ability to generate $2,000 in "one time" event…… 3) not being able to come up with $100 in 30 days is just a lie unless someone is lazy….. 4) women value money

surprise surprise, a "politically incorrect truth" just like how men value looks (another shocker!)….. 5) unless debt is ***earning*** you a return it isn't good debt plain and simple to us!….. 6) one of our young smart readers should use our outline and figure out a way to use his giveaway to start a biz!

****

Managing Life Decisions to Make $100K a Year

[Managing Life Decisions to Make $100K a Year]

In our framework post titled "How to Invest as a Bachelor", the clear first step is finding a way to generate high income. If you can obtain high income in your first year or two the rewards you will reap in a mere five years are phenomenal. With that said here's a blueprint of sorts to obtaining high income as fast as possible. We will start far back in time when you apply to college and will assume that you wish to work in white collar work rather than blue collar work (again focusing on a topic we know well).

Three Bullets in the Chamber: Many years ago when making a decision on where to go to college an older gentleman gave the following advice:

"As you go through life there are three major decisions that will dramatically shape your future. Yes you can recover from a bad decision but the three turning points are as follows: one turn when you decide to go to college, a second turn with the subject you study and a third and final turn when you sign your first offer letter. If you make all three turns correctly the wind is now blowing at your back. You are firing three times and you better make each bullet count"

This quick piece of advice rings true even today, successful mentors are always full of wisdom so you should certainly find one. With that said lets take a look at each bullet or turning point.

Go To College? Generally this is not always a yes decision. If you've worked hard in high school and you've gotten good grades on the all mighty SAT and ACT etc. then you likely have a few good options to choose from. We will go ahead and assume you have a few strong options in front of you, the question is how do you decide which university to attend?

The simplest way to figure this out is as follows:

1. Calculate the cost of the university
2. Calculate the average income upon graduation from the university
3. Calculate the long-term income growth rate
4. See if the payback period is less than 1 full year

Essentially, if you expect to make $60K a year out of college for your first job which will grow at a rate of ~5-10% on an annual basis… You should not obtain debt higher than ~$36K (assumed aggressive 40% tax rate) when you graduate. This is the rule of thumb, simplified equation below.

(Annual Income * (1+ expected percent raise)) – Expected Cost = Positive

For those that believe "College should be a fun learning experience!", "I want to major in something I absolutely love!", "I just want to bang a lot of chicks!" you've already lost. The only partial truth in here is doing something you enjoy, certainly if you enjoy building things a career as an architect is going to out pay a career as a modern artist.

With that out of the way we would recommend the following careers if you're obtaining a four year degree: *Finance, Engineering and Consulting.*

If none of these appeal to you, that is fine you can still play the same career game by following the rules for choosing a major.

How to Choose a Major? Going with the previous build out, you have a few offers from a few schools and you wont be burdened with hundreds of thousands of dollars of debt. That education is looking much more legitimate at this point.

Similar to quickly deciding if college is worth it here is the decision tree for a major:

1. Is the major in demand?
2. Does the major pay well out of college?
3. Do employers recruit for that held degree?

If you answered yes to all three questions, you're looking at a great major to choose. Instead of making life harder on yourself, obtain access to the career center, find the majors that interest you and see what careers they walked into.

For example, if you have the choice between majoring in chemistry or in chemical engineering and notice that the average pay differential is in the tens of thousands… It is clear that you should jump into chemical engineering. Alternatively, if you are choosing between mechanical engineering and electrical engineering and realize Facebook recruits electrical engineers… Well again the choice should be clear, you should focus on what matters, the career at Facebook.

Life is unfair. There is no such thing as a perfect or ideal job out of the gate. No matter where you start you're going to dislike part of the job. If you decide to work on Wall Street you're not going to be making waves in year one, you're going to do a whole lot of boring and mundane tasks while working with some insane clients as well. A small price to pay for building a set of niche skills that will be in demand. Which brings us to the third point.

Become an Expert in the Field: So you have made the first two turns correctly, you have correctly moved into the right university and you're majoring in a subject that employers are fond of. Now what? Now it is time to develop a strong set of skills that few men and women have. Skills that are in demand and difficult to find.

Lets assume you have three offers on the table. All three pay the same $70K + bonus. Congratulations… however… *This does not mean all three offers are equal.*

Offer one is a generalist role where you will be tasked to work for 4 different groups

Offer two is a niche role where you will only work with X type of transactions

Offer three is an inbetween role where you will only work with 2 different groups

Here is where it becomes difficult. Lets review a key question when you chose your major in the first place. "Choose a major that is in demand" lets adjust this "Choose a *career* that is in demand".

You have to take a long and hard look at each option because demand is going to be much more dependent on 1) location, 2) openings and 3) required skills.

Offer one. On a glance this does not look like a smart decision because you are building a wide set of skills that do not allow you to *become a person of value within the firm*. If you are tasked with work from several superiors none of them have a vested interest in your career. Politics matter. Unless each group you are reporting to resides under the same umbrella the chances you want to jump on this offer is small. Rotational programs can be a kiss of death.

Offer two. On a glance this is an interesting option. It is immediately niche. The catch of course is that you are working with a specific type of transaction. If the transaction will be needed forever and requires tough skills (think sell-side or buy-side M&A) you're probably in a good spot. However… If the skills needed for the group are limited and easy to learn (think Equity Capital Markets) you should avoid it. Why? Again all skills are not created equal. Always choose the niche group that requires more of you.

Offer three. Here you will only work under two groups. This is not a bad idea and usually means you're under the same vertical umbrella. You should do your due diligence and look down 2-3 years to see how each candidate progresses. If the results are good, go ahead and make the choice between offer two and this one.

We're getting towards the end here. You've correctly decided on a university, major and career. You've got some momentum going, how do you manage to obtain the last few thousand dollars to put you at the $100K mark… well the answer again is in your niche choice.

Leveraging Your Niche: This is actually a great time to explain why we don't do resume reviews as a business line. The answer is we've done hundreds of them in the past on the side. How is this possible? Simply put if you're in an industry where your skills are needed people will ask you for help and you can help them on your downtime to make a few bucks. It is really that simple.

If you obtain entrance into a career where many hope to enter, they are going to reach out to you and you can simply send a few emails out to explain your services. You won't get rich. You won't love the work. But you will develop 1) salesmanship, 2) ability to work with real customers and 3) better understanding of what an employer would look for. An outstanding example for those uninterested in Wall Street is copywriting. If you can become a great copywriter, you will receive referrals and you will have a side business in no time. **Boom, you're making $100K (70K+30K on the side)**

Wrapping up, if you follow these guidelines you'll find yourself in an outstanding position for success. If you have not followed along and took a wrong step you will be playing catch up, no doubt about it, but we will continue with the series and move to Portfolio mix in your twenties shortly.

****

Managing Personal Perception

Managing Personal Perception

One of the main ideas from this blog is that you're better off avoiding the "status game". This means there is no reason to buy items to impress other people. This is still the truth. The one caveat here is that you don't want to take this to the extreme and decide that dressing up as a slob will get you somewhere (it won't). Instead we'll attempt to explain the steps to managing your own personal *impression*.

10 Rules for Perception

Rule #1 – Perception is Reality: Millions of studies have shown that first impressions matter and can impact a person's belief for long periods of time. This first impression occurs in just a few seconds. Since we know that your initial perception will stick the most, it would be wise to decide carefully on your clothing before going to any major event. Lets take two extremes: 1) a night spent alone reading and 2) a presentation to 100 people on a specific topic. At the end of the day, you're required to dress up for the second event even if the content is the same. People will absolutely judge you before you even begin to speak. This is why perception is always reality.

Rule #2 – Discomfort: A good way to tell the difference between an expensive item and a person on "tilt" is how they operate. Humans are hard wired to see people who are nervous or uncomfortable as less trust worthy. This should be taken into account for your general purchases. As a basic rule of thumb it is not wise to bring anything out in public that would make you squirm. If you're worth $100K and for some reason you have a $50K bracelet or watch… It's time to sell that item since it is actually doing you more harm than good. It doesn't fit your natural demeanor and despite believing your status is raised, it is actually lowered by the uncomfortable body language.

Rule #3 – Physical Perception Comes First: Physical perception is the first item people should focus on. Why? It is the most impactful before someone looks into other items. This means clothing, weight, haircut and overall style are the easiest to fix. In fact, we would actively avoid people who fail in these categories unless it was related to making money/business. Think about it like this, while there are millions of business people who lack style, there are very few people who lack basic style that are truly happy. We mean this seriously. Someone who can't keep their appearance up to date when needed is certainly someone who has some odd social behaviors you probably want to avoid (again, unless related to making money).

Rule #4 – Body Language is Second: Surprisingly we are not even moving into the purchased items before talking about body language. Numerous studies have shown that 80% of communication is through body language (this is also why people are able to communicate without speaking the same language in many cases!). We would recommend picking up a book titled "What Every Body is Saying" and learning the ropes from there. Most people won't take the time to critically analyze their own posture and body language. If they do? They will be surprised to find many mistakes. Body language that comes off as weak, insecure or negative in one form or another. These are simple mistakes to correct and will immediately change your perception. The most glaring and obvious example is a guy sitting at a bar with a beer squarely in front of his chest and other hand in his front pocket. A terrible look. We still see it everywhere.

Rule #5 – Relative Value: This is no surprise. If you're in shape, dress correctly and give off positive body language, you'll need to focus in on relative value. This means you have to decide on your objective. If you simply want to improve your dating options for example, you'd want to be the best looking, best dressed and richest person in the group (99% of the time this will work since you're perceived to be the best option). Essentially you want to appear to be the best.

There is an important point here. Most people focus on being "the best" at all times. Naturally, this is a failed experiment. If you're always the best it means you're trapped in a mediocre setting. In other settings you may want to be in the "middle of the pack" so you can slowly move up over time. The most obvious example is when you're working with a customer/client. You certainly don't want to be the "best" in that situation since your customer will feel insecure and negative towards you. When you have a customer/client you actually reverse the situation and want them to feel like they are the most important person in the room. In simple terms if you're looking to increase dating options specifically then you want to be the best in the room, but if you're looking to make people feel good about themselves, this strategy does not work.

Rule #6 – Overextending Rarely Works: Sure there are con artists who succeed (these people are the exception to the rule). Generally speaking, if you over extend yourself you'll feel uncomfortable with your presentation. This applies to cars, homes, boats, shoes, suits and more. As a rule you should feel comfortable with the item being "stolen". This is probably the best rule of thumb we can use to explain the sensation. If someone tries to buy a custom made suit which costs about $5,000 or so, but their average suit is ~$400… We'll bet money that the suit is rarely used and if it is used, the person acts squeamish as they try to take extra precautions in their outfit. Funny enough, this applies to going out in general as well. Without knowing, there is always an unspoken ability to tell who has a lot of experience going out at night (bars, nightclubs, etc.). If someone is new they give off a different vibe and if they are strapped for cash going out, they also give off a different vibe.

Easy examples to keep in mind are as follows: 1) people who are ordering bottle service but then buy the cheapest bottles on the menu, 2) people who go to a nice cocktail bar but only order beers, 3) wearing gucci loafers with a suit that is not tailored, 4) wearing cartier sunglasses that don't fit the shape of the person's face – implies it was handed down, 5) giving well below average tips despite eating at a higher quality restaurant – not only rude but negative for the persons future reputation.

Rule #7 – Go Up and Watch the Fireworks: Depending on how high you're willing to take your personal perception (and how far you go in life in general), you'll find that more fireworks are seen at the high end. This means it will force people to show their cards quickly. If the person does not like you or is extremely insecure they will immediately make negative comments about any high quality item you have. Similarly, if a person does like you, they will also show their cards and say "great suit!". This dynamic only gets worse and worse as you go up the chain so remember rule #1. Since perception is reality, you have to decide what you're trying to convey before you show up to the event/location.

Rule #8 – Attempt to Scale Equally: Similar to items 6 and 7, you'll want to combine these concepts to your overall lifestyle approach. If you're going to buy custom suits, you probably aren't going to walk into dive bars very often. The restaurants you dine at will also go up in price if you're using them frequently. Similarly, if you're wearing a custom suit, you shouldn't be wearing Aldo shoes. This applies to all of your actions so when you're raising the bar, make the assumption that the relative strength will reflect on you across the board (hotels, apartment/hotel etc.). It just doesn't make sense to see someone in a pair of Gucci shoes walking into a Motel 6.

Rule #9 – Special Item(s): Unsurprisingly, we've never been a fan of the "special item" exception. This is when you're only going to have one item of high quality (a suit, a pair of shoes, etc.). We think it doesn't make much sense because 1) you won't use it much and 2) when you use it, the presentation you give off won't make a lot of sense. Ideally you're only making a scale up (in quality) when you're able to comfortably afford all of the new increases as well. A rule of thumb is quite simple. Say you're financially independent at around $5-6K a month. If you're increasing your net worth by 10% a year (pretty easy), then you could quickly reach $10K a month in spending in around 7 years. At this point you could take a look at all of your items and upgrade everything to match the new spend level. This repeats itself. If you double your net worth, you can easily do a full upgrade to the $20K spend level.

Rule #10 – Going Back is Easy: Clearing this up a bit. Going back means you don't need to give off the exact same perception at all times. If your lifestyle spending is $10K a month, you can always spend less in a specific week. What doesn't work? Being *forced* to go back into a lower spending tier. This is an important distinction since many people "save" 10% of their income which means they are always fighting for lifestyle increases. It doesn't work. Instead, if your building your net worth aggressively, it will be difficult for you to save less as a percentage of your income (you won't have time!).

Important Notes About Your Perception

More Money More Obvious Reactions: More money more problems is largely a lie. This is only a problem if you're looking for problems. The one thing that does change is the way people react to you. If you're rich and you run into someone the same age as you who has not succeeded, they will have a visibly negative reaction towards you. We've seen this a lot. This is the most common negative with regards to increased "status". The good news? You'll essentially filter out the bad people immediately. The ones who are positive and simply say "nice XYZ" will either 1) be rich or 2) they will be showing their cards saying they like you in general. This is a great filter and is an underestimated benefit of slow increasing your ability to spend.

No Style is Correct: There is no "correct" answer to any of the perceptions. If you're trying to attract gold diggers, we actually think its a good idea if that is the goal. If you're trying to pretend to be poor (avoid people in general) that's also great. The one thing that needs to occur? The result needs to match what you wanted in the first place. If your goal is to make someone feel better about themselves and you're wearing a million dollar bracelet, that's probably not going to sit too well.

Avoid if Unsustainable: The vast majority of people live unsustainable lives. If they lose a single stream of income their lifestyle goes down the drain. This is a stressful situation to be in. We take a different approach when compared to the $30,000/year millionaires. Instead we think you *can* spend money on whatever you like. It could be Lambos and Ferraris. Who knows. The main item is that you don't give up your freedom to sustain that lifestyle. We truly believe anyone can get to a couple of million dollars in their 30s. (say $1-2 million at least), this is a livable net worth and after that you can scale it as high as you would like. Just don't break the mold and go into unsustainable territory again.

Don't Buy Stuff For Others: Another good rule for perception is buying stuff specifically for attention (Big Mistake). This really doesn't work out well. If you're going to upgrade your apartment or house, it shouldn't be for "image" purposes. It should be for your own personal use. Naturally, if you're a billionaire there is likely a brand/image angle to it that helps. But. We're speaking about your typical "secretly rich" multi-millionaire.

That wraps it up for us. For fun in the comments please let us know of any notable lifestyle upgrade that was a net positive. Also feel free to share the negative stories but we prefer focusing on the positive ones.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality (***essentially the point of this post!***)… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by **Clicking Here.**

Managing the Passing of Time

Managing the Passing of Time

While there is no way to change the rate at which time passes, there are many ways to adjust our mental perception of time. While we've suspected this was the case, there was an article that talked about this concept in rats. We're rarely interested in any sort of scientific proofs since they are always behind the times. But. In this case we found the article interesting since it gave a few actionable ideas. Instead of rehashing the ideas, we'll provide our own strategy to speed up or slow down the passing of time.

Fun or Boredom: One of the basic concepts is obvious. Time goes by quickly when you're having fun and it slows down when you're bored out of your mind. Taking this to extremes. If you were to go out and party (black out drunk) you quite literally lose chunks of time. On the other extreme if we forced you to participate in Chinese Water Torture (one drop on your head every few seconds), time would freeze. We used these two extremes to conceptualize ways to speed up and slow down time. Oddly a lot of our opinions on how to design your life takes this concept into account. So with that we can jump in.

Travel as Primary High End Entertainment: Generally speaking, we prefer traveling to new destinations as a way to "splurge" or burn money on fun. This is a lifestyle choice as you could choose to buy a fast car (insert other luxury items). We've pushed our readership in this direction since it causes "time stamps" in your brain. If you go to the exact same location over and over again it will not create memory markers. A good example of this is how many states have "standard" vacation destinations (Western Europe, Mexico, Florida, Hawaii etc.). If you were to follow the herd and only vacation in the same 3-5 places, the years would blend together. Sure, maybe you stayed at a slightly different hotel but that is not going to make a meaningful impact on your memory system. An entirely new city and Country is much more likely to create a time stamp.

Counter Example – Consumerism: Naturally, this above paragraph conflicts directly with what everyone else is doing. Most of them will spend their time hanging out with the exact same people, going to the same part of town and taking vacations in the exact same cities (this group lives in this are of town and when they hit 30 they move to xyz area of town). They get a quick boost of dopamine when they purchase some new widget and then go to the same club/bar where they know the exact same people. This creates a feedback loop in the opposite direction. The lifestyle is encouraged and 3-5 years later nothing has changed. This is why most people have a crisis at around age 35 when nothing has changed and a full decade has passed (now we have the reason for why it feels that way).

Online Income: This is a common topic for our blog and is another part of lifestyle design. You can get rich in many ways (real estate, brick and mortar, online, careers etc.). The benefit of online income is the portability. If you're not tied down to a specific location it makes it significantly harder to be trapped into a routine. Compare this to a long commuter. If you're forced to drive the same 30 minute route on a boring straight freeway every single day, the time will just blur together. Maybe the colors of the cars change but the events are hard to remember. You'll remember a few strange days when there was an accident or unusual event. But. It will all end up blurring away without recollection of the year (time stamp).

Counter Example- Stable Career: First of all we don't view a Career as stable since you're simply a line item in an excel sheet. But. For fun we'll say that it is stable. This would be exactly opposite to a location free job. You're going to the same location, in the same city over and over again. The time seems to blur together since the office looks the same, the people may change (but are forgotten in a few weeks once they leave anyway) and the daily routine is exactly the same as well! There are only so many places to eat and drink within 10-15 minutes of the same pin pointed dot on a map. This creates a natural trap to feel like each year is exactly the same so the perception of time is warped once again.

Create Gaps: Another interesting item here is our general suggestion to create jumps/gaps. We think this also adjusts our perception of time. Instead of trying to "spread out the pain" which is what normal people do, you want to condense the pain. The goal of any reader on this website is to be rich by their 30s not their 60s. This means the pain of 30 years of work needs to be condensed into a short decade at maximum. Funny enough, by condensing the pain you'll feel like the first 3-5 years "dragged on and took forever". When you're done, you won't be old at all! This is probably one of the mental hurdles that most people can't jump because they feel like they have been working for more than 10 years even though it has only been two (mental mind game).

Counter Example – Create Stair Steps: By *mapping* something out you've naturally created a flow of time or "life math". Go to school, study, go to college, get some debt, get a good job, pay off the debt, get married at 28-32, have kids, scramble for retirement, retire, die. The map doesn't even look interesting to begin with but this is the "solution" sold to practically every American. Needless to say we disagree. A better way to do it is by creating gaps as we've said since you really don't know what is going to happen in 10 years. Seriously, it is difficult to predict. Will your "stable career" be around? Who knows. Will you have a new idea in the next year? Who knows. Real life is a lot more complicated than the boring life ladder sold to everyone at age 18.

Event Based Income: As always, no one gets rich working for someone else (Doctors, Lawyers etc.). Everyone can complain all they like but if they run the factual numbers they will find that this is the case. Event based income is quite different. It's not easy to forget 1) the first time you started a company, 2) the first time you sold a company and 3) the second idea you started… so on and so forth. Coincidentally, this creates a natural feedback loop for your experience in relation to time. If you are working on something new (or exiting something) it creates definitive hard dates for each event. In fact, a new SKU is more memorable than a promotion at a career since you'll be actively seeing how well it sells (or doesn't sell!). New promotions *rarely* change functions, your business card just has different words on it.

Counter Example – Time Based Income: This is the worst item since it is essentially a drug. Time based income is not memorable. If you work longer hours to earn the income you 1) associate time with money creation and 2) the time seems to feel longer than it is. Anyone who has worked a 16 hour day knows the last 3-4 hours feels MUCH longer than the first 3-4 hours. A horrible cocktail. Each day at work seems to be longer as the person waits for the check to hit in two weeks. In addition, associating time with money is probably the worst item since no one gets rich by selling their time for money.

Create Pauses: Another interesting one we do that conflicts with norms is taking pauses instead of celebrating. Most people get their first big win (a good bonus check or something similar) and go out to celebrate. Instead we try to do the reverse. If you receive a large amount of money or accomplish something, instead of going out to party we'd go out and hit an extremely low key area. Island life is generally an area where time slows down and we would recommend doing that instead. Time feels like it stops on islands since the pace is a lot slower, it is not a concrete jungle (sections of the island are distinctively different) and the weather seems to impact the perception of time as well (probably because night-time is brighter due to lower pollution and brighter stars in the sky).

Counter Example – Hit the Clubs: The common reaction is to celebrate hard. Blow $X at a certain venue, drink and toast to the occasion. While people are free to do what they want when they make it, the psychological impact is a bit of an overkill. If you make your first pot of gold, the party experience will just blend in (Example: if you party for all of your birthdays you won't remember which one was which). We've said it before but we'll say it again. The dopamine you get from becoming financially independent is not matchable. Instead of diluting the dopamine rush, let it run through as you're in a slow environment giving your brain time to relax. (Note: we don't expect anyone to listen to this advice and instead expect that everyone does the same thing – party hard the first time, it's human psychology after all).

Avoid Routines: Even if you're not making money online (yet) and you're working in a career, you can do a lot of things to avoid routines. The most obvious ones include: 1) changing the days you do laundry, 2) avoiding the same wardrobe, 3) changing the location of your workouts, 4) changing the people you meet for coffee and 5) changing the type of books you're reading. All of these items are basic but anyone can do them. The most important one is probably books. If you're not in a good position (money wise) reading is a highly correlated item to wealth since the average CEO reads around 4-5 books a month vs. your average guy who reads practically none.

Counter Example – Same Old: Your typical guy does the same stuff every day. We wrote a basic tweet that said ~4 hours of TV/Movies was enough for a month and people flipped out saying we were against entertainment. Seriously. People really believe that the only forms of entertainment are movies, sports and TV. We don't even want to know how awfully boring their lives are. TV/movies/video games etc are all time sucks with no real incremental value. Sure you can indulge here and there. But. Please don't try to convince someone that it's a net positive (unless somehow related to making money, i.e. pro video gamers can play as much as they can). It's amazing how addicted people become to this routine, probably because there are limited options for any sort of entertainment under $10 a month. That said. Their time should be spent reading and learning how to make money if this is really the only form of fun and entertainment they have. (After re-reading all the negative comments, it makes us even more convinced that investing in next generation entertainment is brilliant. If average people will defend it to death, they will blow their paychecks on it for sure. Great businesses!)

> Anything over an hour a week on these is just terrible:
> 1) watching sports
> 2) movies/video games
> 3) arguing with regulars on the internet
>
> As much hate as it gets, partying hard is a much more entertaining proposition and at least improves sales skills.
>
> — Wall Street Playboys (@WallStPlayboys) August 30, 2018

Space Utilization: This is going to be an unpopular one. For an odd reason we've realized that tight spaces create a feeling of time slowing down. Similarly, large spaces create the feeling of time speeding up. We're not sure why this is the case but anyone who has been stuck on an airplane as it waits in a long line for takeoff knows exactly what this feels like. If you sit in business class or even in economy class with no one next to you, the wait seems to be shorter! We have no idea why this is but it also seems to relate to why small islands feel "slower". If this is true… we all know what to do. When you're trying to work on something with a very short deadline, work in a cramped closed dark area. If you're trying to work on something more artsy and creative, try to stay outside. Now that we've written that out, it also explains why offices are designed with cubicles (tighter spaces for focused work) while the creative people are in larger offices since that is their job.

Counter Example – Bigger is Better: This is more of an American phenomenon. Where big is always considered better: taller, more floor space, higher ceilings etc. We're taking the other side of the coin and saying it's not always better. It depends on what you're trying to accomplish. If you're trying to be creative and create motion, bigger is better. If you're trying to focus and get something done, a tighter area will force you to focus (so you're "allowed" to leave the area once done).

Conceptual Overview: Since we cannot control actual time, we can certainly control our perception of it. If you want to feel like each year was unique and you want to get things done more efficiently we'll outline the following bullets: 1) create time stamps by focusing on unique destinations, 2) avoid routines and rejigger them on a monthly basis or so, 3) use space to decide what projects to work on, 4) use islands and slow areas to elongate a successful event, 5) use high paced scenes as entertainment as they are more likely to create a time stamp than conventional entertainment – shows/movies etc, 6) read a lot (if you haven't made it yet) to make time feel slower and get ahead and 7) continue to think of ways to warp your perception of time (journaling is one we recommend). Good luck and let us know if you have other ways to alter the feeling of time.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality … You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). March Q&A 2019 (CLOSED)

Closed thanks! See everyone next month.

****

Market Chaos – Another Crisis Another Opportunity!

Market Chaos – Another Crisis Another Opportunity!

What a wild week it has been in the stock market, bond market, crypto market and housing market! There is so much going on it's hard to keep track of it all. On a positive note, we've always had the same mantra… "Crisis is another word for opportunity". So. Here's a quick list of easy ways to profit from the current market disturbance. Some of it may not apply to you but feel free to remember it for a future downdraft.

Refinance Mortgage: Under the assumption that you already have a mortgage and decided to live in a particular home/apartment for the next 10-years… Refinancing makes a lot of sense. Notice a key item here, we assume that you've already purchased. You don't want to purchase a home if you believe there is a downturn in the future. If you've already purchased a home (say 3-5 years ago), simply get a lower rate on your current loan balance and collect the difference.

While it is true that rates could go even lower, by getting it set up in the next few months or so, you should be able to lock-in a number that is significantly better than your current rate. In the case that rates really drop to zero in the USA, you can worry about that in about a quarter or so. For now, if you bought a few years ago the chances of a profitable refinance in a place you already own is an easy decision to make.

Emergency Cash: Many Americans live paycheck to paycheck. Since we've gone through a massive bull market and most people were chasing stock prices through the end of last year, it's a great time to double check your cash/liquid positions. You're probably spending a bit more time at home and you're probably reducing your travel at this point in time. So take a few minutes and make sure you have enough emergency money to last you several quarters/months. At peak markets, it's not unreasonable to have at least 6 months if not 12 months of run-way in cash.

To avoid redundant questions, yes… the normal number is 3 months and there is no real change. The point here is that a downturn like this is a good wake up call. If you feel uncomfortable in your current position (worried about job loss/income loss) you should re-balance your portfolio a bit by simply stacking up extra cash in the bank. This is common sense for anyone who is worried about losing their primary stream of income. The 3 month rule is used for a "mid-market" cycle.

Ready to Buy: Your average person will not be able to think on their feet. So if you take a look at the prior recommendation, this would put you in a great position to purchase assets on the cheap if things continue to go south. If we really enter into another recession it is smart to have cash piled up. You don't want to sell your stocks/real estate purchases from 5 years ago since that defeats the purpose entirely. For all of our readers (or at least 90% of them), having a year of living expenses paid sitting in cash would certainly be enough to buy a high quality property if the debt bubble pops.

As you can see from the above, if you believe we're at the peak or near it, this would create downside protection for you. In the worst case scenario you're cash flow negative (business crumbles/career loss/job loss) and you're living off a year of savings. In a positive scenario, you are a top performer or your business is stable and you end up buying something nice at rock bottom prices in a year or so. Keeping the math simple, if you already had 3 months of living expenses saved and you can garner a 50% savings rate, this would result in ~9 months of cash building. Not a bad sacrifice.

Investment "Theories": We've already disclosed our view 15 months ago, only adding to cash and crypto while ignoring everything else. If you're looking for the classic view of what to do it would be as follows: 1) cash, 2) gold, 3) TLT/bonds and 4) decreasing exposure to all high debt load stocks. Cash is self-explanatory since we already did this above! On the gold side, the gold "bugs" will be bullish at all times and the gold "haters" will be bearish at all times. The right time to buy it is when we're going into a down turn as most of the returns are in this time frame. From a volatility and risk/return profile over decades, it returns a lower percent compared to stocks but has a lower volatility to it as well… Fits on the efficient market frontier (expected return vs. standard deviation). The third item, TLT, is a classic one that simply says you're betting on bond yields going down. While yields are already low, it has been a solid investment from 2017 onward. And. To wrap it up, even if you believe in the high flying stocks (typically technology, biotech and emerging/new markets), they typically do much worse than the market as multiples come down across the board.

Notice, this is based on historical recommendations and no one really knows what will happen to the crypto currency market. It's a strange one as we realize the paragraph contradicts what we're saying (since crypto is a new/emerging market). Our bet, which may prove to be wrong, is that a fixed asset crypto like Bitcoin should act more like gold and less like a high flying tech stock trading at 40x+ earnings.

Lots of Disruption: One of the comments we made on our twitter account was that *"people complain about the price of success being too high. Instead of just paying it as fast as they can."* This will become extremely clear if we do enter an official downturn over the next 12-18 months. Why? You'll find that many people who agree with the comment above were really just over earning in a bull economy. They didn't actually pay the price (they spent it all thinking they already made it).

If you live in a major city you'll find that many people who appeared to be rich were really spending everything they had. This is way more common than you think. You'd believe that a somewhat senior person earning $300-500K would be saving tons… only to find out that their net worth is right around the same level ($300-500K)! It sounds preposterous but it is entirely true. The reason for this is that most people are incredibly unbalanced. So most people who earn a lot are either out of shape or have poor social skills (spending tons to appear to be higher status, an important "feeling" to them).

In short, if things get ugly, more and more people will lose a lot of money. This will then lead to a belief that the "price of success is too high" and you'll see an increase in socialist type beliefs. The guys who were over-earning? They will find that they cannot replace their income and end up pushing into the same category (wealth re-distribution beliefs). Unsurprisingly, if you lived through the 2008-2009 crash you should be excited since you're ready to buy when things get ugly. 2008-2009 allowed middle-upper middle class people to jump socioeconomically. It was probably one of the greatest opportunities in the last 50 years. We'll go ahead and wager that you'll get one more shot at it over the coming years.

How do you know when the disruption is near the bottom? Well the phrase blood on the streets is simply replaced with "no one physically on the streets". When actual traffic drops off a cliff, the bars/clubs are incredibly empty and restaurants have no problem "filling you in at any time"… You're at the bottom. While many people may be laughing at this simple metric you'll make out like a bandit if you look for these signs.

More Important Matters: You'd think that there is more strategy involved. There isn't. As with most massive things in life, the simple answers are usually the best. Dollar cost average into index funds instead of trying to bet it all on single stocks. Remain diversified across a broad number of holdings. Always have enough cash to avoid selling. Work extremely hard and you'll see your life improve. Go and practice something (anything) for 60 hours a week and you'll get better. So on and so forth.

The more important items are the intangibles. The key item here is social situations. Under no circumstances do you talk about investing or income during a downturn (the days of everyone asking you the annoying "what do you do" dies down since many won't be working). You will have everyone asking you for jobs/yelling at you that nothing is going to recover (ever). So both conversations are not worth having.

In downtimes, you'll get your new contact list without trying. The people who are surviving and doing well will not complain at all. This is a general framework for life. In the first 3-4 months of a downturn most people are "optimistic" as they are happy to get a break from the grind. The pain sets in about 6 months later when many realize they may be structurally unemployed. This is a terrible feeling and you don't want those feelings negatively directed at you. So be sure to comb through your list of contacts as fast as possible.

Quick Summary: If you already have a mortgage and don't plan on leaving it should be quite easy to reduce your costs. If you think we're going to enter into a correction soon then you need closer to 12 months of cash versus 3 months so you can hold through the downturn. Standard investment theory has you buying gold/bonds/avoiding high multiple stocks… we'd add crypto to this (opinion and no history since it was created after the recession). Expect a ton of disruption if a debt bubble pops and be careful socially for a bit, the high quality people will naturally float to the top (seriously you won't even need to look).

Ending on some good news (better news), you should be able to jump a socioeconomic class if you play a downturn correctly. A 20-35% drop in net worth for many people is more than enough to create a "gap" and you can move up within 3-5 years. Also. Since this corona virus stuff has gotten out of hand, we'll be writing more here soon! No more travel is a great thing! Lots of video conferences instead.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending.

****

Maximizing Retirement Accounts and Why They Will Be Meaningless to You

Maximizing Retirement Accounts and Why They Will Be Meaningless to You

Retirement accounts are largely a scam. They are set up to make you feel richer than you are and create a false sense of security that does not exist. Most of the fund managers within the 401K structure also underperform the market making it an overall bad investment. That said, since many people will be forced to work in a Career or Job for their first 3-5 years of life, lets walk through all of the ways to work the system in your favor.

Where to Put The Money

First Priority Emergency Funds: Lets say you're starting your career. Instead of maxing out your accounts it makes a lot more sense to save a chunk into an emergency cash fund first. Maybe you'll hit a recession, maybe you won't. It just doesn't make any sense to take that type of risk when you've got nothing in the bank to start. We used to think that maxing out the account was the smart move since your tax rate "may go up… That is now a dead idea. Instead, first priority is putting an emergency fund away so if everything goes south you'll have money in the bank just in case.

Contribute the Match: If your Company has a match, this is where you'll happily go up to the percentage match. After all, you plan on starting a Business and want to be financially independent before you're 40 (otherwise we have no idea why you're reading the blog!). Since you're all in on being rich young enough to enjoy it, you'll only put in the match. Typically this is around 3-5% or so. Therefore if you make $100K you're going to put $4,000 into the retirement account assuming that the match is 4%. This will result in a total contribution level of $8,000. That is factually a 100% return and is worth it. Even if you pay penalties to pull the money out that is still going to be worth more than $4,000 (post tax).

Contribute to Pre-Tax Only: Never pay the taxes on it up front. Unless you are 100% certain you're going to jump into a new tax bracket within a year (still working a Career for example) then it does not make any sense to pay taxes on it immediately. Put it into a Pre-tax retirement account and get the 100% match. Do not take mainstream advice that taxes will only go up in the future, in fact they may go *down* during this Presidential term. We're not making a prediction since we're not really interested in retirement accounts anymore but if it does change, you may want to look at ways to get it out (more on that below).

Summary: You're going to put away a chunk of emergency funds. Then you'll only contribute the Company match (we no longer recommend maxing out for our current readership). All of this money will go into *Pre-tax* funds.

Choosing the Right Fund

Mirror the S&P: Make the commitment that you're not interested in working a dead end job/career for 40 years in the hopes of enjoying life at 60. Again, we don't think you're in that group given our readership data. With this in mind the money is only going to go into equities. Since you have a 40 year horizon, there is no reason to own a basket of bonds/treasuries/fixed income if your goal is to create a growth portfolio over a 40 year horizon.

Monitor 1x a Year: Every year, the funds may change. Your Company will send an update or add new retirement related products. Simply check to make sure you're still in the lowest cost fund that mirrors the S&P 500. After that you're entirely done with choosing and monitoring your retirement assets. You will not look at the balance. Since you'll monitor the fund choices 1x a year you can go ahead and make sure you received the Company match and move on (wipe it from your mind).

One Time Events

New Tax Bracket Change: If you are going to switch firms and jump up into a new tax bracket it may be worth it to roll over the entire fund into a Roth IRA. *You'll pay the tax on it but you can then withdraw the entire principal *penalty free* in five years.* This is an important point. If you have $30K in a 401K and jump to a new firm that will move you from tax bracket 1 to tax bracket 2 forever… Go ahead and roll this over into a Roth IRA. Paying the tax on it upfront will hurt, but it won't matter because your tax rate is going to go up anyway. After five years have passed you can now take out the principal in a worst case scenario. For bonus points if you move from a high tax state to a tax free state you can avoid paying state taxes. Just make sure your residency has officially changed and then flip the money over.

Real Estate: If you love the city you live in and would like to purchase a property, you can use $10,000 and avoid paying any penalties on it as well. This is another great reason to get the Company match. Lets say you're moving from State 1 to State 2 (a place you'd love to live forever), when you move… it may be a good time to buy that first property. To keep it simple, if you had $5,000 and got a $5,000 match, you're now unlocking ~$6,000-7,000 post taxes despite contributing the equivalent of ~$3,000-3,500 on a post tax basis.

Summary: You're going to mirror the S&P with the funds offered by your Company. Ideally something that is practically equivalent to an ETF of the S&P 500. After that there are two scenarios where you can unlock more value with 1) roth IRA roll over assuming you are certain your tax bracket will change for the next few years and 2) using $10,000 to fund part of a real estate purchase.

That is our summary of retirement accounts and you'll never have to search for it again on this website. We used to recommend maxing them out but… that just doesn't make any sense. All it does is lock up slightly more money for a longer period of time when you should be financially set *well* before you're anywhere near 60 years old. If you're financially set, the money sitting in these accounts are essentially meaningless.

Why Retirement Accounts Will Be Meaningless

When you begin making money from your product based Company, you'll no longer care about your Retirement accounts. This is due to life style changes and the need for cash flow over net worth. Do you really *need* $500,000 in retirement if you're already financially independent? The answer is no of course. If you're already making enough passive income to more than cover your cost of living, there is no need for the extra money that will be available at age 60 (or higher if they change the laws).

Psychology of Retirement Accounts: It seems that retirement accounts were set up to make people feel richer than they really are. When calculating net worth it should always be done on a *post tax basis*. How is $500K in a 401K account equal to $500K in a brokerage account? They are 100% unequal. Even if the retirement account is all post tax money… It still doesn't work. There is a 10% penalty to be paid so it would be 90% of that value. Either way. The account offers a false sense of security because it seems like you have more money than you do. $500K in a pre-tax account is = to somewhere around $250-300K.

Retirement Accounts Offer No Cash Flow: Since the money can't be withdrawn without penalties, it certainly does not offer any cash flow. So for 40+ years you'll see $0 except for the psychology of knowing there is money floating around in a financial system out there… that can be obtained for an outrageous penalty. Without the cash flow it doesn't help you live your day to day life once you're financially independent (money is locked up for over 30 years… assuming you're a millionaire within 10 years).

Forced Check Ups: This is probably the biggest drag. Who is running the retirement account? If you're in an awful situation where all of the offerings are fund managers charging 1% for something that mirrors the S&P 500, you're in trouble. You'll likely underperform the market which is not good. So you'll be thrilled when you you're officially done working and take all the retirement accounts over to Vanguard for the lowest fees possible to mirror the S&P.

Why You Won't Want to Retire

Here is the kicker. Most people (not our readership) long for retirement because they don't want to do repetitive tasks that make someone else richer. Over and over and over again. Instead you'll want to strike it out on your own and make money for yourself (only way to get rich is with a business). Once this happens and you begin making money on your own, you'll have no interest in sitting on the beach all day. You'll be interested in earning money from your new venture.

Once this becomes exciting or "entertaining" for you, there is no turning back. There is no reason to stop earning money from your venture because you enjoy it. *Who would retire from doing something they enjoy?*

The question laid out above is very important. Retirement accounts are set up under the ***assumption*** that you hate working. Therefore, the entire system knows you're unhappy working. Now… Who would want to be part of that system?

****

Maximizing Your Options in Wall Street

This is a throw back post.

Practically all emails we are receiving surround the same topic, internships, job choices and choosing to focus on GPA/majors/experience. Having been on the other side of the table for the interview process it's sometimes hard to remember all the choices we make and how to make the correct one. Many people are out there trying to "maximize" which bank they work for and for good reason as your first major job is one of the turning points in your career. So we will take a look at how you're going to decide where you will work. Beginning at the lowest level on Wall Street… the Summer Analyst/Associate Level.

Step 1 The Application:

When applying for your summer internships remember the screening process. Here's the refresher 1) GPA 3.5+, 2) Finance course work – accounting or corporate finance, 3) Finance internships in something close to Wall Street, 4) Extracurricular activities that show interest in finance or transferable skills. ***The trump card is an internship in Wall Street role.*** With that said most questions that we are fielding surround the "GPA" so here's the breakdown.

1) Always choose an investment banking role over GPA if you want your best shot to get into Wall Street. Always. Even if you have a 3.0 we will interview you. Why? You are a less risky hire and have the credentials

2) We screen out at ~3.5+ GPA, a 3.7+ GPA may be the water mark for some banks, however a 3.5+ GPA and a real internship at a real bank will trump the 0.2 delta every day of the week

3) Double majors… Again review the 4 step process, if you can obtain a private wealth management job instead of a degree in political science…. You guessed it we're choosing the finance resume

4) Regarding the sub 3.5 GPA and banking experience, you will be interviewing with a negative stigma, we will believe you had "preferred selection"… Hope you get the idea, so be prepared for a grilling on your role there and how you obtained the job (see how you're already in the interview room though)

5) Finally, while finance courses are important once you get through 1-2 basic finance and accounting courses it is best to switch gears and get internships close to a Wall Street role.

Step 2 The Internship:

Some people get caught up in "prestige" for the summer analyst role. This is damaging. As always think about how you will be perceived when you interview for your full time role ***"What will be most impressive to my future interviewer?"***… Ding… That they offered you the slot. So when you choose your internship it is in your best interest to research heavily in both the bank and the group. If you have to choose between Citigroup and Morgan Stanley but know that Citigroup extended 90% offers and Morgan Stanley extended 25% offers… Go with Citigroup and interview with Morgan Stanley during the fall recruiting season. Since we want to make you rich and save you time here are some situations and exceptions.

1) Choosing between a dying bulge bracket or a growing middle market bank? Here you choose the middle market bank. If you're surprised re-read the underlined text, getting an offer is paramount, in the fall you interview with your credentials. It is like walking into a party with an 8.5/10 on your arm already… You get the idea.

2) Choose between a sweatshop Bulge Bracket or an easy Bulge Bracket? Simply look at the offer rate. It is only 10 weeks so if the sweatshop has a 100% conversion… get ready to destroy your body with stimulants for 10 weeks. It's worth it.

3) Choosing between an internship in Banking at a small bank or private wealth management at a Bulge Bracket? Again it bears repeating, transferable skills. If you want to work on Wall Street… then… get Wall Street experience. The Boutique or Middle Market.

4) If you do not know which side of the Street you want and have mixed offers in S&T/Research/Banking at Bulge Brackets to Mid-Markets? Choose Investment Banking it is the most transferable, at minimum they know you work hard

5) Multiple offers but your ideal interview is in a week? Push as hard as possible to sign the date late. If you absolutely must choose today you may be forced to "re-neg". This is taboo advice, however, you will soon realize absolutely no one in the hierarchy cares about you so it's best to place yourself at the best bank possible. Ruining a single job offer is not a life ending situation.

Step 3 The Full-Time Offer:

We already wrote about warning signs and how to choose the right bank, however a good summary on how to choose the right bank in an all else equal scenario is as follows: 1) Prestige *(note it does not say "bulge bracket")*, 2) M&A over ECM or DCM and 3) Life Balance. Notice, here we care much less about getting "offers", instead we care more about placing the right "logo" on our resume:

Goldman M&A banking? Front of the line sir.

Jefferies M&A Banking? Middle of the line sir.

Moelis? Front of the line sir.

Quatalyst with massive deal experience? First in line sir.

So on and so on. As written earlier… Pain today or regret tomorrow.

Notably, this is also a great time to address the bitter banker issue when you finish your 2nd year. To be put simply, your ***low twenties are not the best years of your life.*** Instead you have built a strong resume by working at some terrible job, this pain will continue through for roughly 3 more years, at that point it gets much easier. The pay goes up, the hours go down and you have enough valuable skills to be an important asset to your firm.

Conclusion: If any young reader wants to cut to the chase the best thing you can do for yourself is remember the following ***"If I was the hiring manager what would I want to see?"***. A 4.0 GPA in Chemical Engineering from an Ivy League is great, but how does that help the interviewer? It doesn't. So before you take a new job, pick up a new major, or choose a dangerous platform to work for ask yourself the same question and you'll stumble upon your solution 9 times out of 10. This theme continues even as you move up the ladder. Develop valuable skills and your bank account will thank you.

Mayweather McGregor "Fight": Business Tutorial and Controversial Lessons

Mayweather McGregor "Fight": Business Tutorial and Controversial Lessons

Now that the fight is over (Floyd won as expected and we made $$$), we think it is the perfect time to highlight all of the chaos that occurred leading up to the fight. A lot of the items will be controversial and several will be obvious for those with a background in sales/business/sports. The most important part? If the presidency and the fight didn't prove that people are driven 100% by emotion nothing will (notice we don't talk about politics anymore because there isn't money to be made!). Lets jump in!

IMG_6216

Business Lessons

Brand Damage: We're starting with the most obvious one. We got several messages and read a ton of websites that suggested *"Floyd Mayweather is incentivized to throw the Fight"*. Immediately, our response was the same: *"Ask us how we know you've never run a meaningful business?"* The message is clear and to the point: Brand Damage. If Floyd were to throw the fight he would lose significantly more money by killing all of his boxing revenue: the gym, the TMT store, all endorsements and of course his image as The Best Ever. The funniest part of the entire debate is that people believe Floyd is all about the money… then decide he would throw the fight. That doesn't make any sense at all because he would lose somewhere around $1 billion over the course of his life by throwing the fight.

Consumers Always Take The Bait: We saw our media version of cloaking with the fraud video of McGregor "Ko'ing" Paulie Malignaggi in a sparring session. The media stunt worked with the spread on Mayweather falling from -700 to -400 or so (some places went as low as the 300-350 range) which is absurd. Broadly speaking, people want to believe in the underdog so they fell for the bait and took the entire story hook, line and sinker. If there is one thing that won't change? Average guy always believes in the underdog because he is a reminder of himself… a guy who never had a shot in the first place.

The second part of taking the bait is the real ***entertainment*** opportunity that has now opened up. The real move here is for a fight between Paulie Malignaggi and Conor McGregor. Since they now have a clean beef with fake footage and outrage from Paulie, your average consumer would pay for the fight. That said, since the "jig is up", we doubt the fight would happen since the above average person would know that Conor would lose again (not to mention the significant brand damage for Conor McGregor after another loss). The entertainment value gives it a chance though. While we give it a 0.1% chance of ever happening, if Conor needs money he can always go down this route to make a few million. End of the day… Too much brand damage now that he has his own athletic business. But. It would work for entertainment dollars.

IMG_6215

Marketing is King – Three Steps: The media has done a great job of portraying Floyd Mayweather as a typical boxer who has financial problems. They went so far as to say he owes a ton of money to the IRS even though 30 minutes of research would reveal that he locked in a different investment vehicle to capitalize on a higher return on investment. This was an important step in the marketing process because it gave Conor some fodder for the pre-fight conferences. It also caused people to look into Mayweather and learn about him (the MMA fans that is) and gave them yet another reason to hate him (anyone remember what people said about Donald Trump's taxes for the entire election cycle?)

The second step was Mayweather. He had to find a way to make it seem like Conor had a chance (practically no shot, we had 1:20 due to a DQ or something strange like breaking his own hand). So he went into repetitive talking mode, similar to a sales pitch, stating ***on paper*** Conor has a shot… *"He's a lot younger. When you look at myself and Conor McGregor on paper, he's taller, has a longer reach, he's a bigger man from top to bottom. He's a lot younger, so youth is on his side… And I've been off a couple of years. And I'm in my 40s. So, if you look at everything on paper, it leans toward Conor McGregor."* – Floyd Mayweather. After this… He continued to thank the MMA side for putting the fight together and acted as polite as possible… until the end when he guaranteed the fight wouldn't go the distance during the weigh in… this is marketing 101! He never said he would lose, he just gives people a reason to show up to the fight. If people think Conor has a chance that means more PPV buys, more people in seats and more money for him.

The third step was covered above. You had video of Conor doing well combined with Mayweather saying he was inactive making it possible to get hit during his own training regimen. Combine those two items and the masses believe in some dude with a chest tattoo. Watching all of this unfold was beyond brilliant.

The fourth and final step was hyping the fight up as a brutal one (this took the entire duration of the hype phase to work). Mayweather went on to say he would "go to Conor" which was just code for fighting in the pocket and throwing consistent lead punches… killing any sliver of hope that Conor had. Both fighters said the bout would not go the distance. Conor stated it would last 4 rounds and Mayweather guaranteed on Jimmy Kimmel live that it would not go 12 rounds. This resulted in a perfect set up since most people don't want to see a round 1 KO and they don't want to see a 12 round boring fight. For some reason, the general population (regulars) want to see something in-between, which is what they were essentially communicating.

Will This Be Good For Sports? This will be interesting. Our guess is that this will be a positive for both boxing and MMA because it is a form of cross pollination. If you ran a website that sold yoga pants and expanded into other sporting wear for women… There would be a good chance it worked but not a guarantee. This is similar as you have two types of combat sports combining for a day to see if they can get more dollars out of each pocket (MMA fans spending to watch boxing in the future and vice versa). The second part that makes it interesting is that Mayweather is forty years old. If Mayweather fought at age thirty… The fight would have lasted 1 round at maximum. The timing is actually quite good so we think it'll end up being a good long-term decision. Conor doesn't look terrible losing to an older guy and Mayweather didn't have to KO him in a single round so it looks more reasonable than it actually was. ***Perception is reality*** and they did a good job making this fight seem legit.

Controversial Lessons

We're going to make a lot of people mad with this section but we'll go ahead and do it anyway. There are a lot of controversial topics here and some of them are definitely painful. Ranging from racism (still exists today) to people being taken advantage of. Nothing you can do about so no need to worry about it but here we go…

Who Bet on Conor? We're not overly cynical here so we think the vast majority of people don't know anything about sports which is fine. Your average guy who thinks that Conor had a chance is simply a regular or a fool. They have no actual fitness experience and might look decent since they went to the gym… But they are simply not athletic. They are the same people who believe that "elite" training is about periodization and peaking at the right time. That level of knowledge is given to 14 year olds who competed at the high school level. To emphasize this, the vast majority 98% of people, are not athletic or knowledgeable about the top 2% in any shape or form. So we'll say that 98% of the people who bet on Conor just don't know anything about sports (nothing negative to say) just "smile, nod and agree"

The second group of people are the emotionally attached. We have nothing bad to say about MMA, Conor is a top athlete in his specific sport… that said… It's not the same as boxing. The hardcore ***MMA*** fans and the hardcore ***Ireland*** fans voted heavily on Conor. These guys were simply blinded by emotion. Nothing negative here, it is simply human emotion: 1) dedicated MMA fans and 2) patriotic Irish citizens. The good news is that you should look for these people in the future. If you see another lop sided bet like we had here, you can find these people and make wagers against them in your favor. When people are emotionally attached you should hear the cash register ringing in your head.

The third group represents the scum of the earth. Actual racists. You can spot these guys because they had to show their cards. Look for people who 1) claim to be athletic experts and 2) somehow thought McGregor would win. This is the ugly side of the chaos that ensued over the last couple of months. They cannot hold both beliefs together at the same time. One of them must be false. We're going to be careful and make sure that spotting is done correctly: Step 1: before claiming the person is racist, make sure you check their financial incentives. A ton of the guys who said he had a chance are making money off of the fight so they are doing it to get more people to watch the fight (ESPN is an example, more controversy = more viewers so someone has to take the other side). This is the vast majority. Step 2: if they make nothing from the fight, you'll have to do your own research to see if the person is an actual expert in sports or not and finally Step 3: if they are experts and don't make money from it… make sure there is no emotional attachment: huge MMA fan, Irish, involved specifically with McGregor etc. After checking all three boxes… chances are you've met an actual racist. An extremely small portion of the population, but you now have a clean way to see if someone is an actual scumbag.

Drugs in Sports: Now that we're seeing more and more athletes get busted for drugs it's time to let the cat out the bag. Any smart athlete in the top 0.1% is on drugs of some kind and it would be foolish to avoid them. Sure they are not on millions of dollars of drugs 24/7… But. They are using drugs. How else do these athletes come back in under 6 months from serious injuries such as torn ACLs? The answer is drugs. Besides, with $100M+ on the line what intelligent person wouldn't max out all of the rules he could? Even with blood tests, there are still many ways to get your body to near maximum numbers without tripping the alarms…. To kill the last shred of hope that pro-athletes are "clean" just ask yourself an honest question. If you were borderline professional, the difference between say $1M a year in salary or $60K a year in a development league… Would you look into how the tests are done and maximize your chances? We can all be realistic when it comes to the real answer.

All that said, it would be wise to legalize them to some extent. It's a bit of a predicament because going overboard on drugs results in death and on the other side, low doses result in improved recovery time (injuries) and performance. There is no magic drug to make someone athletic anyway. Even if someone had talent (top 5%), with drugs they would not beat someone who is in the 0.1%. It's just not going to be enough. The rules should be given some more wiggle room. Find out if HGH should be legal for injury recovery. Look into the numbers needed for max performance and make that the cut off. This way, everyone is using the same exact amount since overdosing isn't beneficial (it would actually lower performance long-term). In the future, we wouldn't be surprised if the rules change… It is just far too complicated since encouraging drug use could also lead to severe issues (young athletes using them and killing themselves as well)… At the end of the day, we'd say some sort of NDA agreement for all pro-athletes and those about to go pro would work. The leagues could then allow low doses, making everything clean and younger athletes wouldn't know the truth unless they made it to the big leagues in the first place.

Anything for the Money: Now that it is crystal clear that the entire event was just a spectacle… Everyone knows the truth about the power of marketing. They hit a sweet spot where they capitalized on the masses. Your average guy isn't an expert in anything so illogical things such as "boxing gloves make it impossible for a TKO/KO for Mayweather" made sense to them. In fact, you probably heard such arguments leading up to the fight. The only reason they lowered the weights for the gloves? You guessed it… Marketing (made the fight *seem* more brutal).

IMG_6214

IMG_6213

The nasty part is the lengths at which they were willing to go (we got the round off by one but oh well – Mayweather had to make it look close to merge the two businesses). They embarrassed Paulie Malignaggi for the money (he should have known better since Conor knew he had no chance as well – went so far as to say he wouldn't even bet on himself). They took your average consumer for a ride with huge mark ups in Vegas. And. They also cashed in an ungodly amount of promotions. While the fight hype and set up wasn't all that bad, the darker side should immediately come into question. If a large fight with a ton of built in demand still went through all of these hoops… would a poor person be willing to give you fake information on the internet? Would that same person be willing to sell bunk products at 100% mark ups? Would they sell re-packaged junk and say it's a new innovation? For those that have read Efficiency they know the answer and how to spot it.

Get Ready for the Hate: As we described in a prior post, the average person roots against the favorite 99/100 times. This was no different. Mayweather has been the heel for years and that naturally means… He's the best. The real underlying point is to avoid fame. People who want to be famous and successful will end up receiving death threats, tons of negative attention and forced to live a life "on guard" at all time. While there is nothing to be afraid of, getting rich first then deciding if you actually want fame is a much better set up for the future. The more recognizable you are the more hate you'll get. You'll also find that you have a lot more "friends" who ask you if you need "help" with anything. All of this is just code for ways to get money (angling). Even if you are relatively unknown and rich, a small number of people will leak information which just makes you a target in the future.

With that we'll leave you with our favorite tweet during the fight. And. As you can see, this entire post was written before the fight even began (hence the time post immediately after the win).

IMG_6223

On a final note… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like our book **Efficiency**. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career **and** the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (*the basics and all you need to start*); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it and 9) How to do all of this and maintain a normal social life (avoid choking off your personality).

****

Message To the Financially Independent

Message To the Financially Independent

We have gotten a few requests to do a post tailored to the older crowd ie: people in their thirties. The reason why we do not focus much on people in their thirties is because most people have "made it" or have not by this age. We have relatively normal standards on here and believe $1-2M by you early 30s should be the bare minimum to give any sort of life advice. Lets go ahead and cut the center and assume you are worth $1.5M or so by the age of 33. You have 27 amazing years left before physical decline really hurts your quality of life so let's make the most of it.

Step 1: Elimination

You followed the rules on this blog and took advice from people who matter. You didn't listen to foolish middle class people giving advice on how to get rich when they only make $200K a year at the old age of 35. **You knew better.**

Similarly, now that you look at your bank accounts and realize you can live off of ~$7K a month pretty easily anywhere in the world, it is time to maximize your good years. You are a bright person so you know the rules, you don't burn any bridges by suddenly quitting your career for no good reason. Instead you begin eliminating items that don't make you happy.

Samples below:

Problem clients. While they pay well you're unwilling to work with them anymore at the cost of ~10% of your total pay. There is someone in the firm (younger no doubt) who would jump at the chance to work with this psychotic client. Hand it down. Not only are you going to make your life better in this transaction, the higher ups will more likely than not see you as a leader who is willing to give people responsibility! Maybe you take a short-term pay hit, but nothing can compare to hitting call forward on all of their calls and emails going forward.

In addition, maybe you're the person running the Company. In that case, delegate the bad work to someone who wants it! With a couple million dollars and no reason to service the client, it is better to hand it over to someone who will do a good job. Your lack of enthusiasm will show. You know it. The client knows it. Make the move.

Downsize if necessary. One issue that many higher net worth individuals have is… Lifestyle inflation. Stop it right now. You don't need to have a 3 bedroom apartment if you are a single guy. At max you may need two if you work from home. In addition? Please do not spend your money on multiple declining assets (cars) that you'll never use. You're going to burn money and time that could be spent on developing new relationships and even running game.

Don't get us wrong, if you're successful and worth 8 figures, then feel free to keep your toys. The point is simply to downsize if anything in your life is causing you stress. Stress is no longer in your life.

Chores, Errands and Other Time Wasters: Now is the time to get rid of all the annoying items that used to take up a few hours per week. No more laundry, no more parking (valet every time), no more connecting flights, no more cleaning, no more time wasting organization! Forget it all and delegate when possible.

Back when you were young and trying to put away a decent financial nut, $500K or so in your 20s, you were likely doing all of these things to reinvest in yourself and appreciating assets. No reason for that anymore. Sure this may cost you $500-1,000 a month but who really cares at this point? You're creating time to enjoy life and again… Eliminate stress.

Step one is now complete. You have adjusted your life to free up a significant amount of spare time. You did not foolishly quit your career or company and instead have optimized your life to see what exactly you like and dislike.

Step 2: Quality Of Life Changes

The first step takes roughly 6 months to complete. You'd think it would be easier to pass clients down and reorganize some fixed expenses (downsizing if necessary) but it really does take 6 months. Now you have a much better lens to look through and its time to improve the quality of your life with your new routine.

The Money Question: Many people find that after they eliminate the major headaches from their career or business that they actually enjoy it even more. You will be positively surprised to find that a few major items can really cause 80% of the problems. Get ready to ask yourself the money question, how much of my time do i want to spend on making money?

This is going to be a tough one to answer. Naturally you do not trade time for money but the business processes and clients need to have oversight. Everyone will be different as cliche as that answer is. Simply look at yourself in the mirror and ask if you really want to work the same number of hours or half as much. Generally speaking, most people end up working 30ish hours per week managing projects, researching new ones and jumping in for the occasional headache here and there.

Second Home Base: It is fun typing this section, since the successful readers already know where this is going. By the time you're in your late 20s you were hitting your stride and already traveled to your fair share of international destinations. You liked one of them the most. You are setting up a second home base.

Instead of having one place to call home you now have two and can adjust your new lifestyle to allow for 3-6 months of living in the new location. Naturally, you are already tired of constantly going to new places so you begin establishing a "presence" there and once and a while you can go ahead and take a trip to a new destination. At the end of the day… You already know that you have one spot in mind after visiting 30+ places by yourself already.

No More Alarm Clocks: You've been waiting for this one… for years! Before you were like the latest rap video trying to crush sales numbers every single week… Week after week after week!

http://youtu.be/om07MCkuTM8?t=3s

No more.

Instead you're now in position to set up a consistent and healthy sleeping schedule. Don't get it twisted. You're still going to wake up early since you know its the easiest way to stay ahead of the competition and make the most money. The difference? You no longer have to work those late nights for the unnecessarily intense client. You've got consistency at this point. Which means, smooth sleeping patterns.

Step 3: No More Worries

This is now your number one enemy. Worry.

Under all circumstances you must avoid this monster. Do not do anything that will cause it to awaken (unnecessarily risky investments, debt, marriage etc.). Here is a good rule to start it off. ***If you have to think about it for more than 48 hours and it is not going to make you money, it is a deal breaker.*** Do not think about it for more than a second. Simply say thanks but no thanks and move on with a smile from ear to ear.

Step 4: Follow Your Interests

We're getting to the tail end of the steps here. Now is the time to follow any all interests that you have. Maybe you want to invest in real estate, maybe you hated our comment on cars and want to build a modded up super car. Go for it!

Just remember to avoid tripping up step one and three. If it is going to cause you to have an actual headache, then go back out there and make a few thousand dollars extra per month until you can buy it **worry and stress free.**

Most people will tell you to "follow your interests and passions" from day one. All of these people of course are con-men. Trying to get you to work for $150K or less (wasting your valuable time). At this point you're already free so you can go ahead and pursue that interest of yours.

Step 5: Health is #1

Again you already know this but this needs to be the final step. The reason why worry and stress are to be avoided is because your health is going to be your new #1 priority. This does not mean you live in a bubble, it means that you do not do anything that is going to severely damage your health. Nothing.

Parties, drinking and drugs may be your main interest, just be smart about it. Most people are not smart about it, but if you can intelligently use these things to your advantage (house parties and simply abstain) then it can benefit you to no end.

With that small warning out of the way, feel free to party just don't spend any good years of your life in the hospital.

Recap:

So there you have it. Once you've made your way to becoming relatively rich (about $1.5M at age 33) it is time to 1) eliminate stress, 2) get rid of all worries, 3) save yourself a ton of time and 4) downsize all unnecessary fixed expenses.

Now everyone can see why we do not bother with longer posts that address this topic. The key is really quite simple if you're already at this level. *Do anything and everything that makes you happy, do not do things that make you unhappy.* We do not care what your hobbies are, if you cannot find a way to be happy knowing that every second can be spent doing what you want… then we cannot help. Naturally? Practically no one has this problem.

This is exactly why people who say "money doesn't buy happiness"… Don't have any.

****

Millennial Generation is Going to Be a Group of Haves and Have Nots

Millennial Generation is Going to Be a Group of Haves and Have Nots

For fun we decided to look into the Millennial generation which consists of people born between 1981 and 1996 (22-37 years of age). It's an interesting age group as a chunk of them graduated only to see the Great recession and the ones that are even younger on the age bracket are racking up Student Loans at an alarming rate. We had no idea that 80% of the entire millennial generation had less than $9,999 saved. This is a startling number to say the least. In fact, all it does is prove that small amounts of entrepreneurship is the best way to go, asymmetric risk is the name of the game if someone's net worth is that low. In this post, we're going to outline our own strategy if we had to start over again and also outline benchmarks for multiples of annual spending that someone should have saved (by age).

Ignore the Macro Picture: At the end of the day, the macroeconomic picture doesn't mean much for you. If you have no money, having your net worth go from $10K to $5K… is not going to change your life. That's equivalent to about three months of unemployment checks. Don't worry about things that are out of control since you're essentially starting from zero. The only way to take control of your life is to have individual value that cannot be replicated by a machine. So instead, as usual with this blog, we'll focus on the microeconomic picture and how to fix your own situation first. Fixing the world is something you can noodle on when you're rich.

Microeconomic Environment: There is no nice way of putting this, unless you're able to make the median wage which is around $50-60K a year… You don't deserve to have any fun. Those invites to get drinks and travel are officially canceled. We've seen a lot of young people party hard in College only to end up with no job offers, debt and a belief that life is exciting and fun with no repercussions. As they say *"life comes at you fast"*. If you can live at home… Do it. If you can't find the cheapest possible place and get your income up by working two jobs if needed.

Living With Nothing Sounds Terrible: Yes it does! It's terrible because the situation is essentially a war zone. People have a hard time thinking about compounding and losing a single year in your 20s with no money means you typically have to work multiple years later on in life. Want to put this in perspective? *If you saved one year of living expenses today… or you saved 10% of a year of living expenses for **~17-18 years straight**… you'd get the same rough result.* That is mind boggling when you think about it. It means you're better off throwing money into investments all at once and early. Much better than the ridiculous strategy of saving "10% per year" forever.

For the people that love numbers out there, we'll put some realistic money to work. If you were to save $50K in a single year or $5K per year for 17 years straight… the person who tossed in $50K would now have $157K and the "consistent" saver, would have $154K. If both people were age 23 when they started it means they are both 40 years old with the exact same net worth. Insanity. As you can see this is an obvious set up for our argument based on ***event*** income.

Starting Over, What to Do: The answer is always the same: asymmetric risk. You have to start numerous online companies, consulting companies… hell… even a blog generating a few thousand bucks would be fine because you have zero dollars to start with anyway. This is exactly what we would do. We would take a look at three types of work: sales, entrepreneur and services. The last one is a change of tune from our normal advice since the person is falling behind every single day. Services is an area where you can make well above minimum wage and is also an area where automation is unlikely in the next 10-years.

Services Jobs: What is a services job? It is a job you accept as an absolute dead last resort. ***You go to dead last resort positions when you're falling behind.*** Falling behind is defined as your net-worth no longer tracking to the numbers at the end of this post (net worth relative to annual spending). Services positions that have good paying incomes include: nurse, air traffic controller, plumber, technicians, auto mechanics, electrician and more. If you get good at any of these things that also funds a low-income blog about said profession: You Tube videos on fixing stuff essentially.

Getting Into The Numbers: Study this chart and take it seriously. Since you're reading this blog we sure hope you're not interested in saving 10% of your income and retiring at age 65. The goal is to get rich ASAP and leverage your time since money is always going to be there anyway. It is certainly a lot easier to sleep at night when you're not worried about paying bills that's for sure.

The chart is clear as day but we can assure there is no confusion. If you spend $50,000 per year, it means that you want to have ~$500,000 by the time you're 30 and $1.25 million by the time you're 34. Like everything else in life, if you're making smart decisions your income actually grows exponentially and your net worth ends up generating large amounts of money for you ($70,000 is just 7% when compared to $1 million dollars). We use 21.5x total living expenses as a rough proxy for when you should feel "set". To wrap this up, we use multiples since we have no idea where someone lives. Perhaps you can live on $30,000 a year and feel great… Others might need $120,000 per year. That's not as relevant as the multiple since it adjusts for this naturally. In short, if you're behind on this graph it's time to delete everything: Facebook, Twitter, "beer nights with friends" so on and so forth. If you're on track with this graph feel free to do whatever you like since the difference between being financially set and financially set times 1.5x or 2.0x isn't really going to change your mental health much.

Just Get Over the Hump: The numbers look daunting since they accelerate. The reality? If you get over any of those bars earlier it means you'll blow through the next several years. For instance if you had 10x your annual spending at age 28… you would hit your number at age 31 without contributions (simplistically, assume 7% returns which adds 0.7x incremental at 10.0x). Putting it another way, all you really need to do is "generate income to survive" if you're able to get over the hump earlier in life. Just like physics, objects in motion stay in motion… applies to finances as well.

Front Load All of Your Work: One of the interesting conclusions from this math we've done is that you're better off shoving all of your work into the beginning of the year instead of spreading it out through the full year. Why? Well you can hit your needed investment amount then forget about it. Lets say you're behind and need to put away $40,000 (we made it up), well your best option is to live like a monk for the first half of the year working like a dog and then when you clear it you can forget about it like a bad dream. This creates a forced acceleration effect. If you've already hit your needed investment amount it is unlikely that you'll go negative for the remainder of the years. If the prior statement is true then you're going to be well ahead of all the bars listed in the graph above. Unsurprisingly this is exactly how we operated before becoming financially independent. Try to generate as much possible money in the first 6-8 months of the year and then move into relaxation/fun mode for the last 4-6 months.

Moving onto the Fun Stuff: Well if you've been following along for the past 5-6 years you already know that less than 1% of people will ever listen to the advice on this page. They are more interested in watching Sports, Netflix and debating politics. Since we know two things: 1) millennials are broke and won't have many options and 2) the richer part of the population is getting older… this creates a pretty big business opportunity. The two options are essentially hedonism and healthcare.

Millennials are going to spend all of their money as they view their future as bleak and impossible to overcome. Even though math says it is possible, they are more likely to spend their money on life experiences. This means travel, alcohol, concerts etc. Similarly, their income will go up so you can imagine that more and more foodies will make a good living in the future. On the other side of the equation is the aging population. The people in their mid-60s will spend large amounts of money on healthcare, travel and potentially dining as well.

Massive Inequality: Think about it like this. The number of people willing to work hard is already around 10% maximum (hard work meaning solving problems not something worthless like working long hours). In addition, 80% of people are already behind and have to play catch up. This means you're left with around 2% of the population to compete with (10% times 20%). We didn't even adjust for people with low IQs, people with immense amounts of debt or people who have already hit age 30 with next to nothing to their names. Oh and by the way… many of the guys who are on track now will likely suffer a divorce or another major emotional mistake setting them back as well. This means you're going to see a big big gap between the rich and the poor going forward as ***the rich people will be the only ones with an ability to produce.*** Attempt to have wealth redistribution, we wouldn't even mind. Why? In 10-years the picture would be the same since the number of producers would be small at under a few percentage points versus the consumers with no tangible skills to earn money (only able to spend).

Positive Note: Since this has been a bit of a sadder post we'll have our Q&A on Tuesday the 20th. Remember the only one you should look out for is yourself.

****

Money Changes Your Life

Money Changes Your Life

The problem with being rich is that it is relative. With our focus on single individuals, we'll go ahead and outline a change in thought process as you inevitably move up *levels* in the game of life. We've always had the same belief regarding income and net worth multiples. The simple axiom is as follows:

"Double your net worth or your net income and your life changes"

You cannot start doubling from zero, but we'll start there and walk through some of the changes you'll see as you move through the ranks. *(Key note: we <u>do not include retirement savings in net worth, it counts as a zero</u>)*

Zero Net Worth: At this point most *future successful people* will have extremely high levels of will power. Will power actually *declines* as net worth and income go up because there is less reason to "sweat the small stuff". Details become less relevant as earnings and net worth accelerate. Starting at zero? Everything matters.

A good way to think about net worth when a person has nothing? Constantly envious of what other people have. Any moderately competitive person is going to be unhappy during this time period as they see… every single day… that they are no where near their potential.

This is normal. Anyone in this stage is ready to do anything (and everything) to gain some traction and this includes insane time sucks such as working for a low hourly wage. Willing to trade time for money. There is no other immediate way to pay bills and start moving in the right direction.

A classic trap for the masses and most never figure a way out.

No time for fun because if a person has $0 to their name… they don't deserve to have fun anyway.

$100K Net Worth: At around this point most people begin to feel some baseline level of security. Lots of effort (defined as hours worked in this rare instance) and money are at least *somewhat* correlated.

Anyone who reaches this modest level of net worth will know with certainty that anyone who claims hard work does not lead to more money (a minimal amount at least) is a complete liar and likely a failure at life as well.

Instead of doing anything for money, most in this camp will begin thinking in terms of "highest income per hour". They haven't escaped the trap yet. Instead they calculate how many dollars they are making per hour as that is their new way to free up time.

Generally, most of these guys find "quick hustles" to make a few hundred dollars here and there. Instead of using their *<u>valuable time to build a new skill</u>* they will usually invest free time in finding hustles for an extra $3-5K a year with all their extra time.

$200K Net Worth: Assuming a person successfully kept a decent job (typically a salaried employee), they begin falling into three categories at this point 1) frugality, 2) laziness and 3) scale. Right around this range most people have the ability to slack quite a bit. They will feel financially secure with a six figure bank account.

In Group 1, the person typically buys a home with the majority of the net worth as a down payment on a home. Then. Begins large and material cost cutting initiatives across the board. Minimal water bills, minimal spend on practically anything and moves towards home improvement (done by himself) to keep gaining momentum by essentially spending less… all cash flow goes to that mortgage.

In Group 2, a dangerous "YOLO" lifestyle is brought into play and the person sees his net worth stagnate to a rate of around $10-15K moves per year. Instead of trying to gain at rapid rates, he spends his time using his additional income because he doesn't have a care in the world. This group is hit enormously during a recession and feels the real pain in their mid 30s as new skills were never developed.

In Group 3, a killer mentality usually comes out. This group sees that they are ***<u>being used</u>*** to make money for someone else. ***<u>"No one is going to hire me unless they are making a profit off of me"</u>*** is what they realize.

They are right. They find tangible skills to create a business as soon as possible.

$400K Net Worth: We're down to two groups of people. People who picked up <u>*event* driven income</u> which we have talked about many times in the past (windfall earning typically due to ownership) or you have your frugality guys.

These two groups will never get along, although in some strange cases the windfall people also live frugal lives (they become disgustingly rich in the future). We're in group one.

We have nothing but distaste for frugality type people as they have wasted their *<u>own valuable time</u>*. Instead of building something of value they spend time eating beans and rice. They are typically smart people and instead of using their brains to make hundreds of thousands of dollars more per year, they spend it finding ways to reduce their costs by tens of thousands per year. ***<u>There is a floor to saving and no ceiling to earning.</u>*** That is where the mentality changes.

$800K Net Worth: Generally, if a person has made it this far, there is no way they're earning less than ~$200K per year (unless you're old but as we stated your 401K does not count as net worth). The math simply doesn't work.

If you were making $100K – $18K (retirement) – $22K for tax, healthcare, social security etc… You've only got about 60K per year and it would take almost ***twenty five long hard years*** to save to $800K (assumes 50% savings rate reinvested).

Your mentality is certainly not the same anymore. Your time is far too valuable. At around this point, you're becoming unattached with regular people and it is extremely difficult for anyone to believe you are who you say you are. The vast majority of people will believe you are a liar so you begin to *lie down* to skate under the radar.

You'll find that most people are not happy for you and your tolerance for opinions that are not backed by actual success… declines at alarming rates. Good riddance to 80% of your smartphone contacts.

<u>All You Care About is Scale at This Point.</u>

$1.6M+ Net Worth: Most will go through one of the following: 1) drug addiction, 2) alcohol addiction, 3) family fall outs, 4) "friend" fall outs and 5) a complete disconnection with anyone their age. As a reminder, we are assuming you've been a single person this whole time (defined as no legal marriage) and we have no doubt at least one of the major issues listed above will happen. It is only a matter of time.

1) Drug addiction: Typically cocaine. This seems to be the general escape for most and it could lead to a long-standing downward spiral. Thousands of dollars per week spent on insane party habits.

2) Alcohol Addiction: Showing up to run your business reeking of booze… on a Tuesday morning. Typically leads to dropped balls for clients/customers… consistently… for a long period of time…. at least a ***<u>year</u>***

3) Family Fallout: Quite common as well. No longer interested in any family member or group meet ups as it is not worth your time. Unhealthy belief that *<u>usually changes quickly (6 months or so)</u>* if your family has been good to you.

4) "Friend" Fall Out: Your list of contacts will shrink instantly in the 12 month period after reaching around $1.2M in net worth. Only a handful of people will be happy for you and of those people… most will be rich as well so they will understand everything that is happening as you transition to your new life.

5) Complete Disconnection: This likely contributes to all of the four items above. You won't be able to have many friends your own age. Most will fall into one of these categories: 1) jealous, 2) think you are lying, 3) hoping you will fail. You can read it on their faces. You will tell them something basic about your life and they will then constantly question it later in time about 3-4 months in the future. They want to see if you're a liar to highlight number three… Once you realize you're being interviewed by someone who isn't in your ball park you begin to despise them and cut them off forever.

Long-term? It is better for everyone.

Now that we've passed the "bad part" about getting to your first $1.6M or so, it's interesting to note the change in thinking and how this will be a "tell" in the future if you're speaking to someone who is well off. If you've made it to this level you'll get to $2M pretty quickly but here's the more important part when you're around new people and want to know if they are rich.

The Tells

1) Doesn't seem to care about who is around him/her. Meaning he/she is there to speak to one person usually and doesn't care about anyone else in the group because in the back of his head he is thinking "I don't have time for XXX".

2) Not phased by brand name clothing, cars, celebrities, athletes or "job titles". Sure some rich people are extremely insecure and are "all about that life" with high end brands etc. However. None of them will be *phased by it*. This means either the person will wear the nice brand without even mentioning it or they will wear items with no brands anywhere and not care. Subtle but important.

3) Generally more emotionless. Being emotional is a big burden if someone wants to get rich. Emotions are used to make money and if you have an enormous amount of emotion, it will be difficult to make tough un-emotional money making decisions. Reminder that all items are sold for pleasure or pain… emotions and feelings, nothing more.

4) Eccentric. This is broad, but if the person seems to be eccentric that is a dead giveaway that the person is either dead broke or extremely well off. You'll be able to tell the difference when the check comes so it won't take much longer than one hour to figure out.

5) Decisive. This has been proven over and over again. Wealthy people are generally decisive. They make a decision and move on living with the consequences. They do not prattle along with diatribes that go nowhere. They cut and move.

Now for the final obvious kicker as mentioned at the top… The only interest becomes **scale**.

Scale means the following: how much recurring benefit will i get over the next 10 years if I invest X time into doing this task. Once this philosophy sets in, it never changes.

Why would a person spend 1 year of effort to see a perpetual income stream of $10K a year, when one year of effort into another task would lead to $50K into perpetuity. Life becomes more about cash flow now and the future becomes irrelevant so *rich people are constantly living in the present moment.*

A person who is well off (our definition is never has to work if he/she doesn't want to) then they have no interest in delayed cash flows. This is why floating and working capital metrics become more and more important over time.

Summary

At this point, we now realized all we've done is help gold diggers look for the signs of a successful person if they run into them at a high end bar. Oh well. But on a more serious note understanding the changes in belief systems is clear:

– At zero one believes any cent matters and will power is the only item they have to gain traction

– At around $100K they start looking for "high efficiency" time for money to have a personal life

– At around $200K most begin to relax and live that "yolo life"

– At around $400K you see a clear split between frugality and scale moves (scale always wins)

– At around $800K you become much more disconnected to society, uninterested in anyone who isn't in the same league

– At $1.6M+ all you care about is scale, scale, scale and cash flow that you can use yourself

Finally, as one last note, we're outlining these general beliefs as we've seen assuming you're young. This is why we've excluded all retirement funds from net worth making it excruciatingly difficult to hit these metrics without material success when young.

****

Money. How Much is Enough?

Money. How Much is Enough?

According to a recent article, Warren Buffet believes doubling someone's net worth won't make them happier. We of course disagree. That said there are two sides of the spectrum, doubling someone from $10 for example to $20, doesn't do much. Similarly, doubling someone who has $1 billion dollars or more (like Buffet) is not going to change their day to day life either. Somewhere there is a line in the sand and we'll go ahead and outline our own mathematical way to come up with optimal amounts of money. Remember, the vast majority of rich people are extreme risk averse and boring. They don't believe in touching principal so our numbers are likely on the aggressive side if you were to poll a large number of well off people.

Age Matters: While everyone learns the "discounted cash flow" analysis in college, we'd say the value of money declines at a *faster* rate as you get older. This means a dollar at 80 years old is probably worth 1 cent compared to a thirty year old. This is less about compound interest and more about visiting a hospital and seeing what life is like when we're old. If you're in amazing shape we'd say the "good years" are from age 20 to about 75. Very big range. And. The point remains. Would you rather be 20 years old and have $500K or 80 years old and have $5 billion? The answer is clear, $500K since your time is limited. (yes we'll keep it simple and assume an expected life span of 85 years old).

Since this is a net-worth post we'll put the numbers up: *Age 30:* $2million, *Age 35:* $4-5M *Age 40:* $10+ million. If you're able to hit any of these numbers the incremental net-worth isn't really going to change much. Maybe some of you already own private jets and think these numbers are small (great!) that said, the life style is very difficult to change if you get into double digit territory at age 40.

With the numbers out of the way, the question is "why is it much lower"… the answer is you're going to work. It is not fun waking up every single day with nothing to do. Take a trip back in the time chamber and remember "summer vacations". Unless you were born rich, summer vacations were pretty boring since you had nothing to do. While you can solve some of this boredom with classic hedonism, the challenge of producing is exciting in a different way. Some people actually love working all day (bless their souls) and end up ultra-rich.

Mathematical Explanation of the Numbers: The reason why money is one of the rigged games in life is due to momentum. When people see $2 million or $4-5 million, they assume there is no cash flow. This is practically impossible! Unless someone stops entirely, they are going to generate multiple six figures while maintaining their net worth. Why? Well the only way to get to a few million that quickly is by generating a large amount of money. When you think about it that way, you'll see the snowball effect take place. We'll use basic numbers of 5% on investment returns and unless you develop a terrible addiction to drugs/alcohol/materialism… it's difficult to fail.

At age 30, if you made it to $2 million, it means that you've saved an average of $160K per year (roughly). For fun if you want to check this math, plug in $160K in savings per year multiplied by 5% investment return. You get to about $2 million if we assume you start at age 21. This is not easy and is a fantastic achievement.

Here is where the math gets out of control. If you were able to get to $2 million, it means you were investing $160K per year (see above). This *includes* all of your expenses. The only way to invest $160K a year is if you have covered all of your expenses first. Getting to $4-5 million does not seem unreasonable at all anymore. If your income does *not* go up for the next decade (unlikely) you're going to sit on $3.45 million on the same numbers. If you continue to save $160K with 5 percent returns… that's what you get. Despite age 30-40 being years where income typically goes up.

Money and Fun: Let the controversy begin! What exactly will you do with your extra money? If you've already gone through a partying phase and bought a few nice things for yourself… there isn't much left to do. Sure you can go ahead and buy the super car or a net jets account… that said… is there a lot of incremental gain here? The marginal benefit isn't that high and many of these higher end purchases have recurring costs (the worst type of cost and best type of business to run!). We'd take the reverse approach (no surprise) and spend on things that free up time. This would be services as we have mentioned in the past: 1) clothing, 2) cleaning, 3) massage/physical help, 4) blood work/private doctor and 5) food. If you can have someone else do the tasks you would be forced to do, what you have done is freed up more time. With this free time you can make up the cost of the services (if you still enjoy working) or you can use the free time for fun.

What is fun for ***you***? We phrased this very carefully. The implied message in the question is *fun* without the approval of others. Fun means something that you enjoy doing that doesn't require some sort of ego stroke. If it's fun for you regardless of what other people think, then you've moved into the right direction. If you can strip down the items to things you actually enjoy (attention shouldn't be on the list) then you'll find a normal spend rate. We'll be shocked if someone actually enjoys flying around all the time on a jet (note to younger readers: people who glorify frequent travelling are usually poor because traveling is awful after a period of time). Similarly, people who have to travel all the time generally have high incomes, *people don't travel on business to lose money!*

With that backdrop take a look at the items you can do with money that would be fun: 1) partying, 2) sports/athletics, 3) arts/crafts, 4) music, 5) outdoor activities ranging from hiking to gardening, 6) extreme sports – skydiving etc. and 7) learning a new trade such as pilots license. We are sure we have missed a few (writing – a hobby you see here) but most of these do not require large amounts of money! The big cash outflows go to the same standard items: housing, taxes and food. Since the last one is limited and the first one should be minimal (paid off home/apartment), it is quite difficult to spend up from here.

As you can see we've gone full circle now. If you're able to get to a few million dollars (excluding value of primary residence) there are practically no costs. Keeping it simple, with $10K net profit a month with zero rental/mortgage expenses… it is quite difficult to burn the money even if you quit working entirely (you won't).

Breaking Down a Month: This number sounds small if you're living in NYC, that said you can always move. For fun, we'll run the numbers assuming a $10K spend and it is still quite difficult to call this a "bad life". In order to go through $10,000 you can do the math as follows: 1) $1,000 tax/HOA cost, 2) $1,500 on health/fitness/services, 3) $3,000 a month on food ($100 a day assuming you're not going to eat out constantly – terribly unhealthy), 4) $500 on utilities and 5) Fun/other up to $4,000 a month! It is quite difficult to call $10,000 a month in spending with no real mortgage/rent payment a "tough life". Remember, this is a level of spending that assumes you don't even work because 5% on $2.4 million is… $10K a month.

Spending to Zero: Another fun part of this game is considering "going negative". While it is certainly smarter to never touch the principal (just keep a basic income stream going), if you're forced to go negative you'll see an even longer "tail". As a basic example, if it is impossible for you to work past age 35 for an unforeseen reason… $4-5M is still going to push you through age 80 or so. You could spend between $89K and $111K a year… *for forty five years assuming zero percent returns*!

This is an interesting set up because we know that it is highly unlikely for anyone to stop working prior to age 50 or so (you'll be bored stiff). This gives you 15 years of active income + a guaranteed 45 years of income if you really decided to call it quits. We know about the simulations that suggest the 4% rule breaks down (yes there is a chance of 50% correction) that said it assumes you are actually forced to sell which is just not likely if you've made your money early.

The last important item in terms of spending to zero is the time frame. Going back to the top, since we know that you can go to zero percent return and live for 45 years… *it means there is no reason to save after age 45.* That is right, saving money makes less and less sense from a utility maximization framework. Even if you decided to have kids, you don't want them to grow up without a work ethic. Handing over a boatload of money to someone who never worked for it rarely ends up working out.

Figuring Out Your Own Number: While we've given a framework you can go ahead and come up with your own estimates as well. Some of you want to become billionaires (fantastic!) and some of you want more/less (the classic $10M number seems to be constant amongst the ambitious). Here is how you can figure out your number.

You'll need two figures: 1) the amount of money you want to spend per year in terms of dollars today and 2) the year in which you'll actually stop working. We'll go ahead and guess and say you'll call it quits at age 45 but you can plug in any number you like. We'll assume a life expectancy of 90 years of age.

Basic Formula: (Life Expectancy – Age You Quit) * (Money Needed Per Year)

That is all there is to it. Going beyond this number is quite literally off the curve. If you ever reach a point where you can live off principal to death (money would be in TIPS – items that track inflation and other risk free assets), then you're done. As you can see from the beginning this happens a lot sooner since we heavily doubt anyone gets to a few million dollars without having a high income (doesn't make sense!)

Now for the fun part, we'll open the comments below to *questions and answers related to how much money is needed to call it quits.* We're interested in hearing your formulas and ways you think about life. Many of you will unlikely quit working making this post moot as well.

****

Money Making Machine

Money Making Machine

Most people reading this blog should focus on money. This means you need to generate revenue for a firm, obtain some equity or generate profit from *your* company. No other options. We're going to outline a step by step process for the latter… Right here. Before we do that, however, we need to explain why **no**

one will ever *teach* you to be rich. This includes us. We would **never** give away a 7 figure income. Will we help you start a career in investment banking for $150-250K a year? **Sure.** Hand over a real business opportunity? **No.**

Below is the outline: 1) Why no one will teach you to be rich; 2) The basics of a business; 3) How to do a basic test to determine if demand exists; 4) How much does this process cost; 5) How much will a small business spend in a year (screen cap included); 6) Revisiting money and time and 7) Why you don't want to be a public figure

Lets jump in:

1) I Will *Teach* You Be Rich! As soon as someone makes this claim you should run. ***No one is willing to hold your hand through a real business venture***. The person is a scammer and a con-artist. If he claims that he wants to help you "get started" what this really means is that he wants to obtain recurring revenue off of the sale. In short, you're going to end up paying a recurring fixed cost to line his pockets. It really is that simple.

Secondly, people who claim that they are teaching you to earn more income off of your career are usually doing you a disservice. How? The person is going to do everything in his power to get you to "switch firms" or "negotiate higher pay" based on market compensation. So you change companies or annoy a person high up the food chain because you're underpaid… *Only to ruin your entire standing with the firm and restart the political process.* This usually nets you a meaningless $20K a year that you should not care one bit about. This is every head hunter in the world. They are not your friends.

Finally, if the person is not trying to nab some fixed recurring revenue from you and he is not trying to snatch a fee by switching you over to another firm… He's likely a poverty mindset manipulator. The last angle, usually found on personal finance blogs, is to teach you how to scrimp and save to become rich. **No one gets rich this way.** While you run around looking to save an extra $200 a month, you feel like you "learned something". So you keep going back… Over and over and over again… What do you learn through this process? You learn to be a **cheap fool.** You're teaching yourself that spending money is *bad*. Anyone who has made real money knows this is a terrible mindset. **To make a lot of money… You must spend a lot of money.**

So how do you know if you should buy the product or work with the person? Quite simple really. You do two things. You 1) buy products that provide actual actionable advice only and 2) you only work with people willing to commit a meaningful amount of time to the project (5-10 hours a week for at least 6 months). If you buy products that provide tangible value and actionable advice, you'll never be disappointed (assuming it works). Just make sure that the product doesn't teach you poverty nonsense such as: how to get rich off of your 401K, how to negotiate a 5% pay raise or how to save 25% on e-books.

Finally, if the person is willing to commit real time to you and your future… That is a **real mentor.** Practically everything else is nonsense. If they are not willing to provide tangible advice and they are not willing to invest in you (invest meaning time) move on.

2) The Basics of a Business: Now that we have saved you hundreds of hours of time with the five paragraphs above, lets take a look at what a real business is. A *real* business is something that makes money while you sleep.

It really boils down to this:

Step 1) Find a product that people will *pay for*. If they are not willing to pay for it then it is clearly a terrible idea. You either create a brand new product category that no one has heard of or you make edits to an existing idea. Simple example: if you find a way to make a new smartphone that is better than all of the existing products on the market, you'll make a lot of money. Alternatively, if you create a product that gets rid of the need for smartphones… You will make a lot *more* money.

Step 2) The assumption from step one is that the market is also large enough to generate income. Lets say you create a product that can teach Swahili to a person in less than 3 months. Great. How many people really need to speak Swahili? Not many. The addressable market is too small. Now if you can teach someone how to speak a major language (English/Spanish/Mandarin/French/German) in less than 3 months. You'll be swimming in money that can fill an ocean .

Step 3) So you have both a product that people will pay for and a large enough market to generate income. How much does the product cost? You need to be certain that there is a healthy margin here. If you know that the market will pay $100 for the product but the cost of creating the product is $90… You're simply wasting your time. Unless that $10 spread is going to be recurring when it is set up, you'll lose money hand over fist since miscellaneous expenses always arise.

The three steps above are all you really need to know before you even begin: 1) will people pay for this, 2) is the market large enough for me to spend my *valuable* time chasing, 3) is the margin structure healthy. If you can answer yes to all of these items, you're rocking and rolling.

Now… the obvious question is… how do I even know if step 1 works?!

3) How to Determine if Demand Exists: The beauty of the internet. If you followed the extremely basic and boiled down steps from above… you already know **who you're targeting.** Are you targeting people in their 50s? Are you targeting gymnasts? Are you targeting druggies and alcoholics? **Who are you targeting.** If you cannot answer this question you do not have an idea. You have a colossal waste of time on your hands.

Okay. Point taken you say. Lets get specific with an example then. You're targeting overweight men in their 30s who are looking to fix their weight issue. Good. Here is a step by step process on what you are going to do.

Step 1) Create a solid sales page (you did learn to sell correct?). Create the sales page first and make sure that it is *perfect*. No errors on the sales page. Videos are a plus. Once that sales page is absolutely perfect, you move on to Step 2.

Step 2) Buy traffic. People who think that buying traffic is "dumb"… have never made a lot of money. Period. You buy traffic from your target group on Facebook, Google and many other mediums that we will never mention.

Step 3) See the conversion rate. For the extreme beginners… this means how many people purchased the product? If you buy 1,000 visitors and 25 purchased, your conversion rate is 2.5%. The "standard" is generally 3%.

Step 4) Recalculate your total costs and decide if the venture is worth pursuing. We titled the post money making machine for a reason. That is what you have created if the product works. The ***only*** equation that matters for a "money making machine" is right here:

Long term value of customer – Cost of acquiring customer = Positive or Negative

That is all. Think about it this way… If you spend $10K a day to acquire customers… Does this mean anything? **No.** Who cares how much you spend. What matters is how much value you received from the customer over the long-term or the single point of sale. If your total expenses per day are $10K (marketing, producing the product etc.) but you generate $15K per day in revenue.. Your profit is $5K per day. **You should spend more.**

Reiteration.

This is the only thing that matters to the business.

Your *total* costs simply needs to be lower than the revenue line. So long as this is the case, you spend like mad to get more customers to view your sales page. Beyond the extremely basic equation above, the real takeaway from this section is the following: stop trying to "save". Spend as much as you like until profit margins turn break even.

4) How Much Does This Process Cost? Instead of giving you the non-sense answer of “it depends” we’ll give you a real answer. If you’re looking at a business that you believe can generate $2 million, the start up cost is usually around $50K. This is exactly why low level, high risk angel investment rounds come in at roughly $25K . They want a large portion of equity in exchange for covering half of the cost for you. There are millions of markets and the number can of course be larger or smaller.

If you spend less to start up… your addressable market is *usually* smaller. So on and so forth. It is impossible to give an exact cost breakdown but we’ll go ahead and try.

1) $10K website design/sales page (20%). As you can see, by our awful blog design, this is not our expertise. If you want it done at an elite level, you need to hire a real designer. Get everything set up cleanly and if the product fails you’ll have a template to use later. Just make sure this page is rock solid.

2) $5K demand check (10%). You start with a quick demand check before you even get started with your idea. If you’re going in blind without even bothering to check for demand, you’re playing with fire. With social media, Google and many other tools on the internet… You can drop $5K to make sure there is a potential market. You can easily spend $500 in a day without anyone batting an eye at Google, Facebook or otherwise.

3) $20-25K product manufacturing and design (50% or so). This is the bulk of the costs. You have to find a place to produce your product. Send samples back and forth. Commit to a minimum number of units etc. You will pull your hair out during this process.

4) $10K miscellaneous specific items for your company. Unlike the first three items, this is vague because it is literally impossible to know what you’re making or where the problems will arise. There is one thing for sure however… problems will arise. Payment processing, quality control on the product, incorrect targeting etc. Something will go wrong and you’ll lose at least $10K.

So there you have it.

The goal is always to clear 7 figures.

If you can ever clear $500K or close to 7 figures in a year (net) this qualifies as an *event*. Something most people will never see and something that personal finance blogs never talk about… Because their personal finance blog is the event. Tricking regular people into getting “rich” by increasing their salary (insert laughter) or saving $10 a month on a phone bill (insert more laughter). Moving on….

5) How Much Will a Small Business Spend in a Year: As stated in point one, no one is **ever** going to hold your hand through the whole process. If *real money* is at stake, the person “teaching you” is going to seize the opportunity himself. Business is cut throat. Get used to it.

With that said you’ll see that the breakdown of expenses is extremely similar to what we recommend people in their 20s to do with their own lives. Once you are up and running, roughly 70% is spent on finding ways to generate more money (ie: buying traffic, advertising etc.).

Simple capture

Summary of 2014 Spending (click to enlarge):

1) ~70% on Business Services. If your business makes the majority of its income online… you’re going to spend a ton on advertising, marketing and other such items classified as business services. We provided a few screen caps of basic Google/Facebook spending but there is a zero percent chance we’re going to give the full breakdown. No one ever will. If they did, they would be giving away trade secrets.

2) ~22% Networking/Meetings. Even if you make your money online, you need to meet many new people (grow or die). This is true in every single business on the planet. In fact… this is a good way to see if someone matters to a company or not. Does he travel and spend a lot of time in restaurants/meetings. Pretty simple check. **If he’s always around, no one cares that he’s around.**

3) ~6% Merchandise supplies and other. No need to explain this category. This is typical junk that you need to buy to run your operations. Can’t give exact details here. That gives away 1) identity and 2) the market. Not willing to do this.

4) For fun several smart readers have figured out exactly what is going on in this article

So there you have it, a basic snapshot of what you’re looking at on a full year basis. We’re not going to tell you what the margin structure is or anything like that. But. If you believe that someone would spend $1.03 million on business services/networking for “fun” or spend this much for tiny margins… You’re bonkers.

Note: In the future we will do a live, real time and impossible to fake screen cap.

6) Revisiting Money for Time: We have covered this over and over and over again. But the question continues to reappear.

"Don't trade time for money what do you mean?!"

It means that you will never get rich off of an annual salary or hourly wage. Ever.

Even if you make $100 an hour and work 12 hours a day for life you're clearing $438K gross… Post tax this is roughly $284K. You're not going to be "rich" you're going to be well off. There is a difference. There is nothing wrong with being well off and settling there. Just remember. You will never, ever, ever be rich.

If you need a reminder of what money for time means… **Go to advertising.** It is the best example. You spend money to buy a person's time (potential customers see your product)

If you are investing your time on a specific platform… someone is making money. If you're on facebook, twitter, linked-in etc. **You are the product.** The simple point is that if someone spends a lot of time in a specific area… They can be monetized.

You're taught that marketing, advertising and sales is bad because… That's the last piece of the puzzle. A great product with no audience does not exist.

"If a tree falls in a forest but no one is there to hear it, does it make a sound?" The answer is a resounding and absolute **NO.** If no one ever sees your product (the tree falling) it doesn't exist. Period.

Again you are told that salaries and hourly wages are better than commissions. Why? No one wants more competition. Especially not from someone who is bright. That is a nightmare. They want a slave.

With the main items out of the way… Lets assume you make it. Please read the below…

7) Why You Don't Want to Be a Public Figure: Since the vast majority of our readership is young or youngish, most are not rich enough to understand this. It is important. Once you reach a certain net worth, the last thing you want to do is become "famous".

***"Fame is harassment from regular people."* – Wall Street Playboys**

Regular people have nothing better to do with their lives than live vicariously through someone else. This is why celebrities go nuts. They are harassed every single day as people charge after their cars just to touch their shirt or skin. Lunatics.

If you are truly committed to becoming a public figure (like Mike) you need to really understand what you are signing up for. We have no interest in it and wager that you won't either. Again. This is once you are financially free. Being harassed by regular people is no where near fun.

To cap off this extremely important section, it is best served with some lyrics and a video.

"… **be a Lennon and a fan leave you brainless.** All in the paper, gettin' buried by a neighbor. While all of your relatives spendin' all the money that you gave 'em, F*** it, don't save 'em… **I don't wanna be famous, I just wanna be rich.** 40 mil with some acres…"

Concluding Remarks: So there you have it. For the long story short version here are the clear and concise bullet points, actionable steps and explanations in this post:

1) No one is going to hold your hand to obtain real money. If there is real money involved, the guy would go after it himself. If someone claims that they will "teach" you how to be rich. They are full of it. This is a great sales slogan but is far far far away from reality. No one can teach you. At most they can give you guidelines. Even then… Get a legitimate mentor who is willing to spend *real time* with you.

2) The basics of a business will always be the same. Find a product that people need (pain or pleasure, pain usually sells better: diet, skincare, "get rich" schemes) and drive massive amounts of traffic to the item.

3) Before you get all hyped up (a term used frequently by idiots) test the product first. Throw a few grand at the targeted audience and see if it is in demand or not. If people aren't willing to buy, move on. If people do buy… flood that market as fast as possible. Push as much traffic as possible until the long term value of the customer equals the cost of acquiring the customer. Then reassess. Remember, it's a money making machine as long as you are generating net income.

4) While it always "depends". A typical answer for people who don't want to answer the question. It will cost roughly $50K to start a meaningful venture. This also explains why most private equity investments require a minimum of $50K to get started and $25K is generally the number for angel investing.

5) Similar to your 20s… 70%+ of your money is going to spent on making… more money. Grow or die. No other choice.

6) If you are never able to sell and never able to scale… you can become "well off" but you will NEVER be rich. You need to make money in your sleep to generate real wealth.

7) You don't want to be famous. You just want to be rich. Who cares about approval from regular people? Not you. If you must become public… Good luck and much respect from this side of the web.

One little extra piece of advice… When you get to your numbers… Learn to play dumb. Be extremely dumb. Seem harmless. Only go all out when you need to go all out.

Until then? You sit, you wait, you gather information.

When you *appear* to be following a person's advice… They like you. **Works every time.**

****

Most Decisions Don't Matter and Announcing Next Q&A

Most Decisions Don't Matter and Announcing Next Q&A

Most decisions will not impact your life at all. This is difficult to put into perspective since we're forced to make multiple small decisions every single day. But. If any of our readers think back to the last five years they unlikely find more than one or two "life changing decisions". It's quite odd since the average american always seems to be stressed out about getting from A to B despite the event being un-impactful to their life. This has caused us to come up with a rough decision tree to help people get rich.

First Compounding Decisions: The first item is a caveat. Deciding to eat healthy, exercise consistently and invest your savings on a monthly basis is technically a "daily decision". This is 100% a fair criticism of our earlier paragraph so we're including it here before moving on. We assume that any successful person already does these items on "auto pilot". Working out, eating healthy (90-95% of the time), stretching, brushing your teeth etc. should all be assumed. If someone can't even do this part of their life we think they've already lost the game. That's a rough statement. And. We think it is true. There is no point in being rich if your health is a wreck, your quality of life is falling off and you have medical bills. **In short, we assume you automatically eat healthy, work out and invest small amounts of money on a monthly basis.**

Quitting Makes Life Easier: Quitting gets a bad reputation despite the importance of quitting. To us, quitting is when you realize that you just don't have the ability to do something. The obvious example is a 5' 6" guy giving up his dream to be an olympic volleyball player (yes we're sure there is 1 out of a billion that breaks this rule as well. And. The point stands). Quitting to us is when you realize you can't get to the top 1% without dedicating 16+ hours a day to improve. This is called a lack of talent.

Remember, quitting is only acceptable when someone is certain they have something else to move towards. Lets say you start an online business and seem to stall at $100K per year. Not bad at all. That said, your only real competitive advantage is sales. This is a significant realization. You have figured out exactly why you're profitable and why you're struggling to make the next jump. If this is the case, then it makes sense to go ahead and quit and jump into enterprise sales instead. You're leveraging your talents to do something new (which you realized because of moderate success in online business).

There is actually a lot of information packed into the prior paragraph. In order to realize you've peaked ***you have to know what you lack and what made you successful***. If you can't answer either of those questions, quitting is not an option. Once you have pinpointed exactly what you're good at and exactly what you're bad at, you can make a smart decision that can change your life forever. That sounds like an exaggeration but it isn't. Knowing exactly what is going right and wrong means you can self-evaluate (something regular people lack as they believe they are good at everything) and push you into a new direction. Again. The prior paragraph is simply an example and if you had a lack of sales skills but still made $100K, maybe the answer is to hire a trained sales profession for your company! So on and so forth.

Funny enough, we think quitting is probably the most overlooked skill that people need to acquire. It actually comes in *first* on our list. Everyone else is focused on "grinding it out" despite not having the skills to proceed past a specific level. As soon as you realize your abilities do not function in a specific position, it's time to quit. Not later, not in a few weeks, but that exact day.

The Probabilities Framework: If you're extremely new to generating value and making money, it is time to get used to the probabilities game. This means you should look at every industry you're going to take a "stab at" and see if the effort is even worth it. The numbers don't lie and opinions never change reality.

Take for example a person who is amazing with languages. Will this person make a lot of money by being a language translator? Unlikely. Maybe there are a handful of positions where you can make a high income (say translating for international business) but the number of positions is quite small. Even the top 5% of language specialists don't make that much cash. Also. One has to recognize that this position will lose value over time. We have technology that is able to translate paragraphs from english to any other language. In the future, this technology will become incredibly accurate devaluing the need for humans in the first place (more room for error).

Before moving on we can use a second example, software engineering. Here is a position that has so much demand that they cannot fill the open positions. Yes it is competitive. No not everyone can succeed and make $400K+ a year. But. The median software developer (50th percentile) is certainly making more money than the median teacher/language specialist etc. So if you believe you can become a mediocre software developer and you could also become a mediocre language specialist… go and become a mediocre software developer. For now.

Follow the Money: Without money in the industry, there is no reason to bother. This is a big decision. Many people will enter an industry thinking that they can easily "switch" later. This is incredibly incorrect. 30-40 years ago it was a lot easier to switch industries. You had people with minimal amounts of education simply climbing corporate ladders. In 2018, careers/businesses are incredibly specialized and if you move into one direction it is difficult to make a switch 90% of the time.

Things that are making money today might not make money in 5 years, 10 years or 20 years etc. The best way to approach this is to figure out your own timeframe. If you're looking to get to $500K and that's enough for you, a lot of careers are viable. You could even go into capital raising for investment banking if your hurdle is low. If you're looking for something long-term and sustainable? Hundreds of industries will evaporate. Having a reasonable time horizon is becoming more important as technology accelerates, displacing (and creating!) jobs/careers/industries.

A good rule of thumb is the "fifteen year rule". If an industry is making a lot of money today, then it likely lasts between 10-20 years of "peak earnings". If an industry is seeing earnings growth, it usually means that we haven't reached the peak (of course!). This is not a science and you should do your research. But. Keep this in the back of your mind. If the money is good calculate your expected earnings assuming either declines or slight increases before an expected deceleration.

Asymmetric Results: The best bet to make is an asymmetric bet. This means that the downside is zero but the upside is say 10-20 fold. Why? It is the best way to see a step function in your net worth without setting you back in time. At the end of the day, investing in asymmetric results should be an annual phenomena. A few will hit. This will accelerate your net worth and a few will fall flat on their faces leaving no impact (you don't need to put in much money to see the upside).

Clear examples are: 1) venture capital, 2) any low cost business start up, 3) biotechnology investments and 4) volatile technology stocks – typically small capitalization.

The funny thing about asymmetric investments is that you realize how much you overspend in a month. We'd guess that anyone with a good career could clamp down and come up with $3-5 thousands dollars in a few months. If that results in a 30-50K return you've essentially gotten it all for free by clamping down for a short period of time. This phenomenon of being able to invest in asymmetric ideas only gets better over time. Eventually throwing $25K becomes viable and the return is significant. This is exactly why angel investors exist. They clamp down on their higher end life styles to get some cash and simply place it into some risky bets once and a while. Naturally? These guys end up getting richer and richer.

Practical Applications: In a change of pace, we're going to try a "'practical application" section to a few posts. This will force each post to be actionable versus purely informational where one is forced to read between the lines.

10% Rule: A good way to think about each decision is the long-term ramifications of it (in terms of net worth). If you decide to take a specific risk and it would result in a net worth reduction of about 10%, this is unlikely a major decision. Why? Well a smart person will get anywhere between 6% and 12% in investment returns. Yes we know the long-term average is 7%, so feel free to use that as well. This means a 10% reduction would not break the bank because you would be back to roughly the same level in just over a year.

Time Commitment – 1 Year Rule: Any decision that requires 1 year of your commitment is a serious decision. This is surprising since many people think that a 10% net worth hit is worse than the time commitment. Unsurprisingly, most people don't value their time. If you lose a full year of your time it should be a *certain* decision. These certain decisions include: 1) college, 2) your first job/career, 3) your first major investment that represents over 20% of your net worth and 4) personal relationships. Generally, people spend many hours of their time hanging out with people at bars (people that will never add any value to their life) and think this is a "casual decision". These decisions add up to major life changing amounts of damage. Unless it is kept under control "casual hangouts" should be avoided more often than not.

Practical Examples: The following items will make major impacts to your life: 1) not knowing your talents, 2) not knowing the growth or decline of a market, 3) spending time with unsuccessful people because "you've known them a long time" and 4) investing large amounts of money into risky ventures where you cannot recuperate the costs. In bullets we can use the following:

1. **College:** You only choose schools or majors based entirely off the of the return profile. The people who say college is a fun 4 year or 2 year party (MBA) are simply lucky or reckless. The vast majority of the successful people will choose something that results in a high income. They find their rough talents and go where the probabilities are in their favor.
2. **Career:** Before choosing a career one should at least know their "niche" skill. Sales is the best example. If you're better at advertisements vs. direct sales, you should get into affiliate marketing immediately. If you're not good with ads but are good at long-term sales management, you should go into enterprise sales. These skills are not equal. Broadly speaking, advertisements impact the lower IQ piece of the populations while enterprise sales is used for higher IQ individuals. People will complain about that basic split but it's broadly correct as rich people are typically smarter than the average person.
3. **Relationships:** This is an often ignored part of life. We've seen hundreds of talented people waste their time with go-no-where situations. This could be a girlfriend they will never have kids with, a best friend who still lives at home or a bar/club they go to every single weekend. It's odd to see this behavior but it is engrained in human behavior. Similar to how students typically take the exact same seat in a lecture hall every day. This type of programming needs to be fixed before it leads to long-term pain.
4. **Asymmetric Risks:** If you think an investment has a chance of returning 20x… this does *not* mean you invest. That is right. You should not invest just because something has the potential to go up 20x. Instead you should ask if the chances of the 20x is higher than 5%. The best example is bio-technology stocks. If you know that a specific drug has a 40% chance of approval and is not priced into the security you should buy a certain amount of it. Asymmetric risks that are *missed* can wreck your life time net worth. If you ask a rich person how they made their money they always seem to have at least one small event in their life (a big sale of a company, a large return on an investment etc.)
5. **Leverage:** Using other people's money can be life changing for the better or worse. The answer is in your ability to "force" appreciate the returns. This is typically specific to real estate. If you're unable to offset the debt payments with your own effort it is best to avoid. If you can easily offset it, then the time to buy is now.

When we look at these five practical examples, it unsurprisingly shows us that doing the opposite pays off. Look at the constant decisions made on a daily basis (health, fitness, who you spend time with) and that is a life changing adjustment. Most people view it as a part of their daily life. The second item is the amount of risk one takes on. By calculating the actual risk and return you won't miss out on asymmetric upside and you also won't kill your net worth by 50% leveraging up into an asset you cannot afford.

That wraps it up for today and our next Q&A will be held on Tuesday July 10. We'll leave it open for roughly the day as it should be slow. Have a wonderful weekend!

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality (***essentially the point of this post!***)… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by **Clicking Here**

Motivation is for the Weak

Motivation is for the Weak

The title says it all. Self doubt is normal. However. The need for motivation is for the unsuccessful. If you know someone who needs to be lifted up *emotionally* to achieve something… He never wanted it in the first place. He's simply someone who wishes upon a star for the world to give him something he never deserved. Even worse? He thinks the emotional pump up is good for him.

The type of person who gets amped up by written words in a text book or a motivational video will scour the internet far and wide looking for a solution to his problems. It will never come.

He will attend seminars and speaking venues. It will never help him.

He will try to use the same ideas to sell to his peers. It will never work.

He'll never find his magic product or service to sell. He'll never succeed even in the slightest because he is unwilling to take risks. Perhaps, if he is lucky, he gets by on a middle class salary of $100K per year. But. He's never going to accomplish anything meaningful. Period.

Knowing that most people love this type of inspirational nonsense, *many, many, many people become rich* by transferring this feeling to the masses. As usual, don't just do the opposite, **be the opposite.** Use motivation to sell products because people will make purchases when they are in a high emotional state.

Instead of nagging on and on about how weak people enjoy motivation (by definition they are weak because a successful person doesn't need to be motivated) we're going to give away a step by step process to rid yourself of the need for motivation. **For free.**

Step 1 – Stand up, Walk Out: Lets assume the worst. Someone reading this likely enjoys motivational speeches and other such nonsense. Time to throw away the crutch. Kill it for good. Choose a large, large, large venue (college commencement speeches and motivational seminars are good for this). Sit front and center.

You are waiting now. **Wait until the crowd bends to his words.** When the crowd is bending to his words you'll sense an uncomfortable quiet and focus from those around you. This is usually just moments before the conclusion of the speech.

Stand up. Slowly. Walk through the crowd. Slowly. Never look back. As people stare at you, make eye contact until *they break first or you have walked past them*. Head straight. Do not look down. Time will slow as you feel the scrutiny from your "peers" weighing on your shoulders. ***You are not doing this for the attention.*** Exit the venue.

To reiterate, this is ***not done for attention.*** When you are quizzed (many will ask) as to why you left at the "best part" simply say you had to use the restroom. An emotionless statement. Do not say anything negative or positive about the speech, remain in a neutral state (Ie: you're not doing this to be a hater). Never mention the incident again.

What have you done? **<u>You've taken control of your emotions.</u>** Congratulations. This is step one in your long journey to internal motivation. You will not bend to the words of others for "feelings" or "emotion" you will only listen to logic and reason. Most won't be able to complete step one.

Example: Here is a clear example of motivational junk that doesn't help you. **<u>Started laughing out loud at second 31.</u>**

*Note 1: This is certainly rude. The one time event of learning to control your emotions is worth many thousands of dollars. Here's a hint. The speaker has no interest in giving you money so it is going to be a great long-term investment for you. The only message is to work as hard as you can, no actionable advice is given beyond getting rid of your cell phone.

This video was found in a YouTube search and you can replace it with any other video. The inflection point is usually right before the conclusion which is always the same "work as hard as you can". If you're already trying your best then there is no reason to watch the video correct? Correct.

Step 2 – Testing Phase: The one time event above is going to give you more adrenaline than the entire speech. You've stood up against the largest enemy of all. The masses. Learn to control your heart rate and bring yourself back down to normalcy as fast as possible.

After taking a large jump towards emotional control, it is time to see what you are actually good at. The bad news? Time is not on your side (it never is). The good news? Everyone is good at something.

Find twenty five subjects that you are interested in. Since this blog is about making money, Wall Street and having fun we're going to assume you're more interested in the money part. Go and try all of them until you feel comfortable with the subject. It may take 4-6 months but we doubt it. You're going to be good at some, terrible at others and have potential in *maybe* two of them. Check those two out.

How do you know the difference between good and potential? Other people will tell you that you're good at it. These people will not be your friends and family, they will have businesses in the same field.

To conclude the testing phase, here's the rub. Most people try to "do what they love". This does not work. Almost everyone would love a life where they have sex everyday, get drunk and make a lot of money for doing nothing. Naturally, none of this is really going to get you anywhere. Instead of "doing what you love" find what you are actually good at first (maybe only a few things) then figure out if you can do it for many hours per day… bringing us to step 3.

Step 3 – Stress Testing: Stress test refers to stress testing your physical body. Step number 2 already determined if you have the talent/intelligence to be good at the task (remember other people will tell you that you're good!). Lets assume you found two topics that you have a knack for. Time to stress test. Can you do this for 80+ hours a week consistently? Try it.

You try one. You find that you're sick of it after a week. Complaining about the lack of sleep. Complaining about the types of people you were meeting. Complaining about the effort it took to improve upon your craft. Complaining about the process of setting up the business.

You try another one. You don't complain about your lack of sleep because you wake up energized. Strange. You don't complain about the people you meet, there are some bad apples but it is tolerable. Strange. You don't mind the hassles of dealing with a miniature set of customers. Strange again. Strange that *you're working the same hours but you're not tired anymore.* You found a potential revenue stream.

Step 4 – Prioritize: So you've found one interest with revenue potential. Check. You've already stress tested yourself for 3 months or so. Check. Now it's time to re-prioritize your life to go all in on your new found venture while maintaining a normal social personality. You can guess where we're going with this.

You commit 100%. You care about every single detail. You do not cut any corners. You do not run in blind. You start building based on long hours of research and effort and commit every single ounce of energy into the project until you are beat. Now you've got 1-2 hours of leisure time and 6-8 hours to sleep… Remember step 2? This is how you avoid becoming a boring type A person who no one wants to hang out with .

Keep those fun ideas in your back pocket and they become your new source of fun/entertainment. You will go through phases and cycle through many activities where you'll be "pretty good" and more and more people will enter your social circle.

Wash, rinse, repeat.

Example: Maybe you need an example. One is staring right at you. This blog. This blog falls into the hobby/entertainment aspect of life. While it has evolved over time as any hobby will, the chances that we try to build this blog up appropriately (see cater to the masses) is next to zero percent.

Alright, alright it actually is zero percent since we're terrible writers anyway (too blunt and don't cater to idiots).

Alternatively? We take our real side businesses (some smart readers already figured those out) and Wall Street work extremely seriously. You care about everything in that case. You care if the charts have tic-marks or not. You care if there is a typo on a slide no one will read. You care if you respond to a client in 90 seconds or 45 seconds. **<u>Everything matters.</u>**

Step 5 – Daily, Monthly and Annual Accountability: This is similar to your journal. If you've done the first four steps appropriately you won't waste your time listening to speeches or reading insanely corny success stories. How does reading about the success of someone else without any actual *actionable* advice help you? It doesn't. If you cannot apply it, you have wasted your valuable time. Again, if someone else has to get you to take action… you are going to lose in the ring ***every single time*** to the person who inspired you to take action! You do not read to take action… You only read in search of actionable advice.

No exceptions.

You write down your accomplishments, your failures (you'll fail a lot!) and your future tasks every single day. Every single month. Every single year. *You tell no one on a personal basis that you are doing this.* It is up to you and only you to hold yourself accountable and **compare yourself to the person you were last year.** (under no circumstances do you compare yourself to others, there is always someone better than you)

Example: The easiest example is financial if you're on Wall Street. You know the comp structure and you know what the Street pays. Luckily it is an up or out environment (you're moving up or getting fired).

Analyst – Base $80-100K (100% targeted bonus) 160-200K (age 22-25)

Associate – Base $120-160K (100% targeted bonus minimum) $350-400K if you are promoted to VP (age 26-33, wide range due to young talent and MBAs)

VP – Base $175-200K (100%+, call it 125% targeted bonus) (age 30+)

Director – Base $225-250K (Variable call it 1.5x base salary target) (age 32+)

Managing Director – Base $325-375K (Variable, call it 2x base salary as a target) (age 32+)

*Note: Yes base salaries at the junior level are moving up a tad, call it $5-10K depending on if you're an associate or an analyst. However, as the numbers show, your goal is to get promoted since the variable numbers become larger and larger as a % of your salary

If you're not on Wall Street, try the following: make your income grow at a faster rate each year. *This is extremely difficult.* In simple terms, if you were up 10% last year, your goal is to be up 15% this year. If you are up 20% then you want to be up 25%. The "law of large numbers" works against you. This is the fun part of the game (it is just that, a game).

Finally, throwing income out of the equation, if you run into an acquaintance you have not seen for a year he/she should recognize that *something has changed*. Many times people cannot put their finger on it, but you are simply different (in a good way) compared to the last time you two spoke.

Step 6 – No One Cares About Your Career or Business: Most people talk about their work, career or business. Can it. Unless the person you are meeting can potentially help you in your venture, there is no point in giving people information about your life. When you are out once or twice a week since you earned it (from all of your 12-16 hour days) leave it all behind you.

This will work wonders for you. Most people dislike what they do so bringing up work in a social environment is a terrible decision. In addition, if people realize you're happy with your life they will pepper you with questions and waste more of your time. It's a lose, lose situation. You either kill the atmosphere, make the person feel unhappy talking about careers/work or you have a mediocre person trying to squeeze information out of you.

Remember, if you're going to meet someone to discuss important topics, you're not meeting them out and about on leisure time. To repeat… Can it.

Step 7 – Repeat Step 2: Once you've squeezed as much as you can from one venture, it is time to move to the next. Do not let your life pass you by. Every year should be filled with interesting and new hobbies (see the attempt at 25 different activities) and ideas. If you think that the last year flew by, it means you were in a mundane routine. Do not do this.

Step 8 – Bonus Sales Tip: Now that we've basically killed the myth on motivational speaking and other such nonsense… You know what to do… ***Use it to sell.*** By definition, again, the masses love this stuff! If the masses love to be motivated and pumped up… Use motivation to sell more products and services! Get them amped up and feeling good about themselves then make the sale.

No we're not saying you should sell BS products (you won't last long in that case). Instead, make the connection that if motivation and pump up speeches are popular… You know the masses will buy.

Concluding Remarks and the TL;DR Version: In short, motivation is a tool used to sell to the masses. If you can make someone feel hyped they will bend to your beliefs and convert (convert is basic internet marketing language for purchase). It is perfectly fine to use motivation to your advantage to sell products.

From an individual standpoint however… ***No one should be able to motivate you.*** You should be internally motivated to do well and the external motivators should be telling you to slow down if anything. People who are internally motivated have a problem of going *too far.* People who need external motivation have not even started in the first place.

The Bullets: 1) go against the grain in a large environment to take control of your emotions, 2) find what you're good at – a long-term theme in this blog – no one can hold your hand through this process, 3) stress test yourself intensely and find out if you can actually handle 80+ hours a week – most give up after 50, 4) prioritize everything in your life to maximize your brain cells towards that activity, 5) hold yourself accountable on a daily basis and have an annual review – the harshest critic should be yourself, 6) leave all this effort behind you during down time, your brain needs to recharge and no one cares about your success, 7) repeat step 2, most people work boring 9-5 jobs so they do not know the difference between year one and year five.

We realize this post is going to piss off a lot of people. This is fine. We need to decrease the traffic here and get rid of the mediocre people who have found the blog. They can go back to watching motivational videos! We also noticed that someone else agrees with the belief that motivation is nonsense… naturally he's a successful hedge fund manager with an 8 figure net worth. Go figure.

****

Musings from Nearly a Decade of Blogging

Musings from Nearly a Decade of Blogging

The world has changed quite a bit since 2011/2012. We're nearing a decade of blogging and thought it would be fun to highlight many of the things we've learned over the years. A lot of them are good and some are certainly bad. And. You should be quite entertained by this so it's a good post for the weekend.

Don't Underestimate Trolls: It is true, there are a lot of fake rich people out there. You can tell by their emotional reaction to $5-10K. However. There are a TON of ultra rich anonymous people on Twitter. Twitter has become one of the most fun places to spend time due to the number of intelligent people on the platform. If you're smart you will be able to decipher which accounts are run by wealthy people and which ones are run by frauds. It really isn't hard once you recognize a specific syntax, tone and oddly enough, sense of humor.

Based on the past decade or so our website is effectively split with a massive bar bell. People who are still trying to make it/just getting started and people who have already made it and follow for both entertainment and updates on the future. To give an example, we've received emails from people who have made $1-3M off of our trade ideas and other people who turned their lives around from making $40,000 a year to $200,000 a year. This is certainly not the same. The people who are making millions are ultra wealthy and unlikely need our help. They only follow for confirmation of a suspicion they had regarding some product/service/crypto or what have you. The second group is what we call "forever followers". If you can help someone double their income, they are not going to care about buying your $10 product, $20 product or even $50 product. You have helped someone change their life and they are smart enough to realize that no one is going to execute the plan for them.

On that note, with the fun/love stories out of the way we'd like to emphasize that the internet trolls are POWERFUL people. We are not kidding. There are many trolls out there who are making tens of millions per year. All they do is troll online, say nothing or drop hints related to the next best thing. If you're reading this you're looking for the last item "the next best thing" so we suggest you look deeply into twitter troll accounts with followers in the low 5 figure range. Once someone gets to 100K+ they usually go public as the temptation of fame and "sweeter deals" becomes too big.

Why do they need to have a small/mid sized account? It means that many people have found them and realized they are rich. These people then create automatic updates for their posts. Generally speaking, it's a lot tougher to add real value as an "anon" as the average person cannot think for themselves. They believe that every rich person should be public because it's what they desperately want (attention and fame). Therefore, biggest item to remember is to research deeply into an "anon" that seems to be accurate quite a bit. This is usually a clear signal.

People are Generally Good: If you don't engage in nonsensical arguments on twitter, people will leave you alone. This is a simple rule of thumb. If you spend your time arguing/responding to trolls online all you do is create enemies with no upside. You're better off ignoring. If you look at our feed 98% of the time we don't even respond to ridiculous trolls. The 2% of the time we do it's simply to entertain the real followers. It usually ends after one interaction just for the "laughs" and we move on and ignore people for the next week or so.

Another thing we learned is that if you do help people (generally speaking) they will go out of their way to help you in the future. You'd think that random people on the internet wouldn't care. Yet they do. It is part of human nature. If someone helps you make $20-50K a year in extra income, it is highly likely that you throw money their way. If you don't, well you're just a bad person. You are actually underperforming because the more you give out the more that comes your way over time (for more on that read Felix Dennis – how to get rich).

Another thing on this, people who are good generally take self responsibility. No one shoots 100% and you'll notice any fan base doesn't care if you make mistakes. If you have an error rate of 20% that's insanely low and if you have an error rate of 60% you probably shouldn't have a website/blog. We're putting those numbers up there simply for reference. We quasi follow other accounts (not officially on twitter but we click on them frequently) and we've noticed that an error rate of around 35% ensures that you will build a following. Therefore, since people are generally good/honest if you have any niche skills you can build a following if you have a 65%+ accuracy rate in your craft.

You Will Ebb and Flow: We've considered shutting down this blog at least 20 times. We've also considered trying to scale it out at least 20 times as well. This is an emotional roller coaster you will go through and most people cannot stand the test of time. Over time, you'll find a cadence that works well for you. Over here, it has been about 1x a week and a Q&A session. We'll try to launch a product every 2 years or so unless there is something significant that needs to be said. Even then, we don't charge much for it because if we start making real amounts of money we know we'll go full on "scale" and become mainstream. This remains a hobby.

The other way you will ebb and flow is your social engagement. People who are "all in" on their websites have multiple things they are juggling. Instagram, email lists, twitter, facebook, back-end server work, meeting other bloggers, getting on new podcasts, trying to elevate their "status" in the circle they traffic in. If you're a longer term reader you'll notice we're pretty consistent. Same 1x a week, same every couple of years product launch (to make sure we never lose money on the hobby) and same old twitter rampage followed by silence. If we feel like interacting more and trolling we ramp it up, if we don't we're usually busy and that tends to show in the post counts going down to as little as 1x a month in some cases.

To make sure you don't ebb and flow too much, it is best to remind yourself that it's simply for fun. We have no idea how big platform guys do it. They literally watch their social status swing on a day to day basis based on website views, likes, etc. This probably leads to a lot of mental health issues down the line (not to mention potential threats if you're a public figure). Ebbing and flowing is natural and healthy. If you're too deep in the hole, don't write, don't post and simply go silent for a bit. If you are really excited about something ramp it up and have fun while the energy is there. People can tell if you're excited even through words.

You'll Lose and Gain Readers Every Day: As you improve in the game of life your writing will naturally change. It just isn't possible to talk about the same stuff for years and years unless the person running the website has stagnated. You can see the evolution here in real time. Don't worry about it though, as long as you're making lives better you will always have a place in the metaverse. No matter what the haters say.

Maybe you were originally a blogger for traveling and COVID hit. Somehow you learned how to do something else like play video games at a high level. Well that's the beauty of life and the internet. If you're actually good at it you can pivot your audience over time. Take this website as an example!

Back when we started Wall Street was real profession. Now it is effectively a dying disease/dinosaur that won't exist beyond M&A. We don't even recommend people enter Wall Street unless it is for M&A anymore. We've pivoted into crypto over the past 4-5 years and it has worked out marvelously. Adapt or Die. This applies to your website and your life. If we were still talking about investment banking at this point our audience would actually shrink! That is how fast the world is changing.

You Will Become a Better Communicator: Over time if you write even one post a week, you will improve. Sure it may not come in handy every single second but it helps. It's similar to reading. There are many people who read constantly so they can compute/understand new topics quickly. Writing is the same, just in reverse. The more you write the easier it is to get your point across. It is also easier to see what people want/are interested in.

The downside? You'll see that some people are honestly hopeless! Sorry, it is true. Some people can't even understand a 60-80 word tweet. We've seen some insane comments in our mentions and they are beyond hopeless. In that situation we always recommend the same, learn a trade and live below your means. If tweets are easily misunderstood, competing in a global environment with brilliant people isn't a good decision. Much better to learn a specific skill and punch away at it for years.

The second part of communication is seeing the big picture. We'll use Twitter as an example. We've noticed that people who have a large twitter following are able to convey complex things in a small number of words. Threads are too long. The only time a thread is useful is when each tweet in the thread can be a stand alone tweet. Then you've really mastered the game.

If You Have an Idea Just Start Writing: Don't bother with putting it off. Take our your phone and just start rolling with it from a stream of consciousness. Even if it is 5 in the morning or 11pm. It doesn't matter. If you don't do it, you'll lose the idea within 24 hours and it won't have the same feel to it. Everyone can tell.

This type of style will make your writing a lot more unique and consistent/authentic. No one comes up with a brand new idea every single week that is interesting so you'll have your ups and downs like any normal person. The key is to avoid "dropping the ball". There are many many posts we've forgotten about due to procrastination. Our new rule of thumb is to simply whip out the phone and write the first paragraph or two with the big headlines before it is too late. This allows your mind to hold onto the idea for the rest of the day and you can always publish it later in time.

Example of a New Hobby/Idea/Project: Based on our twitter activity you can gather we took an interest in the hashmasks project. We have even reached out to get in contact with them regarding a free marketing event for them (yes seriously). And. You'll notice we haven't recommended anything specific to buy at this point. Why? Credibility. Also. Anyone reading this knows we already own a mask.

What we see is a great NFT project that needs some marketing juice. They are currently doing a competition for some "tribes" to create the best group of masks. While this is cool, we think they are aiming far too low. Far, far, far too low. If you go back in time this is similar to magic the gathering cards. When they came out the big deal was sitting around in these tournaments with other extremely deep in the weeds people playing the game.

For something like this it is better to make a big splash. Again. No one shoots 100% but we try to find good risk reward trades. We've lived through many +500% calls and many -50% calls and you learn to identify the better risk reward frame works on a near term basis.

So you're probably wondering, why are we interested in the hashmarks project? We think the "risk reward" is really just marketing. All the project really needs is a single "event" of global awareness that is unique and brash for the project to become quite interesting. If the awareness remains with the niche NFT community only, the upside is minimal. If everyone in the world knows what a hashmask is due to an *event*, the price of a single one would move up 100x (conversely if it never catches on, it wont be worth much).

As an example, we named our clown Goldman Sachs and now there are several clowns named after banks (clearly there is potential with the NCT token)! Simple idea and resonates with the rich people in crypto but tough to get attention in a bottle. If a tree falls in the forrest and no one is there to hear it, it makes no noise at all.

That aside. There is a good chance that the people who work on the project will read this. *So we're here to say there is a ton of upside here. Just think bigger!* If you're not willing to think bigger, how will it ever become a bigger product?

Take your plan to make them valuable over 10 years and ask "how could i do this in one month?". There are many rich people in the crypto industry, you only need one event.

Once global awareness is there, it's tough to put the genie back in the bottle (a good thing). The product is a very high risk call option so there is no need to swing for singles, try to get the home run once and you're set for good. Swinging for singles is best for established products.

As another example, if Elon Musk or Chamath changed their profile photo to a hashmask for a single day, that would be iconic and more than enough to spark awareness. A single big event is better when it comes to making something go viral.

Make No Assumptions! This is harder than it looks on surface. You really have no idea who your super fans are and who your regular fans are. You can try to guess and you'll be wrong!

While the haters are obvious (just yelling and attempting to discredit – simply ignore) the tough part is finding the people who really appreciate your work/writing/insight. These people can be loud, they can also be dead silent. You just never know.

If you can live with this fact (that you'll never now who your real supporters are), you'll have a much better time living in the Metaverse. In fact, if you simply do your thing you'll likely get more super fans. By trying to figure out who enjoys your work, you'll end up pushing more readers away. So simply write whatever is on your mind and ignore the noise.

Don't Stress Over the Long Run: We've had countless typos. Our grammar isn't correct (sorry 5th grade teachers!). We don't even bother fixing them at times. Why? Over the long term the only thing that matters is that you're making life better for someone/anyone reading your information. At this point we really believe it. There is just no way for you to have an unsuccessful time building a website/social media presence while delivering real value. It could be as simple as a website dedicated to yoga (women love that stuff).

Over the long-run you'll have a ton of ups and downs but if you're actually living life you will always have something to talk about every single year. There is no doubt that this blog will not be the same in five years. If it is you will know that it is no longer real.

If we were still talking about investment banking you'd know that we were still stuck in… investment banking. So as you evolve so will your website. Some won't like it, they will leave. Others will come in. It nets out to the same. The key? Don't stress. Seriously. It doesn't do any good and you're not trying to become a millionaire off of words on a computer screen!

Hopefully this post was useful for you and if you have real information that will help people, you should start a website with your free time. The worst that could possibly happen is that you improve your writing skills. No downside and lots of upside.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life. **We hold Q&As 1x a month for purchasers only.**

****

Myths About Wall Street

For no apparent reason this site is seeing more email traffic. With that said, it seems there are a lot of myths about Wall Street Floating around out there that need to be flushed out and burned. In no particular order here are the highlights of the ideas that people believe that simply are not true.

Easy Path to a Billion Dollars: This one is the most outlandish. Assuming that you are not well connected and you are actually a hard working, passionate and smart individual who landed a Wall Street job… You could potentially make a few million. A billion is simply out of reach. Here's the basic reason why. When you start in Investment Banking or even in a Hedge Fund there will be someone who is actually well connected. If your dad is the number one Portfolio Manager at Capital Group (FYI this is a $1 trilion+ fund) you will have an extremely easy time moving up the "ranks" so to speak. That's life. Now for the rest of the potential candidates out there be prepared to work hard. ***Some of the best workers on the Street are ex-military or ex-division 1 athletes***, these hard working souls go through the ranks the hard way, 80+ hour weeks, playing politics, taking risks by jumping jobs and by simply getting a little bit lucky as well. Assuming everything clicks, in general, you're looking at a Director/Managing Director slot long-term which nets you roughly $1M annual.

Bulge Brackets Are Where It's At: This is another bad one. Just because you got a job at Morgan Stanley or Goldman Sachs does not mean you're going to get paid more than someone who works at Quatalyst, Lazard, Moelis or any other firm… Even the mid-markets. Why? Two reasons. 1) If you are straight out of college they know (GS/MS) that they can pay you less and you will still stick around for more work because you want that exit opportunity and 2) Companies are still companies, if you worked at Lehman or another firm that got destroyed, you're not getting a good bonus. In fact, generally on the lower to even mid-career there are many smaller banks that will pay up for the best talent. Like for like a managing director at GS is certainly better off but again at that level it is performance based so you should be making the firm large amounts of money. As you'd expect, the best worker is always the one who makes the firm the most money.

You Need to Be Good at Math: This is another common one. Can you run percentages in your head, do algebra, spit out quick rule of 72 numbers and quickly look at numbers to see outliers? Congrats you're done. Now if you actually want to do the "math" side of the business get ready for a whole different type of career path. Get your PHD in mathematics from a major top 20 College. To drive the point home, ***you will be asked for your SAT math score or GMAT score but we do not care about your math courses in college*** only the finance ones. That should make the difficulty level clear.

Wall Street is a Lazy Way to Make Money: This is another knee slapping, "rolling on floor" laughing and just saw a guy benching the bar funny assumption. Unless you are the PM at Capital Group or a PM at another long-only mutual fund with billions of dollars collecting a few "bips" your life going through the ranks will suck. If you read the first paragraph notice how military and athletes do well? They work harder than you can imagine and don't complain about it. Don't get us wrong everyone is forced into complaints and unhappiness at some point, but generally speaking a military guy or an athlete is a much better fit than an engineer with a 4.0 who grew up in the suburbs. Every recruiting season we have to answer the same tired question on what makes a great Wall Street candidate. The answer is here ***"A Smart guy with a positive attitude who grew up poor and wants to earn money no matter how hard he must work".*** We will choose an ex-military finance major from a top tier school over a archaic mathematics major with the same 4.0 GPA any day of the week and it is not even close.

The Buy-side is Always Greener: Another good one. As noted the buy-side is the most prestigious but this does not always mean more pay. Lets say you are 28 years old and you are about to get promoted to the Vice President role on the sell-side, you're almost guaranteed to clear $400K+. Now lets say you are 28 years old working at a $1B fund that just lost 10% year to date and saw fund flows decline, congratulations you get $0 for a bonus which can be 66% of your total compensation at that point. ***The correct way to think about the buy-side is unlimited potential***. A simple anecdote would be comparing put and call options. With calls your upside is infinite (buy-side), with puts your upside is limited (sell-side). Another good way to think about it – the variation in pay is severe on the buy-side and much tighter on the sell-side.

The Best Skill to Have is Modelling: Almost want to put this one as the first paragraph because this is the worst advice to possibly give someone. ***You should not take any modelling courses before you start your job and you would be better suited practicing hot keys in Microsoft Office.*** How speed is much more important? Look at a financial release such as this one from Google. You must update your hand-me-down model with 0 errors for all new numbers in 30 minutes to an hour, that's your benchmark.

Stock Performance is Everything: Another great one. People believe Sell-Side analysts get paid to "pick stocks", simply not true. This is absolutely true on the buy-side where you can make a ton of money running a profitable book at a hedge fund but the sell-side is named that for a reason. Your job is to sell. ***So the best skill possible is salesmanship.*** Get companies to like you, build relationships and network… now you can see why a "positive attitude" is so key, you'll never see a strong salesman who is unhappy, negative and mean to clients all of the time. In addition, it would actually be in your best interest to make sales your number one priority even on the buy-side. Why? You're likely not connected so the only way to get your Portfolio Manager to take a position in a stock (one-third, half, two-thirds or full) is to sell him on an idea. Not only that but you're going to be jumping around Wall Street to move up the ranks quickly. ***Your resume will look like a ping-pong machine so you better be a good interviewer… sales again.***

Steep Learning Curve: A great one you will always hear. The truth is this. ***You will learn how to hold your emotions together better and better with each passing year.*** When you are bombarded with 100 emails in 20 minutes, must respond, must be political, must be happy and must be accurate on 0 hours of sleep get ready to learn to contain yourself. Everyone gets unhappy and complains at times but your job is to hold this in better than your peers at all times. Oh and by the way, a real all nighter is when you get ZERO hours of sleep and then work a FULL 16 hour working day without leaving the office. So university "all-nighters" are pretty much bush league.

With all that said here is the quick summary of what has much more truth to it.

- **When you invest you're playing rigged poker.** Generally yes. The PM at Capital Group can get any CEO on the phone with him.
- **You will gain 30 pounds of fat from 2 years in Investment Banking.** Yes unless you are extremely obsessed with perfection.
- **Wall Street Saying "Family, Friends, Girlfriend… choose two".** Yes, you already know our advice.
- **Primarily "D-bags and Assholes".** Yep, you'll meet a lot of disturbing pieces of human garbage.
- **They usually don't get laid.** Yes again! This is usually due to the bragging, prestige and one-upsmanship.
- **You Don't Get Lunch Breaks.** Correct again, you usually go outside and buy it (quickly) or have it delivered.
- **You Get Meal Allowances.** Yes, horray! You worked over 12 hours so you get $25 for dinner, wait you're getting fatter…
- **You Get a Free Cell Plan.** Yep, have fun with those morning or late night blow up "FYI emails" get used to typing "Will do"

That should suffice.

****

Navigating Wall Street

Navigating Wall Street

"How do you suggest I get into XYZ Wall Street job"

With that being the primary question, we have attached a Navigation Map.

Wall Street Cheat Sheet

Now if you look carefully at this chart, the lines “linking” to other boxes is the easiest way to transition. So an investment banker could go to PE with some hard work, but would be harder pressed to jump to a long-only shop. In addition, if he wanted to move down to a tier 3 job that would be tremendously easy. Moving up the prestige scale is significantly harder than moving down.

The next thing to note is once you drop below tier 3, you’re in no mans land. The hardest of all jumps is from tier 4 to tier 3. The reason why is at tier 3 and above you’re looking at high paying positions with significantly higher stress levels. In tier 3 it would be easier to jump down banks (Ex. from a bulge bracket research position to a mid market investment banking position). Same is true from tier 2 to tier 1.

Now if you look at the chart from left to right it moves from transactional positions to modeling positions to stock picking/portfolio positions. This explains why it is much more difficult to move from corporate M&A to sales and trading even though they have relatively equal pedigree. The jobs are simply not that transferable. In a corporate finance job you’re looking at acquisitions, not movements in stock prices and in a Sales and Trading position you’re monitoring many stocks and must be on top of significant moves in stock prices.

For a trained eye there are two glaring omissions. 1) People with PHD’s and 2) Venture Capital.

1) For the PHD position if you understand the niche versus broad concept it would be in your best interest to apply your niche knowledge to break into either a research position or a hedge fund position. At that point you’re in the game and you can move around after 1-2 years of experience with relative ease.

2) For Venture Capital, we hesitated on placing it into the private equity bucket since it is ***relatively*** similar, you are deploying capital into a small firm and hope to exit the position at a profit. The reason why it is excluded from Wall Street is the segment is niche and your job could be impressive to meaningless. The reason why is some Venture Capital firms simply make you call and try to obtain funding or cold call to source deals. This would actually be a better link to Sales and Trading. Alternatively, you could be a rock-star and have a large amount of cash to invest yourself… In which case you unlikely need any advice from this site. With all that said we already covered the basics of the topic.

Pay? Note anything below Tier three is a significant drop in pay (50% or more). When people speak of “Front Office Wall Street” they are referring to Tier 3 and above jobs. As an example a person with 5 years of experience in Sales and Trading is making $150-200K at minimum. A person working in financial advisory services is making $75K or so as they are likely seeing 5% raises versus $10-20K+ raises which are the norm in front office roles.

There are exceptions (a person who started his own asset management firm as an example) but generally your goal is to jump into a Tier 3 or above job as soon as possible to learn the necessary skills to have a long career on the Street.

Conclusion: While there are always exceptions to the map laid out, it is best to start there. Print it out and ask yourself where you could slide in with the best “pitch”. In addition, remember that time is not on your side in any way. The longer you stay in any position, be it Banking, Research, Accounting or otherwise, the tougher it is to move. Give yourself 1-2 years max before jumping into one of the tier 3 or better jobs. There are times to be patient and when it comes to moving up or getting into Wall Street… this is not one of those times. Good luck out there.

****

Necessary and Unnecessary Risk, No Point Investing if Broke

Necessary and Unnecessary Risk, No Point Investing if Broke

Attempting to come up with your own higher risk investment portfolio only makes sense if you're worth over a million dollars. This is something we've said several times in the past and yet people still try to cling on to their $100K trading portfolios. We'll explain why it doesn't make sense, what a "return" is and how to avoid falling into this trap. Remember, only 2-3% of professional money managers outperform the market after fees and these individuals have gone to top tier schools, get to meet the CEOs and CFOs of public companies regularly and do it as a full time profession. Thinking that you'll have enough time to compete with them while simultaneously working your job/career and building a secondary form of income is just not a smart idea. That said we'll lay out the why.

Unnecessary Risk – No Point

What is a Return? A return when you put money to work today that will lead to a higher dollar value in the future. So if you spend $1 today but in five years it is worth $2, that is a 100% return over five years. In addition, if you spend $10 today, but this leads to you *saving* $20 in the future, this means you also incurred a positive return (100% as well). That last one is the part where people get the math twisted. If you're in the <$500K net worth territory there are tons of ways to generate a 100% return without significant risk: bulk purchases and cost downs.

Bulk Purchase: Lets use two options, you can either 1) invest in a bunch of stocks and bonds with $10,000 or 2) you are allowed to bulk purchase anything you like with $10,000. We will all but guarantee, the second option will generate much higher returns than the first one. Why? Scale. If you want an easy way to get a 100% return off of your $10,000 you should purchase the following in bulk: toothpaste, toilet paper, towels, underwear, socks, garbage bags, cases of your favorite drinks, cases of your preferred protein, cases of your favorite frozen food and anything else that you routinely use. Why? Well if you can buy a significant amount it means you're locking in a 50% return at minimum.

Think of yourself as a convenient store. The only reason why a convenient store makes money is they simply buy in bulk and sell at a slight mark up to suggested retail. By doing this yourself you're able to lock in the gains while simultaneously avoiding the additional mark ups in the future (you won't need to go to them, since you're the actual store now). If you think this is a joke, we would go ahead and track your expenses. We will bet you ratchet up a few hundred dollars every month in convenience related purchases that would go to zero, while simultaneously paying 30-50% less by purchasing in bulk. For fun, this is a good practice to have even when you make a bunch of money, have one closet full of stuff you have to buy anyway (detergent, garbage bags, paper towels etc.). *Again, 50% return locked in.*

Fixed Costs: Another big one in terms of guaranteed returns (or fixed costs) is your location and your rent. There are two strategies here, calculate the cost of your commute + your annual rent and see if you can "negotiate down". Depending on the market it is possible to negotiate a lower payment if you fund the entire year in a single day. In addition to this, if you commute you have to calculate this cost into the cost of your rent and see if you can net out a positive return.

The reality is that when you're young you just don't have the money to start up in the best location. So you are probably moving longer distances than you want to offset the cost of some rental expense. Over time, this math breaks down as the commuting cost (say $300 a month or even $400) needs to be added to your rental cost as a "fixed" payment. So if you can move to a closer spot, increase your rent by $250… You actually need to move. This similar math applies to your rent vs. buy decision (again, remember that buying a place locks you into a location so you have to stay there for at last 10 year to de-risk the return profile).

Finally Forced Returns: This is the last and most important item. If you followed our prior two posts, it suggests that unless you're rich, there is no reason to take on additional risk for no guarantee of returns. If you can invest in anything and put 3-4 hours into it pushing the returns up to 20-50%… You have to do it. Why? This is called paying your dues. When you are not rich, life has a way of punishing people for taking the lazy way out. That one stock" or "one investment" is going to go south and suddenly you lost an entire year of investing. Remember, if your net worth takes a step back by more than 10% you have lost an entire year of work.

Forced returns based on our prior recommendations are: 1) fixed up websites, 2) additional hours to a new project with limited downside, 3) fixed up homes/properties where you're next to certain you can move the needle by 20% or more and 4) any and all re-selling opportunities that require you to hold some inventory.

Ultra Low-end: Before moving on, there are even some people who attempt to make "big stock bets" when they only have $50,000 to invest. This is beyond crazy as you're better off clicking around the internet and opening bank accounts to get returns. You can do extremely frugal things such as churn bank accounts ($300 sign ups), churn credit cards (25,000+ miles each about $250 in value) and of course bulk purchase gift cards of $1,000 or more. That last one is probably the best option for returns if you only have $50,000 to your name. You go online and buy gift cards at a discount to places you are forced to shop at (like a grocery store). The mark down can be as high as 5% getting you a guaranteed 5% return in less than 6 months (it means you're locking in 10% gains per year with *no risk*). A good example is department stores like Target. While we don't have the time to do this anymore, it actually works extremely well during holiday seasons as well. If you're going to buy your brother or sister an iPhone for Christmas, just buy the $1,000 Apple gift card for ~$920 and buy the iPhone. Congrats you just got a discount from a store that "doesn't offer discounts".

Necessary Risk

Now the summary above reads like it is all about being "risk free". The reality is that there is a huge difference between necessary and unnecessary risk. Society teaches us to avoid risk in general (90%+ of businesses fail, buy insurance for every issue fathomable etc.). There is a balance that needs to be cleared up. The balance is between unnecessary and necessary risk. The prior section highlighted a ton of ways to avoid unnecessary risk, if you're not a millionaire you can get high returns since the amount of money you're working with is small. $300 is a full 1% if you only have $30,000 while $300 is only 0.03% to a millionaire. This concept of always thinking in percentage terms should be written on a post-it and hung on every single refrigerator around the world. *If your percentage return is higher than a point or two in less than a month it means you're outperforming the "market rate".*

Leverage: Leverage works when you can sustain the time horizon risk. This is why we recommend going down a more levered path once you're a millionaire. If you have a million dollars the income you're getting (dividends, bonds, rental income etc) is going to provide a base line cash flow number. If you're generating say 5% returns that is $50,000 a year. If we go ahead and cut that in half ($25,000) it means that a leverage ratio below ~$25,000 a year in payments is not good given a 30-year horizon.

Example: If you can buy a home and rent it out, your income from the $1M is going to cover the entire cost. Assume we go into a massive recession and the asset you bought is now worth "less" than what you bought it for. Well… It actually doesn't matter. Fast forward 20-30 years and that asset is more likely than not going to be worth much more than what you paid for it. The cash flow from the asset went down during a bad down turn but it was still *net income positive and cash flow positive.*

This is what we'd define as necessary risk, if you want to continue building your net worth you are going to underperform your capabilities without leverage. Inflation eats at the value of the loan outstanding and the cash flow from your investments has already de-risked the need for a fire sale at any point in time.

Asymmetric Business Risk: Talking about stock piling necessary items while simultaneously suggesting a business/new venture is not something you'll see on most websites. Most have an either or set-up: frugal save forever or risk on at all times. The reality is you can actually do both with the right priorities. It's a matter of *process over risk*.

Example: Asymmetric risk to the upside is using any of your current skills and starting a service from it. While we absolutely hate services and time for money exchange options, for people who really don't know "where to start" they are forced down this consulting/service route. You simply take what you do and offer it as a stand-alone entity. If what you're doing cannot be offered as a stand-alone entity you might be in an area of work where there is no actual value being created (bureaucracy and significant politics is a tell-tale sign for no value addition). Simplistically, you take what you're already doing and offer it as a private offering.

Once this step is done you'll eventually get a sense for what type of physical product is needed (make sure it is recurring or consumable) and expand into that area over time. This type of risk needs to be taken as you're leveraging your relationships with your current client/customer base to onboard them.

Conclusion: This should summarize the difference between necessary and unnecessary risk. It also highlights the importance of thinking in percentage returns and using leverage (inflation and cash flows) to your advantage in the future. If you can take out debt and use it as a tool (IE: let inflation devalue it over time without serious risk) it's quite useful for optimizing you long-term returns. Just remember. No reason to add risk for no reason. This is where most people get messed up. They chase risk when there are risk free options that offer double digit returns if your net worth is currently under $1M.

****

Networking Jobs and a Social Circle

There are many strong blogs out there that establish the importance of a good set of friends, network of connections or a crew.

The Basics: A lot of emails have come in asking about "how to network" and the theme is the same, people are asking the wrong questions. Instead of asking how "you can get something" the question you should be asking is ***"How can I be a positive in a person's life"***. Networking and building a strong social circle is relatively simple at heart, 1) help someone make more money, 2) improve their sex life or 3) improve their mood by being a fun and interesting person.

Not everyone can help in categories one and two but ***everyone can improve in category three***. Specific to Wall Street, if you are going to work in an extremely intense environment with painful working hours at times, you probably want to spend this time with someone you enjoy. Fraternities and even the military at times get a bad "rap" for their hazing and hard-core nature, but this is a great model for building strong bonds. People who think and believe in the same things will form stronger relationships compared to a host-leech relationship, going through hell and high water together forms a much stronger bond than a situation filled with rainbows and sunshine. With that said, you would not be surprised to see a large athletic, militaristic and frat culture at many banks.

Jobs: Given the above assessment what is the best course of action to give yourself an edge in networking when you start pushing your resume around? In relatively simple terms it is as follows 1) trusted personal recommendation, 2) transferable experience and 3) personality. When push comes to shove, if a candidate is not personally recommended number two sees a much tougher review process. This makes sense logically, if a MD recommends a low end Analyst/Associate and there are some minor formatting errors, the MD's signature of approval over-rides meaningless mistakes. If you're going in cold, this would be an immediate ding. With that said, in rank order you should tap all close connections immediately (friends, family, fraternities, linked-in connections, professors, career centers/job fairs etc.) after that you'll be cold emailing with a clean and revised resume that shows you're relatively intense when it comes to presentation. You will prioritize all work experience related to finance above every other activity and you'll bring this to light in short 3 sentence intro's during your cold emailing approach. Finally, to close out all positive email responses, you should invite people to meet for "coffee" or "drinks" at any time of their convenience (meeting in person is substantially higher ROI compared to a phone call). At that point you're working on 2 and 3, selling any transferable skills and coming off as a positive interesting and fun person (by year 2 most people are bitter so your attitude will be welcomed).

Friends: Overall, you don't need many close friends to have a happy life. Most people have a handful of close friends then a broader network of soft touch relationships. Below are a few questions that would be a decent filter from a purely biased perspective.

1. Are you a positive person?
2. Do you have an interesting career or job?
3. Are you in shape?
4. Do you have a real hobby such as music, cooking, dancing, singing, etc.?
5. Have you traveled outside the country?
6. Do you spend over an hour a day watching TV, checking mainstream news or Facebook?
7. Is it easy to generalize you into a group?
8. Do you get angry over things you cannot control?
9. Do you say hello to a new person every single day?
10. Do you spend 14+ hours a day being productive?

If you answered yes to the first five (+1) and no to all of the next five (+1), you're in great shape. 8/10 would be respectable.

Soft Touch: A few colleagues of ours have a saying "A friend is someone you benefit from". This is quite aggressive and is a joke, but really it is referring to soft touch friendships where you develop a relationship based on mutual gain versus the host/leech relationship mentioned earlier in this article.

An example would be a bar or club you frequent and know the crowd should yield high results for you. The trick would be to "get known", befriend the bouncer immediately, tip the least busy bartender the most and show up to the venue at all times with a new girl or group of girls. The mutual gain should be clear, your new status helps you get more girls, you're bringing them business and bar/club owners want to have high amounts of women (attractive*).

Alternatively, if you want to develop a business relationship the process is much the same. Create a value additive process or become the source of value additive ideas or information. Once this level of trust is passed back and forth it will snowball where you gain more trust of larger groups of individuals over a long time horizon.

Conclusion: This is a relatively short take on networking as it should be. The type A personality usually ends up taking the hard route of revising his resume multiple times and eventually landing a job but this is a long-term pain point as the real money is always in "who you know" as cliche as that sounds. With that said start expanding your comfort zone and believing in yourself because time is not on your side. It never is.

****

New Year Book Reviews

New Year Book Reviews

In our post, just a few short days ago, we suggested that readers pick up a book. This is the best alternative compared to spending a 10x premium on nightlife and paying UBER surge charges that could cause a global financial crisis. The post will be much shorter in length (~500 words per review) so we avoid giving away the main concepts of each book.

Gorilla Mindset: Recall, we gave away 10 free copies of the book as we were far too busy to read and do a book review at that time. Mike's book is the most helpful book we've read in terms of creating a ***Mind Body Connection***. We're not sure if that was the intention, but that is the main takeaway we received. If you are a newbie and do not have your life together, we would suggest choosing just one section every 2 weeks to incorporate into your life.

Example: Mike goes through a series of posture exercises and forces you to write down what you believe you want out of life on a daily basis. This would generally cause a person to have too many things running through his mind to execute on. Simply put? Thinking about your posture, cutting out negative people and scaling yourself all at the same time is likely an overload on your brain. We would choose one every two weeks and once it has been incorporated over the next two weeks… Move on to the next.

While we think the most important aspect is creating a mind-body connection there are numerous helpful items that we were unaware of within the book. To name a few he covers supplements that will improve your skin, your mood and even your depression! While we don't suffer from any of those ailments at this time, it is certainly good to know you have a laundry list of items to research.

You're essentially reading a book by a person who used himself as a patient over the past 35 years… testing every single bunk and real supplement known to man-kind. We'll take real experience over mainstream beliefs 100 times out of 100.

Finally, an overlook portion of the book is the section on selecting people for your life. We clearly agree. If there are negative people in your life (yes this includes your family) you need to get rid of them. Importantly, we're not saying all families or all friends are bad, however you must choose who you associate with as it will change the course of your life forever. No. That is not an exaggeration. If you decide to hang out with dead-beats, overweight people, complainers and broke people… You'll be pulled down before you drag them up. The old adage: *"You can lead a horse to water but you can't make it drink"* is a life fact.

One Negative: There is one sentence we absolutely think should be deleted from the book. Forever. **"Money is neither good nor evil".** We know you're reading this Mike! We will never agree with this statement as **1) poverty is the root of all evil**, 2) by claiming money is neither good or evil you've tricked yourself into saying you don't need it… YOU DO and 3) assuming you have money you're able to do *more good* for society therefore it is an enabler of doing good things for society (we assume all of you are normal human beings with a conscious).

Finally, we strongly suggest a *print* copy as it is a *work book*, instead of a typical book where you simply take notes.

The Charisma Myth: This is unquestionably the best book we have read that has been written by a female. That is not a joke. While other people that cater to men claim they are better than "all women", we can easily say that 99.9% of men will not become anywhere near as successful as Olivia Fox Cabane (or as important). Hopefully that got your attention. Here is an excerpt:

"By choosing what you imagine, and by learning how to adjust your mental state, you can ensure that body language projects more presence, power and warmth, and thus charisma. In terms of achieving charisma, your internal state is critical"

Does that sound dangerously familiar to the book you see above? It certainly does.

Before you learn how to improve your charisma you have to find your baseline type of charisma, there are four: Authority, Kindness, Visionary and Focus.

Lets use this blog as an example. It would take less than fifteen seconds to realize that the default charisma state is Authority and Focus while having a severe lack in Kindness (we even delete low quality comments!). While this may work for a specific targeted niche… this is certainly not the best approach for all situations. If you were to attend a new conference where you're meeting hundreds of successful people you want to turn on the "kindness" charisma instead of your default Authority and Focus charisma.

She argues that it is not possible to mentally control your body at all times. Were are not aware of our own eyes fluttering in front of us while everyone is well aware if we even do a partial eye roll. It is a much better strategy to essentially "check-in" to each charisma type that will be most appropriate for the situation. In times of great turbulence, people would certainly prefer to flock towards an Authority Charisma leader versus a Kindness leader. Alternatively, at a cocktail party, people would prefer spending time with kindness charisma and visionary charisma.

We've simplified this quite a bit, however she includes several techniques to help you understand where your baseline charisma is, how to improve it and which ones to *use* in which situation. You'll find that your charisma type will also explain why you feel more comfortable in situation X versus situation Y.

One Negative: The one hole we find is that we do *not* believe she is entirely correct when stating you cannot control your body. For example, if you are reading this post right now… you can simply place the palm of your hand on your forehead. Boom. You had a partial smile for no apparent reason (perhaps a full smile). If we learn to be aware of our body language and *practice healthy body language*, your body will mentally remember it and *default* to the correct body language over time.

How to Fail At Everything and Still Win Big: The book covers a wide range of topics, our primary takeaway is that affirmations are real, passions/goals are nonsense and being selfish is generally beneficial in the long-run. We are certainly avoiding many many other topics that are covered in the book but we'll focus on those three.

Affirmations: The background story for the book deals with a health problem Scott had and tied back to a new affirmation he used while dealing with the issue. You can guess how it ends after the first chapter of course. However. The long story along with thousands of words makes you wonder if there is a pattern behind writing something down… and the ability to make it happen. Yes it sounds cheesy but is true. If you 1) continuously write down what you intend to achieve, 2) mean it and 3) set your life up to go down that path… eventually you will get there. Importantly, if you don't believe it and don't tell yourself mentally (everyday) then they simply won't work.

Passions and Goals are Nonsense: We laughed when reading this on page two of the book. As it is exactly what we said about New Years Resolutions or "goals". He expands the word goals into passions and explains that making money has absolutely nothing to do with getting rich. This is certainly true as our own business has nothing to do with any passion of ours, we do it for the money just as many Wall Street people work here for… the money. You don't give a loan to a guy who has "passion" you give a loan to a guy who is going to eat Ramen noodles for 1 year straight to turn a profit.

Think Long-Term: Scott makes an interesting note on taxes and benefiting society. We agree that people are generally net producers or net burdens on society. By definition, if you are paying more in taxes than you even spend in a year, there is no way you're a burden on society. Why? You're giving more money back to the government (and your country) than you are spending on yourself. Therefore, there is a surplus. We agree. While others will call you selfish, if you think long-term, becoming successful will generate the most benefit for the greatest number of people and there is absolutely no debate.

Finally, the most important piece of the book surrounds two topics: 1) creating a "system for success" and 2) the notion that we are "moist robots". Since that is the focal point, we'll avoid it so we don't give away the book.

One Negative: While we 100% agree that diet and fitness is paramount to success, we didn't agree with a lot of the beliefs in the book. He hints at becoming a vegetarian and the overall take simply didn't jive with us. We'll leave it at that.

Skill With People: We picked this one up last second this weekend due to a comment from a reader (Recent Graduate). The good news? It was absolutely great for a short read. The more important news? **You must buy it in paperback form.**

If you buy this book, it is essentially a 50 page cliff note version of people skills. You'll find that some of the tactics come second nature to you while others you continuously mess up. We would recommend ordering a paper back copy to carry around and highlight the mistakes you continuously make. Once you've fixed the mistake, remove the highlight and move onto the next one. Wash, rinse, repeat.

To reiterate, this is more of a quick reference book such as a pocket dictionary, but for people skills.

Fun Side Notes

1) Many of you are quite bright. You remember we gave away 10 copies of Gorilla Mindset for *free*. **Well the most important lesson is today.** When you give something away for free most people will not return a favor to you. Of the 10 copies we gave away a total of 3 reviews came back (that was the only request to leave a review). That is not a joke! If anyone you know believes that people will treat a free book in the same regard as a book they paid for… Well now you have crystal clear proof that they are wrong.

2) "Book" or Books" was one of the most frequent searches on our search bar this year. If there is significant interest in book updates we may make a page for it and continuously update the page. Before voicing an opinion however, remember that we read well over 100+ pages a day which would create quite a few books. Maybe we'll do 1 book every quarter.

As usual no questions, but if you leave an interesting comment we're happy to respond.

****

New Years Resolutions

The formatting of this post is going to be undeniably screwed due to mobile but it needs to go up anyway for the new year (advanced apologies for the format). With that said we don't believe in new years resolutions in the traditional sense. Instead we want to make larger strides in life themes (theme idea stolen from James Altucher).

Below are some major themes you should add to your life if you haven't already.

1. Less Complaining: Yes there are skinnier girls in Russia. Yes there are fat ugly girls who think they are 9's here and yes, there are many problems in the good ol' USA. The problem? Complaining get you nowhere. No one cares about your problems because your goal in life should be… Solving people's problems. With that said, it is damn near impossible to never complain, no one lives a perfect life, but you should see noticeable declines in the amount of time you spend whining.

"You can't call yourself successful if you're getting angry & complaining. No matter your definition, successful people don't do either." – WallStPlayboys

2. Less Analysis Paralysis: This is near zero at this point but for many it is a wide spread disease. Trapped in their own heads. If you're able to successfully analyze a situation there is a way to capitalize on it. What does this mean? If you know people are going to do X there is an opportunity in doing Y instead. If girls all go for the "meathead" you should become a meathead and hit the gym. Find the solution. If you see that people are lazy and want a step by step guide for Y… Instead of analyzing this phenomenon… Go create the product. In short, actions are everything.

"If you can analyze a situation but you cannot capitalize on it… You're not very good at analyzing the situation at all." – WallStPlayboys

3. Less Negative People: The truth is, you really are the average of the people you speak to. Don't waste your time talking to people who make you feel bad or spend too much time doing #1 and #2 above. You will notice a circular trend where those that are complaining and sitting on their hands thinking tend to be in the same position year after year. Don't let this be you and continue to surround yourself with the opposite.

"What is everyone else doing? It's probably a bad idea." – WallStPlayboys

4. Less Worrying: At the end of the day, in the USA you're taught to worry about everything. Worry about meeting a stranger, worry about getting some crazy disease from food, worry about what other people think about your social media status and worry about the next collapse. Forget it. Worrying is unnecessary stress. We're not saying to simply jump off a cliff but intelligently cutting out worry is a smart move to make. As an example: taking extreme measures to protect your identity is a smart move depending on who you are as you have too much to lose. On the flip side, worrying about when interest rates are going to move 0.25% is insanity, unless you're Big Ben himself you're simply wasting your time. Finally, from a game perspective, you should absolutely not worry about any approach that fails, you're simply closer to your next success.

"Why worry about things you can't control? You can't control them so move on to things you can do today." – WallStPlayboys

5. Less Frivolous Spending: Always strive to be an efficient spender, or a minimalist. If you've got 9 digits in the bank and another 8 figures on the way, we have no idea why you're reading this blog and enjoy the balling life style. For the rest of us, take a quick look through your spending patterns (use mint or something similar) and try to make a few tweaks that will improve the bottom line. A good starting point is throwing away your television and trading it in for books.

"Become a minimalist don't be frugal" – WallStPlayboys

Time to move onto growth, here you will find things you always need more of.

1. More Mentors: January first is the best day of the year to review your contact list and look for a new mentor to add to your top 5. Maybe your goals have changed a bit and you want to spend more time gaining muscle or making money, in that case your mentor top 5 should automatically adjust. If the person you want to become is not in your phone, you better start hunting… yesterday.

"We have a guide to finding mentors… the more important question to ask is… Do you deserve help?" – WallStPlayboys

2. More Streams of Income: This one is for the older gents. If you're fairly settled into. Your career it is certainly time for you to expand your streams of income. One day you'll lose your job, we all will, and you want to have a hedge against this inevitable short-term failure period. This means setting up a few side businesses that can generate $500-1,000 a month (the more the better). We don't know what your skillet is, but good information is the most valuable item in the world so find your niche and pass it on in a way that can help generate income. Become self reliant as fast as possible.

"Who do I trust? Me." – WallStPlayboys

3. More Strength: Yep, no matter who you are you want to get physically stronger. Even if you're in your 50's or 60's it's time to turn back the clock. Start comparing yourself to your peers and ask "am I in the top 5% of my age bucket?" If you get there try to make it to the 1% etc etc. continue to get physically better. Build more muscle, increase muscular endurance, decrease body fat. No one has a great workout at the gym and then returns home to regret the workout. Never happened. Never will.

"If you can see straight after finishing your last set, you're simply not lifting hard enough" – WallStPlayboys

4. More Control of Thoughts: Hopefully you can control the vast majority of your thought process but we all slip so it is a good refrigerator reminder. Take the most annoying people in the world and surround yourself with them once and a while (this is to be done in rare instances to avoid contradicting point 3 of avoiding negative people). The best way to do this is to simply go out and talk to a bunch of people, you'll eventually run into the weirdos, see fat girls who think they are 9's, girls who wear flip flops, guys who complain all day and dudes who talk politics 24/7 when they don't have any political pull etc. etc. this is one of the hardest parts of self improvement but it needs to be done. We are what we think about, so learn to control what you think about.

"Rewire Your Brain to Frame Everything in Your Life as a Positive." – WallStPlayboys

5. More Help: This is another one for the older gents. If you have a few solid mentors, it is time to pay it back. There are a lot of confused men out there taking advice from, 1) negative people, 2) keyboard jockeys, 3) feminist men/women etc. None of these people are good role models so spend some time finding one or maybe two fixable young up and comers and help guide them down the right path. The more successful you become the more these people find you so it will inevitable happen. Instead of shutting the door let a few in since it won't take too much time to fix some of their beliefs. If you can't drag someone out of the gutter, it means you're still in it. So give back once you're free.

"Your value as a man is not how much you have but how many people you can drag out of the gutter" – WallStPlayboys

****

New York vs. San Francisco. Landslide for New York City.

New York vs. San Francisco. Landslide for New York City.

For fun we had a twitter back and forth with our friend Sam who claims that San Francisco is far and away better than New York City. Needless to say, we disagree 1,000 fold. Comparing Man Francisco to the greatest city in the entire United States, is like comparing a European Model to an Overweight Vegan…. Wait… That is the exact same comparison.

The Only Positives About San Francisco

The following people will enjoy Man Francisco: 1) Married couples, 2) liberals, 3) people who dislike hygiene, 4) vegans, 5) tattoo artists, 6) those who enjoy soy and 7) unattractive individuals with low self esteem.

The following benefits of Man Francisco: 1) the weather and 2) produce/farmers market.

If you do not like any of the items above, you're not going to enjoy Man Francisco relative to NYC. Lets go ahead and kill this topic as the only benefits have been outlined above. This will be long as there are practically no benefits at all. Lets start with the people.

The People In NYC Are Much Better

1) Cheap People: The vast majority of people living in San Francisco are cheap. Sharing apps came about not because of the value it gives to society but because the society believes in making items as free as possible. Ignore the fact that this has the adverse consequence of filling your entire city with people who will prefer "Pabst" beer and a $9 twenty pound burritos. No surprise… this does not bring in attractive clientele and leads to the next problem…

In NYC: The people are not cheap and they will spend at will for a good time. You do not have to worry about calculating checks to the exact dollar and cents on a group dinner. When you leave healthy tips, the bartenders and bouncers will remember you forever and will show appreciation for it.

2) Fat People: Make no mistake, anyone who says Man Francisco is full of in shape people relative to NYC is a liar. They are either married or have low standards which makes them turn a blind eye to the extreme obesity and disgusting bodies of people in the city. You are more likely to find an *overweight gluten free vegan than an attractive female*. Honestly. If someone eats gluten free, sugar free, vegan poptarts for breakfast how did they get fat? Add it to the list of unexplained world mysteries. On that note, you are also more likely to find overweight homeless people than an attractive female above the 6 range.

In NYC: There are general door policies. While there are fat people all over the place, there are ground rules for being in shape and attending nicer venues. If you look terrible and don't have a large amount of money the venue knows you're not going to add any value to the event. Bring something to the table. Don't show up in terrible clothing, overweight and unsuccessful expecting access to the Victoria Secret Fashion Show. You will be laughed at… Politely… As they won't let you in. This is called having standards

3) Homeless People: On the topic of homeless people, they run the city. Back in 1968 there was a single homeless person who used to sell pencils nearby union square who suffered a horrific accident due to a war and didn't have legs. Today? You can't walk around union square without jumping over homeless people like a game of Mario. Oh and don't worry. They are also fat.

The problem is so large we would like our readers to read this quote: *"We encourage people and dogs alike to do their business in other places, like a proper restroom or one of our fire hydrants, which are stronger and made out of cast iron."*

Pause for a second. A lamp post was literally taken down by public urination and San Francisco has resorted to comparing humans to dogs with the statement "*people and dogs* alike" not… "dogs and people alike". We are not trolling, here is the article.

Since we are comparing people and dogs like its no big deal it is fair to say the people also look like dogs as well.

*In NYC: There are homeless people and it is extremely unfortunate. The climate in NYC is not good for homeless men and women, however, they are not *entitled* homeless people. A trip to downtown San Francisco compared to NYC will set the record straight. The number of homeless people in SF is ridiculously higher and they are entitled/aggressive as well.*

4) The People are Unattractive: Before people jump all over the sentence above and say "omg that was so mean!" we are going to go ahead and allow you to decide for yourself. Type in the phrase "san francisco women" and then type in the phrase "New York City women" into google images. Here's a rough idea of the difference.

1463155_10100833897659203_1057983173_ images

Now there is nothing wrong if you believe that it's about "who you are is on the inside" (we know you're lying) but lets accept this as a fact. The problem? The women is Man Francisco have the worst attitudes you will ever see relative to their looks. The standard joke is that the city is full of 49ers (fours who believe they are nines). The joke is true.

In general, you can tell if a city is good based on the delta between the girl and the guy. Typically a girl will be at least a point more attractive than her man because this is how the world generally works. In Man Francisco, it will be reversed. In the rare situation where a guy is roughly equal in physical attractiveness to the girl… Make no mistake, she is the exact same age as him or within a couple of meaningless years.

In short, your dating options are exactly the same as Stephen Curry. You're gonna be hitting a lot of threes.

In NYC: There are too many industries not to find a group of attractive people you enjoy hanging out with. You have many popular industries including Media and Fashion causing the average person to remain roughly above average if you stay in the nice neighborhoods.

5) Diversity: This is a joke of a topic since NYC is actually more diverse in terms of cultures, however, if you want to date a female who is not overweight your only choice will be Asian women. There is nothing wrong with this, but, you better have that yellow fever otherwise you're going to be in pain for a long time. Therefore you can see that the only type of person who would be okay from a personal life standpoint would have to be either 1) married or 2) interested in Asia or both. If you're not in one of these buckets you'll be puking into one shortly.

In NYC: The city has 9+ million people. Re-read that again. There are so many people in the city that you will inevitably find a group or section of town that is enjoyable. Not everyone can live in SoHo in a decked out apartment. But. There are just too many options every single day of the week. You'll find a great spot in no time regardless of your nationality. In SF, you're Asian or White.

6) Extreme Liberalism Gone Wrong: San Francisco is feminism ground zero. Ground zero. In addition, if you are not a Bernie Sanders/Hillary Clinton supporter you're instantly labeled a monster. More importantly, outside of your political affiliation, the city looks a bit like a circus. It is halloween 24/7/365 and not the good kind with attractive women running around in sexy outfits.

We did a quick google search and even this month there was an outrageously disgusting event called "Brides of March". In this event "men" dress up in wedding gowns along with women and parade the city. Please see for yourself (we apologize for the eye damage).

Yes…. That is chest hair…. and we tried to clean up the comparison with a NYC fashion show.

Unknown

images-1

In NYC: The city is generally more left leaning, however it is within reason. If you lean more right-winged… people will not throw a fit and call you a racist "xenophobe" monster. You can even have debates on the topic and still get along just fine. Try telling the group of guys above that you're not a Bernie Sanders supporter.

7) Passive Aggressive Losers: In New York City a girl will tell you straight if she is not interested. In San Francisco, a girl will talk to you and then bad mouth you to the only 7/10 in the group while you leave to the restroom (no worries she won't be a San Francisco native). Everyone is afraid to offend everyone else so they end up getting on their iPhones and sending cryptic passive aggressive nonsense behind your back. Everyone walks on egg shells to avoid offending any specific group which then makes it impossible to have standards. And… When you don't have standards you get the aforementioned event above.

In NYC: People are extremely to the point and blunt. There is no point in wasting time there because everyone is trying to hustle on to the next level in life. This is actually a great feeling. No one wakes up in the morning and says "I want to have the same life forever and just be a free spirit". If you have thick skin you will love NYC as people will tell you up front if they are interested or not. No time is wasted here.

8) A Technology County: Sure… Technology is a great way to make money. The problem? The vast majority of engineers are Aspies with no social skills and are terribly boring. Say what you will but the stereotype is generally true, most math related/tech related individuals are dorks. You're probably better off taking acid and talking to yourself than hitting the local bar filled with unicorn employees. Sadly, even the word unicorn doesn't have the greatest connotation to it.

In NYC: There is no Technology culture in NYC. Well.. There is a bit, however it is contained. Unlike San Francisco where you cannot go five feet without hearing about the the "cool unicorn" you can avoid the entire industry as a whole which is full of aforementioned Aspies and passive aggressive boring people.

9) Lack of Style: We have mentioned this in the above but it deserves a full paragraph. The people who live in San Francisco dress like absolute garbage. They will commonly wear hoodies, flip flops and do disgusting things to their bodies such as neck tattoos, chest tattoos, septum piercings and create large holes in their ears. Not only do they wear terrible products… they don't even fit. It costs $20 to get clothing fitted and it would take 1 hour of effort to find a brand that fits "close enough" if someone cared about their image at all. They don't.

strange-wtf-ear-piercing-lock

In NYC: There is a large fashion community and girls know how to dress. This also pertains to getting into bars and clubs. If you're a male wearing an ill fitted outfit, everyone in the venue is going to know and you're going to be ostracized pretty quickly. It takes less than 10-15 minutes to make sure you look nice and that is a quality that goes a long way in the city that never sleeps. The jokester above would never be allowed into any venue worth entering. In SF… He's embraced with open arms as being "different".

10) Homosexuality: There is a large community of homosexuals in the city. If that is your thing you will enjoy Man Francisco. We are heterosexual.

In NYC: Similar answer there are 9M+ people so there is likely a homosexual community as well. It is unlikely as large as San Francisco.

In Summary: The people in San Francisco are just terrible compared to New York. If you are offended by everything and are a weak human being then you may prefer the people in SF. In addition, assuming you meet some of the stranger metrics (vegan, yellow fever, boring personality who has never done drugs or drank in his life) then you just might find a niche with all the autistic people in the Tech Capital of the country.

The Actual Cities Are Not Comparable

1) NYC Nightlife is Outstanding: Sure nightlife is a bit more expensive than SF… the catch? **It is worth it.** The funniest part about that statement is the phrase "Catch" also describes a great venue in NYC… another double meaning.

If you go to a typical bar or even club in San Francisco, people will stand around in groups with their hands in their pockets and circle the following topics: 1) recent tech start up, 2) non-profits and 3) work related drama. It is absolutely fine to have minimal topics if you're shy… But why does the group have to be afraid of "outsiders". Trying to break into a group of people in San Francisco is like robbing a radioactive nuclear power plant. It is incredible that you broke into the plant with such skill. But. Now you have cancer.

In NYC: You can go out during any day of the week. That means Monday through Sunday and find absolutely outstanding venues. There is not a single day where you won't find a good venue and you'd be hard pressed to find one in the entire year that is not popping off. Last call in NYC is never and in SF it is 2am. It is not even worth talking about this topic anymore, it would be insulting to the city of NYC to do so.

2) Day Time Venues Still Win in NYC: San Francisco has several great tourist attractions. It really does. From the Golden Gate Bridge to the SF MOMA to the Marina District. There are great places to have a fun day trip, the problem is it ends there. Your choices of consistent day time activities starts to fall.

In NYC: You have the same relative value with the Statue of Liberty, Times Square, Empire State building etc. The difference lies in the choices for theatre, plays, matinee sports games (Brooklyn, Madison Square Garden) all of these venues are not even seen in San Francisco… They have one sports team and that is all. More importantly, the activities are far more crowded and bustling compared to San Francisco.

3) Public Transportation is a Joke: Complain all you like about the crowded subway systems in New York but they are better than anything San Francisco has to offer. You have three options in San Francisco, Muni, BART and the Bus. You would think that SF would have an elaborate city that allows for you to move about the town at all hours of the night (Tech Capital!). Unfortunately, you do not. BART shuts down around midnight and we have no idea what the bus system is about… it is too crowded, slow and complicated to bother with. You'll be forced to download the Uber app.

In NYC: Sure the subways are crowded but at least you can move about town seamlessly. They run at all hours of the night and if you're in a jam you'll find a way to make it back to your destination even if the other options are dead (Taxi's, Uber etc.). More importantly, the seats are not made of actual cloth like the disgusting BART station and you will find more attractive girls on the subway than inside an SF nightclub.

4) Restaurants and Shopping Are Better: Union Square, Sushi and huge burritos. Congratulations you've exhausted your options in San Francisco. The best part is if you find a nicer venue you'll have to 1) book outrageously ahead of time and 2) deal with expensive prices relative to the value. On a second thought, lets throw money out the window and it still isn't worth it. You'll be fighting tooth and nail to get into the good joints with no value add since there is no one to talk to in the closed off structure of the venue.

*In NYC: Stores everywhere. You can walk into hundreds of areas alone and spark up conversations within minutes. If you have mediocre social skills you'll find yourself picking up new contacts along with the check every single time. It would be difficult to fail in the open structure of many venues unless you were having a rough day and wanted to relax by yourself. Good luck sitting down in an open setting and *not* interacting with someone. You'd have to be an aspie.*

5) Produce, Vegan Food and Lack of Hygiene: The one category that San Francisco dominates. If you are into gluten free vegan butternut cookies made by a guy who doesn't wash his hands… You're in luck! You can find organic everything made by elves from Ireland if you wanted to. They have it all.

In NYC: Unfortunately, the options are not comparable. You will have to risk your life and eat food that is not purely vegan all of the time and you might even have to buy a non-organic banana once and a while. Tough sacrifices.

Concluding Remarks

This was by far the most entertaining post of all time for us. **Comparing NYC to San Francisco is an absolute disgrace.** The only people who will enjoy San Francisco are mentioned above: 1) married people, 2) unattractive people, 3) cheap people, 4) homeless people, 5) passive aggressive people, 6) techies, 7) those with extreme levels of yellow fever, 8) homosexuals, 9) people with no sense of style and 10) Aspies.

Before the hater comments come in, we do not care about the ten people who will enjoy SF above (the minority). We are simply saying… if you don't heavily identify with one of these groups you will unlikely enjoy the city. Maybe you'll be forced to spend some time there… If so… Get out as fast as you can.

We hope you enjoyed this click bait post =)

No Marriage PitchBook – Project Two Chainz

*****Download Presentation Click here –> Project Two Chainz ***

Today we are here to represent men in *Project…Two Chainz.* Men have come to us asking for strategic advise regarding staying single (going public – IPO) or getting married (entering into a merger agreement). With that said, lets turn to S**lide 2** for our necessary disclosures.

We are required to tell you that these materials have been prepared by one or more writers of WallStreetPlayboys.com for the men or potential men to whom such materials are directly addressed and delivered in connection with an actual or potential "engagement" and may not be used or relied upon for any purpose other than as specifically contemplated by a written agreement with us. In accordance with The Bro Bible (Bro Code XXIV (signed into law since the dawn of time) and such other laws, rules and regulations as applicable within and outside the Man-o-sphere, Investment Community, Investment Bankers, Hedge Fund Managers, or otherwise. **Please turn to Slide 3.**

We will be covering the main topics, starting with a Date-o-nomics Overview, Single Life Valuation (IPO), Marriage (Potential Merger), Caveats and our concluding thoughts on how to improve America. Let's get started on S**lide 4**.

Successful men have asked WallStreetPlayboys whether, in our opinion, staying single or getting married is of best interest in the current environment. ***It is in our opinion that the current environment suggests men stay single and avoid the current "Life Plan".*** We have run the numbers and looked at the ***net net net*** (Yeah we took that IB accounting training course for analysts as well) valuation of men and have concluded that this is the best course of action for the time being. Please take a look at the bottom of the slide.

The bad. The real bad bro. Even with a pre-nup the following occurs: 1) your future assets can get crushed in a divorce, 2) even if she done gone and cheated you're still in the red, 3) in mutual agreement… you're still burned… Now that we've gone over the bad here's the logic behind the good.

You avoid the average age of marriage… 29 too early. You can check out our basic analysis here as men can age like wine. If you work hard… 1) income increases, 2) good-lookedness increases, 3) more assets become protected by a prenup if you decided to bite that bullet much later in life. With that said, all of these rewards do not come for free. You need to work hard and have some talent, please turn to S**lide 5**.

Work ethic (operating margin expansion) and talent (long-term revenue growth) must work in harmony to create the best range of values for a man. Lets take a look starting in the top. So becoming George is likely a tough sell, however we believe he's a great case study for the Playboy lifestyle which we will cover later on in this presentation. With that said lets take a look at the center of the chart where we believe everyone can get to the unlocked potential of a hard working man.

Finally, if you're a lazy loser then you simply do not deserve to succeed and your life gets worse and worse over time ending with a big goose egg and WTF reaction from us. So, if you decide to take a journey through the volatile equities market we believe you'll succeed as hard work can beat average talent if average talent is "settling down". Now you're wondering how boss can my life get? Well lets take a look at **Slide 6**.

Alright now that you looked to the bottom left please pay attention. Lets get started. With the red dotted line. As you can see even George realizes that marriage was a bad decision and has since likely swallowed the red pill (bro-love, fist bump). Now lets take a look at the results. After his divorce he decided to never marry again and even won a bet with Michelle Pfeiffer/Nicole Kidman that he would not be married by 40…. He even got $10K out of the deal and slept with Michelle's sister. **Game recognized.** Not even a hater can hate on that one.

We won't go into great detail on the quotes since they are there on the page, however a summary is as follows: 1) always be failing, 2) America is losing the war.. .for now, 3) travel is good, 4) do you want kids?, 5) work hard and listen when you're young, 6) the internet has some dumb die hard ugly radical feminists out there, 7) we pick on the feminists for a reason, 8) Don't marry. We will touch on caveats later.

Finally, to conclude this slide, do you think it is a coincidence he landed Stacy Keibler **AND** won an Academy Award for being the Co-producer of Best Picture Argo in 2012? Coincidence? ***We think not.*** As a final note, you're valued up to 1,000 as we assume that is what George Clooney is currently batting at this point in his life. Okay so now you're asking well, did you run the numbers on the merger scenario? Of course we did please turn to **Slide 7.**

As you can see starting in the top left corner we ran the numbers ex-revenue or cost synergies for a base case scenario. Notably, gross margins expand, which are then immediately offset by a large increase in operating expenses, clothes and makeup. Quite the headwind heading into a pro-forma analysis. In addition if we can move your attention to our sensitivity analysis you see that Net Income is quite variable depending on the revenue generation capabilities of your wife… This is good and bad news as our extensive research in clubs and bars suggest that revenue generation and "beauty" are inversely related. Now if you are interested in nickels over dimes then we have one last scenario analysis to look at.

At the bottom of the page we have here an incremental cost analysis, in particular a Home and a Loss of new Sex Partners are significant headwinds in your future. To conclude our analysis we learned that there are zero revenue benefits associated with such a merger. None bro. We believe this leads to a net headwind of roughly $2.4M over ten years. With that said lets take a look at the one and only caveat to the story, kids, please turn to **Slide 8.**

You see that this is the one and only reason we see fit to enter a marriage agreement is if you'd like a family. At this point in time since we are simply pitching no marriage here we have not taken a deeper dive into this analysis. For your viewing pleasure, however, we have come up with a few solutions. First being to adopt a baby. You can change his life and the incremental costs are minimal relative to marriage, second you can simply leave the country Thailand and Argentina come to mind. With that said, this all sounds so bad and awful so how do we fix this? How do we make a marriage more beneficial? With that said lets move on to **Slide 9.**

As you can see the current environment is encouraging the activities on the right side while discouraging the activities on the left. We're no rocket scientists, only Investment Bankers, so who would you rather be? An ugly writer on Jezebel or a WallStreetPlayboy? A Playboy Bunny or a woman who video tapes herself consuming candy corn Oreos and is damaging her body in unfathomable ways making it clear she does not value her own life? A Billionaire or a Broke Ugly Hippie? A real Barbie Doll or the new "Natural" Barbie Doll that is being released? We had no idea Barbie was on drugs? We think you know the answer. If we can get more people to understand logic we will all be healthier, wealthier and happier with our lives. Everyone wins if we take care of ourselves. With that said please turn to **Slide 10.**

Here is our contact information if you'd like to hear more of our important life advise. Buy us a shot, like us on Facebook and follow us on Twitter.

If you're a girl we may include a presentation to improve your life as well, in the mean time ***any donation would increase the likely hood that we add you to our rotation.***

With that said lets go ahead and turn it over to Questions and Answers. **Please discuss.**

****

No One Cares About You

You walk into a bar or a club. No one notices you.

You walk around drunk in the middle of the day. No one bothers to stop you.

You lose your job. No one searches for a new position for you.

You lose a family member. The most you'll get is the obligatory "I'm so sorry to hear that".

You get into a car accident. In a few days you're that guy who got hurt last week. Last week turns into last year and you're forgotten.

What is the point? The point is no one can help you as much as you can. There are no hand outs in life and you should lose the belief that anyone should care about you in the first place. Why should anyone care about your life if it doesn't positively impact theirs? They shouldn't. It is your job to become a real friend to people you meet from hello. ***Maybe your mom and dad told you you're special. Unfortunately mom and dad are dead wrong.***

Once you realize that no one cares who you are or what you do, you'll take responsibility for your own life and actions. If you want to date supermodels you better be the man that supermodels would want to date. Supermodels don't date frustrated losers. No. They date successful magnetic men with unbreakable confidence and a positive mindset.

Instead of asking how you can get someone to help you achieve greatness, ask how you can help others achieve greatness. ***You are only as good as the weakest link you're able to bring up from the gutter.*** That is a positive, magnetic and sustainable trait for your entire life.

How many lives can you positively improve today… at this very moment? ***That is how many people should care about you.***

Obscure Post on the Digital Future a VR World

Obscure Post on the Digital Future a VR World

Many people are concerned about the future as the physical realm is changing more in a year than it has changed in the past decade. People are working from home, commute times have dropped and commercial real estate prices are falling off a cliff. While this is causing a lot of short-term pain, we'd argue that the long-term is brighter than ever. Virtual reality, crypto currencies, and remote work allows for a new digital economy to be born (not limited to physical space).

A More Digital World: Right now, kids are spending more time on their computers than they spend outside. Back 40 years ago, kids would spend a lot of time in the sun playing sports. Instead, they now compete with digital products (video games) and interact on their smartphones/computers/tablets.

As Darwin coined… This is a game of "survival of the fittest". In the future, the economy is going to be more digital in nature since virtual reality opens up for worlds that are even more complicated and interesting than the physical one we live in today. Therefore, new businesses that we cannot imagine today will be extremely profitable in the future.

Here are some simple hints based on what is already happening if we look at crypto currencies alone. While everyone is looking at the recent Square announcement (purchasing $50M in bitcoin) we feel that it's right/justified to give everyone an update on the other changes.

Decentralized finance: We covered this part of the ecosystem in basic terms in a prior post. Essentially, everyone is able to loan money in a peer-to-peer fashion. The loans are currently collateralized which seems to be a stick point for many individuals. Collateralized loans are safer for the lender as they are able to pick up the collateral if the loan isn't paid back or the price of the collateral drops below a certain level (too close for comfort). We strongly recommend people look into this space.

Non-fungible Tokens: While most are focused on a few select currencies, artists are creating digital products that are "one" in nature. Imagine a Mona Lisa type painting and having only one original copy of it. While you could make fakes (there are many fake paintings in the world), there is only one original. The use of non-fungible tokens allows a digital artist to create original pieces that cannot be replicated as they are protected by code. We're keeping the technical jargon out of the equation in this post so it is easier to understand. Artists can now create digital images that are rare.

Digital Property Rights: Over the past 20-30 years, digital items were easily replicated and sent around for free. There was no way to claim a "right" to anything beyond a website. This is now changing. If we can protect photos/images it is only a matter of time before other items can become protected. Think of a digital pet, a digital night club and a digital trip to Europe. It feels like "science fiction" however the technology we have today is making this a more and more likely scenario on an annual basis. Once virtual reality/augmented reality becomes high quality, the difference in feel will become non-existent.

Zooming Out: Take a step back, if the above appears to be complicated… that is the opportunity! It means that there will be a large learning curve as we build out a new digital economy that is separate from the physical economy. We'll need money to transact, individuals to explain how the digital economy operates and new structures/organizations to solve any disputes. If you are an artist/musician this is even better for you because it means you gain more control of your revenue streams/value capture.

What does this new reality look like? The real answer is no one knows for sure. Back in the late 90s, no one would have predicted the smartphone, uber and millions of software companies that exist today. What we do know is that the market opportunity is probably in the tens of trillions of dollars. Why? Simple. If virtual reality becomes equivalent to reality (feel and atmosphere), you've quite literally created a brand new world. This is extremely similar to finding a new planet where humans could live.

Some Predictions: This wouldn't be a fun post if we didn't attempt to visualize the virtual world. So please laugh, enjoy or think about the following potential consequences.

Streaming Money: In the virtual world, assuming digital currencies are the future, this means you would no longer be paid on an "hourly basis" you could be paid based on a running meter like filling a gas tank. If you're helping company B do any task in the virtual world, it automatically fills your account balance as you're working and shuts off when you take your breaks. This is great for transparency and reduces positions where money is being paid out for no apparent reason (there are millions of these types of jobs in major corporations).

Museums & Pets (yes pets!): One clear growing segment is non-fungible tokens, as mentioned above. Since we know that humans prefer scarcity (expensive art, rare sports cards, diamonds/gold etc.). it means that these rare digital items should have value. The big collectors could then create digital museums, digital collectables and rare digital pets.

While this also sound sci-fi, it did happen for a brief period of time in the mid-late 90s. We're really dating ourselves here, but back in the mid-late 90s there was a popular digital pet named a "Tamagotchi". While the fad did eventually die (for numerous reasons), this becomes a lot more realistic if everyone is interacting in a virtual world. Instead of having a virtual dog, you could have a virtual dragon/mystical creature that is rare/expensive. If this sounds unlikely, we'd recommend looking at the number of virtual items purchased for video games alone (it's a billion dollar industry).

Concerts/Scarce Events: We had a small version of this occur due to the COVID-19 pandemic, but the future will be a million times more detailed/interesting. A popular rapper/artist would no longer need to travel across the globe for every performance. They could host a virtual conference and have people pay for entry into their virtual concert room. Sounds extreme? Well… Travis Scott held a virtual concert using Fortnite that had over 12 million attendees.

Transparent Predictions: On the internet you have millions of fake screen shots, fake stock price returns, fake "I called it" proclamations. In the virtual world you could create a transparent system so all predictions/failures can be verified and checked without any ability to alter the time/date. We already see a small portion of this on Twitter. Since you cannot alter it, people with good prediction skills end up getting some traction. We say some, as it's difficult to go through hundreds of thousands of tweets to find out if the person is accurate or not. In the virtual world, this would be transparent and easy to check! So if you're good at predicting the future/major events you can look forward to a much brighter future as you can charge for your skills later on. For those that are unable to produce consistent results, the "jig is up" and you'll lose trust rapidly.

Increased Autonomy: This is another major benefit. In the past the game of "scale" was to add headcount. This made sense in the industrial era. Companies want to prove that they are growing. They want to prove that they are adding headcount. Unfortunately, the is a skill-set for the physical realm not the digital realm.

Back in the 90s, you had to have a large organization to generate large amounts of revenue. In the 2020s, it is clear that you can build $30-50M+ annual revenue businesses with a handful of people (or less!). This is an amazing opportunity for anyone with a high IQ and limited resources. The resource constraint goes away since digital transactions will have limited friction.

Since you can generate millions of dollars as a solo organization (or a small number of people), the amount of self-sufficiency you receive is also higher.

Lower Barriers: Are you of the belief that the protesters are right? Are you of the belief that they are wrong and a problem for society? Guess what? It doesn't matter in the virtual world! If you make your product in the digital realm, no one even needs to know what you look like. This is extremely similar to the affiliate marketing industry where your ad/copy skills are the product. No one knows who made it behind the computer screen. So if you were worried about racism in any way shape or form, this becomes a non-issue as no one will know who you are anyway.

As a side note, to be entirely race and gender blind, everyone should simply be a string of numbers/letters on a screen "298ij77sd76isj767so". This would make it impossible to discriminate based on any physical attributes. So? Both sides of the debate should be happier. If you believed that XYZ race had an edge or that XYZ race was being helped for no reason, both of these issues are solved instantly.

The Downside of Responsibility: If you are confident in your skills and abilities, the above should sound absolutely amazing. You're paid based on what you are delivering. There is no middle man. There is no racism. There is no physical limitation (since no one can tell). And. You don't even have to work for an organization.

This is also a huge hit to people who were rent-seekers (adding no real value and simply doing nothing at work). This is a big negative because they cannot fake value by knowing the "right" people anymore. You're flattening the access to clients/customers/consumers. Therefore, be extremely wary of people who are negative on the future (and technology) as they are announcing *publicly* that they are rent seekers in their current positions.

Strange Post: We realize this is a strange post for this website given the prior content but we needed to put it out there. Most are worried about the current state of the "old economy" but a new one is going to come. It will not only show up, but it will show up extremely quickly. Instead of being afraid of new technology it is always best to embrace it and be "early". If you're early, the rest will take care of itself.

If you want to learn more about the future we strongly recommend reading up on the following topics: 1) smart contracts and decentralized finance, 2) non-fungible tokens and decentralized organizations, 3) Virtual reality and augmented reality, 4) electrification of cars and batteries in particular – your home will eventually become a self-sustaining entity with a large battery!, 5) self-driving vehicles and drone delivery systems and 6) 3D printing capabilities.

Now that we've gotten this out of the way we'd love to hear about any other new items that are likely going to be developed in the virtual world. We'll delete all negative comments saying this "won't work" as we prefer to block pessimists who refuse to read and self-educate. But. If you have an interesting idea for the virtual world or more digital future we're interested in hearing about it.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life. **We hold Q&As 1x a month for purchasers only.**

Office Politics

Office Politics

First of all congratulations. Chances are if you are reading this post you either obtained a position on Wall Street or you want to increase your income. This post is going to be quite long but if you can understand the message and execute we can practically guarantee you will see results. This is tailored to Analysts/Associates since most of our readers are at this level. Lets get started.

Entry Level Myth:

"If I work as hard as I can and attempt to please everyone in the office I will obtain a top tier ranking and have headhunters pounding on my door in no time". ***Entirely False.***

The truth is you must do the following: 1) find the people within the office who are going to help you get placed into a fund/PE shop, 2) manage multiple tasks prioritizing those with more political weight over those with minimal political weight, 3) respond aggressively to important tasks on the fly and 4) get all of the important people in the office to like you as a person.

What does this all mean? It means on day one you better figure out who matters and who does not. There is no excuse for not knowing who the important figures are within this office by the end of the first quarter. Luckily you're reading this post so we're going to make your life a whole lot easier.

Day One – Who Matters?

You're walking into the office with your brooks brothers T-shirt and your oversized suit and sit down at your desk. After the first 8-10 hours the office begins to clear out. While every other Analyst/Associate is sitting around staring at the screen to show "face time" it's time to become the CSI of your investment bank.

Investment Banker: Open up the most recent pitchbook with a "qualifications" section. There should be 1-6 slides explaining why they should bank with your firm. Guess what? On the slides there will be Tombstones. Tombstones tell you the most recent deals that have closed and include major deals as well. Circle and highlight all the major deals and transactions over the last 2-3 years. Now go on your Company's internal contact sheet and ***find the Managing director responsible for those transactions***.

Sales and Trading: This is the easiest one. When everyone leaves the office pretend that you are reading research reports to understand what your Analysts are saying when the dust settles immediately go through the Account list. Quickly look for the major accounts. Fidelity, Capital Group, CREF, Invesco, Wellington, Citadel, SAC Capital, Soros…. You get the idea. Now all you have to do is ***find the sales person in charge of these accounts.***

Equity Research: This is a cross between investment banking and sales and trading. Go through the IPOs that have occurred in the past and see which analyst is constantly being asked to cover more stocks. As an example: Analyst 1 seems to be adding companies over the past 2-4 years versus Analyst 2 who has covered the exact same companies. Why? While not related to IBD due to the Chinese Wall many companies will request a certain analyst cover their stock instead of analyst number two if the stock is between two spaces. Finally, the two other ways to find the good analysts is by looking at 1) call log of clients (if large accounts mentioned above fidelity/CREF etc call in he is a good analyst) and 2) institutional investor is the trump card. If the analyst is ranked in the top 3, no doubt you want to try and become part of that team ***find all ranked analysts***.

Analyze the Data:

You have the dirt. It is time to look at the food chain and figure out where to position yourself within the investment bank. Again no time to waste. If you choose incorrectly you will have a 10-100x harder time getting promoted compared to choosing correctly. If the guy pulling for you can pay for your promotion as a rounding error compared to the revenue he brings in, ***you better believe the firm will promote you to keep the managing director happy.*** It isn't even about you at that point, a big guy says he wants you to stay, this means the firm will make sure you are paid enough to stay.

You got the names in your hand. Lets say there are three important managing directors. How do you know which one to latch on to? **Look at what has happened in the past.** Find all of the people within the investment bank who have been promoted over the last 3-5 years. Which managing directors did they work for? Of the three that are amazing, hopefully at least two are kind enough to promote within. Now you know who to keep happy.

Lets look at this from a basic business perspective. If your boss is making it rain and is a golden goose to the firm, why would they care about paying you an extra few thousand dollars? A top tier Managing director is making in excess of seven figures. *The bank actually works for the managing director, the managing director does not work for the bank because if he is a top MD he is in charge of the relationships and uses the bank for leverage and/or its balance sheet.* They will do what is needed to keep him happy and part of keeping him happy is keeping his team intact. If you are an analyst about to get promoted to an Associate there is no way the firm is going to say no to an extra $50K a year in expenses if it means the managing director will stick around. The number of good analysts/associates is small, so this same logic applies to the Associate to VP promotion however the skillset you need to sell is certainly different. They will simply refuse to promote the other analysts/associates and let them exit the firm. Cost structure unchanged, top tier performers are still with the firm. Sounds like an intelligent business model.

Positioning:

We're making a rather large jump now we assume you know how to do work without making major errors. It's time to strategically drop quality by ~2-4% on the lower ranked managing directors and increase quality on the higher ranked managing directors by ~2-4%. This is going to take serious concentration and will help you immensely.

For investment banking this means you have a few extra formatting errors on your low level work and for the high up MDs you have none. For Sales and Trading this means you are slightly faster with your requests from the top S&T MDs and for Equity Research this means a mix of quicker speed and quality of information and data requests. ***As they say, the devil is in the details.***

Why would you do this? Well the answer is clear. If everyone else is trying to please every single MD with the same quality of work, you know with certainty that they are giving 9/10 work to everyone, instead you're giving 10/10 work to some and 8/10 work to others. We've said it before and will say it again, what is everyone else doing… probably a bad idea.

Guess what will happen? ***Slowly you'll end up doing more work on the right team.***

The Transition:

You must be able to change gears if you hope to succeed long-term. Lets say you've correctly landed yourself more responsibility on the right team. Lets say you're heading into that important annual review. It is time to listen to all of the criticism because if you don't you'll miss the train.

Here is the explanation:

At the bottom of the totem pole your movement to the next level is generally a function of likability and error free work. **Make everyone like you within that team.** There are no excuses, no matter how much you may want to kill that one Director or that one psycho Vice President… It is simply not worth it to lose the momentum you've created.

With that said, the best time to find your weak political spots is going to be… during your review. Take copious notes on any negative feed back and **immediately triangulate who made the comments.** Do not shirk on this step or you will regret it. This is because your life is going to be chaotic at this point.

Simplistically, if 8 people reviewed you at the end of the year, you need to be certain that person 1 and person 6 are the ones that made comment one and comment 4. Why? **Now you can remember this specifically for their projects.** No matter what, do not let this error occur again on their projects. Everyone makes mistakes, but you need to dial in on these comments to win their affection when it comes time for that promotion.

The Home Stretch:

So you have the office situation locked up like a death row inmate. The key is to remain on the gas pedal and continue to ask a smart questions once in a while and receive minor actionable feedback. Why would you do this? ***You're validating their belief that they are good leaders.*** Again this is not about you, no one cares about you, this is about slight nudges of validation after you ask an innocent and intelligent question. Here is the example unrelated to Wall Street.

You want to gain a few pounds of muscle but you've hit a plateau. You read a few books and still can't seem to jump the gap… You find someone who has done this before. You contact. No answer. You contact again. No answer. You contact a third time and the person finally answers.

"I know you're a busy person and I have been researching this topic for a few months and learned xx and xx, to cut to the chase I'm trying to gain another 5 pounds and have hit a plateau. Would you mind sparing me a few seconds so I can troubleshoot the issue"

Guess what, you're going to get an answer and then they are going to hang up. 9/10 they are hoping you don't contact them again because they are extremely busy and don't have time to waste. 2 months go by. You send them the following

"Didn't gain just 5 pounds of muscle, gained 10. Thank you for everything. (attached photo)"

Want to take a guess if this person will be willing to help you again?

****

Office Politics… It Only Gets Worse

Office Politics… It Only Gets Worse

We wrote a quick view of office politics at the entry level and it only gets worse. Once you're able to distinguish who "matters" from who doesn't and correctly align your reputation with the top performers… You're only one step into the madness. We'll attempt to explain some of the high level strategies to continue getting ahead while maintaining high external performance as well. Fortunately, *we're no longer in the field* and this will likely be the last Wall Street related post we do for quite some time (excluding general market compensation updates well ahead of the news).

Review: Before jumping into office politics at the revenue generating level lets review what needs to be done for a junior banker who is trying to make the jump from low six figure income to mid-six figures as fast as possible:

1) Performance always comes first. Without doing your work correctly no person at the firm will ever like you. Throw away this notion that it is "all politics" in reality it is more of a 50/50. But. The first 50 percent is a *requirement* which means without good performance, nothing you do from a politics stand point will ever help you (only exception is your mom or dad is the CEO of a major client/company).

2) Once your performance is locked down… It is time to avoid association with people who are not in the "inner circle". This is easy to find out. Write down all of the people who are generating the most revenue and write down the order of the names on internal large emails. **People will mess up.** You will be able to tell that the top priority people are generally mentioned up front in several emails "accidentally".

3) While rank order at a firm is important it is not a 100% predictor of being in the "inner circle". You may find that a managing director is on the verge of being fired, while a director has clear line of sight to an MD promotion. The clear move is to associate more with the director since the MD is losing more and more of his *political capital*

Now that we've reviewed the three basic items we'll go into the details of how to survive in a revenue generating role.

It Only Gets Worse (Part 1): Make no mistake. The politics only get worse at a revenue generating role as you're forced to cross pollinate your support internally. It is not enough to have one or two big hitters above you as support. You now must spread your marketing internally to other branches of the firm. If you're a banker, you want the sales team and research time (only top performers) to know you extremely well. Once you have support from other branches the firm will then believe you're "in it for the long haul".

1) The first step is finding the top performers in each division and slowly building out a contact list there. Maybe you can meet at conferences and industry events or you can meet at Company wide "global leaders" events. Either way. You must find a quick way to begin establishing rapport with the rest of the top performers

2) You must avoid stepping on the wrong toes. If person A is well liked by person B (higher up)… and Person A does not like you… You're going to have to find a way to get Person B to like you. Why? Well, with 100% certainty Person A is *sharpening a knife to throw right into your back* as soon as you slip up even once. Make one mis-step and he'll take you out. The only way to avoid this political disaster is if Person B already likes you and he's aware… Now you've effectively castrated a potential conflicting situation. Person A will now find a easier fish to fry.

3) Divest the HR team. At this point, HR becomes less meaningful and you can simply begin divesting your interest in their opinion. While you were previously building rapport across HR as a junior employee, your best bet is to simply get Junior employees to be "okay" working for you and HR will view you as a "middle of the road employee". This is now okay. Your pay does not touch the hands of HR anymore so you're best to invest time internally promoting your own work.

In summary, while your previous goal was 1) performance, 2) top performers and 3) HR. Your new goals are 1) clients, 2) Top Performers and 3) performers outside of your group. This is a key distinction as your time spent being the HR cheerleader is no longer worth it.

The VP Avalanche Zone: To summarize the first level of revenue generation, you're on the chopping block. The best way to think about Wall Street is as follows: 1) Analyst – overpaid person they are trying to invest in, 2) Associate underpaid person by year 2 as you should be client facing, 3) VP – every single action scrutinized, 4) director/MD – consistent performance based income.

1) The biggest mistake is mentioned above. Now that your entire livelihood is based on performance there is no reason to waste your valuable time with issues that do not generate income. You already have a strong foothold with HR and other non-revenue pieces of the Company so you just need to maintain your perception in the office. Do not reinvest valuable time into being a cheerleader when you can make 2-3 phone calls to clients instead. Finally, if you have an extra 10-15 minutes to help a non-revenue generating position like HR… Then go for it. The point is that you never spend a single second on it if you can find ways to generate revenue instead.

2) Bolt on if possible. Assuming you've done a great job establishing relationships with top performers, there is a high likelihood that the top performer has spill over clients. This is a gold mine. While you're not going to make a ton of money taking table scraps from the guy making $3M+ a year… You're not going to get yelled at either. There is nothing wrong with serving clientele who were previously *underserved* in the past. Lots of people make the mistake of either 1)

going it all alone into a different direction or 2) trying to build a base from scratch when others are willing to help. There is a clear middle ground where you pick up easy slack and spend your free time on adhoc client building.

3) Get ready to manage egos. No matter what you do, lots of clients and internal employees will not like you. This is the name of the game. The president of the United States gets a 50% approval rating so don't expect a 90% approval rating from clients either. Again. This emphasizes the importance of solid internal relationships as the hand me down clients are the easiest to win over if you can simply avoid dropping the ball.

In summary, you're going to take the low hanging fruit if possible and get used to lots of people not liking you because… well.. it's always a numbers game.

Break Off Transition: Assuming you've done a good job with the three items above it is now absolutely paramount to do the following 1) give credit to everyone who helped you and 2) get an offer from a competing firm. What?! Yes you read that correctly.

If you do extremely well and give credit to people who help… you've successfully done the right thing in the eyes of everyone. However. If you have correctly built out a base outside the low hanging fruit it will be extremely easy to jump to another platform. Once you obtain an offer you're going to see exactly what they think in terms of your potential long term. This is going to result in a direct promotion or a new position… with of course another promotion.

There are rare instances where you won't need a bargaining chip. But. The reality is that they will hold you at the VP level for as long as possible. They will claim all your success is related to people above you and you'll "play dumb" by echoing the same sentiment. Again. If you're smart. You've used the low hanging fruit as selling points to your other group of organic clients and can hit the ground running at a new firm. In addition, once your current firm realizes you've already carved out a new niche, they will have a hard time letting you simply walk out the door.

It Only Gets Worse (Part 2): Now lets assume you've done everything correctly. You survived the avalanche zone. You have moved into an SVP or Director role. Now you're effectively a standalone entity with a dwindling amount of political capital. The positive is that all your political capital can be used directly to make more money and the negative is that you're officially back to square zero from a political capital perspective. (Reminder, each year of solid performance is about 1 unit of political capital and every 3-4 units means a meaningful promotion or raise).

Just one problem. The ceiling is becoming real.

At this point, you're surrounded by ~80% solid performers and 20% mediocre ones. The bonus pool to chase after is now a dog-eat-dog fight as all of you understand the game and will be leveraging every single offer to get more money. Every transaction closed, every single item that shows up as revenue will be an immediate tug into the direction of the generator. In an ideal world you'll be doing more transactions than most. But. That is not always the case.

Finally, the last bit of headache is the client hurdle. The top performers naturally have the top clients so it is even more difficult to crack into the higher fee transactions without even being in the room.

You can guess what needs to be done now… Which is latch on aggressively to your new carved out sector and client base. Your new game plan is to continue growing the base outside of the giant clients and wait for them to evolve and grow. The faster your new clients grow to become major companies, the better and easier your life will become.

One last word on this… Wall Street is extremely small. If you find a specific person was recently fired or jumped to a new firm… You should immediately email and contact that firm to see if you can jump in with a few extra business cards (IE: they let you take over a sector that was already covered internally by your firm).

Thoughts on the Future: Near-term we're not incredibly bullish on Wall Street compensation. If money is continuously printed perhaps we see a couple of years of flattish pay until the inevitable decline and eventual recession. The layoffs have already occurred and as we noted… well in advance… bonuses were down about 5-10% (9% being the average).

The quick take is that we'll eventually have to go through a downturn or compensation compression time period for a couple of years. In this environment it is actually better to *enter* the industry at the bottom and it is best to *exit* the industry around now before the decline.

Thoughts on What to Do: We'll say it a million times (pun intended), there is no reason to rely on someone else to pay for your food, rent and livelihood. Every single person should own a business that does not require you to trade time for money (no scale). Once you can create an actual product that sells and is not a mumbo jumbo feel good product (heroine for regular people) you can sit back and really appreciate actual control of your life. Most think they dislike their career, but in reality they dislike ***reporting to other people*.** Being in charge of your own life and freedom is really the first step to being rich in the first place.

****

Overview of Healthcare: Part 1?

Overview of Healthcare: Part 1?

By popular demand we're doing a new overview, this time focusing on healthcare (Finally!). We're going to keep this simple and stick with three basic buckets. 1) Healthcare Equipment, 2) Bio-Technology and 3) Pharmaceuticals. If there is a lot of demand for an additional space (or sub-segment within the sector) we'll add it but this should serve as a solid overview given that these three sectors are in the news everyday (so it seems).

Notably, interest in the healthcare sector is likely being bid-up because of recent M&A activity (tax inversions) and stock price performance on the bio-medical side (breakthrough drugs). In short, a lot of people are interested in health care simply because it is *hot* right now. This is similar to the high level of interest in the internet sector.

With that said, here's the high level overview….

Notes to Be Aware of Before Beginning

1)If you are shooting for investment banking, having a background in healthcare is certainly not necessary. It may help with your spin (IE: a dual major in biology and finance would be better than solely finance) but certainly isn't needed.

2) If you are shooting for healthcare from an investment perspective (think Equity Research, Healthcare specific investing funds) then advanced knowledge certainly helps. IE: many Equity Research analysts have PHDs in the healthcare space (naturally this applies to the buyside as well if they make the switch).

3) We are not covering hospital management, health care services (similar to biz services), health care insurance or Healthcare REITs. The reason why is these segments can be classified under different umbrellas. As an example healthcare REITs could simply be under real estate and Insurance could simply be under FIG (we already covered Insurance in detail). Finally, the last sector we *should* touch on is life sciences, but we'll wait to see if people are interested in the space.

Valuation Backdrop: First and foremost, the healthcare sector derives much more of its value from the products and medical treatments created than any valuation metric used. In fact, this is exactly why valuation is the least important part of the process. The real value in healthcare stocks, and why they can be extremely volatile in spaces such as bio-technology come from the products. Products, products, products!

Now that we've gone over the importance of understanding the drugs and products, if you're looking for specific metrics for valuation you should then turn to the following:

1) EV/EBITDA

2) Discounted Cash flow

3) Price to Earnings

4) Free Cash Flow Multiples

5) EV/Sales

The most common starts with the EBITDA metric as it is used across the Health Care space. The EV/EBITDA metric starts as the baseline and as you become more interested in the asset you'd build out a full discounted cash flow model and predict earnings power/upside to drug/product launches. Nothing fancy and as expected, higher growth companies would lean toward EV/Sales metrics.

With that lets go ahead and look at each sector.

Healthcare Equipment/Devices (SYK, JNJ, ISRG)

One of the larger segments within healthcare, equipment and devices can include: 1) joint replacements, 2) trauma surgeries; 3) surgical equipment and navigation systems; 4) endoscopic and communications systems; 5) neurosurgical, neurovascular and spinal device.

Instead of going through each one of these major segments we can simplify it as follows:

Reconstructive Surgery (joint replacements, trauma): While difficult to pin down, for the surgery market you're going to look at the market in terms of overall replacements and market share within this space. As a simple example, you can expect a million or so hip/knee replacements per year (costs per surgery can exceed $10K)

We can do an entire post outlining different estimates for each type of surgery or procedure (~4+ million hernia repair procedures, ~2M appendix removals a year, partial removal/reconstruction of a colon at ~2.5M per year) however the point is to estimate the number of procedures by market and build from there. Each surgery company you work with will have a different market it is addressing. Total costs of each surgery also have wide bands that range from as low as a few thousand dollars to tens of thousands.

Medical Devices (Instruments, Endoscopy): This sub-segment focuses on products to help examine the human body (particularly inside organs as you are all well aware). Roughly speaking, the endoscopy equipment market is estimated to be $28.2 billion in size as of 2013 and is expected to grow at 5-7% CAGR.

This is a bit easier to understand at a high level as most are more familiar with these products. You can splice the $28.2B into smaller sub-segments as well: cameras, processors, displays/monitors and other accessories (brushes, fluid devices).

NeuroTechnology (neurosurgical devices and spine related issues): Finally, we reach the neurotechnology/spinal market. While the neurotechnology market is difficult to size, if you are looking for spinal implants it is a ~$5-6B market (low single digit growth). In addition, if you want to split the spinal arena into spinal devices as well, you find that the market is growing at ~4-6% annually (2013 market is roughly $10-12B).

You were asking about M&A? As noted at the top of the post, lots of M&A continues to occur in this space. There is a reason why… **Tax inversions AND aggressive M&A targets**.

Tax Inversions: These are specifically *hot* in the healthcare space and a quick Google search will get you up to speed on why companies are doing this, the simple answer is this… to save on US taxes. You purchase a company overseas and reincorporate to avoid paying US taxes.

Clear M&A Strategies: An overlooked reason beyond tax inversions for the recent M&A activity is the relatively low hurdle rate to take on more acquisitions. Companies are spending more and more on M&A to obtain market share and grow revenue: hurdle rates as low as ~12% IRR.

Valuation: Here we're looking at more classic healthcare valuations. So you should be thinking in terms of EBITDA/Cash flow and various forms of return metrics (IRR and ROIC).

Some Final Takeaways: Given the backdrop to healthcare equipment companies, you should also be aware of the importance of *organic vs. inorganic revenue.* This is certainly key as rampant M&A (as seen in this space) must be met by additional scrutiny from investors/shareholders as growth within each segment (Spine/Surgery/others) should not be 100% due to acquisitions.

Bio-Technology (GILD, AMGN)

This is one of the hottest spaces within the Health Care industry.

This sector is best explained with an example, starting with a Bio-tech Giant ($160B+) Gilead. The Company develops and commercializes medicine which can include hepatitis vaccines, work on HIV/AIDs related products and cardiovascular/respiratory issues.

As you can imagine, the key question here is:

"Does the cure work?"

This answer will then drive your total addressable market and your ability to sell the product at scale. If the vaccine/medicine works, margins and profits are high since the cost of re-creating the concoction is usually quite low.

As promised, here's a large example:

Sofosbuvir (Sovaldi) was createdby Gilead to treat Hepatitis C. The product costs between ~$84K for 12 weeks of treatment to $168K for 24 weeks of treatment. Here's the kicker… The cure works *90% of the time.*

Needless to say this created a large opportunity for the firm as the Company generated revenue of ~$3.48B in Q2 of 2014 from Sovaldi sales due to the high $1,000/pill price tag.

Risk/Reward: While this is a large example where a single quarter in sales were larger than the entire previous year for the product line, the downside would be 1) changes in regulation, 2) competing drug products with higher cure rates, 3) similar products with less side effects.

In short the bio technology space is driven primarily by drug innovation. You're going to follow updates from the FDA, the launch of the product in multiple geographies and monitor competitor drug releases as well.

While working in this space you would track drug trials for curing XYZ disease by comparing different response rates (example drug A has 50% effectiveness and passed X trials, drug B has 65% and passed Y trials etc.). Essentially, you create a landscape of the competitive drug market and flag each drug as it passes through Phase I, Phase II trials and so forth.

For more information on Sovaldi you can check out their website: http://www.sovaldi.com/

If you're interested in learning more about newer drug releases then you can stick with another example and follow Zydelig (a leukemia related drug).

http://www.fda.gov/NewsEvents/Newsroom/PressAnnouncements/ucm406387.htm

Valuation: Given the backdrop, these companies have higher volatility and trade at large multiples where 5-7x sales, 10-15x EBITDA and 15-30x earnings are not uncommon. From that basis, Bio-tech is a space where you'll lean more to sales and EBITDA multiples and less towards the DCF.

Drivers of the Space: These companies generally have less revenue (as expected they are valued based on future of their drugs). Therefore the main driver is going to be a promising drug being released (would be on radars for acquisitions – depending on how far down the road they are) and the

Final Note: To be clear with regards to the Biotech space, we are not recommending any security. The industry requires quite a bit of research and the above explanation was simply an example of how an important medical breakthrough can lead to billions of dollars in revenue (a previous event). Solvadi is not a common occurrence as it won the FDA's breakthrough therapy designation and was approved by the FDA in December of 2013. The goal of a top tier biotechnology investor is to understand when and where the next medical breakthrough will come. If you're a banker, you're looking to appropriately size the opportunity of the next break through (easier said than done).

Pharmaceutical Companies (JNJ, PFE, BMY)

Similar to Bio-tech we are going to use an example to highlight the main pieces of this segment. The biggest name brand company that people are aware of is… Johnson and Johnson. From a high level here are the primary markets they serve.

Immunology: This is estimated to be a ~$10B industry growing at mid-single digits. As the name implies, this refers to diseases caused by disorders within the immune system: Immunodeficiency (where immune systems fails to give a proper response), autoimmunity (immune system attacks its own host body). We can split the Immunology market into several pieces but we're going to keep it simple for this post. Example product would be Stelara – used to treat psoriasis a skin disease (*do not Google image that – you've been warned*)

Oncology: This is a $4-5B market depending on who you ask growing at a faster clip of roughly double digits. Oncology in short is the study of tumors/cancer. To keep with the format, a sample product here would be Zytiga (prostate cancer treatment).

Diabetes: Another self explanatory market for you guys, here we're looking at a ~$40 billion market growing at 6-10% annually. A good example of a diabetes drug would be INVOKANA (canagliflozin) a type II diabetes treatment.

Neuro/Mood Products: This market directly treats patients with mood disorders such as ADHD and schizophrenia. This market is roughly $40-50B in size and a sample product in this space would be esketamine.

Likely missing a few here but the above should serve as a solid high level view.

Valuation: In this space you can primarily look at the four classic valuation metrics given at the beginning of this post 1) EV/EBITDA, 2) Discounted Cash flow, 3) Price to Earnings and 4) Free Cash Flow Multiples. To provide some additional help for your napkin or back of envelope: Sales multiples of ~3.5-4.5x on a forward year basis, PEG's of ~2-3x, P/Es of 15-30x

Drivers of the Space: As expected, the main drivers are positive trial results, changes in regulation and release of generics.

Final Thoughts: Similar to biotech we are looking at variable outlooks based on performance of new cures and treatment results from innovative products. That said the multiples are generally a bit lower due to large pharma companies having lower growth profiles relative to a large number of hyper growth bio-tech companies.

—

Some points to help you in recruiting – Generally, healthcare practices are located in NYC/New Jersey/San Francisco; Healthcare has quite a bit of activity so you would likely get experience in M&A and Equity/Debt raises improving your capital markets knowledge; Beyond products, tracking phases of drug trials, naturally regulations play a big part in this space as well

There you have it, a short and sweet (if you call 2,000+ words short!) overview. If there is another space within healthcare that people need more information on we may do a part two. However, the three spaces above cover the main sectors that are driving interest in the space. Finally, we'll likely continue with these if people are interested in more sector overviews.**Financial Institutions Group**; **Technology Part 1**; **Technology Part 2**

Overview of Leveraged Finance

Overview of Leveraged Finance

We have not done an overview in quite some time and needed a post specific to Wall Street. This will elaborate a bit on our hedge fund posts and provide an overview for those that are interested in Investment Banking (You will work closely with Leverage Finance at some point in your career). As with our many other overviews, please feel free to add any additional color. These posts generally rank extremely high with page views and low with comments as many of you Wall Street guys are introverted! Overview below: 1) Introduction; 2) Corporate Debt Securities; 3) Purposes of Debt Instruments; 4) Lending Side of Leveraged Finance; 5) Credit Analysis; 6) Investment Considerations

Introduction

Unlike the equity market, the credit universe captures a huge variety of security-types. Why? It encompasses (pretty much) every other sort of financing. The size and complexity is also magnitudes larger than the equity market (roughly speaking the US bond market is 3x the size of the equity market!!!). As such, we're focusing on perhaps the most significant portion of the credit markets to institutional (i.e., HF / PE) investors: **the leveraged finance market (LevFin).**

We are focusing on LevFinfirst for the following key reasons: Depth Instead of Breadth: We could give an overview of the entire credit market at a much higher level, or we could explain part of it really well. We prefer more quality and of course *actionable and useful* information. **Single Markets Make Descriptions Easier:** Fundamental credit analysis is best introduced within the vacuum of a single market segment and a limited number of security-types **Cross Sectional Leverage:** As noted above, LevFin is useful to the largest cross-section of our Wall Street focused readership. Almost all front office Wall Street careers are guaranteed to involve at least some exposure to and interaction with LevFin in one form or another. Better to learn the basics now so you don't have to deal with it later.

Corporate Debt Securities

As many of you know, corporations have three basic ways of securing financing: 1) debt, 2) equity, and 3) hybrid securities. We're only concerned with credit for now, so we're going to ignore equities, hybrids and other more complex securities.

Corporate Debt Securities (In rough order of seniority)…

Revolving Credit Lines (Revolvers / Short-Term Financing): Simplistically a corporate credit card issued to a company by a bank. Companies are allowed to draw on and repay revolvers as they please. They are usually secured by a Company's cash flow, meaning they always have to be 100% repaid before any other non-mandatory debt prepayment. As a result, revolvers are the cheapest form of debt financing.

You will find many of these instruments outlined in SEC filings. Simple example? Companies access the revolving credit facility when there is a short term swing in cash flows. They access the facility for the temporary operating purpose and repay the debt.

Ford is a great example (Page 67 of 10-K filing), emphasis is ours.

*"We target to have an average ongoing Automotive gross cash balance of about $20 billion. We expect to **have periods when we will be above or below this amount due to** (i) future cash flow expectations such as for pension contributions, debt maturities, capital investments, or restructuring requirements, **(ii) short-term timing differences**, and (iii) changes in the global economic environment. In addition, we also target to maintain a revolving credit facility for our Automotive business of about $10 billion to protect against exogenous shocks."*

Other types of short-term / senior-most financing can include: 1) Swingline Loans, 2) Bridge Loans, 3) Commercial Paper, 4) Letters of credit (LOCs)

Loans (Term Loans / Amortizing Loans): Exactly what they sound like! Loans issued to corporations by banks (which in turn usually syndicate the loan to other banks and institutional investors so as not to keep too much risk on their own balance sheets). They require full payback over periods of anywhere from roughly 3-9 years. These loans usually include restrictive covenants as well since they are ranked second in overall seniority.

Unlike Revolvers (cash flow), Loans are secured by a lien (claim, or first right) on the value of a company's assets in bankruptcy.

Here is an overview of the various types of term loans:

Term Loan A (TLA / Amortizing Term Loan / Senior Secured: This is the most senior Loan type. Secured by a priority lien on the Company's assets. Amortized evenly. Syndicated to banks. Lower interest rates. Maturities <=6 Years

Institutional Term Loan (TLB / Term Loan B/C/D / Senior Unsecured): Junior to TLAs. Either unsecured, or secured by a lien that is typically junior to that of the TLA (in bankruptcy, they only get right to corporate assets once the TLA lenders have been repaid first). Amortize partially with bullet repayment schedule. Syndicated to both banks and institutional investors. Higher interest rates. Maturities range is roughly 3-9 years. There are two major types of TLBs worth mentioning:

2nd Lien Loan: Specifically refers to TLBs with a junior claim (2^{nd} lien) on corporate assets and

Covenant-Light Loans (Covi-lite): Loans that have more relaxed, bond-like financial covenants rather than maintenance covenants that are typical with loans. Usually issued in "seller's markets", as companies can get away with more relaxed covenants when investors have excess cash to invest.

Bonds: Even the masses are familiar with this one. About as vanilla as debt securities come. The lender purchases a bond from the borrower in exchange for periodic fixed interest (coupon) payments (hence the term "fixed income") principal repayment at maturity.

Broadly, there are two types:

Investment Grade: Bonds issues by companies considered investment grade (BBB- or higher)

High Yield (HY Bonds / Leveraged Bonds / Subordinated Notes / Junk Bonds): Bonds issued by companies rated BB+ and lower. Carry much higher interest rates than Investment Grade Bonds

Mezzanine Financing (Mezz): Here we won't go into too much detail as we're knocking on the hybrid securities arena. But here are two basic bullets on the topic:

Hybrid-like debt financing, also called "in between" debt which ranks above equity but below other debt in a company's capital structure

Typically high-yield subordinated debt coupled with equity warrants ("equity kicker")

Leveraged Finance: Within the context of the credit market, "Leveraged Finance" involves any debt financing in which a company is financing *with more debt than what is considered normal* for that company or industry (overleveraging itself) relative to earnings and cash flow. This is certainly a vague line to draw.

What's more than normal? *There's no set answer.* But. Some rules of thumb are based on interest rate spread cut-offs (anything > LIBOR+125-150bps), ratings (anything BB+ or lower), and leverage ratios (Net Debt / EBITDA) relative to industry comps. Typical LevFin issuers include sponsors, fallen angels, company's exiting bankruptcy and startups that need seed capital.

If you work in a specific sector (A Detailed Look at Financial Institutions Group; Overview of the Consumer Sector; Overview of the Healthcare Sector; Overview of the Oil and Gas Sector; A Detailed Look at Technology Media and Telecom (TMT)... also find Part 2 here) You will find various rules of thumb to add to your definition of "over leveraged".

In Short: There are several types of debt/loans and the seniority is as follows: 1) Revolving Credit, 2) Term Loans – followed by B's C's and various levels of security, 3) Bonds, 4) Mezzanine Financing and 5) Leverage Finance.

Purposes

What is more telling than interest rate cutoffs or leverage benchmarking? What is the company *using* leveraged financing for?

Overleveraging is a risky and expensive proposition, so it is typically used for specific projects in which the borrower feels the potential upside from the project is high enough to justify the increased cost of capital. This increased leverage generally comes with restrictive covenants particularly in an aggressive leveraged finance investment. Examples of such project include:

LBOs: The business model of Private Equity. The increased leverage is justified by the increased returns on equity possible once the debt is paid down. The simplest example… even for your "Average Joe" is the purchase of a fixer upper home. He puts down a minimal down payment (over leverage) then tries to fix the asset and sell it for a profit (or generate higher than expected cash flow to more than offset the monthly payments).

If you want a basic overview of a real estate LBO/private equity investment we have one here and if you'd like to look at company specific ones… You'll have to wait! Generally for a company there is ~10-20% equity and ~80-90% debt, heavily leveraged and you're looking for a 20% annual ROI (yes the typical definition is 90% debt and 10% equity but we're expanding the range to encompass more transactions)

M&A / Capital Expenditures: If a company identifies an attractive enough acquisition target or capital investment opportunity, they can justify the leverage based on the synergies and growth opportunities they think a potential investment will provide them.

Re-capitalizations: Equity holders will leverage the Company in order to use the proceeds for a dividend, stock repurchase, equity infusion, or any other transaction that will significantly impact a Company's debt / equity ratio. Recaps are used when the company's current capital mix is equity-heavy enough to justify allowing equity holder to liquidate of portion of their stake

Refinancing: Investment grade issues will use Refis to take advantage of periods of low interest rates in order to swap their existing debt out for *new*… Cheaper debt. Companies that use LevFin to refinance, are likely facing a maturity wall, cash flow shortage, or upcoming default event.

Refinancing using the LevFin market is somewhat of a "last resort". But. Lacking other options, companies prefer expensive debt that's matures 7 years from now over cheaper debt that matures tomorrow that they don't know if they can repay.

In Short: Leveraged Finance is expensive debt that's usually tied to a specific purpose. It is crucial to understand what the financing is being used for as the reasons for the financing will determine what investors are interested in the debt instruments.

Lending Side of Leveraged Finance (Lenders / Investors)

Leveraged Finance includes three of primary security-types: Institutional Term Loans, High Yield Bonds and Mezzanine Financing. These are typically the only debt securities with high enough yields to attract institutional investors. As such, they are the focus of a majority of institutional credit analysis. This brings us to the other side of the LevFin market: **who the investors (or lenders) are.**

In contrast to the low-risk Investment Grade debt market (largely funded directly by banks themselves), lenders in the LevFin market are typically institutional investors seeking to generate a higher risk-adjusted return.

Besides banks and finance companies, they include:

1) Hedge Funds: Debt focus; **2) Niche Private Equity Shops:** Specifically, Mezzanine funds, **3) Traditional Institutional Investors:** Pensions, Endowments, Insurers etc.

And finally…. The most infamous example…

4) Collateralized Debt Obligations (CDOs): The perpetrators of the 2008 Financial Crisis (partial joke for the intense finance readers). A CDO is essentially a corporate entity that is set up in order to buy a slug of debt securities and pool them together. CDO investors then buy stakes (liens) in that entity, which gives them a right to the cash flows from the debt purchased. The CDO is cut into slices (tranches) based on seniority, and investors pick which tranche they want to invest in based on their risk-return preferences.

The debt payments are then paid out to investors in a waterfall fashion, with those who bought the more expensive senior tranches being paid before those who bought the cheaper and higher yielding junior tranches.

Finally, to give you an idea about sizing: the HY Bond market is ~$1.4Tn, the Leveraged Loan market is ~$625Bn, and the Mezzanine Finance market is ~$500Bn. So all in, LevFin is about a $2.5Tn market!!! There is a lot of money out there!!!

In Short: When you start looking at "over leveraged" investments you begin talking to more and more risk loving investors. Or as they like to call themselves "sophisticated investors" (please tell us you got that joke!). The market is huge at $2.5Tn and you will certainly deal with the LevFin market at some point during your career.

Credit Analysis

Whether you are investing in equity or credit, you are evaluating whether or not a given company is worthy of an investment (stating the obvious we know). That is, if you give XYZ Corp. some of your money now, is XYZ likely to give you your money (and more) back in the future. The biggest risk in both cases is that you are not paid any of your money back.

Alternatively? You are not paid the "appropriate" amount of money back for the amount of risk you took on.

The difference is in the potential upsides? For *equity investors*, upside is unlimited. For *credit investors*, the upside is contractually limited.

Credit investors are guaranteed their upside, so their biggest focus is on the risk of not getting paid back. Since their returns are capped (fixed income), they spend a lot more time caring about the nature of the actual security that they are investing in. Where does it fall within a given Company's capital structure? Do they believe the Company will be able to afford their interest payments? Will this lead to an eventual return of principal? They aren't nearly as focused on earnings or the income statement as a whole. instead. They focus much more on the balance sheet and cash-flow statement.

While credit analysts end up covering the same companies as the equity analysts… They spend almost all of their time on different things.

Credit analysts also find themselves working on unique and complicated situations that the equity analysts often avoid. This includes restructuring, asset sales and joint ventures. It requires hours of reading through bank covenants and other financial documents which most equity analysts don't have the time to do. In order to predict cash flow, you still have to be able to predict revenue, so you do spend a decent amount of time on revenue and costs as well.

In Short: Credit investors have much less upside relative to equity investors. They are looking to secure a defined return and want to mitigate risk to hit their specific benchmarks. Therefore, a credit analyst would look at a security in a different light relative to an equity analyst.

Investment Considerations

Given that credit investors will look at investments in a different fashion… Below is an outline of some of the key takeaways:

Default Risk: The likelihood of a borrower's being unable to pay interest or principal on time. Based on the issuer's financial condition, industry segment, conditions in that industry and economic variables/intangibles (company management as an example). Default risk will, in most cases, be most visibly expressed by a company's public credit rating from S&P, Moody's and the like.

Loss-given-default Risk: Severity of loss. How much will the lender lose in the event of a default? Investors assess this risk based on the collateral (if any) backing the loan and the amount of other debt and equity subordinated to the loan.

Industry Sector: Loans to issuers in defensive sectors (like consumer products) can be more appealing in a time of economic uncertainty, whereas cyclical borrowers (like chemicals or autos) can be more appealing during an economic upswing.

Sponsorship: If a sponsor has a good track record, a loan will be easier to syndicate and can be priced lower. In contrast… If the sponsor group does not have a loyal set of relationship lenders, the deal may need to be priced higher to clear the market.

Liquidity: All else being equal, more liquid instruments command thinner spreads than less liquid ones.

Market Technicals: If there are a lot of dollars chasing little product. Then… issuers will be able to command lower spreads. If the opposite is true? Then spreads will need to increase for loans to clear the market.

In Short: Credit analysts focus more on *downside* risk. Why? Well the upside is already capped at X% return so that is already set in stone. What is not set in stone? The downside of a default and overall payment risks.

Concluding Remarks

Since this post is heavily tailored to Wall Street specific individuals you probably read the entire post. That said here are the main takeaways in bulleted form as requested:

– You will likely work with the Leveraged Finance team at some point in your career. That said if you're interviewing for one you now have an overview. Two birds. One stone

– The LevFin market is huge at $2.5Tn

– Several types of debt/loans and the seniority is as follows: 1) Revolving Credit, 2) Term Loans – followed by B's C's and various levels of security, 3) Bonds, 4) Mezzanine Financing and 5) Leverage Finance

– It is crucial to understand what the financing is being used for as the reasons for the financing will determine what investors are interested in the debt instruments

– When you start looking at "over leveraged" investments you begin talking to more and more risk loving investors or "sophisticated investors"

– Credit investors have much less upside relative to equity investors. They are looking to secure a defined return and want to mitigate risk to hit their specific benchmarks

– Credit analysts focus more on *downside* risk. Why? Well the upside is already capped at X% return so that is already set in stone. What is not set in stone? The downside of a default and overall payment risks

****

Overview of the Oil and Gas Sector

Overview of the Oil and Gas Sector

Hopefully this post will generate some debate with regards to profiting from the recent drop in oil prices. As we have done in the past, we will do a sector overview and we will unlikely hit on every aspect (that would require far too much work). If Oil and Gas is not of interest to you, we have done the following sector overviews: 1) Financial Institutions Group, 2) TMT (Part 1) and TMT (Part 2), 3) Healthcare, 4) Consumer.

Overview: The oil market is seeing significant pressure from the declining value of crude oil. The price of crude has dropped from ~$105 in June of 2014 to ~$55 as of late December (West Texas Intermediate – WTI). In addition, the price of Brent has fallen from ~$105 to ~$60 in the same time period. For those that are interested the difference between Brent Crude and WTI crude, here it is:

Brent Crude: Extracted from the North Sea and comprises of Brent Blend, Forties Blend, Oseberg and Ekofisk crudes (also known as the BFOE Quotation)

WTI Crude: This is the underlying commodity of the Chicago Mercantile Exchange's oil futures contracts. WTI is lighter and sweeter than Brent, and considerably lighter and sweeter than Dubai or Oman.

Why the Price Difference: Pretty basic here, the price differential is due to the increased transportation cost from Oklahoma to Louisiana. There is limited pipeline capacity. While this is likely extremely basic for those that work in the space, if you're new to the space, the price differential of ~$4-5 is confusing on a glance.

While we could dive into the other baskets (Dubai, Oman etc.) we will keep it simple and refer to crude as WTI Crude since it is the underlying commodity in the Chicago Exchange.

Without getting into a lot of the details here, the main question most are wondering is what caused the price drop? Simplistically, oversupply of oil. Or an "oil glut". If you want to look at recent catalysts that occurred… on November 27, 2014 OPEC elected to maintain its 30 million barrel per day output level which caused the market to decline. Why? It suggests that oversupply will remain (near-term) as they are not electing to decrease output levels that caused the glut in the first place.

To wrap up the overview, here are some high level numbers on an annual basis to be aware of:

– *Demand:* You're looking at ~90-98 million barrels per day on a global basis, ~17-20 million barrels in the USA, ~12-16 million barrels in Europe and ~8-12 million barrels for china.

– *Supply:* Naturally, given the "oil glut" you're looking at supply that is currently outstripping global demand at a rate of ~1-2 million barrels per day. Simply put, it is estimated that the current output is supplying 1-2 million barrels more per day than is needed, causing prices to drop. To be crystal clear here, in the supply case we are not breaking it out by region as many regions are net importers of oil. For example, even if the USA demands 19 million barrels a day, the amount generated in the USA is less than 13 million barrels a day. The rest is imported from other countries.

– *Future Oil Demand: T*he next question you are likely asking: "Is demand going to increase? If it does we have nothing to worry about". This is a good question and for your back pocket using GDP minus 0.5% would get you to overall demand growth of crude oil.

There you have it. You now have a basic overview of what is occurring in the oil space. There is an over supply of ~1-2 million barrels a day. Demand for crude has historically increased just below GDP growth (this is a global GDP centric comment) and OPEC recently announced that it is not cutting production which led to additional pressure on Crude oil.

Natural Gas: Everyone is aware of what natural gas is: a fossil fuel that is created when plants, gases and animals are exposed to intense heat. Primarily, natural gas is used for heating, cooking and electricity.

Units to Measure: The conventional unit of measure is "million British thermal units" also seen as MMbtu. For this post we will refer to it as "million btu". In addition, when looking at global numbers the convention is to refer to 1 billion cubic feet, this is equivalent to ~1 trillion Btu = 1 Bcf. For this post we will use the same convention and use Bcf.

Before moving forward, in case the paragraph is confusing, when people refer to the price of natural gas it usually refers to $/million btu and when you are looking at large scale supply and demand it is usually in measure of Bcf.

Given that the vast majority of you would work in the USA, here are the metrics for natural gas on an annual basis that you should be cognizant of:

US Demand: You're looking at ~70-75Bcf in total demand. This is broken down as follows: ~20-25 Bcf Residential and Commercial, ~19-23 Bcf Industrial, 20-25 Bcf electric and 5-9 Bcf in other use.

US Supply: Onshore supply is roughly 30-33Bcf, Shale providers ~ 40-45 Bcf, Mexico wraps it up with ~3Bcf

Canadian Demand: While we are not going to go into this geography, it deserves a mention due to all the press it has received. The Canadian oil sands are responsible for roughly 13-17 Bcf per year and is primarily generated in Alberta and British Columbia.

The overview is now wrapped up with the high level numbers on natural gas out of the way as well. With that said lets move onto the sub-sector takeaways.

Note: There will be some redundant themes similar to our other overviews as many items must be tracked across all sub-segments in the O&G space, we repeat them in case a reader is only interested in one section

Global Oil and Gas (Chevron, Exxon and others)

Here we are looking at the large caps. As you've seen in the past when you look at larger scale companies you're looking for Free Cash flow as your primary valuation metric. Given this dynamic and the size and scale of oil and gas companies (setting up new rigs, drilling sites etc.) monitoring and modeling out a CAPEX schedule is also of utmost importance.

In addition to these two highlights, the risks for large caps such as Exxon and others would include… commodity costs. Naturally, the recent oil price declines have caused stock price pressure across the board. Beyond this metric which is impacting the entire space, larger companies are also at risk to tax law changes, environmental and political risks as well.

Oil and Nat Gas Prices: As you can imagine this is a material driver of business viability and growth. Tracking the macro changes in Oil prices (movements of+/- $5 are quite material) and tracking the changes in Nat Gas prices (movements of more than 10-20 cents on a $/MMBtu are material).

OPEC: The next major meeting is on June 5, 2015. If demand and supply levels remain where they are we would hope for a decrease in daily barrel production. If you're hoping that oil prices remain dirt cheap, then you're looking for continued over supply. Keep it simple!

Wells and Drilling: For the major bellwethers, you are going to focus heavily on the future CAPEX and drilling sites as they will determine future cash flow. For example, the Company will give specific metrics on a location and drilling expectations and give % of complete metrics over time. In an ideal world you'll see that project in location X has started on time and will be 100% complete within or before the allotted time frame with all wells firing at timeline Y. We realize the paragraph is a bit vague but if you read through the filings of major oil company you'll find these percentages in the 10-Ks/10-Qs and analyst day presentations and earnings calls.

– Simple example from Q3 they talk about the LNG project in the press release: http://investor.chevron.com/phoenix.zhtml?c=130102&p=irol-EventDetails&EventId=5170148 (click on Q3 press release). This would represent an important talking point for investors/bankers.

Revenue Mix: As expected with the major companies you have larger line items to look at and are going to track margin profiles by region and sub sector. If you want to dig into the weeds again, refer to the Q3 earnings and look through the supplemental comments. This is where the "goodies" are. You can see breakouts by refining, actual volume, liquids, natural gas and the BOE (Barrel of Oil Equivalent). In an ideal world, all of these lines would see improving revenue and margin profiles. This is practically never the case so it is up to you to find the key metrics driving each P&L.

FX: This is a bit obvious and is only worth a quick bullet. Given the size and scope of these companies FX rates and changes can materially move the top and bottom line.

Assets Sales: Again, since we are looking at major oil corporations you're looking to see if interest in specific production facilities are being sold (if unprofitable or at break even). You'll be tracking these asset sales to assess the risk of the overall entity (For example: over exposure to a specific geography).

Valuation Metrics: The main items you're going to look at if you wanted to check a quick comp sheet would be the following: the simplistic P/E ratio, P/FCF, EV/DACF and the dividend yield as many investors are looking for high yield securities. The only item on this list that may raise an eyebrow is DACF which is Debt Adjusted Cash Flow.

DACF = CFO + after tax financing costs + before tax exploration expenses +/- working capital adjustments

The reason this metric is used is due to the after-tax calculation, which makes the valuation independent of financing decisions made by the firm.

Refinery (Major players all here again, Marathon, ConocoPhillips, Valero and others)

We don't need much description here as everyone is aware of what an oil refinery is: processing of crude oil into items such as petroleum, gasoline, kerosene etc. This is probably the piece of the oil industry that most think of when they hear "oil company".

A Bit More Defensive: Since these companies need to refine crude oil, they are a bit less impacted by the severe drop in crude. Simply put, the crude oil needs to be converted so it won't see a falling knife type stock chart if oil goes down $10 (reverse is of course true for an E&P company – more on that later). In fact the decline in the price of crude oil can help this segment since the cost of the main supply (crude oil) has dropped. Again it still needs to be converted to gasoline/kerosene or otherwise to fill the demand void.

Oil and Nat Gas Prices: While it should be tracked, as mentioned above, the changes are going to impact this space a bit less.

Large Capital Projects: The business model is more capital intensive. You're looking for large projects that can help make or break companies as they refine large amounts of crude oil. Location is also key in this case as having access to large and cheap amounts of oil is beneficial.

Cash Returns: Not to the same extent as an MLP of course, but cash returns to shareholders are monitored closely. Given the size and scale of large refinery companies investors deserve solid capital allocation programs.

Exports and Macro: Given the large scale, these companies are a bit more lenient on the macro and US export laws/regulations. If you can't sell the refined oil (export it) then… you're simply losing that $$$.

Valuation: Keeping it simple again the main items you're looking at are: 1) EV/EBITDA, 2) EV/Cash flow, 3) Tangible book value, 3) Dividend yield and total return to shareholders – including the share repurchase program and 4) annual EBITDA/Cash Flow Growth rates.

Master Limited Partnerships – MLPs (Dominion Midstream Partners, American Midstream Partners and others)

MLPs primarily pertain to the use of natural resources, such as petroleum and natural gas extraction and transportation. An MLP is a limited partnership that is publicly traded. The Company takes advantage of the tax benefits of being a limited partner, is liquid by being a traded security and pays its investors through a quarterly dividend (this is similar to a REIT).

Oil and Nat Gas Prices: As you can imagine this is a material driver of business viability and growth. Tracking the macro changes in Oil prices (movements of +/-$5 are quite material) and tracking the changes in Nat Gas prices (movements of more than 10-20 cents on a $/MMBtu are material).

Pipeline Business: If you want to boil down the business to a simple nugget, you're obtaining a stable income from the transportation of oil/gas. With this in mind it is key to have a robust pipeline of cash flow positive business in the future to continue paying out dividends to your investor base. As you can imagine right-of-first-offer contracts become important to track so the companies you're looking at can have a positive future run-rate of cash flow.

All Contracts are Not Equal: Since we are lining up large pipelines of deals, the type of contract will matter… a lot. You can simplify this point by thinking of getting a loan. A variable loan or a variable contract on a specific pipeline is not going to be as good as a guaranteed fixed line that you are certain will generate positive free cash flow. It is up to you to dig through the weeds.

Customers are Not Equal as Well: Since you are building a pipeline here, you want to have import customers that are solid (think companies like BP plc). This allows you to be much more certain about your order size and scale.

Less Mobile CAPEX: Since we are looking at longer term items some companies may or may not have large *committed* CAPEX spending in the future. Unlike E&P where it is a bit easier to shut down or ramp up CAPEX. This will impact valuation. This is particularly true if you have a lot of committed CAPEX spending into a declining oil price environment.

OPEC: The next major meeting is on June 5, 2015. If demand and supply levels remain where they are we would hope for a decrease in daily barrel production. If you're hoping that oil prices remain dirt cheap, then you're hoping for continues over supply production levels. Keep it simple!

Valuation Metrics: We'll keep this a bit more basic as the main drivers are clearer and straight forward: 1) dividend yield and growth, 2) Discounted cash flow – we're dealing with longer-term contracts to it makes more sense, 3) Net Asset Value, 4) EV/EBITDA or EV/FCF.

Exploration and Production – E&P (Pioneer Natural Resources, Devon Energy and others)

Also referred to as E&P for short, this sector has been impacted materially over the last 6 months as the title is self explanatory. These oil and gas companies specifically work in the exploration and production of oil, meaning that the significant price drop in oil has caused a lot of the business to become unprofitable. On a positive note, when the price of oil was in the $85-100 range, this segment naturally blossomed at outperformed the S&P since profitability was quite high.

Macro Trackers:

Oil and Nat Gas Prices: As you can imagine this is a material driver of business viability and growth. Tracking the macro changes in Oil prices (movements of $10 are quite material) and tracking the changes in Nat Gas prices (movements of more than 10-15c on a $/MMBtu are material).

Weather: One small overlap with the Consumer sector, tracking weather patterns is key. If temperatures drop materially, this can lead to higher usage of natural gas for heating. The reverse is also true if a winter season is unusually warm.

Capital Expense: If companies intend to increase drilling in the future and are taking out debt to do so, you can see how this will be a spiral downward or upward depending on the demand function. In a positive scenario, capex spend is high to continue finding more oil/gas and the price of oil and gas is high. In a negative scenario, companies are taking debt to search for oil that is not profitable.

OPEC: The next major meeting is on June 5, 2015. If demand and supply levels remain where they are we would hope for a decrease in daily barrel production. If you're hoping that oil prices remain dirt cheap, then you're looking for continued over supply. Keep it simple!

Location, Location, Location: No this is not a real estate speech. However. The location of where the oil is being primarily produced (this is on a company by company basis) can drive valuation in the future. Some locations are simply more profitable than others. For simplicity take a look at this Wall Street Journal chart: (Link: http://oilprice.com/Energy/Crude-Oil/The-US-Shale-Breakeven-Price-Debate.html)

You see that having a higher exposure to the Eagle Ford area for a company is significantly better than high exposure to Tuscaloosa Marine.

Hedging Contracts: Get your hands dirty and look through Company specific filings for hedging contracts. See if the company has specific oil/gas price hedges over the next year or so which protects them on the downside given the material move downward in oil prices. Smart companies will hedge a sizable portion of the headwind.

Net Debt: Finally the key balance sheet metric to monitor is net debt. Naturally if your leverage becomes to high and you're trading at a large multiple relative to your EBITDA or FCF… This is going to trigger serious investor fears as debt default becomes likely.

Valuation Metrics: The items you're going to look at if you want to create a solid yet simple comp sheet are as follows: 1) Net Asset Value (NAV), 2) Price to Net Asset Value, 3) P/E or Cash flow per share, 4) DACF (as seen in the global oil overview above) 5) EV/EBITDA and cash flow, 6) Debt/EBITDA and cash flow and 7) the same valuation metrics including/excluding hedges

Oil Services (Forbes Energy Services and others)

Now we're getting to the final frontier, some more obscure oil companies. This is a bit of a catch all bucket where you're looking for companies that assist in the oil production/drilling process. An example of a product would be machinery that assists in choosing the best position for an Oil & Gas Rig/Well.

Oil and Nat Gas Prices: As you can imagine this is a material driver of business viability and growth. If people are not drilling people are not going to need oil services. Lower gas prices do not help this sub-sector.

Cheap Assets to Buy? We are tossing this in here simply because the size of these companies are generally smaller. If their market caps/valuation come under extreme pressure there should be interest in buying the best of breed and tucking them into major oil companies. We are not here to speculate just pointing out the material difference in size of a smaller oil services company compared to a behemoth like Chevron.

Increases in Oil Efficiency: If the services companies are able to decrease the cost of drilling the business model will improve. In short, the technology/services they deploy need to improve the oil production process and your business will improve. This should be obvious but that is the real saving grace if oil prices remain low for the services sub-sector.

Valuation: Since this is a small sector the valuation metrics are pretty generic. Focus on 1) EV/EBITDA, 2) EBITDA Growth, 3) FCF metrics and 4) Dividend yield. Again, due to the pricing pressure from oil, it is imperative to find the companies with the best technology/services edge as they will eventually help the larger players turn a higher profit margin off of the drilling.

Basic O&G Specific Trade: For those that read the entire post you will likely understand the following trade. Lets *assume* you believe that oil prices are going to continue declining. Lets assume you are bearish and believe it will go to say $30 a barrel.

A portfolio manager asks you what to do in this scenario. You must make a play solely in the oil and gas field.

With your belief in mind, the move is to short the E&P sector and buy the refinery sector. This is because E&P businesses will have their business models dry up while refineries will be relatively agnostic to the oil price change.

If you believe oil prices are going to rocket back up to $100 soon. Then the reverse trade is the move to make.

Concluding Remarks

That does it for the O&G overview. In short you're looking for the following:

1) Oil price and Nat gas prices and their impact on O&G Companies. Generally those more levered to the sourcing of oil will be hit harder where as those who use the oil for other products will be protected

2) OPEC always the overhanging macro piece of the picture

3) Free Cash flow and EBITDA is king given the size and scope of these companies

4) Follow the chain of events. IE: customers and contracts are never equal

5) Check the balance sheet: less debt in a low oil price environment is better and lower rates on the debt would add to that cushion

6) CAPEX is key. Many of these companies have large plans that may or *may not* be cancelled at any time.

7) Location! If you're drilling in highly profitable areas you can wait out the storm as your break even levels for profitability will keep you afloat for a longer period of time.

8) Taxes – the entire reason for the MLP space, no one like taxes. Particularly people in Texas.

9) Hedges – commodity driven companies have a high interest in keeping hedges to protect the bottom line. Read the filings.

10) Weather – Generally, the colder it is, the more gas is consumed.

Per usual post up extra comments/questions.

****

Ownership and Responsibility: The Green Light to Making More Money

[Ownership and Responsibility: The Green Light to Making More Money]

Around the age of 21-23 most people find out that the work place is not as easy as they thought. For those that end up starting a company they also find out that ownership is 100x harder than working for a Company. Either way, when you're exhausted all of the time you begin to think in terms of time. *"I would rather find a position that pays the most for the least amount of hours"*. While great in concept (no one wants to work long hours for low pay), tying income to any sort of ticking time clock is not a good way to get rich. Imagine walking up to someone and saying they have to pay $1,000 per hour for your time (~$2 million a year). Everyone would laugh unless you were already a famous/wealthy person who could add that much value in an hour. Now if you said you expect to make $1,000/hour for every $3,000/hour you made them… the proposition would turn from laughter to *"Where do I sign up"*.

What Not to Do – Tie Yourself to Hours

Don't work for an hourly wage or salary. This might not be possible if you're looking for anything to keep the lights on. That said, you want to get out of an hourly/salary income since it will inhibit your income growth. This is an attempt to leverage your time (which is limited to 24 hours regardless of where you are in the world) and an hourly wage won't give you an ability to scale.

Take a look at high paying salaried/hourly professions and it's rare to see anything north of a few hundred dollars. Even $100 per hour is $200,000 per year (rough math is to multiply the hourly wage by 2,000). Even if you were able to generate this income and we assume a $200/hour position ($400,000/year) we have to remember that this is not something you can *sell*. For every hour you work you're not building any future income. If you decide you want to quit tomorrow, that income stream is gone and no one pays you to leave your position (unless you received a severance package).

Now that we've bashed this form of income, if you're forced to do something like this we would recommend anything where you're sitting at a desk. This allows you to at least "double dip" on your time. For example, the chances that someone is reading this at work is quite high (we know this from web traffic data). So if someone has time to sit around and watch Netflix or Sports replays… They certainly have time to learn basic copy writing. For people who are really desperate for money, you can also buy and re-sell products at a premium (luxury hand bags, video game consoles etc.). The point here is that having access to a computer and internet while at work is a huge advantage as you can move the needle on your earnings without impacting your job performance.

The main ideas here are as follows: 1) you cannot sell any position that is deemed a job/career. Even if you were to start an amazing career, when it comes time to leave you can't sell it for money. 2) anything white collar is significantly better than blue collar. There is absolutely nothing wrong with high paying blue collar positions if that is where you must start. But. If you can't sit in front of a computer you have less access to future revenue streams. 3) putting yourself in a position where you're tied to time spent versus results limits the amount of money you can make. Even if you were to work 16 hour days, that's going to be the official cap with no upside from there.

First Step in the Right Direction – Results Oriented Pay

While we've touched on the importance of results oriented pay, it's important to look at the math on why the numbers add up so quickly. There are really two types of payment mechanisms: 1) recurring and 2) high ticket priced items. We're ignoring B2C (business to consumer) since the commission there is going mirror an hourly wage as there is a limited amount of revenue associated with each sale. While this concept is not new, we've finally figured out a way to explain it in terms of time. Essentially by tying yourself to units sold you're able to condense the sales cycle. This is a common phrase used in a lot of businesses "sales cycle" all it really means is the time to obtain a sale. If you're in a high ticket priced item business the sales cycle is typically long (investment banking is notorious for incredibly long sales cycles – classic Company Man lifestyle). In a new standard here we have a graph to depict the difference so it is visible.

If you are earning say $200,000 per year and this is the income you can generate without a results oriented position, you might be ahead of the sales position in the near-term. This is because the sales person needs to learn to *shorten* his sales cycle. By way of example if we assume the sales person is a real estate agent and we give him a 2% commission (usually around 6% combined seller + buyer so we're conservative), he would need to sell about 5 houses worth $1,000,000 each. This is certainly an achievable number as you're looking at 1 sale every 2.4 months. In fact that number looks awfully low and is likely tied to someone who is just getting started!

There are now multiple ways the sales person can catch up: 1) sell more homes at lower costs, say 20 homes at $500,000 to increase inventory, 2) sell a single luxury home worth $5,000,000 or 3) ***shorten his sales cycle*.** The last one is incredibly important. The last one is probably the most under-rated. Your average person believes that you have to "screw people over" to get rich, when in reality we can see that by shortening your sales cycle you'll actually generate a lot more money. If you do a fantastic job selling a property, it is quite likely that the seller will then refer you to sell another property. As a rule of thumb it takes about three years to significantly shorten your sales cycle and it is certainly possible to sell two homes a month which would increase your number of sales by almost 5 times. Since you were making $100,000 a year with your low sales number, if you can increase your ability to sell that takes you to nearly $500,000 a year. In addition, all you would need to do is increase the average selling price slightly over the next 3 years and suddenly you're hovering around $600,000 a year. Not a bad position to be in.

The difference is quite large here, while the salaried professional sees a steady increase to his income working to $300,000 over a 10 year span, the stair-step movement for the sales professional is quite impressive. Instead of seeing a stable line up and to the right (not going to work if you want to get rich), you see a big step function movement up. This causes three significant changes for the sales person: 1) typically the sales person has a lower cost of living since he doesn't know if his transactions would close, 2) the payments are one time in nature and up-front versus spread out across a longer time period and 3) instead of having a question mark around his/her return, he knows the exact amount that will be wired to his account on closing day.

When we put this together you're looking at a pretty huge spread between a salary employee and a solid sales person. The number we get to is around $3,000,000 in additional income over a 10 year time frame. This does not include any sort of "kicker" or benefit from selling higher priced items (higher margin) as is typical in enterprise sales outside of real estate. Also. We assumed that all of your sales are one-time in nature. If you're lucky enough to land a position where you're in charge of simply "renewing" contracts every year or two you're in even *better* shape. This is because a high quality product has high retention and makes the follow up sale easier.

Now before we move to the value of equity it's important to understand the psychological reason why sales is avoided. The answer is quite simple: responsibility. It's not natural for humans to enjoy being told "no" over and over again. So most people are unwilling to go through the process of hearing negative feedback over and over until they figure it out. Also. It causes the individual to see significant *responsibility*. Responsibility is just a fancy way of saying "being forced to take care of yourself".

Getting Rich with Ownership and Leverage

If the sales person seemed attractive to you we have to remember that he works for a Company. That company must make money otherwise they wouldn't hire the sales person. If the sales person makes $100,000 a year or $5,000,000 a year… the company by definition needs to make more than this to justify his employment. So while it's exciting to see the numbers from a performance based perspective, if we look at an ownership model we'll see a bigger spread. In fact the spread doubles (at minimum) if someone can earn the exact same amount of money as the sales person.

Equity is everything. As you can see there is a substantial difference between the sales person and the Company even though they earn exactly the same amount of money. Even if the sales person is generating $700,000 per year, he's not worth as much as a company generating $700,000 per year. Why? You can click sell. If you click sell we assume you're going to make around 5x (maybe the is aggressive. But. The point stands). Even if the sale button was only 3x, you're looking at a $2.1 million dollar difference in value. Now it's certainly difficult to build a $1 million dollar business, the math says you're better off earning an extra $50,000 from a business than an extra ~$200,000 from any job. This is because of the "exit" multiple or equity value.

Now lets turn to leverage and ownership. A common move once you know a specific market well is to purchase businesses that can be turned around. If you have a business that you bought for say $400,000 net income and it generates $100,000 net income per year… You only need to increase the net income by approximately $40,000 in two years to see a 100% return. Why? Well if you generate $100,000 and then $140,000 you're at $240,000… Then you have to add $560,000 ($140,00*4) the new value of the Company and you're at $800,000… versus the original $400,000 paid out. There is certainly a discount here since money next year isn't worth as much as money today, however, the leverage is clear as day. If you're getting a 4x value for every dollar you bring in, this means each dollar for your company is worth 4x as much as a dollar made working for someone else.

But it gets even better. No one said you needed to use your own money to purchase the asset. If you're borrowing money you can actually see even greater returns. This is exactly why real estate investors are commonly self-made millionaires. Since you're able to force appreciate the asset, you can get well north of 100% returns in a short period of time by simply making repairs or bargaining at the right time. So we can take a look at that quick calculation as well.

If you purchase an asset for say 20% of the value (using homes as that's a common one to think of) and it's worth $100,000 that's $20,000. Now once we make repairs/forced appreciation we can say the cost of that was $20,000. If the total investment is now $40,000 and the Home is now worth $180,000 and you sell… that is $80,000 in profit off of a $40,000 investment. While this may feel far-fetched, returns like these are actually *common when you have niche knowledge.* There are quite a few people who own homes, take out money from the equity of the home to purchase a business they know well and do exactly this. Before, these types of arrangements were most commonly tied to Real Estate and Real Estate only. We're happy to say that is no longer the case (hint)!

Conclusion: In a time when there are few good investment choices (set it and forget it options) there is always an opportunity for forced appreciation. You're not supposed to say "always". But. We truly believe it. Markets are not perfectly efficient so if you look for the right property, business, or any asset that can be fixed, you can probably find it within the next month. This is essentially the plan we're going with in 2019 since the rest of our money is going into more boring stable investments (around 3% returns). If you can fix it, the returns are likely higher **and** we would argue that it is less risky as well. So that's our *"2019 Resolution"* a shift to forced appreciation purchases.

****

Parasite Movie (Spoilers & Metaphors etc.)

Parasite Movie (Spoilers & Metaphors etc.)

As stated in the title, this has a ton of spoilers so don't read it unless you've seen the movie or plan to see it. In summary, we are not surprised that it was extremely popular as it should resonate with the masses. Unfortunately, our "take" on the movie is going to be quite different since we don't agree with the premise "getting rich is just a fantasy/dream if you grew up poor". Since we know that's not true, it's harder to relate to the movie. That said we'll go ahead and provide some highlights and attempt to do it in chronological order (difficult as many of the themes are connected later on in the movie). Time to crack open our "literature 101" skills from middle school.

The Set-Up: Unless you've seen it recently this is a quick reminder of the cast members. and how the movie starts. If you remember it well skip this subsection. *Names of Characters:*To keep it simple we'll refer to the cast members as follows to make it easier: *Kim Family – Poor:* Mr. Kim, Mrs. Kim, Daughter of Kim, Son of Kim; *Park Family – Wealthy:* Mr. Park, Mrs. Park, Daughter of Park, Son of Park; *Others – Supporting Cast:* Original Housekeeper, Original Housekeeper Husband, College Student Friend, Park Family Driver. By way of background, the Kim family lives in a basement style apartment with a bug problem and uses the gig economy to survive. The Park family lives in a mansion on top of a hill with a purely capitalist husband and a wife who has been insulated from hardship her entire life (due to wealth provided by husband). This is purposeful juxtaposition, both families also have an equal number of members wife, husband, daughter and son. In order to go to the Park family you have to climb up stairs then up a large hill, similarly, for the Kim family you go down hill and down stairs to an actual basement apartment that is below the street level (underground). This physical representation is for "upper and lower" class.

*Kick off of Movie:*The beginning is actually quite funny if you think it through to the end from a purely logical perspective. Son of Kim has a college student friend show up to his basement level apartment and offer him a great deal. College student is leaving to go study abroad and is romantically interested in Daughter of Kim (a girl has has been tutoring). The exchange is clear. He'll help his friend out (get him an easy tutoring job that pays well) as long as he doesn't get involved with Daughter of Kim. In the end, this doesn't work out so the message of the movie is to never help out poor people… It always ends in death and disaster (yes that sentence is a joke for those that are tone deaf!).

Back to setting up the movie: 1) college student helps Son of Kim with a tutoring job offer – he also gives the family a *"lucky rock" – more on this later*, 2) all he has to do is teach and avoid getting romantically involved with Daughter of Park, 3) Son of Kim has his sister Daughter of Kim forge some documents to say he went to Oxford, 4) before going off to interview for the position, Son of Kim tells his father "I don't feel like I'm cheating as I'm going to get this degree in the future", and 5) he goes off to interview and gets the job.

No One is Good or Bad: While the movie is set up to make it seem like Son of Kim is the protagonist, in the end, the viewer is not meant to favor either family. While the viewer feels bad for the poor family (since their living situation is terrible), they also take full advantage of the Park family acting as parasites.

Similarly, the Park family is not evil. They pay everyone on time, they are not abusive and don't purposefully insult anyone. Over time, without knowing it, Mr. Park does insult Mr. Kim's smell but did not know he was hearing the conversation. If anything, the average viewer is likely a bit jealous of the lives of the Park family and believes the poor family is "smart" for taking advantage of them. You can see the jealously consistently come out in the movie as Mr. Kim has the gall to ask Mr. Park "do you love your wife" on multiple occasions. This is a clear insult and is a way for Mr. Kim to try and find something (anything) that Mr. Park doesn't have.

The Beginning of the End: The first few minutes of the film has the crowd rooting for the poor family. Son of Kim finds a way to get Daughter of Kim a job as an art instructor. Now they have two forms of income coming from the Park family. One tutoring the Daughter of Park and another as an art instructor for Son of Park. At this point no one feels bad for either family, creating an extra form of income seems harmless. Until the scheming begins.

Daughter of Kim takes a ride in a car to the train station, utilizing the Park Family Driver. She leaves her underwear in the car and gets him fired. While the audience is still somewhat okay with this (the driver was making a pass at her), they are now ruining the lives of others for their benefit. This is a direct commentary on a common poor person complaint that "rich people take advantage of the lives of others". Meanwhile, the poor family is doing exactly that. This becomes more apparent when they also get the Original House Keeper fired by faking a disease (that she has tuberculosis). Since the audience does not know anything about the Original Housekeeper they are at best neutral on the Kim family at this point. Hard to root for someone who has gotten two people fired.

At this point you're wondering "what exactly are they going to do when college student comes back and sees this giant pyramid scheme". At no point does the Kim family have any sort of long-term strategy. They are optimizing for the present moment. Their entire livelihood is built underneath one man (Mr. Park) and they have stabbed three people in the back to get there: first with Daughter of Kim becoming physically involved with Daughter of Park, second with the Park Family Driver and third the Original Housekeeper (three strikes and you're out!).

The Event: The Park family goes out of town for a trip shortly after the Kim family gets the Original Housekeeper fired. The Kim family takes full advantage of this: drinking their alcohol, eating the food, laying on their beds and even reading the diary of Daughter of Park. During this time of festivities, Son of Kim makes the same remark as college student. College student planned on asking Daughter of Park to be his girlfriend when he got back and Son of Kim states the same thing while drinking with the Kim family. The Kim Family bursts into laughter as they know (and the audience knows) this makes little sense given their situation. On a quick sentimental note, the message from this is that you should always "tell someone you love them" and avoid waiting for the right time.

The event occurs when the Original Housekeeper shows up to the doorstep late at night. She forgot something in the "basement" before she left and needs to get into the home. The Kim family allows her to come in. Fast forwarding ahead, they find out that the Original housekeeper had a husband living in the basement the entire time. This horrifies the Kim family as they learn that there are people who are suffering much more than they are. Not only that but they got the original housekeeper fired.

A Failed Man as a Child: The scene is probably extremely painful for an unsuccessful man to watch. The husband of the original housekeeper is completely disheveled and his wife is quite literally feeding him out of a bottle. The choice of items was explicit as he is drinking milk out of a bottle and appears to be 50+ years old. Also. He has a practical shrine of Mr. Park and prays to him since he relies on his efforts to survive. The similarities between this man and Mr. Kim become clear when he later explains that he lost all of his money with a "cake shop". This is exactly how Mr. Kim lost a large amount of money as well. The viewer quickly realizes that original housekeeper and her husband don't have a "husband and wife" relationship, but more of a mother and child relationship.

The Battle: During this time, the housekeeper family and the Kim's begin a physical battle. The housekeeper family has video proof that the Park family is a large pyramid scheme leeching off the estate. Instead of finding a way to work together they physically fight and battle it out. At one point, the housekeeper family is winning since they have their finger on the "send button" for a video recording the entire ordeal. During this time period, the original housekeeper mimics the talking points of a North Korean newscaster while telling the Kim family to "keep their hands up!". It appears that this is meant to be a message as well, neither family is interested in cooperating and the poor people would rather fight each than come up with a clean strategy long-term. Give all the power to one person (the wrong one) and it ends with a horrible dictatorship

Use of Stairs Escalates/Emphasizing Class: At this point the movement going up and down the house and through the movie intensifies. The Kim family and the "housekeeper family" are moving up and down stairs frequently. To emphasize that they are poor, the movie has the characters moving up and down the stairs on all fours like animals/bugs. They are less likely to walk up and down the stairs on two feet. In fact, when the Kim family is hiding from Mr. Park and Mrs. Park at one point in the movie, they slide out from a table and move on all fours to escape *down* the stairs. Mr. Park is the last to go and isn't even on all fours, he physically slides like a snake to make it to exit.

Use of Water: The use of water is the classic "cleaning" symbol. As they go back to to their apartment, it is raining and they find that their entire apartment is flooded. A degenerate who would piss outside of their apartment was splashed with water by both Son of Kim and Mr. Kim himself to get him out of the alley. And. At the end of the movie, the "lucky rock" not only floats miraculously to the top during the flooding but it is also placed in a makeshift river during Son of Kim's "dream to do it the right way".

Poor Live in Constant Paranoia/Stress: This part is something that is relatable and true. Stress is likely the worst thing for your health and the Kim family is under consistent stress. They are constantly stressed about bills/money, they then trade this stress for a fear of being caught, they then trade this stress for planning out a murder of the original housekeeper and the original housekeeper husband. Meanwhile they also endure small amounts of stress from the Park family. When interviewing for the driver position (Mr. Kim's schemed job), he is forced to be extremely careful. Mr. Park stares at his coffee cup to see if he takes turns incorrectly and quickly ends conversations if Mr. Kim begins to cross "the line".

Consistent Reminder of Plans: This was quite interesting, somehow the movie was able to identify this common theme that translates to the USA as well. People with a belief system that creates poverty believe that "plans don't work". So the best plan is "no plan". Naturally, the viewer can quickly realize that they never had "good plans". What did they intend to do when college student came back? What did son of Kim gain by starting a relationship with the daughter of Mr. Park (expense is lost friend who actually helped him a lot)? While the flooding of their apartment was a bad event, the majority of the decisions were made to optimize near term profits at the expense of long-term results.

Economic Mobility Okay for Young Women: On a separate note, not chronological, the only person who seemed to integrate quickly in the house was the daughter of Kim. She is depicted as an attractive Korean girl and quickly manages the operation in the home. Perhaps as a way to tell the viewer "if you're a good looking girl you have a shot at integration!" This is the classic "marrying up" commentary that is made in societies in general.

Economic Immobility: Unsurprisingly, this was the overarching theme of the movie. Class warfare. One family has their house flooded the other family is trying to throw the "perfect birthday parties" have the "perfect food" and "have a perfectly maintained home". Rich people problems versus poor people problems. In the end son of Mr. Kim dreams about working hard and eventually becoming rich to afford the house. Since we're left with the knowledge that it is a dream, the audience receives an implied message "it's not going to happen". A feeling of hopelessness.

Naturally, we don't agree with this sentiment. Living in the USA? It's 100% possible to move up. Is it easy? No. Is it smart to backstab the first person who gives you a shot by sleeping with some girl he likes? No. Is it going to require more work than a person who was born on third base? Yes. Can you control that? No. So in the end, we didn't agree with the overarching theme and are 100% not surprised it was one of the most popular movies of the year (won a bunch of awards). These conclusions don't conflict as the average person is more likely to feel stuck (hint most people believe they deserve more than what they have). Despite all the facts (life is better for almost every economic class in the USA compared to 50 years ago).

Conclusion: For readers of this blog, the confusion is really two things: 1) avoid being flashy around people who are not in the same economic zone, you'll end up creating jealousy and resentment. We've said it before, but calculate the annual income of the people in the room and say you make 20% less than that (even if you make much more) and 2) don't go out of your way trying to bring someone else down. You're going to end up creating more problems for yourself down the line. The short term benefit is never worth it as your brain will remember what you did (forever).

Addendum: Some of the other stuff we left out as it didn't seem to have much meaning beyond theatrics. The stabbing and death scene where Mr. Kim kills Mr. Park and daughter of Mr. Kim dies (housekeeper husband stabs her) was complete chaos. Perhaps the point is that even if you're ultra rich you don't have complete control over your life and could die at any time (Mr. Park does in fact die).

The second one is pretty standard for movies like this: everyone is hiding something even the Daughter of Kim who apparently has a secret smoking addiction. Mrs. Park is also naive and child like as she has been insulated by the hardships of life while Mr. Park is overly fixated on making money while "outsourcing" a lot of parenting. The rest of the characters are faking that something (the boy is faking his artistic skills, the Kim family has fake jobs and the Daughter of Mr. Park is not doing much studying).

Newer Readers: On a somewhat related note, if you want to end up like Mr. Park without the murder scene you should probably check out our products: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending.

****

How To Earn Passive Income

These days it seems that everyone is looking for set it and forget it ways to make income. The problem is that you either need 1) valuable information that is static or 2) a grip of cash. Every other income stream in the world is not static in the least bit. If you have to constantly update the item (this blog is a great example) then it is no longer passive as it requires time.

Our definition of passive income is this:

"Income that is generated without the use of your time"

Other forms of income are at best… location independent income.

Passive Business

This is the type of business everyone dreams of. A set it and forget it business that generates loads of money without being monitored.

1) Static Website: In the older days of online sales (before they created video sales pitches and continuity programs), there would be a simple sales page followed by a product offering… You have seen these before.

"Do YOU want the WOMAN of your DREAMS?"

Followed by a lot of emergency type language (red text of course) and a "Click to Buy" and check out at the bottom.

These are always accompanied by testimonials as well. The consumer reads the entire sales pitch (usually a good 5-10 pages long) and then makes his purchase decision. This is 100% passive as you have a **product** that is simply sitting there with a **sales pitch.** If there is no need to update the product, then it is simply passive income.

2) Recurring Service: The second form of primarily static information would be a service. For those that work on Wall Street… a great example would be FactSet or Capital IQ.

Before you jump in and say "but these products are updated!" the point is that the revenue is recurring. If we really want to get nitty gritty then we can simply use software as an example. You pay for the use of a specific program such as Microsoft and then you bill the client on a yearly basis for 1) services (not passive) and 2) use of the software (passive) since the software would never be updated.

Naturally, the software is updated to keep up with competition, but you should get the idea. It is simply access to a **value additive system** that does not need to be updated in a meaningful way.

3) Location Independent Income: While this is not passive income, we will add it for clarification. Location independent income can be summarized as follows – **"A task you can do on the internet".** That is all a person really means by "location independent income". Since you are making your money through the internet as a medium of communication this can include 1) online company, 2) blogging and 3) convincing your employer to allow remote access.

Overall, we believe everyone should at least attempt to create location independent income. Ideally, you can create a massive income from a static website, but the vast majority will end up creating some location independent income. If you are able to create large static income, we commend you and you have accomplished a difficult task.

Passive Investments

This is the second form of passive income. Having a grip of cash. In finance, when you interview you're asked for the most important financial statement. Generally speaking the best answer is "Cash Flow Statement" because… **Cash is King.** Managing cash flows is extremely important and a large sum of cash can help breed… **More cash.** With the importance of a high savings number let's take a look at multiple investment streams from a risk tolerance perspective. We will start with the highest risk, **highest capital growth and work down to lowest risk lowest capital growth.**

1) Qualified Dividends: This is the most common source of dividend income. Simply put, if you own the S&P 500 you pick up a ~2% dividend (as of this posting) on an annual basis. This means that if you own $100K of S&P 500, you will also receive $2,000 by the end of the year. For most individuals the $2,000 will be taxed at 15%, however if you have a personal income of ~$400K or ~$450K as a household, then you will be taxed at 20%. We are not going to go into a long winded post discussing taxes and their merits; instead this is simply how the system works.

The Rub: Post tax yield of low single digits (2-4%) with more hope of equity upside. The higher the dividend the less expected equity upside on the stock (generally).

2) Unqualified Dividends (REITS, MLPS and Special One Time Dividends): What is the difference between a qualified and an unqualified dividend? The unqualified dividend is taxed as regular income. That is the simple difference. Today, REITs pay a high dividend, however you should be cognizant that the income you receive may be taxed up to 35% and beyond if you are in a higher income tax bracket

The Rub: Post tax yield of mid single digits (4-7%) with a bit less hope for equity upside.

3) Junk Bonds: We won't go through a long winded explanation of how bonds are safer than equity. However. The simple explanation is that you're first in-line in case of bankruptcy and you're entitled to income "above the line" of the income statement (ie you represent the interest payment line. Junk bonds pay high yields however… This comes with additional risk… Tread carefully when seeing high single digit yields.

The Rub: Strong yield of mid single (5-7%) with very minimal hope for upside, unless the Company sees large changes to is investment grade (in which they will likely buy back the bonds and reissue new ones at a lower rate).

4) Investment Grade Bonds: These are significantly less risky (unless you owned some of those collateralized debt obligations back in 2008) but essentially you'll pick up a nice yield of ~3-5% and you can sit back, relax and collect those monthly coupons. Of course these bonds still have risk, but the debt ratings for these securities are quite tight.

The Rub: Medium Yield at 4% and we are approaching minimal risk territory.

5) Government Bonds: There are many types of bonds, 30 year bonds, 10 year bonds, 5 year bonds, 1 year bonds… we could go on and on. In addition to these durations, you also have different tax structures with municipal bonds, treasuries, treasury inflation protected securities (TIPS) etc. We could do a 70 page post on bonds and it still wouldn't cover everything. Instead think of these bonds as "risk free". Please note we are putting risk free in quotes because literally nothing in life is 100% risk free. If the government defaults, you will not get paid. However. We find this highly unlikely as we are not part of the doom and gloom, losing in life camp.

The Rub: Practically risk free and will likely outpace inflation by just a hair (excluding TIPS of course)

6) Certificate of Deposits: These are FDIC backed time deposit investments. They are essentially risk free and offer low rates. This is a poor tool for wealth creation, however a staggered long-term CD will allow you to keep pace with inflation (hopefully).

The Rub: Essentially a way to hedge inflation.

Securitizing Your Future

The big difference. How do you balance risk (higher risk at the stock level) and time (your age) to achieve the best balance for the future? In our view, the best balance is actually a bit less dependent on age and is more dependent on your life style and net savings.

Guideline according to us:

1) If you have less than 5x your annual spending in savings. You should have it primarily in stocks. Call it 90% stocks and 10% cash in case there is an emergency

2) As soon as you reach 5-8x in annual spending in savings you can make a shift. Here we recommend 70% exposure to stocks, 20% exposure to bonds and still a 10% cash position.

3) As soon as you reach 10-15x of annual spending in savings, you are now near "retirement" in terms of ability to live entirely off of cash flow. Here you can have a mix with 40% stocks, 30% bonds, 20% low risk government bonds and CDs, 10% cash.

4) As soon as you reach 15-25x of annual spending in savings. You are now free. If you can simply keep this cash in a mix of baskets of goods, you will unlikely have any money issues in your future. You can either take risk off the table (practically all of it) by leaving it entirely in low risk bonds and government backed securities. Or you can continue to grow your wealth (if you are young).

Please note that we assume you are near retirement at 10-15x annual income as savings… because many people will pick up a hobby or job they enjoy for minimal income. No need to retire and sit on the beach for the rest of your life.

Concluding Remarks

In our view, it is best to create a mixed bag as fast as possible. You work and have a solid career that pays well. You can create a small business on the side and create some location independent or even static business income. You then save cash by keeping your lifestyle in check and build up a nice nest egg that gives you momentum. You will see your portfolio gain momentum once you have ~ 8x annual spending in savings/investments.

At that point it is up to you. If you're young we suggest keeping a bit more in the stock market and if you're older then you dial back the risk and look at bonds/deposits.

****

People Suffer from a Lack of Prioritization

People Suffer from a Lack of Prioritization

If you remember life before the pandemic (only a few short months ago), there were common excuses for being out of shape: 1) they have long commutes, 2) they don't have the time and 3) they are forced to eat bad food due to client meetings. Fast forward through the pandemic and what we learn is that people (in general) have gained a significant amount of weight. This weight gain is so common and talked about that you can visibly see it if you look at videos of the general population online (protests, COIVD-19 parties or otherwise).

No Excuse for Weight Gain: During the pandemic there is quite literally no excuse for gaining weight. This is the first crystal clear example of lacking prioritization. Even if you lived in an apartment and didn't move you could spend a significant amount of time doing pushups, lunges, jumping jacks, sit ups, pull-ups on the door, tricep dips and even lifting heavy furniture/items. *"Where there is a will there is a way"* is a classic saying for a reason. Instead what we've seen is that people drink more, do more drugs and generally decline in terms of physical fitness. The ones who are getting in better shape were the ones who didn't need the extra time to stay in shape in the first place! Crazy how that works.

The most interesting part about the weight gain? It appears to be related to alcohol and improper nutrition. Which is even crazier since you can simply drink water the whole day and eat healthy meals without leaving the apartment/home. In fact, it is much easier as you don't even need caffeine anymore. No one needs to be wired and on edge since there is no one else in the home/apartment.

Online Sales – Another Example: This is also the best time to learn copywriting. The chances that anyone is doing this? Slim. Instead the common excuse you'll hear is "this unprecedented times" or "in these difficult times", it isn't possible to get ahead. When in reality, this is the best time to get ahead. You know that the vast majority of the population is drinking.

They are getting lazier. You can work while they relax.

What happens when 6 months of effort meets 6 months of laziness? A wide separation in skills.The picture is not pretty for people who sat on their hands.

The conclusion here is also pretty clear. If you have a friend or colleague who has stated that he is interested in starting an online business, learning copy writing or any sort of online sales… You know he is full of it at this point. If a world wide global pandemic where businesses were being disrupted left right and center didn't cause a change in behavior… Nothing will. Again this is good news for you. It means that the vast majority of people won't try which also decreases the competition by definition.

Creating a Positive View of Any Situation Creates Correct Prioritization: When you look at any situation there is always a good and a bad side. Even if you win a million dollars in a local lottery, the bad side is that people will know who you are and hit you up for money (or worse). The key is to always look at any event and focus on the positive outcome and steer your actions in that direction. This is a extreme version of black and white where we analyze something and take a stance so the prior few sentences are likely "SHOCKING". And. The point stands. There is a good and bad to everything. It is up to the individual to decide which decision is superior.

While average people focus on the inability to go out and "rage with their friends"… You can't really change the laws. So instead of complaining about the laws it's time to take action and focus on the positives. You now have time to read, write, work on a project you've been neglecting, eat healthier, kick out bad habits and improve all intangible skills that were unimportant pre-pandemic. If none of these items apply to someone, what they are really saying is they don't want to improve their lives.

So think about it simplistically, if you try to look at the positive of any situation, you will naturally move in the correct direction. If the we remain locked down, you can focus on reading, fitness, copywriting and other indoor activities that are productive. If the world partially opens up a little and say restaurants are "good to go" then you can say "great, i can now skip out on cooking X days out of the week and free up time for project Y". The key is to look at the positive productive angle based on the environment. Productivity will drive your long-term individual value to society.

Don't Burn Your Time with People Who Lack Prioritization: After a certain age you realize that giving advice is largely meaningless. People have already made their decisions most of the time so you're better off creating a platform to voice your opinions. This allows you to reach the 1-2% of people who are actually interested in improving their lives and you can resort to the old *"Smile, Nod and Agree"* for your real life interactions.

You can gauge a person's character by simply seeing how dedicated they are to improving. If they tell you they are going to do XYZ, figure out what happens over the next month or so. The vast majority (again 98%) will give up on what they said they would do. In fact a good rule of thumb is to find out what someone "doesn't have time for". This will give you the answer. If they don't have time for XYZ it means they don't value it and they will not take action any time soon. If someone doesn't have time to create a second form of income, it means they don't care enough and are content with the risk they are currently taking.

This is an important concept to keep in mind. If you know the person doesn't prioritize correctly, it ***does not*** make them a bad person. It just means you shouldn't personally invest your time in their future. You can hang out at parties but you won't mix anything performance oriented.

Lack of Skills is a Lack of Prioritization: Since everyone has heard of someone who got lucky (won the lotto, got hooked up by someone with a stellar career/job), the human mind then wanders to looking for shortcuts. This is a death sentence as the person will spend the majority of his or her time looking for an escape versus building any sort of internal skill set that cannot be replicated.

How to see this in real life? Just look at the work place. For those that have been involved in the workplace, they will know that performance does not matter as much as politics. If the right person likes you, you're better off in that situation vs. being the best performer. The starry-eyed ideals die very quickly after college. After all, who is going to battle it out with the CEO's cousin? No one smart, that's who.

Want to figure out who the inefficient people are? Just look for the guys attempting to "help the winners". If you are in a large office environment and you notice someone is constantly trying to attach themselves to a particular person you have learned two things: 1) the person is trying to take credit for the work of the successful person and 2) the successful person is of political or business importance to the firm. It is much harder to become a winner and drive value as an individual, so the vast majority resort to fictional (sometimes real) support roles for the important revenue generators.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life. **We hold Q&As 1x a month for purchasers only.**

Permanent Portfolios and a Plan A vs. Plan B

Permanent Portfolios and a Plan A vs. Plan B

Lately, we've been considering a "permanent portfolio" which simply means a new way to invest that avoids large ups and downs. Since we started this blog about 7 years ago we suggested dollar cost averaging all of your money into the S&P 500 if you are not rich yet (after the basic cash buffer is made). That is still a good strategy if you're young but we recently stopped investing in the stock market (end of last year) and have simply been moving to cash/crypto since then. Why? Well if you haven't been working/selling items for your own company since 2008… it means you haven't seen a recession. Recessions are the best time to get rich since everything goes "on sale". Long story short, our 2021 recession expectation (rough range), is the last recession we're attempting to "time".

General Principles: Before jumping into what a permanent portfolio would look like, we have to explain why it's possible to create one. The reality is that anyone who is a millionaire by 30, will have high income/cash flow… otherwise they wouldn't have made it to a million dollars so quickly. This part is usually confusing to someone with a normal income since your monthly cash flows can quickly equal a year of savings for median wage earners. What does this all mean? It means you can *move* your allocation without actually selling any assets. As a simple example if you have a million dollars equally split between four asset classes ($250K each), but you are able to save $25K in a month… By simply putting it all into one asset class for two months you have "rebalanced" your portfolio by a few points (it would represent 28.5% instead of 25% in just 2 months).

This is a significant advantage for you (if you're in this situation). Said a different way, one part of the entire portfolio could go down a full 10% ($250K goes down to $225K)… But you could simply take all your earnings for a month and toss it into the basket to rebalance to 25% (all else equal). This example alone should explain why we think individuals should not waste time looking up "the next big thing" until they are officially rich. If you simply close your eyes and buy the major asset classes (stocks/bonds/real estate/crypto/gold), you're going to do fine and are better off making large amounts of money before attempting to time out your purchases more. Your monthly purchase will equal your old annual purchase if you focus on becoming rich the right way (sales, ownership or tech).

A Recession is Simply Opportunity: If you're successful the chances of being employed/making decent money during a recession is quite high. Why? Well this is how life works. Recessions are painful for most, yet the ultra successful stay insulated. They are able to find employment since they are actually delivering value (unlike most within the Company or Industry if you run your own business). This gives you a chance to buy talent at a discount (high quality people who were cut due to office politics vs. performance) and it gives you a chance to buy assets that are deemed "too risky" even if the business model is completely unchanged long-term. A good example of this is when the housing bubble crashed, that created a "cloud of worry" around rental income and people decided that homeownership was "not for them". Of course… this ended up being the best possible time to buy since people still need somewhere to live over the next 50 years. In short, watch the news closely during the down turn (seriously!) and if they say an industry is "forever changed and this time it is different" look into that industry because it usually isn't. Funny enough this even worked during the tech bust, when the view was that the values were forever going to be deflated, meanwhile the top companies that actually survived and thrived are worth significantly more than they were back in the 2000-2001 period.

A New Permanent Portfolio: The world continues to change rapidly, about 15 years ago smartphones were not pervasive and there was no such thing as crypto currency. So the way we think about a "permanent" portfolio is to have sub-segments along with a 'alternative class" where you buy small amounts of any emerging future company/asset class. Who knows, maybe the next best investment will be real estate on another planet (seriously, anything is possible over a 50-100 year frame). The chances of this happening are slim but being prepared for structural shifts is the whole point of a permanent portfolio. The second most important piece of a permanent portfolio is "no stress". You're creating a permanent portfolio to simply increase your net worth over time and no longer think about money in the future.

Pause for a Second: Before any confusion arises, everything outlined in Triangle Investing is till valid. If you're not rich yet, you're better off just dollar cost averaging into stocks, real estate and crypto. When we refer to "dollar cost averaging" into homes, it means you're just taking a portion of your net worth every year to buy some sort of rental property (or any other asset that is real estate focused). This post is meant for two different strategies we've been mulling on *once you've hit your financial independence hurdle.* We have to emphasize that point. This post is for people who are looking for new ideas once they are set and there are really two clear paths: 1) a permanent portfolio and 2) a strategy to get your plan A. We can't think of a third plan so it really turns into a permanent portfolio and a high risk plan A.

Permanent Portfolio

Since retirement makes no logical sense as your brain erodes from lack of use, we assume that you'll always be doing something for money. If you follow our plan for a million dollars within 10 years, the math suggests that you will eventually be worth ~$10M in the future due to compounding and continued effort (you didn't get to a million with a low income!). This is a great set up but does not answer the obvious question "what type of life do you want to live".

If you are not interested in driving lambos and traveling on private jets or first class at all times, the permanent portfolio is likely better for you. This is similar to what is known as an "equal weight" portfolio. There are many other names for it including the "Quattro" strategy. The basic premise is as follows: there are 4 clear asset groups for active management – 1) stocks, 2) bonds, 3) cash and 4) gold. Remember this is based on legacy portfolio management theory and does not include new markets like crypto currency.

How does it work? You simply put 25% of all of your income into each of the four groups. At the end of the year (or twice a year), you sell the winners and re-buy some of the losers to rebalance at 25%. Since gold goes up during recessions (historically) and stocks go up during upturns, this naturally allows your portfolio to grow over time. Will you get rich off of this? No. Will you go broke off of this? No. This is the point of the strategy as it reduces risk for you over long periods of time. Also. This strategy is also perfectly fine if someone does not want to think about investing while they grow their business.

Fast Forward to 2019: At this point the world has changed quite a bit. While the equal weight strategy will likely work, we think it makes more sense to have something that is much more "future friendly". This means you're going to have more assets to actively reduce the chances of missing out on the "next big thing". People who missed out on Bitcoin at prices below $1,000 for example are still trying to play catch up. So we've come up with a percentage that should work as a new "permanent portfolio" for the next 50 years or so and it looks something like this: *25% Stocks, 20% bonds, 20% Cash, 20% Gold, 10% Crypto and 5% alternative assets.* The emphasis here is that this balance refers to all of your invested assets and does not refer to real estate since we view that as a separate entity entirely (since you can have forced returns where you actively fix it to improve the performance). For those that want to nit-pick, what usually happens is that the person will own a couple of properties (one he lives in) and one or two rentals at minimum.

Rebalancing: Since our portfolio is a lot more complicated when compared to the standard portfolio, we would only rebalance once a year. When you think about it this will also allow you to "ride your winners" longer and also forces you to sell the big winners at higher levels. Selling and rebalancing is costly not just in fees but time as well (tax issues also occur due to1 year holding periods). The losers in the portfolio are unlikely going to impact you since the volatility is tied to the crypto, stock and alternative asset pieces which are a smaller chunk of the overall portfolio.

Final Note on Permanent Portfolio: The biggest downside of the permanent portfolio is that you're not actively learning about new things. You're creating a portfolio that will go up over time and makes sure that you will be able to slightly increase your spending for the rest of your life. The biggest upside is that you are free to do anything you like with your free time: spend hours on the beach, travel, sleep in, work less and read less. While this sounds like hell to people who are still trying to work their way to the top, a permanent portfolio allows you to sit back and decide on what you would like to do next. So. Remember this set up for the future since its a good way to put "time on hold" if you ever need to.

Aiming for a Big Plan A

The second idea we've been ruminating on is the "Plan A" portfolio with extra money. One of the main items from this blog is that we're recommending a basic strategy to get modestly rich that will work for anyone. It does't require immense talent it just requires a lot of work and reflection. What are you good at, find that skill, work long hours for the first 3-5 years of life and hit your basic financial independence number. Only people who absolutely "must" be worth $100M+ would not follow this plan. They would go down the full ownership route on day one as that is the only way to really get rich (starting and running a company).

Investing for Plan A: Making the numbers up we assume that you're worth $5 million. At this point you can generate around $250,000 pretty easily with just 5% returns. That's more than enough money for the vast majority of people but lets go ahead and say that you have bigger goals in mind. If you want to try and make another leap the only way to do so is through serious concentration. Mainstream financial advice always says to "diversify" but the people who get rich do so by selling their companies and owning a large chunk of it.

What does this mean? It means that your alternative strategy is to simply go all in and swing for the fences. If you already have $5 million and that is enough for you personally, then it is time to go ahead and take all your future income and put it into risky investments. This is not something "mainstream" advice will tell you since they always go with the lower risk answers.

Venture and Angel Investing: You guessed it. Getting in early is the only real way to get outsized returns. One of the most important changes over the past 10 years is that individuals can now invest in early stage companies rather seamlessly. You don't have to wait for the Company to go public and you don't have to wait for a major round. All you need to do is make contacts and offer a large investment in the first fund raising round. *The key here is that you need to be right at least once*. If you're right once with a large initial investment of say $100,000 (a large sum for a first round raise), you can get a return that is well in excess of 10x.

As you can imagine… This is the direction we're choosing. This is not a recommendation as there is nothing wrong with a permanent portfolio or a 10% annual return on all of your money. We've reached a point where working an extra year and saving it into index funds, or cash/bonds doesn't make any impact to daily life. What is the point in increasing your monthly spending by around $500-1,000 (again making the number up). You're only going to live a different life if you're able to double or triple your monthly spending and at some point you will hit scale issues. Adding 50% to multi-million dollar portfolio with work is much harder than adding 50% when you only have a couple of hundred thousand dollars to your name.

Unsurprisingly, this change in strategy is slowly bleeding into the content on this blog. Prior to 2016/2017 we focused a lot more on compounding investments to make sure there was enough buffer room to sustain a recession. We're past that now. A 50% drop in the stock market, bond market and real estate market would not impact our lives. In fact nothing would change except the numbers on the screen since a 50% decrease in cash flow still allows for financial independence. Many will say that is a brag which is fine but it's more of a "change in situation". Take a step back and ask yourself, if you knew that someone would hand you enough money to pay for all food, clothing, travel, housing and healthcare expenses for the next 200 years… Would you personally be interested in an extra few hundred dollars a month? The answer is probably no which is why our thought process and ideas are starting to move away from the original strategies on the blog.

Time for Change "Quitting": We recently wrote that one of the most important skills is learning to quit. Another person on Twitter used the phrase pivot but the concept is the same. We've realized that once you hit a certain net worth, the impact of making 5-10% gains is not interesting anymore. While we won't do anything crazy (touch the principal), there is no reason to take all future income and buy the same old stuff. So we're quitting the low-risk low-reward portfolios going forward. The strategy is to attempt to reach the "next level" which requires doubling or tripling net worth and the only way to do that is … you guessed it… by taking on more risk! Surprise surprise. As a fun note, as we've mentioned the last 8 months, we have stopped investing more money into stocks and our current cash flow has been going into only cash and crypto. By the end of the year we intend on putting a large investment into a high risk asset. Once this happens we'll likely explain the process on the blog. No. Most people won't like the articles. But. We can't really do anything about that as its the direction we're going.

On that note if you have deep knowledge on any high risk high return investments please leave them in the comments.

****

Personal Finance Advice on the Internet is Bogus

[Personal Finance Advice on the Internet is Bogus]

After getting more and more comments about making money, breaking out of the middle class and generating passive income we decided to read a few popular personal finance blogs. The first step was realizing that most of these blogs encourage you to live a boring life by focusing on net worth instead of Adjusted Lifetime Spending.

A quick digression.

After an hour or so of reading personal finance blogs it became irritating. So irritating that we're going to go ahead and outline every single piece of terrible advice you are receiving. Lets begin.

Bogus Rule #1 Save 10% of Your Income: Anyone who gives out this sort of advice is making a cruel joke, is broke or is a liar. One of these. The 10% rule does not work because your income should increase over time. If you save 10% of your income for life and your income never increases, you will be able to "retire" (see die) at the ripe old age of 60+ with the exact same standard of living… if you want to call it living.

How is this a cruel joke? Easy. If you believe you're doing the right thing by saving "10% of your income" you're going to lose motivation immediately. In your head you will mentally believe that you're on the right "track" and instead of reinvesting in yourself you should ride the smooth wave to the same mediocre life at 60!

How is the person broke? Well if the person believes this, then there is absolutely no way he made it rich on his own. Why? If you actually want to get rich, you are busy generating a lot of income for many years of your life (usually in the beginning) so you are actually saving closer to 75%+ and hit closer to $1M by thirty or so. Why again? Simple, your life is extremely miserable if you try to live off of 25% of your income and have a salary of $100K a year… 25% on $400K is not difficult and the game works in your favor. The real question is… what is this person trying to sell you?

– If this advice is coming from internet blogs (subject of this post) then he/she is trying to build a connection with you to keep you on their site generating money for them**.** Ever notice they try to make it seem like they were "just like you" in the *past* what an outstanding coincidence! The standard move is "I was 25-35 years old up to my eyeballs in credit card debt… then…"

– If this advice is coming from a financial advisor (read broke guy who makes $80-100K a year). He is actually trying to get you to open accounts for his $50-100 sign on bonus! And…. If this advice is coming from your employer? They want you to save just enough to feel good about yourself but not enough to be independent and quit! It also helps because knowing you can never leave allows them to pay you a smaller bonus.

There you go. Bogus advice #1 busted. Try to save 25% of your income per year and you'll realize that the only way to do this, without stabbing yourself in the eye with a hot needle, is by generating significantly more income than average.

Bogus Rule #2 Focus on Day to Day Purchases: This is the second most useless piece of advice. It comes in many forms. You should spend your extremely valuable brain cells on… watching your $4 latte purchases, $4 bag lunch vs $7 take out lunch and you should be laser focused on $3 toilet paper versus $4 toilet paper. Before getting too annoyed by this, it actually follows the same outline as above! Anyone who actually believes this is the way to become wealthy/rich is playing a cruel joke on you, is broke or is a liar.

How is this a cruel joke? It is a cruel joke because you are going to develop a frugality belief system. In addition to this development you're not going to think about the extremely high cost of avoiding coffee. Want a solution? Every single time you get coffee… buy two. **One for you and one for the guy you're meeting for coffee.** Now you're down $8 instead of $4. How long does it take to make $8 with practically no skills? About 30 minutes. Go on fiverr and do a mundane job at your desk to make up the cost. Here's the rub. If you can continuously find someone useful to have coffee with, the return on investment in a year is probably going to be $10,000 or so. How does that coffee taste now?

Finally, how many rich people do you know that fret about a $4 coffee? That is correct. Zero. If you are able to meet a rich person for coffee there is a zero percent chance he is going to be interested in the coffee. None. In addition, notice the trick from the question above… Rich people don't pay a cent for coffee. Caffeine for thought.

How is the person a liar? Lets put the two points together. If someone is telling you that saving $4 on coffee and $2 on toilet paper and $3 on bag lunches made you rich… This is mathematically impossible. If you saved an extra $10 a day for the rest of your life you're putting away $3,650 a year. This is a rounding error.

Bogus advice #2 busted. The reason they are giving you this terrible life advice is so you feel better about your life when you read their blog. "If I just save $10 a day more I can be rich too!!!! (*completely ignore the person's $500K internet income!*)". If you feel better about your life after reading their blog, you are going to post their website links on Twitter, Facebook and Instagram… This generates more income for them and you've been sold mathematical snake oil. In short, they made you feel good so you could spread their gospel… see make them rich. The "family man" is really just the mob, you are part of "the family"… doing his dirty work.

Bogus Rule #3 Bond Exposure Should be Equal to Your Age: This makes no sense at all. If you have bond exposure equal to your age this implies that you should have 21% of your total assets earning 0% in inflation adjusted earnings power right after graduation. Too complicated? The reality is here: bond and CD exposure = $ you are unwilling to lose.

In a low interest rate environment, the net gains by a diversified bond fund is likely in the 3-4% range. This means the yield is roughly offsetting inflation. So? ***The only time you should have exposure to bonds is when you are financially independent.***

If you are not financially independent here is where you should invest your money. 1) In yourself. In anything that will actually generate real dollars for you over the next 2-3 years, 2) in a business you are starting where you can get cash on cash return within 1 year and 3) index fund/stocks since you have to take on risk in order to move towards financial independence in the first place.

Other than that? If you have a low net worth keep a few months of living expenses in the bank in case you hit a rough patch and get to work on how you should really invest as noted in the three points above. The implied message is obvious, you have to continuously take on risk and volatility until you hit your stride. It will pay off.

Bogus Rule #4 Spend 30% of your income on Housing Costs: This is laughable at best. Housing costs at 30 percent implies that you are going to be spending at least $2.5K per month on housing if you make $100K a year. This is insane! You don't make enough money to afford $2.5K per month if you're only generating $100K per year. Lose the ego and downsize.

Until you hit your stride financially, you should spend as close as possible to 10-15% of your income on housing. If you are fresh out of college working in a legitimate career then you're going to have roomates. Tough it out. You're not going to spend any time in the room anyway (if you're smart!) so there is no point in having a high end place. When can you spend 30% of your income on housing? When your passive income is more than 2x this metric.

Bogus Rule #5 – Get Rich Slowly: Complete and utter lie. No one who is actually rich gets to their level in a long period of time. There is not a single successful person on this planet who got rich over 40 years and the general public knows his name. Not one. The reality is that you get rich in a windfall or by grinding out a large amount money over a shorter period of time. Why? The laws of mathematics once again!

Lets say you are happy with your lifestyle but you're only saving 10% of your income… Now lets say one year you sell a business you were working on. It is sold for 10x your annual income. Boom an *event*. Assuming you do not spend the proceeds… you never have to worry about finances again. Why? Your savings just increased by a factor of 100x. Most people think their savings rate was only 92% versus 10% which doesn't sound like much… This is not how you do the math. If you were saving $5K off of $50K a year, you incur an event at $500K, *<u>you just saved $500K/$5K = 100 years of savings in a single day.</u>* Make no mistake, most people who actually become rich have an *event* that makes it rain so hard the Mojave Desert could be turned into a swamp land.

Second way to get rich? Re-read point number one. If you go through these personal finance gurus who really tout "saving slowly" as the way to get rich you will realize that they made 3-4 times the median national income. It is simply non-sense. Place any normal human being in a major western city, give them an ounce of self control, pay them 4 times the median income of that city and they can save 9x the median income in just three years. Look at how quickly the math works in their favor: Average income $50K, earned income $200K = 3 years at saving $150K = $450K…. $450K in three years = $450/$5K = *<u>90 times the median savings of the median household.</u>*

It had absolutely nothing to do with slowly saving money. It had absolutely everything to do with making money fast, fast, fast. The ETFs out there are going to return 7% – 10% a year… maybe. You ain't gonna get rich quickly that way.

Bogus Rule #6 – Focus on Entertainment Cost Cutting: This appears to be the "new age" personal finance advice. "Cut your cable! Just use Netflix!" or… "Go to XYZ cheap carrier and save $40 a month!". This type of advice should make you puke. If you are thrilled to find a way to cut your costs by $5 a month through internet research you've already lost. You are running head first into a brick wall at full speed. Why? You're not addressing the real issue. Which is consuming for pleasure (entertainment) vs. consuming to learn (reading)

Here is what you do instead. At the end of every single year you can review your budget by getting into an excel spread sheet or using mint.com or a similar software. Got it? Now for one full day you get to browse the internet and find all the fixed costs you can reduce. With us so far? Once you spend 8-10 hours doing this, make all the changes and you no longer get to review your costs for the rest of the year.

Congratulations. With this simple step above, you better make at least $10K more this coming year. Take all your free time that would have been wasted trying to save $5 and go earn money instead. If you don't make $10K by following this advice you're wasting your time consuming entertainment off of your "cheaper" television costs. The real cost of television is not the cable bill. The cost of television is the time you waste watching it.

Bogus Rule #7 – Buy a Home as Your First Major Investment: Simply put, no. A real estate asset should not be purchased as your first major investment because it will lock you into a specific location. This means you're forced to stay in one spot and will not be portable in terms of obtaining a new Career. In addition, if you work online you're locking yourself into one location (at least temporarily) which was the entire point of making money online in the first place.

<u>If you are a housing evangelist then here is the blueprint to buying your home:</u> 1) Be 100% certain you do not want to leave the area for the next 10 years; 2) Befriend a lot of people who can do housing construction for you on the cheap. This will take you 2-3 years to develop strong relationships so you receive a legitimate discount on renovations (yes you must add value to their lives); 3) Buy the home with minimal debt; 4) Buy a fixer upper; 5) Call your new friends to help you make changes; 6) Your only costs are now maintenance (use HOA costs for high end condos as a proxy – 1% hit per year); 7) Simply assume your home will grow at a rate of 1% maintenance + 2-3% inflation over the long run

There you go, now you know the truth about the personal finance space which is full of lies and bogus equations that will ensure you remain broke for 40+ years and wondering "where your life went". We have said this at least 100 times in the past, but if it is popular and mainstream you should probably do the opposite. Practically everything on here advocates the opposite: 1) Try to save the inverse of 10-20%… Try to save close to 80-90% of your income! The implied message is go out and make money so your life isn't miserable off 10-25%; 2) Double down on day to day purchases, buy TWO coffees, one for you and someone you want to build a relationship with; 3) Bond exposure is practically useless unless you're financially independent, no risk, no reward; 4) Housing costs should be a bare bones minimum since it eats too much of your income. You should be working extremely hard if you are broke which means you won't be hosting dinner parties with that granite counter-top anytime soon; 5) Getting rich slowly is a myth, getting rich happens fast, fast, fast, fast, fast!; 6) Forget fixed cost cutting. You get one day per year at maximum to plan all your cost cutting at once. After that 80/20 rule applies and its no longer worth your valuable time; 7) Unless you're not going to move and love the location/city, do not bother with buying a home since it will be an inflation adjusted neutral investment

****

Personal Finance and Dating

Personal Finance and Dating

Four ways to attract girls: 1) looks, 2) social skills – "game", 3) relative status and 4) money. That breaks it down quite well. Instead of arguing about which one is "more important" we are going to focus on money in this post. You should always work towards maximizing all of your four categories. However. We assume you are at the *median* in the other three categories (no competitive advantage when it comes to status, looks or game. Simply the median).

1) Overview of Why Money Matters

2) Quick Calculations For Your Relative Dating Market Value

3) If She Can't Experience It, It Does Not Exist

4) Why Over 70% of People Are "Below Average"

5) "But I Know a Rich Guy Who Struggles"

Overview of Why Money Matters

Since our readership is full of intelligent people… you already know why money matters. You can use money to improve your looks (clothes, healthier food). You can use money to hire a social skills coach (extreme situation). You can use money to hire a personal trainer (fitness). You can use money to elevate your relative status (owning expensive assets). *Money simply makes life easier.*

Please take a look at the graph below and you'll understand why you should work hard in your 20s. The graph depicts her expectations of your income versus your age.

Untitled

As you get older and older, the amount of money you're *expected* to have will continue to increase! If you're young (college or just out of college), girls do not have high expectations. You're young, broke and hopefully cool/popular. Money doesn't matter much.

You simply do the following: 1) get in incredible shape and join a sports team, 2) learn how to dress and 3) improve your social skills. Since girls do not have high expectations when you're 18-22 years old, do not try to use money to get girls. You don't have enough money and they do not care. They are more concerned with you being a cool and attractive person.

At 23 the fun begins.

For those of you that made the right decisions… the amount of money you're making will help you *immensely*. If you are making ~$150K out of college as an investment banker, you're going to have a slight edge over your competition. However. When you start making ~$300K+ at age 26-28 you are now in the top ~10% in major cities and life will get significantly easier.

In Short: When you are young, girls care much less about how much money you make. They care much more about how cool you are (status). How attractive you are (looks). How funny and interesting you are ("game"). This changes at age ~23. Even if you're still trying to date younger girls they *expect* you to have some income. Living at home in your parents basement is simply not going to cut it. You should have a roommate for the first year or two, post college. But. You should go ahead and live on your own by the time you are ~25 years old.

Quick Calculations For Your Relative Dating Market Value

Unlike other places on the Internet, we are going to break down the income brackets for you in a simple graph.

income

As you can see by the graph, you need to make *at least* the median income in order to consistently date girls in the 6-7 range. If you are extremely good looking or have extremely high status (musician, DJ etc.) you can break these rules. But. Nothing else will help you if you're below the median. If you have incredible social skills but can't even afford to live in a major city, the girl is going to ditch you. A girl who is a solid 7 still has dating options.

Girls in the 5 and Below Range: As mentioned in the graph… Who cares. Don't bother "practicing game" on these girls. Simply avoid them and move on. One day you will black out from partying too much and make a mistake. But. Do not talk to these girls on purpose! Everyone has a loss somewhere on their dating resume.

Girls in the 6 Range: A six is simply your type but other people wouldn't be attracted to them. If you like XYZ type look and she's "okay" it usually means she's a 6 to you and a 5 to someone else. This shouldn't matter to you, so simply proceed as normal. She knows she's in the 7 range for most guys and will adjust her expectations accordingly (notice: girls automatically give themselves 1 extra point). This means you should *generate at least the median income*.

Girls in the 7 Range: Now you're solidly in "cute" territory. This means the girl knows she's relatively attractive and she will raise her expectations. You need to be in decent shape, have decent social skills and not be socially awkward. More importantly, since this is about money, you should *generate at least 1.0-1.5x the median income* to consistently get girls in the 7 range.

Girls in the 8 Range: Competition is heating up aggressively. Just like improvement, dating is not a linear curve. It is an exponential curve. Girls in the 8 range know they are attractive. They are approached all of the time and will raise their standards yet again. You need to be in shape, decent looking and have solid social skills. You also need to generate serious amounts of cash flow to stay in the 8 range consistently. This means you need to *generate at least 3.0-4.5x the* *median income.* It becomes much more complicated at these levels. If you're doing great on all of the other items (looks, status, social skills) you only need to generate about 3x the median income.

Girls in the 9+ Range: Now we are in the upper echelon. Congratulations! Anything in the "9-10" range is simply a girl everyone will say is gorgeous. In addition, she is likely your "type". Meaning if you're into Latin girls or if you're into white girls, the lowest they will be called is a "9". A 10 to you may be a Russian blonde, but if another person likes Asian girls she will be a "9". These girls have an incredible amount of options. For all you know, they are already high end escorts for wealthy men in the 9 figure range. If you want to consistently compete at this level you need to generate *5-10x the median income*. The range gets much wider depending on who you are. One thing is for sure. Extremely attractive women have a ton of options so they will not date men who are "average". Anyone who believes otherwise is simply full of it. Good luck splitting a $40 round of drinks with a girl in the 9 range. You'll get paved.

In Short: You can calculate your worth pretty easily. If you're doing fine in all of the three other categories and you can generate the median income… You can pick up girls in the 7 range consistently.

"As long as you have two commas in your bank account… You will always be a seven" – Wall Street Playboys

The quote above isn't really a joke. If you have $1M generating ~5-6% returns you are making the median household income (post-tax) and will have no problem dating 7s. If you're in the seven figure net worth range and cannot do this it means you either: 1) have serious social issues, 2) are out of shape and are in bad health or 3) are not spending any of it. The third piece is critical.

If She Can't Experience It, It Does Not Exist

Repeat that phrase over and over again. If a girl cannot experience the money you have, it does not exist in her mind. This is why we continue to hammer down the importance of building a company *and* building a career in your 20s. If you make $1.2M a year but live in an RV located in Alaska… She's not going to care about you.

*The income requirements are based on money being *used**. If you generate the median income and use all of it, you will be able to date 7s without much trouble.

Location: As you can imagine, the median income requirements are based on *your city*. In major cities such as New York, San Francisco, Los Angeles and Miami, this is roughly *$80-85K gross income***.** If you are living in a city where the median wage is only $1K a month and can spend $3K a month… You're well into the 8 range. Income depends on your location. Everything in life is relative.

Net Worth Can Be Meaningless: In the extreme case where you are worth $5M+. But. Live in an RV… Girls will not care at all. If you are generating $250K+ in disposable income but spend $1K a month, you're not going to get any girls. If you generate $250K+ in spendable income but you are *using it all* now you're getting somewhere.

Create The Experience: This is where being well rounded will help you immensely. You should have many hobbies. You leverage these hobbies into interesting experiences which can include the following: 1) front row tickets to a concert, 2) tables directly next to the DJ, 3) large sporting events such as the Mayweather Pacquiao fight, 4) high end art events, 5) charity events where you are seen literally giving money away, 6) nice apartment/condo in the center of the city, 7) using a black car service at all times, 8) drugs and 9) anything else you can think of. If you don't have a personality then you already know what to do… *Get out of your comfort zone.* No attractive girl is going to enjoy spending her time around a type A boring person. They want excitement and fun. Looking at a 10-year yield curve is no where on her list.

Boring City, Limited Upside: This is yet another topic we don't see discussed much. If you live in a city that is boring and does not have much to do… You're *limiting your ability to leverage your income.* This is absolutely critical. If you get into the 3x median income range and find that there is no way to leverage your income… It is time to leave! In addition, the cities with the least to do typically have the least attractive women! You can apply this across countries as well. If you live in the most popular city in country X you're going to find that there are a lot more forms of entertainment and the "high end" has high caliber women (PHD, Lebain, Catch, 1Oak). Sure there may be rare "exceptions to the rule" but we don't know many cities full of attractive women with nothing to do (you couldn't pay us enough to live in Nampa, Idaho).

In Short: If she can't experience it, it does not exist. If you are an 8 figure man and spend $1K a month you're not going to obtain any leverage out of your cash flow. Find interesting hobbies and use them to meet the girls you like. If you can spend 3x the median income in your city and are not able to meet women, this is a clear sign that 1) looks, 2) social skills or 3) status needs to be raised immediately. Something needs to be fixed.

Why Over 80% of People Are "Below Average"

This graph explains everything in life. It explains income, it explains dating and it even explains life experiences. There is a massive positively biased skew to life and over 80% of people will fall below the average. This is simply reality.

distribution

Knowing that ~80% of people are going to fall below average you know that the girls are going to flock to the top 20%. This is shown on numerous college campus studies where 1/5 of the men receive the majority of the sex (*Reiteration:* join a college sports team if you can! Full ride + immediate status).

This ratio doesn't change as you get older and likely gets worse! Particularly as you get into the 30+ range where many men have decided to marry and others simply gave up and settled for a life of mediocrity.

Staying Above Average on the Income Side: This one is easy. Read our post on careers and you will have a hard time being below average. If you put in your best effort based on what type of intelligence you have… You will make money at or above the average. This will give you enough income to spend *at least* the median level in your city and invest the rest. You'll gain momentum over time particularly as *your event and performance based income* increases over time. In the interim… You are spending at or slightly above the median to maintain a normal and fun social life.

Use Money to Improve Your Looks: You cannot do anything about your height. You cannot do anything about your race. You can do a lot with 1) your build, 2) your hair style, 3) the clothes you wear, 4) your body language and 5) your diet. Instead of wasting hours and hours talking about things you cannot control, focus on the 5 items listed in this paragraph. Do the opposite of your peers and get a basic understanding of how to improve your looks. Use your money to get a solid gym membership, purchase some nice fitting clothes, stretch daily to improve your posture and of course use that money to buy premium fuel for your body (fruits, vegetables, fish oil etc.).

Use Money to Improve Your Status: This is straight forward. In a club environment, the easiest way is to become friends with the bouncer and bartender. Alternatively. You can go straight for the jugular and obtain the table next to the DJ. It simply depends on where you are in life. If you're trying to compete with guys in the 8 figure range in the most expensive club in town on an investment banking associate budget… You're going to struggle. This is simply reality. Find a venue that has girls you'd like to meet and calculate your relative status in that environment. If you will be in the top ~1/5 in the venue… It's the correct venue to enter.

In Short: Life is a positively skewed bell curve. It is not a normal bell curve. The vast majority of people fall below average leaving an open field for those in the top 20%. This ratio only gets worse over time and if you can get into the top 2-3% you'll be swimming in options. Sooner than later… you'll be avoiding phone calls. If you have to go out of your way to meet girls and you are 30+… Something went wrong.

"But I Know a Rich Guy Who Struggles"

To wrap up this post, the most common rebuttal is someone saying "I know a rich guy who can't get girls! Therefore money doesn't matter!"

This is pure non-sense. We have provided a solid guideline to how much money you need to make…

For a 7: ~1.0-1.5x median income; **For an 8:** ~3-4.5x median income; **For a 9:** 5.0x+ median income.

The only way this equation *does not work* is if you violate the original premises laid out in the post. We simply have not seen anyone with normal social skills and an income of $250K+ complain about girls in NYC. If you are 1) overweight, 2) dress like a slob, 3) don't spend money on experiences and 4) have horrible social skills, then you have broken the rules in this post.

Boring Type A Personality: This is the most common. Many, many, many people with high incomes do not have an interesting personality. This is why we recommend going out 2x per week when you're young (Thursday & Saturday). This creates a baseline for your social skills. It forces you to improve. Under no circumstances do you live inside of a basement coding the next amazing app for 7 years straight. You deserve to go out at least two times a week. If you know someone who is a boring type A person but has money… You know what to do. Befriend them and try to see if you can create money together. If there is no business overlap and the guy is unwilling to learn basic social skills, stop returning his calls. Move on.

Simply Unattractive: You don't need to be a model. You don't need to be 6′ 3″ with blonde hair, blue eyes and a testosterone level of 1,000 at all times. You simply need to be the best *you* that you can be. If you are of average height but have a solid build, you're going to be well ahead of your peers. Guys who are shorter but are built like "Greek gods" are going to do just fine (Frank Zane is a great example). Again. You do not have to look like a professional body builder either. Simply get your body fat into the single digits and put on extra muscle weight. As a review, here are the general guidelines (get to within 85-90% of these numbers):

Wrist Measurement Multiplied by (Number) to Obtain Ideal Body Part Metric: *Chest:*6.57x, *Waist***:**4.57x, *Hip:*5.57x *Thigh:*3.43x *Bicep:*2.43x *Neck:*2.43x *Calves:*2.29x **Forearm:** 1.86x

Poor Style: This is honestly an epidemic. While obesity is certainly the number one epidemic in the USA, poor fit and poor style is second on the list. It does not take much to look nice! Simply find clothes that fit and put them on!

In addition, take the next step and also find what colors suit you best. We don't know if you are Black, White, Latino, Asian, Indian or Middle Eastern (we also don't care). But. Please find the colors that will match your skin tone best. Here is a quick and basic book on the topic.

In Short: The argument of knowing a "rich guy who struggles" is simply rationalization. The person is trying to find examples to prove he is correct. This way he does not have to take responsibility for his life or his decisions. The only group of people we see struggle with women (once they clear 3x the median wage) are… *Type A boring people and extremely lazy slobs.* If you go out 2x per week and stay in shape? You're not going to end up in this camp.

Use this to filter out your friends. Anyone who tries to tell you money doesn't matter… is rationalizing their failures. Take a mental note and slowly fade away from them.

Concluding Remarks:

This post focused primarily on income and dating. If you are extremely handsome "a male 10" or have extremely high status in an area (DJ, Musician, etc.) then you can certainly break these rules. The overall premise, however, is the same. If you can spend 1.5x the median wage in your city (not save but spend on experiences) then you will have no problems dating in the 7 range. If you can get into the 5x median range and are in shape with solid social skills, you're going to be sending girls into voice-mail consistently.

– **For a 7**: ~1.0-1.5x median wage ; **For an 8:** ~3-4.5x median wage; **For a 9:** 5.0x+ median wage

– If you cannot find a way to date attractive girls while spending 3x+ the median wage in your city, the problem is personal. You should be able to obtain dates easily by having better ideas, better venues (concerts, major events, private parties, charity events) and better logistics

– As you get older, girls expect you to make more money. When you're young take advantage of this and prepare for the future. By 30 you should be at or above the median in spending power (bare minimum).

– *"As long as you have two commas in your bank account you will always be a seven"*

– If she can't experience it, it does not exist. If your net worth is in the 8 figure range but you live in an RV and dress like a slob, no one will care.

– Location matters a lot for 1) determining median income, 2) potential upside in terms of experiences and 3) your ability to leverage your income to *your advantage*

– Money can improve your looks, it can improve your status (calculate the relative value of people at the venue) and it can even improve your social skills as you should feel much more confident in your personal value

– Dating and *life in general* is a positively skewed bell curve. Roughly 80% of people are below average. This is simply a harsh truth.

– Anyone who claims that money is irrelevant is simply rationalizing or is extremely young (has not seen the wealth impact yet). If they are in their 20s, they don't know whats going to happen when the inflection point hits (around 30) and the long-term pain will come (40+).

– Avoid people who attempt to rationalize their poor decisions.

– from the comments here is the "median" for the other three categories:

Looks: you are about 5'8″. You are roughly 13-15% body fat. You are not fat or skinny or ripped. You know how to wear appropriate fitting clothes. You look better with a shirt on than a shirt off at the beach.

Game: you don't have social anxiety issues. You can spark a convo at a bar with girls or at a coffee shop. You do not have cold hard calculated regimens. A guy with incredible game can teach you a trick or two but you don't *need* advice. You are socially normal.

Status: since you're at the median it doesn't hurt or help you. You are not a DJ, bartender, promoter, musician, gangster, or ball player. You are simply a typical guy in the environment. You are not able to push guys around with status symbols (tables, bottles, sports car).

Notably, we will not let the post degrade into a debate regarding "what is more important" (IE: Looks or game, money or looks, status or money etc.)

Why? It depends on who you are talking to.

If the girl is obsessed with music you are going to have a huge edge by being in a good band (status).

If the girl is a trust fund baby, you are going to have a huge edge by being attractive since she doesn't need the money (looks)

If the girl is upper middle class and lives a boring life, your edge is going to come from entertainment/fun (game)

If the girl is dead broke and is a gold digger, you're going to have a huge edge by being rich (money)

Just don't trust them!

****

PHD? No One Cares.

PHD? No One Cares.

For one reason or another we receive a large amount of email regarding Doctorate degrees. The title of the post is direct, a bit mean and for better or worse absolutely correct. **If you have a PHD and want to work on Wall Street, no one cares.** Now that you're paying attention we'll go ahead and break down every division in finance and why you will never need a PHD in Wall Street. Unless this dinosaur industry changes entirely, you'll never need anything beyond an undergraduate degree, at most an MBA to work on Wall Street because Wall Street is a relationship business.

Investment Banking: In short terms investment banking is a real estate agent for companies. If you want to buy a house you hire a real estate agent and if you want to buy a company you hire bankers. That is plain and simple. Now why would you ever need a PHD for this? You don't. In fact if you have a PHD it will be **harder** for you to ever enter investment banking since you have spent 4 years acquiring a skill set that is not useful for investment banking. If you must get an MBA, which we suggest you avoid, that is the maximum education level you will need.

Again the reason is simple an MBA is a networking opportunity. Your job as an investment banker is to build relationships and help fund them (capital raises) or sell them (M&A). An MBA would give you an opportunity to build out this network and shows some dedication to building bonds. *Your PHD study in XYZ does not generate money for any investment bank.*

Sales and Trading: Here again a PHD does not matter and shows a fundamental misunderstanding of the work that is done on Wall Street. In a Sales role you are calling hundreds of clients, you are in charge of managing soft touch relationships on a very large scale. You're assigned a sector (space) or region (say Texas) to cover and you're now responsible for helping the firm maintain relationships in these regions to generate trading volume.

Again here, having a PHD will make it **harder** for you to get an interview because your skills *do not generate money for the investment bank.*

Hedge Funds: Long Short Equity? Merger Arbitration? Macro fund? None of these jobs require or have a need for a PHD. On paper they will see a person who is overly qualified from an educational stand point. What does this mean? Now they are now concerned that you have a boxed view of the world. For the most part they are likely correct as you're trained in the scientific method and have a structured thought process that they likely do not need.

Here again, *how does your PHD help the hedge fund make money? It doesn't.*

Equity Research: Here you're doing niche work covering specific sectors, Industrials, Technology, Medical, Financials etc. Perhaps here the value of a PHD would shine in terms of product differentiation? Unfortunately not. Research is essentially the marketing arm for an investment bank and is a liason between the buyside and C-level executives. There is no need for a PHD for this type of analysis and relationship building.

If you do not believe that Equity Research does not require a PHD then simply look up the financial analysts on TV. You will see again that the maximum education level is an MBA. *Your PHD does not help you develop relationships with C level executives and again does not help you generate money for the firm.*

(** Small caveat is for the Medical division, here there may be some use for specific PHD's but the point is that is not by any means necessary to move up on Wall Street and you'll likely get very few extra points for having a PHD since again the job is a sales role)

Corporate Development: Here you're working for the M&A division within a large company, lets call it Fortune 500 for simplicity. Your job is to find strategic acquisitions, as an example look at small $10-100M companies that a company such as Google could acquire. While you need to understand what products and services each niche company offers your job does not entail product testing. In that case, the product will be run by the R&D team not the finance team.

In this case what would be of most value? You guessed it, again the most valuable and easily transferable skill would be financial modeling which could be done in investment banking, equity research, hedge funds, private equity and otherwise. *Your PHD does not help the firm make money and you would likely be better suited for the R&D team.*

Private Equity: We have used an example, a fixer upper house, to explain the private equity model. Your job is to find companies that can be acquired with debt and subsequently be sold for a profit ~3-5 years down the road. A strong candidate for private equity would have a solid foundation in financial modeling, reading sales memorandums, creating debt structures and of course building relationships. This is exactly why an ex-banker is the best fit for the role, they spend their time building relationships and building financial models.

If you have a PHD, again this does not help the Private Equity fund make money.

Mutual Funds/Fund of Funds: This is the last major pillar within finance, as noted by our networking map and again a PHD is not necessary. Here you're taking (most likely) long-term views of an entire company and are calculating the associated risks to build out major portfolios. Perhaps you're more focused on running the consumer portfolio, or you are in charge of dividend only stocks, at the end of the day your job does not entail creating a product/service (products/services from a business perspective, not a financial services perspective).

Your PHD does not help any mutual fund make money.

Final Caveats and Thoughts: Notice we have italicized the main point of the article several times, finance and Wall Street is about generating revenue and subsequent profits. If your PHD is not going to help the firm make money they will have no use for your niche skills. With this in mind there is only one space where a PHD would be necessary – working as a high level quant. The rest of Wall Street, again 99% of the industry, would need at minimum a bachelors degree and at maximum an MBA.

Finally, if you do not believe any information within this post you can prove this thesis out by yourself 1) sign up for a premium linked in account and find all the Managing Directors in finance across Investment Banking, Private Equity, Equity Research and Sales and Trading, 2) search out Portfolio Managers in Hedge Funds and Mutual Funds, 3) search out Corporate Development Heads. Across the board you will see the same theme, the vast majority will have high level undergraduate degrees or MBAs from top tier schools.

To end this post, always ask the following questions before you decide to pursue a higher education or any degree. ***“Will a company value my acquired skill set? Will my degree help me generate long-term profits for the firm?”*** If the answer is a no, don’t be surprised if you don’t receive any interviews.

****

For the long-term readers you’ll notice we get annoyed by all the PHD questions. The reason is as follows: 1) we have covered this topic numerous times on twitter, 2) our myths about Wall Street post explained that complex math is not needed, the most complex formula will be a DCF, CAGR, WACC or CAPM which is a dead giveaway that a PHD is not needed 3) Wall Street is a sales job, 4) the biggest reason – if you believe a PHD will make you more attractive to an employer on the Street you have not done your research and do not know what your job will entail (this topic has been covered numerous times on the blog).

Edit: if you absolutely want to get a PHD and work on Wall Street the most viable options are 1) become a quant and 2) work in bio-tech/medical niche fields that require a PHD or where a PHD is helpful. Notably, even in the second bucket, most don’t have anyhing beyond an MBA.

****

Physical Commodity Trading – Guest Post

Physical Commodity Trading – Guest Post

*****This post is courtesy of frequent commenter Houston Natural Gas Analyst*****

Physical Commodity Trading 101

The physical commodities trading space is a particularly niche segment of the overall Wall Street variety of career paths. It is extremely different from the paper trading that banks largely stick to in that you actually take delivery of the product you are trading, thus logistics come into play and you own large parts of the value chain to increase trade margins.

My area of expertise is in the North American gas trading space and the international LNG markets. However, given the fact that these transactions aren’t as exciting as those that take place in speculative crude oil trading, the example I will provide below will follow the sale of oil to a utility in Taiwan by a commodity trading house.

As you will see, there are many moving parts to a deal, this is why commodity trading floors are large and have multiple units or ‘desks’ all working on the same trades as it takes many people specializing in many different fields in order to complete a single physical transaction. Physical transactions are not heavily ‘screen based’ and most deals are completed via instant messaging and over the phone. These types of trades are impossible to complete as a one man show.

Before we jump in I’ll attempt to pre-emptively answer what I believe will be the most common question…

Compensation: Small salary. The upside comes from annual bonuses, which is formulated from my team’s y/e P&L, which is paid part cash (and mostly not deferred unlike at the banks) and part stock. Last year (which was one of the most lucrative years yet… despite the drop in commodity prices) the typical gas trader at my firm made something to the tune of $1.1MM all in. A lot of times this can be substantially lower if there isn’t as many opportunities to exploit arbitrage windows and I’ll go ahead and peg the typical gas trader compensation at ~300k – 600k all in YoY on a long term basis.

Last year the volatility in commodity markets presented many opportunities to exploit time arbitrage windows and thus the compensation figures for traders were substantial.

And with that out of the way, let’s get into it:

The time separating the purchase of oil from its sale increases the price risk. The counterparty default risk and the specificity of each transaction introduce additional challenges to oil and freight hedging and make trade risk management complex.

To discuss the elements of oil and freight hedging, let’s have a look at the hedging components in the timeline of a typical crude oil transaction:

Day 1: TRADE AGREEMENT

– An oil trader at a commodity merchant has agreed to buy 1MM barrels of Saharan blend crude oil FOB (free on board) from an international oil company loading in 41 to 45 days at Skikda, Alegeria at a USD -1 per barrel negative differential from the Brent benchmark. (The Brent crude oil benchmark is used for pricing physical oil in the Atlantic Basin.)

– Simultaneously the trader has agreed to sell the oil CIF (cos, insurance and freight) to a refinery in Taiwan for delivery in 101 to 105 days at a +4 positive differential from the Dubai benchmark. (The Dubai crude oil benchmark is used for pricing crude oil exports to East Asia.)

– Immediately after the trader got his oil trade agreement confirmation the freight paper trading desk covers the risk exposure that the freight represents with a composite of long freight forward agreements (FFA)

– Typically, a commodity trading and shipping advisory tailors the composite to the specific needs of the transaction…. The correlation, volatility and the covariance of the instruments chosen are quantified to create a composite achieving decent liquidity while minimizing the basis risk

– The shipping desk at the merchant is now vetting candidates and negotiates a suitable vessel opened for the loading area with a laycan i.e. the period in which the vessel has to present herself at the port in question, in the next 41 to 45 days

– Immediately after the trader got the agreement, the oil paper trading desk buys 1000 Brent/Dubai swaps to cover the 1MM barrels under the trade agreement. They could also use a combination of Brent futures and forward month Dubai swaps to cover the Brent and East of Suez prices. But the Brent/Dubai swap enhances hedging due to how liquid it is

– Opening this position is to lock in differential values. A lot of math is involved here but at the end of the day what happens is that the hedge removes any market risk from the trade and the position is solely exposed to the spread between the price where the trade originated and where it will ultimately be discharged. (North Africa/Far East arbitrage)

Days 2 – 40: PRICING PERIOD

– Oil and the cost of freight are marked-to-market daily

– Tanker freight is volatile and needs to be marked-to-market just like the oil that they transport

– The sooner parties come to an agreement on a vessel the better. Typically the trader's hedge desk will then close the freight swaps and chase paper confirmations for the trader

– In our example a suezmax tanker voyage is locked in at USD 3.50 per barrel with a realized hedging gain

– On day 1 the Saharan oil was traded at +1, thereafter it will be marked-to-market daily

– As a result the market sets the price of the oil during the pricing period

– The final price settlement however is determined by the average when the loading is completed

– For the purchase the Saharan is fixed in the trade agreement as the Brent average during the loading period

– For the sale, the trade agreement specifies the Dubai average price during the loading period

Days 41 – 45: LOADING

– When tanker hoses are disconnected from the ship's manifold, the vessel has finished loading its cargo

– At this point, the merchant buys the Saharan blend crude oil at the average Brent price minus 1 (USD 100 per barrel in our example) and thereby defines its inventory cost (USD 100MM)

– When originating crude oil (day 1) the trader's analyst requested a letter of credit (LoC) from an investment bank's commodities desk

– Through this intermediation the company provides credit to this international clients in the form of offshore US dollars

– The oil company seller that the trader bought from draws on the LoC and the agreed amount becomes a secured loan of the trading company

– Thanks to the LoC the risk of the trader defaulting on the oil purchase is effectively transferred to the issuing institution

– Because the oil sales price with the refinery has been determined at an average Dubai loading +4 (USD 103 per barrel in our example) the trader has no price risk anymore

– Once the oil is priced, the oil paper traders sell their Brent/Dubai swaps with a realized hedging gain of USD 1MM

– If the average price was determined at the average Dubai discharge +4 the trade would still be exposed to price-risk and the would need to sell a forward month Dubai Swap matching the period when the refinery is finally pricing

Days 46 – 100: TRANSPORTATION

– The contract is for 1MM barrels, typically the loading is less than 98% of the volume capacity to allow for expansion

– The exact quantity of oil is determined at the loading port

– As a result the invoice quantity of oil is the quantity states in the bill of lading

– Ideally, the physical excess/deficit between the nominated quantity and the total barrels loaded would be zero but unfortunately this is never the case

– As such, the excess/deficit relative to the LoC is marked to market

Days 101 – 105: DELIVERY

– Once the tanker discharges in Taiwan, the merchant invoices the refinery the bill of lading quantity times the Dubai average +4 (USD 103 per barrel) as agreed in the trade agreement

– Until the trading company receives the payment for the cargo, the receivable is securitized by a bank's commodities structuring group in a "Special Purpose Vehicle" (SPV) sponsored by the trading companythereby providing a supplemental layer of cash flow

– This allows the company to manage credit risks via securitization i.e. transferring them to the capital markets instead of assuming the transaction's credit risk (that the refinery doesn't fulfill its obligations in a timely manner after the cargo delivery)

– The bank bundles this and other notes like it into a zero-coupon fixed income security and transfers the risks to the capital markets

Summary: There you have it. The day-to-day work of a Houston/London/Singapore/Geneva commodities trader. The above explanation demonstrates how the commodity risk management of a straightforward transaction can become rather complex. Oftentimes, additional transaction layers make it very tough for the company's internal hedge desk to audit the trading risks and as a result provide for an accurate hedging of the full transaction. This happens surprisingly often and forces guys like me to get trapped at the office pretty late. It's particularly bad when edits to the risk management of a transaction have to be correlated between London Houston and Singapore's trading desks.

I understand all of this is extremely hard to follow if you don't work in the space and have included an extremely simple version of a position model that has been annotated so that it's easier to follow along.

As mentioned above, any questions? Ask away.

Next, I'll go ahead and describe a typical day in the life of someone who works on a phys commodities desk. Every day is relatively different given the nature of the job, but given the fact that the business is a bit slower paced than traditional wall streetfinancial trading roles it's slightly more routine:

A Day in the Life

6:30 AM – Alarm goes off, check emails that came in overnightfrom our international desks, make sure there was no trouble when London and Singapore rolled their risk models on exposure for the group.

7:00 AM – Jump in car and drive to the office (Houston public transit system is awful and doesn't go anywhere except around the city core.)

7:30 AM – Arrive on the desk, swing by the coffee shop downstairs for a coffee and small pastry.

7:45 AM – Start firing up my terminal (Bloomberg, Outlook, Excel, ICE trading platform, Yahoo Messenger, AIM, Symphony) emails begin flooding into inbox, mostly research reports. Instant message buddies at other firms, brokers, and other traders to get their thoughts on how the day is going to pan out. By now most guys are at their desks and some enter into positions. If you're working at an oil & gas major this is the time that you'll be reaching out to your 'regulars' to take some of the production that came in overnight off your hands. Typically – you must sell all of the commodity length at an oil & gas producing company before you're allowed to take positions in the spec book. However there are a few oil & gas companies that differ in this regard and have dedicated desks which solely trade speculatively and don't have to be bothered to sell the equity production at the beginning of the day.

8:00 AM – Check in with market intelligence services regarding any plant maintenance, pipeline damage/closures, power outages etc. Instant message my schedulers and ops guys to see if there are any problems taking place in end markets regarding logistics as well. Make sure weather is not impairing the movement of any of our energy.

8:30 – CME opens. Brokers start blasting my IM with wiresshowing bid/ask spreads, market starts to light up and I jump on the phone with brokers and sales & trading guys at the banks to sniff out any valuable information which could potentially be exploited for a profitable trade. The market is usually most active in the first 30 min of the day and the last 30 min of the day.

9:00 – Market is a bit calmer might make a few scalp trades in financial products here and there based on run of the mill technical signals. Fire up regression model my analyst built to forecast the EIA gas storage numbers which will be released in the next 30 min. Flatten any exposure going into the news release because although EIA reports aren't particularly accurate they have the potential to cause massive movements in the market.

9:30 – EIA report drops, turns out there was an inventory build in gas with demand remaining flat. Gas futures drop 150 basis points; I analyze the movement and see the impact it has had on physical gas prices around the country. Try to find anomalies caused by the price action which can be exploited.

10:30 – Still on the phone/IMing counterparties, brokers, and buddies at other firms. Arb model lights up showing that gas at Chicago City Gates will perform stronger relative to the futures market. Buy 500,000 mmBtu July Natural Gas FOB Chicago City Gates @ $2.85 sell 50 Aug Natural Gas Futures @ $2.80. (I am no longer worried about where the price of gas goes because that risk has been offset by the position I took in the futures market, I am now strictly concerned with how gas in Chicago performs against the futures index.)

11:30 – Lunch time. Order food in via post-mates since I can't leave the desk while I'm in this position.

1:00 – Markets are closing, volatility begins to spike. Sell 500,000 mmBtu July Natrual Gas FOB Chicago City Gates @ $2.86 buy 50 Aug Natural Gas Futures @ $2.75. Result: profit of $30,000 (5k on phys 25k on futures.) Turns out my thesis based on the arb model and some fundamentals proved accurate.

2:00 – Meander around the trading floor, shoot the shit with counter-parties and the guys on my desk, read a couple Wall Street Journal and Bloomberg articles. Enter into intense discussion about the quality of the guy's suit that's talking on CNBC and how hot one of the chicks are.

3:00 – Discuss the daily market action with other traders, follow up with reporters regarding market commentary etc. swing into a 15 min position report meeting to review exposure of the book and prep game plan for tomorrow.

4:00 – Write up all the trades made during the day, review contracts negotiated during the day, return calls, emails, and IMs I missed while intently watching my trade. Follow up with junior traders on their projects relating to updating/building new arbitrage models etc.

5:00 – Finished for the day. Head out for drinks.

****

Predicting When You'll Feel Rich and Ways To Guarantee That You'll Never Feel Rich

Predicting When You'll Feel Rich and Ways To Guarantee That You'll Never Feel Rich

You want to get rich. Everyone does. It's just taboo to say so. No one wakes up and says "Hey I want to be as average as possible". On this side of the web wanting to get rich and admitting so is encouraged (maybe you're rich already)! Now that we have people visiting from all over the USA, we think it's time to predict exactly when you'll wake up and say from a purely financial perspective.

"Well. Looks like I'm officially Rich!"

<u>Feeling Temporarily Rich</u>

Almost everyone will feel temporarily rich several times in their lives, we think this is primarily due to one-time windfalls of income. Maybe you got your very first investment banking analyst bonus check, maybe you just closed your first $1M+ property sale and maybe you were gambling for fun at Vegas and won $10,000. Either way… you're going to feel rich temporarily. From what we have seen, most people will feel temporarily rich when they receive a .

One Time Windfalls: <u>one-time windfall that pays for approximately one month worth of living expenses</u>

If you spend some time traveling at some point in your life you're going to visit a specific location that you enjoy. It could be Russia for the nightlife or it could be Brazil for the beaches and happy go lucky people. Either way, if you enjoy your first visit imagine what happens if you return to find that your currency has appreciated by some 20-100%! We're using a wide range but the numbers are not out of the realm of possibilities. Going back to a place you enjoyed and seeing the cost plummet will make you feel temporarily rich for the month or so you spend in that location. For those in the United States, the recent currency moves over the past 2-3 years should have everyone feeling a lot richer.

Large Currency Exchange Gain:

<u>Feeling Rich Based on Income and Passive Income</u>

At this point in time. If you're making $50K a year you're in the top 1% worldwide (top 0.31% to be exact according to the global rich list). So congratulations on being in the 1% already. The problem is that you won't feel rich because your environment is not Subsaharan Africa or Thailand, you're living in the greatest country on earth: the United States. Here? $50K is approximately equal to the median household income so you're smack dab in the middle. You're unlikely going to feel rich due to your environment… take a look at the chart below for more details (2013 data).

Basic Calculation – Relative Wealth:

Median Income

As you can see, the median income and average income varies across the country. This will be a major determinant in feeling "rich" or not. Importantly, we also raise the bar a bit more and say that you must look at the income. The reasoning is pretty clear, the median is going to be lower than the average. There is a floor to earning ($0) and there is no cap (if Warren Buffet walks into a room of 50 people, the average net worth is significantly higher than the median). In that scenario, the average should be to the right of the median on the bell curve.

AverageThe basic calculation to feel rich from what we have seen? **~2-3x Average Income**

It gets more complicated. Lets say you're living in a major city and absolutely loathe it. Well even if you make 3x the average income… you're not going to feel rich! There are a lot of unhappy people making a ton of money living in a place they absolutely hate. This is a big problem because it says that being rich could require more income if you're forced to live in a city you don't like at all. This is a bigger balancing act and from what we've seen it takes another full multiple to feel rich (locked into a city you don't like).

Location Scenario – Relative Location: *The calculation to feel rich in a place you dislike?* **~4x Average Income**

Now the plus side is that you may be able to reduce the necessary income to feel rich if you absolutely love the city you're in! Generally speaking, if you spent the last two years traveling the world and found a place you love, you'll need less money to feel rich. Psychologically it is quite difficult to give up money (any money addict will agree) so the multiple isn't quite a full turn but somewhere around half a turn. If you find a city you love you'll feel rich with

~1.5-2.5x average income.

The main premise in feeling rich forever is that it is relative to your passive income (not semi-passive income). A well run business or a high paying career could go away tomorrow. Sure this is less likely with a business. But. The potential for it to go to zero is still there. This is why "feeling rich forever" is relative to your inactive income. If you receive $10M tomorrow, you'll feel rich forever due to the passive income generated by the money.

Feeling Rich Forever – Passive Income: The simple calculation = 1.5x your annual spending in passive income.

Feeling Broke Forever

The calculations to feel rich are pretty straight forward. The problem is that life is complex and there are many "curveballs" that will prevent you from ever feeling rich. Most of these curveballs are psychological where people become addicted to status items or beating everyone else in the race to the "highest net worth" game.

No matter what, you're not going to be the richest person in the world. Constantly changing the people you "compare yourself with" will lead to nothing but unhappiness. If you live in a major city it is practically impossible to become the richest man there and if you do succeed in that… you're going to become famous which involves another whole host of problems. Importantly, getting relatively rich is the name of the game over here. Trying to become the richest man in the world usually leads to a life of constant work and stress. Figure out how much money you'll need to live a life you enjoy, multiply this number by ~30 and put the blinders on. Trying to beat the guy who owns 1,000 income producing is not going to make your life any easier!

The Constant Comparison Game: real estate assets

The second easiest way to feel broke forever is to ignore the fact that life is a mosaic. Would you take an extra $1M in order to be overweight for the rest of your life? Would you trade $1M for a personality that leans to pure risk aversion (See no fun life experiences). Would you hand someone half of your net worth to be five inches taller and more muscular (we sure hope not). In short, ignoring the full picture makes most people envious. They see one piece of a person's life and ignore the rest that they wouldn't touch with a 10 foot pole. Instead, recognize that a person can be successful in one category while unsuccessful in many other categories… ask for advice on the piece that they are good at (ignore the others).

Ignoring the Full Picture:

When you start with nothing, there is absolutely no way you're going to enjoy everything you do. You'll be forced to do dirty work to succeed even if you think it is "below you". There is no choice. However, once you have a large war chest of cash, you can become much more selective in your income streams. Working in a position you loathe just to earn more money does not make sense if you don't need the additional income. If your passive income already covers all of your living costs with a large buffer as well, doing things you hate will ensure that you'll never feel rich.

Earning Income You Hate:

This is a very common mistake. Once someone feels rich they load up on items that cause Huge recurring costs include stretch mortgages, car payments and addictions to status goods. Feel free to buy a few high end items just avoid that ones that kill your cash flow. Cash flow is significantly more valuable that one-time charges because the one-time costs can be avoided in year two but a recurring payment can last up to 30 years.

Giving Up Your Freedom: recurring costs.

This one catches a lot of people by surprise, if you're already well off financially ? It really does not make sense. Spending late nights working on a project you enjoy makes a lot of sense. Spending late nights working on a project you loathe when you could be attending a once in a decade event does not. If you have the means to do as you please, don't wake up in 3-5 years and say "I wish a did XYZ". There are no second chances when it comes to time (money can be made and lost rapidly).

Not Valuing Your Time: does it make sense to put off things that *can't* be done when your older

Everyone will feel temporarily rich at least a few times in their lives, in order to feel rich we estimate the following 1) you'll need 2-3x the average income in your city, 2) 4x if you're in a city you dislike, 3) 1.5-2.5x if you love the city you live in and 4) if your 100% passive income gets to 1.5x your annual expenses you'll feel rich *forever*. Now if you're interested in feeling broke forever we can recommend: 1) comparing yourself to everyone, 2) only looking at one trait of every single person, 3) continuing to work in positions you loathe, 4) giving up your freedom with heavy debt load items or recurring payments and 5) choosing money over life experiences when you no longer need it! Hopefully everyone got a good laugh out of the last five items, however, if you walk around this week see how many people fall victim to these psychological facts (there are many especially in high paying professions!).

Concluding Remarks:
****

Predictions for the Future

Predictions for the Future

For fun we're going to do a prediction post. We'll include an estimated time frame as well. We're doing this to see how terribly wrong (perhaps right!) we are in terms of what is in store for the future. Our guess is that most of the predictions up front will be correct (timing off) while the ones toward the end are more extreme and less likely to occur. Feel free to leave your own predictions in the comment section (agree or disagree) and on top of that we can circle this post for a later date for review.

Higher Likelihood Predictions

We anticipate seeing a recession within 2-3 years of this post. It has now been ~10 years since the last pull back and it is unlikely the market continues on the tear through 2020. Perhaps we see a pull back in 2021 so we'll go ahead and include the third year to be safer on this less controversial topic. The good news is that recessions allow you to use excess cash to buy a lot of assets at a big discount. This is music to your ears since you only need about 1 year of solid savings to see outsized gains during the next pull back. For fun, we'll go ahead and estimate the trough at -40% for the equities market from peak to bottom. The last one was massive at closer to 50% so we'll be more optimistic and say 40%. While we're more confident in a recession occurring in the next 2-3 years, we're less confident in the magnitude since that is much harder to call. But. For fun there you have it.

: Recession Within 2-3 Years of this Post

More and more we are seeing openings for jobs (note not careers) that are location independent. It doesn't require much more than a computer and internet access to do a lot of work these days. This could include customer service, consulting, tech positions and anything journalistic in nature. These trends will impact the more expensive cities as we'll see the middle class leave. While the expensive cities will still be expensive, we anticipate seeing a "hollowing out" where the lower end employees eventually get some breathing room (again 2-3 years due to a pull back) and a natural competition for the top (no change for the 1% ever!). In some cases we would not be surprised to see an increase in housing prices outside of the main cities. Specifically, we'd expect prices to increase in the largest cities for tax free states (Texas, Nevada, Florida in particular). They won't sky rocket due to a large inventory but they should go up.

Expensive City Rental Softness:

Despite the news cycle nothing has changed. People who bought in at the highs were just trying to without knowing anything. This is exactly what is supposed to happen. It takes at least 6 months to a year before anyone can comprehend the basics, so anyone who bought during the 200% run within a month… Is gambling. This has been a fun roller coaster to watch because it has flushed out all the people who didn't know anything about the space. They are becoming much more jittery. Unfortunately, they haven't capitulated yet so there could be much more downside to come. The good news? in a few years it should pull through with another rally once again. Generally speaking, these declines last about 18 months. For fun we'll say the next rally will be 2020 with 2022 being the "big year" of upside. Less confidence on timing, tons of confidence in the eventual result. As a side note, people valuing this in terms of fiat are certainly missing the entire point.

Another Boost in Crypto: get rich

We're not here to say what is right and what is wrong. We're here to present a basic prediction and opinion. In about 10 years we anticipate that traditional sports will see slowing growth. If you look around, kids are not playing outside as much, they are spending their time staring at smart phones and computer screens. We all know what this means… eSports. To emphasize, we're not suggesting someone should play video games, we're suggesting that the market for eSports will become large and traditional sports will start to plateau. The market for sports have been on a tear for about 40 years and every single market eventually hits capacity. We'd expect a slow down and stabilization in sports in 10 years.

Slowdown in Traditional Sports:

Culture has changed quite a bit over the last 10 years. Hooking up, lots of cynicism, lots of angry people and very few with a way to afford a family. We're guessing it'll be a lot more similar to slow growth vs. the rampant growth we saw with the baby boomer generation. It is tough to justify having a kid when student loans are weighing down on your cash flow statement like 4,000 tons of bricks. We're not saying that people should or shouldn't have kids (people are going to do what they like) what we are saying is that the population growth should slow down. Once we figure out how to clean up the finances of the younger generation – set to fail by debt – we can reassess the future of population growth. We think the numbers will slow down within 5-7 years or so. People in the late 80s and early 90s made it out just barely but the latest numbers are gruesome.

Smaller Families:

In another 10 years we think the weight will finally break the camels back. 10 years ago we looked for any investment product that would go up in-line with school tuition. We failed and now we know why…. It was incredibly lucrative! We always found it funny that going to college was pumped into the brains of every child and yet there was no investment vehicle to match the dollar for dollar increase (helping prepare for the future burden). It would have been an amazing investment vehicle and way to secure a college education. Since that ship has sailed, we think the college scam will also sail in about 10 years. Learning how to code does to require a four year degree and many of those four year degrees are expiring worthless (many baristas have 4-year degrees). Combine all of this together and we see a looming student debt bubble that pops combined with an alternative to the status quo system.

Competition for Traditional Education and Student Debt:

Contrary to popular belief we do not believe low waged jobs will be the first ones targeted by AI. If the AI is actually good, why would they use it to replace a minimum wage worker? Instead they will go for the replaceable middle layer which ranges from accounting to excel sheets and paper work (lots of law as well). This will cause a shift in value from "processing" to "creative" work. This has been a theme here for a while where you don't want to have any skills that can be taught to someone else. If someone else can learn how to do it quickly, then a robot will easily learn it as well. If a robot can learn it… you can fill in the rest! Instead AI will help replace mundane jobs that require no creativity, giving more and more value to people who actually combine skills in a new way. This will occur over the next 5 years or so. In fact, AI is already being used for a TON of online advertising. It is so prevalent today that *not* having it would hurt conversion ratios in a meaningful way.

AI Job Replacement:

This one will be quite interesting to watch. There are many people who will inherit a large amount of money ($500K-$1M or so) with no background in financial literacy. This will either be a complete mess or it will save a lot of people who had very little to look forward to. Our guess is that this will spur on a lot of economic activity as inherited assets will likely be larger than the individual needs… leading to more consumption. The rough age range for this transfer is around 30-40 years old. In about 20 years they will see a large inflow of money and it will be interesting to see how they handle it. It will also be interesting to see if this trend continues where the wealth was created by a prior generation versus the current generation. How they manage the money will be interesting as well. And. We're on the side that says they overspend.

Generational Wealth Transfer Boost:

For better or worse we see this continuing. What technology allows people to do is maximize their value. While people complain that so and so is "overpaid" it is typically the middle layer that is overpaid for a position that could be automated. For proof of this look at the average corporation and take a good look at the middle layer. It's a lot of politics, lots of busy work and lots of wasted time browsing Facebook, YouTube and Netflix. While every industry has downtime (even investment banking) your typical corporate job has an insane amount of it. Look at any org chart and you can replace three middle people for a single high quality employee (not even a problem to be honest). Since technology gets rid of inefficiency, we see a lot more barbell set ups with high payed employees and low paid employees at the other end. The middle gets hollowed out. While this is seems "bad", this website isn't tailored to the middle so it should be good news to everyone at the high-end of the pay scale. You'll have a reason to work harder since you can monetize . We think this will be similar to AI and the wealth gap widens in about 5 years or so.

Lots More Inequality: your time much more efficiently

That is right. In about 5-10 years as well you won't need to leave your home. We're getting closer and closer with drones, 24 hour delivery and streaming content. In a few short years the latest technology will impact the largest cities and allow for near-instant delivery, incredibly fast internet and of course, consistent downloadable content. We're not entirely sure what this means for square footage of real estate (likely smaller) but the implication is both positive and negative. On the positive side, you don't have to wait and can simply order items when the timing is correct and have it delivered in 24 hours. The negative side? People will likely become less and less healthy as a result living most of their lives indoors in front of a computer screen. As all of these automated delivery services become scalable, the notion of owning a car would likely be erased as well. Who needs garages and parking lots if you're simply jumping into self driving vehicles that are both safer and cheaper? No one! So get ready to live a much safer life in the future since we'll get rid of one of the leading causes of death and reduce the need for "car insurance" in the future.

No Need to Leave Home and If so… It is Third Party:

Extreme and Less Likely Predictions

Assuming you are well off we think people that are 40 or younger today can live to 100+ if they have a heavy bank account. There are a lot of advances being made in anti-aging and being able to afford the best health care would allow someone to live past 100. We doubt the average person will see any benefits from advanced technology (since it is expensive) and think this will be reserved for the elite who take care of their bodies. Thinking about this logically, a top tier professional athlete easily spends six figures on his health and "body maintenance". This number should be similar for someone who is older (80+) looking to crack the century marker. As a quick hint, you'll want to be a bit thinner, eating tons of vegetables and live a low stress life past age 70. Essentially, living long will be a choice along with economic resources.

Ability to live Past 100:

Want to pick out your "best" DNA for your kid? Well that story is likely going to come true. In the near future, 20 – 30 years, you'll be able to pick out your best genes and pass those along to your child along with choosing the sex of the baby. We already have the skills to clone animals and we're only a few steps away from consistently choosing the best genetics. Sure there are no guarantees, but being able to avoid rare diseases and disorders would be a huge positive. We wouldn't want to pass along our own OCD personality to anyone in the future anyway!

Cloning and Gene Selection:

Forget about going outside to meet people, we already went through the online dating scene… now imagine a virtual world. It will be possible to meet people anywhere in the world and it will be possible for people to essentially create fake virtual lives for themselves. The cynical side wants to say that no one will have kids and they will live in this dopamine induced world. The more optimistic side says it'll be a lot easier to meet people with your interests without the awkward internet meet up since you'll have a visual presentation on day one.

Virtual World Take Over:

While family resources likely add up to a trillion dollars for the lucky few based on combined assets, we think there is potential to see the first "Trillionaire" in US dollar terms before the end of 2040 or so. We saw the computer age passed by the internet age and we'll see a "Sovereign individual" pass the internet age resulting in another 10x in wealth ($1 trillion dollars vs. Bezos at $100B or so). It is certainly a big stretch since we're talking about a 10 fold in total value but isn't out of the realm of possibilities if continued wealth transfer continues to the select few.

The First Official Trillionaire:

Another crazy one. We think governments will shift into a consumption tax model in the future. If there is inequality it is a lot easier to tax spending than it is to tax net worth. If someone simply has assets it is difficult to simply take them away. Alternatively. It is a lot easier to tax consumption. Increasing taxes on houses valued over a certain amount, fancy cars, fancy watches etc will all be targeted. This will help create a universal basic income in the future. Which leads us to the next big assumption of basic income!

Consumption Taxes:

With all of the major trends listed above we think there is potential for a universal basic income in the next 30 years or so. The people who will be retiring in 30 years will likely see the emergence of a new basic income and this will be funded by consumption (not wage or wealth taxes). By creating a universal basic income we can now worry a bit less about getting by and focus more on creative work that'll benefit society.

Universal Basic Income:

We'll go ahead and say it. People are sheep. People want to be led and very few have the ability to think for themselves. This is why people end up stealing ideas from other people and re-printing them in this endless echo chamber (hint hint we saw it during the election as well). There are people who are obsessed with power that will always go out there and run for a political position (the only type of people trying politics are naturally power hungry and believe they should have authority, otherwise they wouldn't run, we can't imagine boring with that!). Naturally, we don't see politics dying any time soon and as usual we don't care about them. We only care about them if we can make money off of it near-term. Then it goes back to being an irrelevant item (as all of you have noticed we don't bother talking about it anymore after the money was made). Long-story short, we're no where near the end of politics (unfortunately).

More Politics:

That about wraps it up! If you're interested in capitalizing on these trends we strongly suggest . In addition as a note,

looking at Triangle Investing**we'll hold a Q&A this Saturday at Noon EST for 24 hours (receipt for either book is needed) thank you.**
****

Preparing for Bear Markets: Chaos = Opportunity

Preparing for Bear Markets: Chaos = Opportunity

It has been over a decade since the last bear market. Sure we've had some periods where over 52 weeks the S&P 500 is down. But. The trend has been up and to the right. Before anyone complains that we're "bearish all the time" and never changed our stance. This is public and can be confirmed (no we did not edit it as proved by archives as well). As of today's writing (December 13, 2018) we're now changing our tune a bit. While we don't think we go into full blown correction territory in the next 12 months, the upside of investing in to the S&P has started to wane. There is no such thing as "forever growth" and yields continue to increase (around 3% returns risk free are now available). So with that in mind we'll jump through the main things to know about down-markets and how to navigate them.

we have had a recommendation to simply buy the S&P 500 index since 2012

What We're Doing Today

We'll update the blog when we officially say we're out of the market. The reason for this post is that we're no longer investing in the market (okay 5%). If you read through all of our posts (takes time and not worth the effort) you'll notice we slowly moved from 100% of total excess cash flow into the market, to 20% this year and now that number is officially 5%. As a reminder, the definition of excess cash is 1) all business expenses, 2) all business investments, 3) 1 year of living expenses in cash and then finally 4) the rest is considered "excess cash flow". From today going forward, we'll be investing 95% of all excess into boring old risk free investments that are returning around 3% today. If this number goes to 4-5% we'll begin *selling* stocks and putting more and more money into risk free assets. As usual none of this is investment advice and we're simply highlighting our own opinions on what to do. While the market might go up for another ~2 years (some geopolitical issues get solved) we doubt it goes up more than 5-6% each year. If this is the case we're only missing out on a measly 2-3% of additional returns with the headache of potentially being down 20-25%. If you've been in the market this year, you've gotten a good preview of what it's like to watch your account go down double digits (equities) from the peak.

Think About Timing: cash flow

People didn't like our comment of "don't buy a home now". The point was pretty simple, if you believe assets are elevated right now… There is no reason to buy. Large purchases and bigger financial decisions should be made in recessions not bull markets. This is counter intuitive but makes a lot more sense when you think about it. If you're watching the markets tank and people are losing their jobs, then you're more likely to get a deal on any large item you buy. It has been over a decade and we really doubt a bull market lasts more than 15 years (already the longest bull market in history)… so a rich person can simply gather his chips and play the waiting game. Large purchases in this case would be homes, nice cars, moving to a nicer apartment etc. Anything that would be a large cash out flow should be avoided if markets appear to be elevated. As you can see the main issue with any of these purchases is that you're missing out on pretty good returns by simply investing in risk free assets, an extra $30,000 a year *Risk Free* is a lot better than any investment that could lose 20% in the next 3-5 year frame.

Avoid Large Purchases Now: There are always exceptions and we realize that.

While there are always ways to scale your projects with leverage, the math begins to get fuzzy. Assuming you have some debt at around 4%, there might be an opportunity to match this number very soon. You should be salivating at the free money. Imagine having a 4% rate on a mortgage you had several years ago, all you would have to do is begin putting your own money into risk free assets if it gets to 4%. It's a weird situation but is a likely scenario for you. Okay. More realistically you take on an extremely small amount of risk (return slightly better than risk free rate) and suddenly you're making a return on the outstanding mortgage. At this point you've de-risked all of your debt through a potential downturn. Over time inflation eats away at your debt load and you're sitting pretty.

No More Leverage:

Now before the negative comments come in, there are a billion ways to play this. There is no “correct” way. In a change of stance from our usual “just do this” and cut to the chase… debt is far too complicated. We don’t know the return profile of your projects. We don’t know if there is a way to get “forced returns” on a specific asset. We don’t know your industry as well as you do. All we’re saying is that a rising rates environment and an opportunity to reduce downside is extremely attractive if you’re up well over 100% on all of your levered investments. One of the good signs of a near peak or post peak market is a feeling of anxiety/denial (photo below). Our own ideas are looking less and less attractive every single month and we have no doubt this is occurring for many other people .If you find something that you’re next to certain will generate 10%+ returns, then go for that 4-5% loan.

(We think we’re somewhere around Thrill, Euphoria and Anxiety. If you group those three that’s probably about right. Essentially people who didn’t believe markets would be fine have started to take on notable risk, this is usually a bad sign for things to come particularly as we see a lot of nervousness around the most recent pullback. Like we said, we still think there is about 2-3 years left but we’ll update our blog as we go along since it’s a fun topic)

We’ve seen an increase in status items. Rolex’s, Gucci shoes, high-end hand bags etc. While they are great and definitely have use as we’ve mentioned in the past… we’re skeptical of the people we see purchasing the items at this point. We took a look at what it takes to stand out from a crowd of well off people and you’re seeing a bad trend (takes a lot more than before to stand out). This could be a byproduct of changing environments. Yet. We have gone to places we no longer attend and see the same thing. Guys who can’t make more than $250K a year “flexing” with $25,000 watches. Sure. All of our reads on this could be wrong as it’s hard to predict who is with 100% accuracy. But… As usual, we trust our own intuition.

Consumer Spending Freeze: really rich in a room

Consumer spending freeze for us means no more “upgrades” for a couple years. This isn’t a big deal as the last decade has been amazing and beyond comprehension. Being forced to hit the pause button on new toys/goodies is probably a good thing (flex the will power muscle a little bit). The entire point of these items isn’t to buy them to cover “insecurity” the point of material goods is that they work! Now that they don’t work as well… Time to hit the pause button. Just like the market, the same cycle will occur. When those nicer items start to become rare and everyone is using an “older version”, we can go back to buying a few nice items here and there.

At this point, you’re probably imaging a guy shoveling cash into a barrel which is being delivered to a bank to collect 3% every single day. Shovel in, bag filled, deposit, sleep. This isn’t far from the truth. The part that is missing is a shift in spending. If the environment is changing, a lot of the normally nice places begin to fade (Las Vegas is ground zero for seeing the culture change, gets worse during economic booms). Well. This means it’s time to change spending venues. Good ideas include: yoga, meditation, spas, sports (playing not watching) and reading. Since everyone is spending to consume… in typical fashion… we reverse positions. Drinking a bit less and going through a nice detox phase is a good idea any year. Even more so in times like this. We’re ramping up our spending here and luckily its a lot less expensive allowing more time to shovel into the barrel.

Change in Spending:

How This Sets Up for the Next 2-3 Years

While we’ll update the blog if our views change, we’re pretty convinced that by around 2020 markets will have largely peaked out. Peaked out doesn’t necessarily mean they go down, it simply means the risk/return profile isn’t favorable (see the earlier chart again). We have to remember that as rates go up the market needs to offer much better returns than the risk free rate, otherwise it’s just not worth the time. Yes. We realize we said that twice in this post but its extremely important to remember particularly if someone reading this hasn’t even seen a bear market (a decade worth of people have not, more alarming… that’s around 25% of the work force if we assume a 20-60 year old age range).

Assuming we’re right and there is a pull back sooner than later, if something half the size of 2008-2009 happens, we’ll be thrilled beyond belief. What you’re looking for is profitable companies with valuations below the cash on the balance sheet. This is a pretty standard approach and happens pretty frequently when there is a panic sale of an asset. Don’t get too greedy and be sure to check the fundamentals of any company. As long as you’re next to certain the Company will generate positive cash flows, you’re in a great position to scoop it up. For those in finance the basic term for this is “negative enterprise value”. We’re keeping it simple with that definition and if you see anything that looks like this, it’s time for us to swoop in. Being a vulture isn’t a bad thing.

Wait for Blood on the Streets – Cash Value:

No one times the exact bottom. Okay. Someone technically has to by definition. That said, you’re going to get the bottom in some shape or form if you unwind your cash balance into equities, real estate and any other asset on a monthly basis. It’s psychologically difficult to do this as you’ll try to time the bottom only to see the investment go down another 5-10%. Painful. The good news is that consistency allows you to “average out” near the bottom which is good enough. If the bottom is minus 25% and you have an average entry with it down -18%, that’s solid and good enough for the next 10 years. That’s right. It is enough to set you up for the next decade because no one dumps large amounts of money in at the bottom, otherwise they wouldn't complain about recessions so much. Crisis is another word for opportunity. (Side note: generally -20% is considered an official pull back.)

A Slow Unwind:

This is the brutal part of the post. Your biggest returns are going to be searching for painful situations. Real estate professionals don't like to talk about it but one of the best ways to get good deals is when a family member dies (not yours a different person) and they are forced to immediately sell the house for cash. There are going to be a lot of situations like this in the next recession. In fact if you search back in 2010 guys like Warren Buffet recommended this in a much nicer way "i'd love to buy a bunch of single family homes". What that really meant is all of these loans blew up and people were desperate for cash and he'd take advantage of it. That's really what the underlying message was in a more to the point way. People say that recessions and housing are not related (in some senses they are not) but we've found that there are a lot of cash strapped people in recessions which causes you to find some of these extremely undervalued opportunities.

Search for Pain:

You can tell how good the economy or sub-sector is doing based on your ability to negotiate for a change in price. If you find getting a good deal as a fun game, you're going to love the environment in a few years. Back in 2008-2009 you could honestly negotiate anything. Even basic items like clothing had sales people who would give you their employee discounts or other backdoor discounts just to try and make the store appear more profitable. It's quite interesting to watch how psychologies change from "we never do that" to "here are the 100 ways I can get you a lower price". As of today we're around the "we never do that stuff" phase and that's usually a sign for the future.

Negotiate:

Primary Items to Focus On

You'll notice that the primary item we care about is interest rates. That is because it determines your entire risk tolerance. If we could get 4-5% returns risk-free, there would be no reason to invest in other assets unless we were seeing hyper inflation. If we're experiencing hyper inflation then you'll want to own assets since they would also inflate. Putting the doomsday scenario aside, we just look at interest rates and it's becoming interesting as yield curves are getting close to an inversion. (the 10-yr and 2-yr are what we prefer to look at)

Interest Rates:

This isn't even a real one just one we use. You can find every single multiple on the planet for stock markets and you'll see that there is a median/average for each one. If you ever see this multiple go north of 30%, you want to check your investments again. Why? Well we know that the average is say 15x and then there must be a time period where it goes well above this to average (can't go to zero unless all equities die). So selling just because something is at the average doesn't make logical sense (more upside left). For a good list of multiples just check out www.multpl.com (no affiliation it's a common website that people use)

The 30% Rule:

This is going to be a lot harder to figure out on your own and is even harder if you've never seen a recession. We're not knocking on the people who haven't been through one, it's not their fault and we can't confuse stupidity with ignorance (not even close to the same). That said…. an extremely good tell is high leverage. While some people may have higher risk tolerance than you do, take a good look at the type of people taking on leverage. As soon as you see people who are extremely low risk deciding to take on leverage that seems a bit high… that's your cue. People who make bad financial decisions are always levered up so they don't say much. When the low risk guys start taking on risk that makes you do a double take… it may be time to look at the portfolio allocation again.

High Leverage:

Now that rates are no longer at zero (or practically zero). We'd recommend taking a look at this rough chart as a good proxy.

Bonus:

As usual good luck and make your own decisions (we hope you get rich if the market is up, down or flat). If you're young this post probably doesn't matter much since your own business + career will determine wealth not compounding of $20-40K. But. If you're older and haven't seen a recession in 10 years… At least take a look!

****

Preventing Personal Financial Collapse – Worst Case Scenarios

Preventing Personal Financial Collapse – Worst Case Scenarios

The best way to avoid personal financial failure is by having as many income streams as possible. From our own experience you want to try and develop streams of income at the same time. We've seen that people who attempt to develop 4-5 streams of income at the same time are usually left with nothing. All of their ideas are only 20-30% good and that's just not enough to develop a meaningful income stream (we'll draw the line at ~$2,000 a month to represent a meaningful stream). Once you develop two streams of income the move is to develop a Trying to squeeze the last 0.005 ounces of toothpaste from the tube does not make sense when compared with your other option (getting a new tube).

twothird stream.

The Three Back Up Plans First

For those of you that are working a career to start, you're going to put all of your retirement money into the S&P 500 or a fund that mirrors the S&P 500 with low expense ratios (at least under 0.20%). Why? Well you can't touch the money for This is such a long period of time that timing the market is meaningless. The best strategy is to go through the potential investment vehicles available to you and find the lowest expense ratio fund that largely mirrors the S&P 500. Sit back and throw money into it up to your employers maximum match at minimum. Eventually, you'll stop contributing when you quit your career outright (free long term S&P market exposure!).

Backup #1 – 401K/Retirement Funds: some 40 years.

Knowing that your backup plan is already in place we have a simple calculation for how much money should be in your liquid cash account As you accumulate more and more money, you're not going to want to risk seeing it go away. This is why we can recommend S&P 500 indexing over the long-term but feel completely fine owning some bonds/cash as well. If you've been working and and something happens (market crash or business crash) you absolutely do not want to touch any principal. Besides you're in your 30s at that point and the best years of a man's life is in the 25-50 range, having to adjust your lifestyle would be horrible (1 year would get you through practically any recession).

Backup #2 – Cash Fund: 1 month per year worked.building a business for the last 12 years

Finally, the last backup plan is a basic staggered CD. Every 3 months you should receive a small chunk of money, that money is then reinvested into a CD another 3 months out. You're not doing this to get rich (it won't work), you're doing this to have a "one time charge" fund. Lets say everything is fine and then one day you break your collar bone in a skiing accident (we may or may not know someone who did this recently). Well that would be a one time charge of a few thousand dollars. You'll have this money accounted for at all times. You use the lump sum to pay for it and spend the next year rebuilding that part of the staggered CD. Charge it to the game but you were prepared! The below table should give an idea of how it works:

Backup #3 – Staggering CDs:

Multiple Revenue Streams

Now the numbers above look daunting if you're just starting out. The reality is that the first 5-6 years are horrible. You feel like you're going no where. You've got one income stream (typically a career) and your arms are flailing around trying to get a second one up and running. The good news is that your second and third income stream will likely hit around Why? Well check out the framework.

This is normal.the same time.

You've made all the right moves and found a good career, the problem is that you're smart and realize that it could go away tomorrow. The issue with a career is that the risk of being If you lose your career in year one or two, there are thousands of positions that will take you in. You're not making a ton of money so it's not hard to replenish. When you start making multiple six-figures… the Company is going to *search* for ways to replace this type of cost in their P&L (remember they are running a business). If this larger income stream goes away it becomes significantly harder to replace since there are not as many positions that pay in this range.

First Income Stream – Typically Career: structurally unemployedincreases over time.

Forget the saying that "the first million is the hardest" That is all the saying really means. If you're able to get a second income stream up you'll learn so much during the process that the third income stream will be easier to make. Once you're able to replicate what you have learned to a few different sectors you're all set because the cash flow model turns exponential.

Second Income Stream – the Hardest: the second income stream is the hardest!

The interesting part about the third income stream is that it typically comes at the same time as the second stream of income (~5-6 years of building a second stream). During this time you're making money in your career (pocketing a large chunk of it every year) so your bank account will open up the door for that third income stream already. The most common third income streams we have seen utilized are , Bonds, Dividend ETFs and REITs.

Third Income Stream: Real Estate

Worst Case Scenario Planning

No one is going to take the exact same path as laid out in the above chart (in fact we took a). Given that set up, we should think about where the "primary risks are". Meaning, what items in here would make it difficult to become financially well off?

mix of two plans from this older post

The primary risk to personal financial collapse is an active income. This is why we don't really believe in "retirement" where you sit around on the beach drinking Mai Tai's all day long. Since you'll build a ton of skills over the next 20 years it will be hard to walk away from thousands of dollars in income. In addition, by avoiding active income your pulse on the industry will decline. With the framework set up above, you'll dedicate to active income even if you're financially set (we also assume you're under 50 if you're reading this).

Primary Risk is Active Income: your ability to earnat minimum 20 hours per week

This is why you'll keep a large chunk of money in a checking account. If the economy goes into a recession and all the items to the right side of the chart (Real Estate, Bonds, Dividends, Reits) all get cut in half… Well you won't have to sell any of it! By preventing a draw down on any real passive income stream (where you invest ~5 hours a year monitoring), you'll never have to worry about cash flow again.

Second Risk is a Recession:

Lets say you've largely taken the path outlined in the chart. A recession hits at age 31. Conveniently right when you left your career! Well you can still take a lot of punches and survive: 1) assume your biggest active income stream goes away – extreme & unlikely scenario and 2) assume your passive income gets cut in half. Your cash flow now is $30K a year + 1,000 a month or ~$42,000 a year. Importantly, you don't need to spend any of this for a year because you've saved enough to survive this scenario. You'll build up a second income stream (again) over the next year and we know that recessions generally don't last longer than ~12 months. By the time you're through the worst part of it? You're back to ~$60,000 a year + $24,000 in passive income or

Worst Case Scenario Math: a 100% improvement in the worst possible situation.

What Are the Two Biggest Conclusions from This?

Your biggest risks actually have nothing to do with your current form of income. You can earn money with a career for now, a business or (God forbid) a job and be perfectly fine. Adaptive income is the key to success. Back when humans had no real "economy" we survived due to adaptation . In today's economy refers to skills learned to generate active income.

First Conclusion: *"adapt or die""adapt or die"*

We don't have time. There is no argument against working hard when you have the chance (18-30 year old time frame, unless you hit it big early). We have heard it all and it never adds up. The only thing you're left with if you don't work hard when you've got the chance is a lifetime of regret. Life is just a game of probabilities and there is .

The Second Conclusion: no amount of money that will allow you to get your time back

As you get older your body will slow down. We don't care if someone is on every drug known to mankind. There is no way to maintain peak performance from ages 30-60 as the body continues to atrophy. If it were possible, professional athletes would have much longer careers. Knowing that your "life energy" is going to decline over time (starting around late 20s), there is no physical way for you to invest your peak energy into earning money. The chart below summarizes it well:

note there is no age where it's "impossible" hence we deleted the x-axis, the point is that there is a finite number of years to live so by definition the number of chances at success declines.

Time

Finally, the probability of failure is not a good excuse. If you don't try… your chances are exactly 0. In addition, what do you lose by giving up your early years? You lose absolutely nothing by failing for ~12 years straight. Here is what you lose in summary: 1) you lose the chance to obtain permanent liver damage, 2) you lose the chance to hang out with people who will unquestionably drag you down and 3) you lose both money and women because the women are *largely* uninterested in some young dude out "seeing the world". Sure, you'll end up with a few cool stories. But. You'll wake up with the realization that you'll be working for the rest of your life (making someone else rich or barely scraping by!)

Nothing.

1) you will not have more energy than you have today so use it wisely, 2) create both recurring income streams and a worst case scenario cash fund, 3) work on at maximum two ideas at once, 4) if you go down the "career" route, realize the risk of it going to zero *increases* over time and 5) make the assumption that your primary income stream will go away one day and see how the worst case scenario looks.

Summary Points:
****

Q&A – Closed

Q&A is closed! We apologize for this one being shorter (too much work), so we'll do another one relatively shortly thx! Also we'll be sure to provide longer answers for the next Q&A as well.

Q&A Announcement and Introduction to Personal Finance Book

Q&A Announcement and Introduction to Personal Finance Book

This has been a banner year and unquestionably the best year in history. We're the sale of an asset by December 2017 that will come in just shy of 5x annual earnings (not bad considering 36 months to 48 months is the norm for the industry it serves). The real benefit is that it gave us time to put together a personal finance product and we can officially kill the questions tab since there is no need to run a forum (too much time and we prefer adding the most value in one shot). All of this is good news for everyone reading this page: first we can give out our entire portfolio management strategy, second we can host more for anyone who purchases either product and third there will be significantly less questions so we can focus on writing many more differentiated topics for free in 2018. To wrap it all up, on for those who purchased . Okay, okay bonus time… we're going to meet some people privately in 2018 (more than usual) since we'll unlikely launch any new product beyond the personal finance book in 2018 (we're going to buy another internet company and will be drowning in work).

completing*free* Q&As*November 25 we will open up a Q&A* **Efficiency**

At first, we assumed that we would create a forum. Then after the questions came in we assumed we would just have a questions tab. Then we realized 95% of the questions were around personal finance: Stocks, Real Estate and Crypto Currencies. Since we have invested a sizable amount in all three, we may as well create the product, sell it and kill the questions tab. This all came down to "demand testing" . Normally a demand test tells you if you should create the idea, in this case, it made a glaring opening for a brand new one. we think it's the least we can do and go back to free content and free Q&As. Everyone wins with this set up as we won't have to answer 20 emails a day.

Why We Created A Questions Tab:)*While we'll lose money on it (just as we did with Efficiency,* due to opportunity cost

We'll give away part of the punch line, our readership is in their 20s to around 40 years of age. They shouldn't bother with bonds at that age. If they get rich they will be smart enough to diversify (we'll include a brief page or two on that after the stock market section). So, we will focus on only those three topics. Our target audience will continue to circle people in their 20s and 30s, . We don't believe in trying to change people's opinions (past the age 35 or so) and we have already gotten multiple success stories from people who after following a lot of the advice on here.

Why Only Three Categories: they got burned the most and have the most potentialhit their first million

Introduction to Triangle Investing

We're still working on the title but we think it is appropriate. A triangle is the strongest shape given that force is evenly distributed along its sides. Look no further than architectural design and you'll see a lot of information about triangles. In addition, we're covering the three most important asset classes for wealth. Sure we will touch on cash and bonds… the problem is that cash and bonds are are rarely used for wealth preservation (they are used to protect your money once you have it!). So with that said if you have a better title let us know, below is the introduction:

Timing is really everything, we had no interest in writing an investing book but realized all of the questions coming in from our Questions tab (now discontinued) surrounded investing and personal finance. Luckily, right as we finished Q3 of 2017, we got an offer for a website that we couldn't refuse. When you suddenly free up 10 hours a week you have a lot more free time on your hands

Our opinions are heavily biased. We think most well off people end up living boring lives: 1) house, 2) a couple of cars, 3) no fun life experiences and 4) live to work when they are already rich. If we think about money as a tool the value begins to change tremendously. There are people who have ~$10M and are miserable because they missed out on life and are already 40-50 years old. Their pursuit of money was nothing more than a trap since they didn't get to experience life at all. Now of course… We're not saying money is meaningless. Far from it. There is a balance that needs to be struck and we'll outline our *opinions* on when the balance is reached. We think everyone should be able to get to ~$1M in net worth by the time they are ~30 if they would like (our baseline value) but in this book we'll disclose our own personal opinions. The numbers are higher, the timelines are faster and the long-term net-worth number is likely below what most people would expect. Besides. Who wants to die with a $50M net worth? It means you left $50M of fun on the table before the grim reaper hit.

The second item… we would like to highlight is that this is an opinion based product. The reality is that investing should be done entirely by yourself. In fact, we would wager that a lot of the things we're invested in . That is the entire point of diversification. If we invest in say 5 different asset classes and 3 out of five succeed long-term that's more than enough to live comfortably.

There are no guarantees in investing.**will fail**

The third item… None of the items here go against If your cash flow is not up to at least $10K a month there is no reason to bother with investing. You're better off following all of the ideas outlined in . If you are currently in a Career making $120K a year, this is not good enough. You should focus on following the rules outlined in efficiency, getting the second source of income to living wage… then think about investing. You'll need money to buy ads and scale your business.

*Efficiency.Efficiency*Your first course of action is to get two streams of cash flow and there will never be an exception to this rule.

The fourth item… Now that we've beaten the main points to death, the last item is coming to your own conclusions. While we are giving out what we're investing in as of January 1 2017, we would recommend checking back in every year or two to see if we've flipped the portfolio.

The fifth and final item…. Our numbers are not for everyone. Some people want $100M+, other people only need $500K so please keep this in mind when looking at our opinions. If you plan on having more or less money, that will make an enormous difference on your portfolio management strategy. Our numbers (rough approximations) are given out in the first chapter which will give you an idea of the risk tolerance we run with.

The three asset classes we will cover are: 1) Crypto Currencies, 2) Stocks and 3) Real Estate.

1) Financial Benchmarks and Overview; 2) Overview of Stocks; 3) Overview of Real Estate; 4) Overview of Crypto Currencies; 5) Overview of Bonds/CDs; 6) Portfolio Overview by Age; 7) Putting it All Together. The Table of contents is certainly shorter, that said the length of the product is likely going to exceed Efficiency (at least similar) by the time we are done with it. The best part, is all of it will essentially be original content since it is more of an opinion based book. When it comes to investing there is no "right" way to do anything so each reader is going to make their own adjustments. Will you use a 1031 exchange to build a small real estate portfolio that is gifted to your future kids? Will you skip real estate entirely and get exposure through REITs? Will you ignore crypto currencies which are likely the most important innovation we will see in our lifetime? (yes you can still be rich without them) Will you focus on nothing but small cap stocks? So on and so forth.

Table of Contents:

A List of Great Updates… For You

By organizing as such we can now do more frequent Q&As in 2018. All of the content will be out and you won't have to pay for any questions going forward. We won't have the time to create any new products unfortunately. Even if there was demand we already know (and see) that 2018 is going to be a lot of work. The good news is that Q&As will be frequent and free for all of the people who enjoy our work…. By creating an opinion based product, we think sales will be lower relative to Efficiency but it has been worth it as several people have already implemented a lot of the strategies successfully. No one will agree with everything in the product but at least our tools will be out there for a few bucks… With the structure set up if you've built a relationship with us, you can expect us to reach out if we're ever in your area. (you know who you are!) While we anticipate drinking out of a fire hose for all of 2018, this usually results in a want and need to go out more when a task is complete… We'll be able to post on differentiated topics going forward, while our post on wasn't popular we think it will be a *huge* topic in the future since it's where we're investing a lot of time (we are biased of course). We live in an era where you can personally reach millions of people and be paid for your efforts without being tied down by some signaling entity (a prestigious firm) that grants you the right to an "important opinion" We are becoming more interested in: 1) scaling and fixing internet companies, 2) crypto currencies and the broader impact it will make – a large business opportunity for anyone young out there and 3) . We dabbled in commercial real estate in the past as highlighted by some older posts but we should probably revisit them again. Probably the best update, is we'll allow the readership to drive more posts here and there by posting on twitter. It has been interesting to see the audience evolve and we're going to keep up with what our readers what to hear since it has changed quite a bit over the last five years. We can't think of a better way to help than to write on what people want to know more about.

1) More Frequent Interaction: 2) Release of All Tools3) More Meet Ups: 4) New Topics: selling an internet company**5) Ideas Include:**commercial real estate**6) More Ideas Driven by *You*:**

Q&A is Open and Why We Are More Aggressive With Portfolio Mangement

![Q&A is Open and Why We Are More Aggressive With Portfolio Mangement]

The Q&A section will be held right here on this post (). As usual it will work as follows: 1) leave your transaction ID *in* the comment 2) you are allowed one question on any topic excluding personal finance which will be covered on January 1, 2018, 3) since we will be done with selling a business and the book… Q&As will be available every single month during 2018 for all purchasers (only need to purchase one book either Efficiency or Triangle Investing to participate) and 4) . This should be good news for everyone reading this blog since we can now answer all the primary questions with two products and respond frequently to personal questions on a monthly basis. Everyone wins and we get to avoid taking a loss on the blog for 2 years in a row (thank god!). Now lets jump into the topic of the day, re-balancing a portfolio… or what we call, reinvesting in each asset class.

IT IS NOW CLOSEDwe will manually delete it before approving,the Q&A will only be open for 48 hours closing at midnight Sunday the 26th

Portfolio "Re-balancing"

We made a comment about "never reducing dollar exposure" and got immediate criticism. This was music to our ears since the opinion flew right in the face of *conventional* advice of portfolio re-balancing on an annual basis. Since our blog caters to more ambitious individuals, with enough knowledge of differentiated investment vehicles you can certainly increase exposure to almost all of your assets on an annual basis. Triangle Investing focuses on the three major categories in 2018: Stocks, Real Estate and Crypto Currencies. These are the three areas to focus on based on our current demographics (20-40 range). That said we'll also touch on cash and bonds at the end.

This is an uncorrelated asset class with high risk and high reward. The most valuable piece of this asset class is that the vast majority of people don't understand it. When a new security is mis-understood it means that price discovery has not taken place and the asset is not priced correctly. If you want proof of this you can simply buy a couple of the recent books on the topic… They are not very good! Suggesting that the value is only in sending money overseas or "digital gold" misses the point by a wide margin. Again. This is an opportunity for you as it acts as a high beta play. We find it odd that people who tout high risk at a young age tell people to avoid a high risk high reward assets that can be understood by reading a few thousand pages of white papers.

: Crypto Currencies

Since crypto currencies are here to stay (we'll explain in detail in our book) the value proposition is going to create a wide range of opportunities and risks. Look no further than the scam ICOs (90%+) that are being launched on a daily basis and the mis-pricing of legitimate software code (blockchains being used correctly).

Now… how do you make sure your exposure on a dollar basis continues to go up if an asset can correct by 50% overnight? The answer is in cash flow and allocation. For example, if you're a younger investor with $500K in assets, you can likely create an income stream of $40K or so per year (8% returns are doable for someone with niche knowledge). Since we know an asset such as crypto currencies can decline by 50% this means your exposure should be around $20-30K. Why? Well if it corrects and you're certain in the value of the crypto currencies you've purchased you can dollar cost average into the dip. This still leaves you with $25K+ in excess returns that can be reinvested into stocks/real estate or bonds.

This asset is used for your monthly cash flow. With that sentence alone we've probably given away the type of real estate we would recommend buying. Essentially, if you can take on some leverage () and generate monthly cash flow by collecting rent checks, you're able to dollar cost average into a multitude of projects. You can either save up for the next real estate property or you can invest in stocks, bonds or crypto currencies. The crypto currency exposure is not the same because it does *not* print money for you. The real estate asset does. Cash flow then allows you to re-balance aggressively.

: Real EstateUse Other People's Money

Lets say a young investor has done well and now has real estate exposure generating $2,000 a month. This number may not grow much, but the stable returns allows him to either 1) build equity in the home, 2) invest in a new asset with leverage and 3) take the money and "re-balance" by buying other assets. By doing this with your real estate returns you never have to sell any of your assets. Selling and re-balancing just triggers more and more fees which can range from 1-3% depending on what you're selling and re-buying.

No doubt in our minds that prices are elevated today. That said, having exposure to stocks is a near necessity to remain balanced and several boring ETFs offer good dividend yields such as Vanguard's High Dividend yield ETF (VYM). If you've got niche knowledge you can also invest in the trends that you believe are long-term in nature (artificial intelligence, move to social media from mainstream media, robotics, virtual reality and more). By investing in the companies that should grow over the next 10 years combined with a stable dividend portfolio… the long-term rate returns should be in the high single digits.

: Stocks

The last group we're putting together. As a person gets older they become more and more risk averse since they worked for many years to amass a large net worth. If you're truly in a category where your annual income (active money) cannot offset declines in your investments, then you're looking at a bigger and bigger cash/bond position. The problem today? The returns are simply horrifying. Making 4% and only seeing 3% or so on a post-tax basis is barely keeping up with inflation. Until you're unable to offset big corrections in the market we'd simply build a small balance that increases by a month of living expenses per year. As an example a person who has been working for 10 years should have 10 months of living expenses or so.

and Bonds: Cash

Why do we believe that you can increase exposure to all asset classes consistently? We assume you'll be making more and more money from ages 21-40 or so! Call us optimistic but it is definitely possible. Once you run the math you'll be surprised to see that it is possible to increase your exposure to all items assuming that your income is growing and you're diversified. Lets take a look at the math.

The Obvious Catch!

The first part is earning more money, we have you increasing your income from 100K to $280K over 6 years. This is not easy for your standard person but we're talking to YOU a person who is going to go into a high paying career start an online business as soon as possible. Not only that, but if you take the numbers down lower it doesn't change anything since its about diversification and the amount of money you can re-invest every year.

and

The second part is the Net income after tax (self explanatory and we keep it at 35%) and the more important idea is that you're saving about 50% of what you make. Every two years you're going to try to increase the savings rate by about 5% (you'll still be spending more money, but your savings rate goes up). This makes it possible for you to live a better life every two years (upgrade) while saving more money on a percentage basis. .

Your cost of living increases go up slower than your income

The next part shows your total portfolio amount each year (). The last and final part is the "worst case scenario" where you make an assumption on how badly the portfolio could decline. Since we assume zero gains, we think it is achievable to take your worst case scenario from a 50% loss (high risk when you start) down to a 30% total loss by year 6. Below you can see how there is always a positive "difference" number when you compare the Re-investment to the Worst Case (calculated by taking Investment minus Worst Case)

assumes zero gains, making the income part of the equation much more achievable

To put this all together, you already know what we're going to say… . You will save more naturally since you won't have time to burn the money and you will be able to *continuously* build your net worth. Now if you get to $20M+ we have no doubt it will be next to impossible to offset a 50% reduction in investments… Unfortunately we are not there yet! For fun, we'd say it is possible to get to ~$700K in annual income for anyone reading this blog (if they are serious). Using a 20% correction as a "worst case scenario reduction" for a diversified group of investments this means you can amass a portfolio of at least $1.5 million or so before you're even worried about big stock market corrections. If you want to get more conservative you can add to the bond/cash exposure and suddenly you can go up to $2M knowing that you'll increase exposure across the board! We have no doubt lots of people will hate this post but that's fine, we'd say it's better to focus on making more money than poking around doomsday scenarios where everything is down 75%+. With that we'll leave you with a favorite quote of ours That is why the rich get richer!

Earning more money is significantly better than trying to save more**And…** *"The more money you make, the more risk you can take".*

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like . The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality)

Efficiency, Get Rich Without Giving Up Your Life

Q&A is Now closed!!! Thank you everyone this was 1,000,000 times better and thank you to all the contributors who chipped in during the Q&A!

Quality of Life and Time: 15 Things to Remember

Quality of Life and Time: 15 Things to Remember

At the end of the day (assuming no major leaps in technology) time is the one finite quality that we all have in common. We all die eventually. As you accumulate more and more "" also known as money, the time you have remains largely constant and the value of the time you have left goes no where but up. If you've wondered why money continues to flow into cities with good weather and beaches… Now you know! Quality of life becomes significantly more important since you're trying to that you have left over (the coming decades). Below we'll outline several items that will impact your quality of life which is essentially maximizing the utility of your time.

digitsmaximize the utility

Physical and Lifestyle Changes

Excluding the small number of oddballs, there are very few people who would prefer to live in a jungle or the mountains. The location is harder on your body and social interaction declines significantly as your neighbor could be several miles away. While many young people won't have the luxury to choose their location (at first!) as they accumulate a larger and larger net worth, they typically move to sunny areas with beautiful beaches. Having a core social group and being around other humans is a big part of happiness. Larger cities with warm temperatures will continue to attract people with wealth for the foreseeable future.

1) Location:

No way that we can tell you which "culture" is best. It is irrelevant. The key here is that the culture will drive the type of people you meet. If the culture in your city looks down upon stylish clothing, you're probably a person who does not like to dress up. If the culture is more nature driven, we doubt you'll constantly overhear conversations about the latest technology gadget. So on and so forth. This culture dynamic will impact your overall quality of life in a big way. If you're surrounded by people who are "not your type" it will be quite difficult to remain positive on a daily basis. This type of sacrifice is not worth it and you should leave as soon as you can (when it is financially viable).

2) Culture:

The next item on the list goes by mis-understood. As you accumulate a large financial nut, the chances that you use services go up in an exponential fashion. Your schedule might include a personal trainer to a specific massage therapist. Living in an area with minimal services can be a major headache if you're trying to leverage your time and do "less yourself". Services also expand your ability to generate a higher income. Once you reach this point, you'll realize that paying for services is actually a benefit to everyone. Someone else makes a living and you spend the free time generating more money. If you had to do your own laundry or apartment cleaning, it would lead to a major loss in revenue.

3) Services:

Another major issue when considering quality of life is healthcare. If you live in the middle of no where (went full rogue and moved to the mountains) a medical emergency could cost you your life. Sure you could have access to fast transportation and if you're a billionaire maybe you even have a doctor on call. At the end of the day? The top doctors are going to live in hubs since that is where the majority of the demand is. There is no reason to put your own life at risk by living in a city with poor healthcare and limited access to the latest and greatest technology.

4) Healthcare:

While this is becoming much more ubiquitous and major cities offer the full slate of produce, the ease of access should be taken into account. While Jeff Bezos is taking over the world with the purchase of Whole Foods, he's not going to open a Whole Foods in the middle of Mount Everest any time soon. The current offerings of a city should be taken into account and this is likely a 4th or maybe even a 5th reason why you'll live within spitting distance of a major city.If you're looking for high quality produce… living far away from the source will not help your cause.

5) Food/Nutrition:

At the end of the day we're all animals. If you live in a city that does not have people you find attractive a major part of your happiness (utility) will go away. You could always hop on a plane but the access is always limited relative to living in the city with people you want to be around. Imagine being a deca-millionaire and living in Alaska for example. Sure you may save on taxes but that's not going to offset the quality of life declines such as people, weather and services (side note if you love Alaska no worries, this was just an example!). As a final note, if a in general it also makes it much more likely that your current set of friends and colleagues will visit.

6) Dating: city has attractive people

Fame is something that cannot be reversed (very difficult). Once you're a public figure you're opening up both you and your family to immediate unwanted attention (lawsuits as well). This is why we choose to avoid fame. If you're well off in a small town, word will get around very quickly about your current "status" within the new environment. If you were to live in a city with many famous/rich people, it becomes a lot harder to pin point you as a whale (target). The vast majority of people will lie *up* to try and gather more attention… This is the wrong strategy. By lying down, you're much more likable and less likely to be seen as a threat as long as you never disclose your real income and net worth to anyone in the area. As a note, the other big benefit is spending goes under the radar (unless you buy that lambo!)

7) Attention:

The ability to move around should also be taken into account. If you can go from a nice restaurant to a museum to a beautiful park in a matter of 30 minutes… you're in a "fast" city. Notice, fast does not relate to the speed at which people are rushing around the city. It relates to your own personal portability. If you're able to move swiftly between items of importance to *you* the value of that city goes up. Going to the gym, the museum, a bar you like, the beach and a park within a few short minutes is an important perk. Your time is becoming more valuable by the minute.

8) Speed:

That is right! Even if you're already fabulously well off, taxes should be taken into account if you intend on having a family and passing along a greater and greater fortune. By living in an area with lower taxes, your ability to accumulate more wealth compounds by the tax savings. As a basic example, if your tax rate goes down by 10%, you'd double your money every ~7 years on this benefit alone! Sure we're making a simplistic example since the math isn't perfect, but the compounding effect remains. If you reach billionaire status we're guessing there are many more complex strategies… but you'll worry about that when you get there!

9) Taxes:

The final item to take into account for quality of life is a "hub" which refers to international travel. While it is likely a lot lower on this list, if you find an international hub with a significant number of flight options, your quality of life goes up. You're now free to take quick vacations to get a change of scenery with a few clicks on a computer and a short drive to the international airport. Ideally, you've found the place you call home and don't leave much. But. The option should be accounted for. Changing your schedule once and a while can drive a lot of value. You're able to experience something completely new without having multiple layovers to get to to your destination.

10) Value of a Hub:

Mental "Health" Adjustments

Being in an environment that likely mirrors urban life vs. suburban life, you'll find a lot of value in meditation. Adding just 20 minutes per day to clear your head and avoid the "noise" will allow you to stay focused and relaxed on a day to day basis. The best part about this practice is that it is not location dependent. You can do this while living in a pent house apartment or a three bedroom home 15 minutes away from the center of the city. Mental exercises are generally portable which is why (for the first time ever) we emphasized the physical portion first in this post.

11) Meditation:

As you move up in the "game" of life, you'll find that the triangle gets smaller and smaller. Practically everybody knows each other and there is *always someone better*. Always. You could be the third richest guy in the world… until the second richest guy in the world walks into the room (or the 4th richest guy gets a massive lift in his stock price)! Since the average person is spending their time "asking what so and so is up to" you know that this type of thinking guarantees failure. We would repeat this again. “There is always someone better”. There is no reason to compare yourself to the people around you because this does immense damage to your mental health. Instead, you focus on yourself and the qualitative metrics you would like to improve. We gave your our own qualitative metric which is…

12) Self Comparison: Efficiency.

Another major benefit of urban areas (or living near an urban area) is the consistent change. By putting yourself in an environment with consistent and constant change, the ability to learn new things will increase. Many of you are already there, but for those that are not, once you get to money you ask yourself… . There really isn’t much left from a financial accomplishment perspective once you are set for life but you don’t want to end up bored. Many people go down the drug and alcohol abuse route for a period of time and it is best to avoid this by learning new things instead. Sure you may be the best at selling SHOCKING diet pills online, but we doubt that makes you the best swimmer in the world or the best dancer in the world as well. Find something new to do every single year to avoid falling into the “boredom” trap.

13) Learning: *“F You” “What is left”*

Never help people for free. We’ve already proven that doesn’t work since people will assume the value you are bringing is worthless (or that your time is not of value). Instead, find a way to help people (who are worth your time) at a big discount. A discount allows you to filter out the people who wouldn’t listen in the first place and it allows you to earn a few dollars for sending the elevator back down. If you’re trying to help someone in their 20s you should charge less and if you’re helping someone in their 30s you should charge more. The irony of course is that the person in his 30s is less likely to listen even if he is paying more! By forcing the pricing up you’re making it *more* likely that he listens to you. After all, if he doesn’t listen he just wasted more and more money. This is human psychology at its finest.

14) Find a Way to Help: *Hint Hint: Now you know why we run this blog in the first place.*

That’s right! thinks you should quit entirely if you get rich and that’s exactly why you should never listen to average guy. By quitting you give up an immense amount of mental stability. Getting richer is probably the hardest “game” on earth and it is a lot of fun if you don’t need the money. It also allows you to see if you can become more efficient with your time. Everything we would encourage. Now if you’re in your 60s, maybe you can go ahead and retire to pursue other hobbies… But. We would wager the typical reader here will be rich by their 30s. This is far too early to hit the “escape” button and call it a life. If you really want to take time off, figure out exactly what you’re going to do first, then . During the transition period you can go ahead and travel the world only to realize you could have done that while running your online empire! (Duh!).

15) Keep Working: Average guySell the Company

We are putting an asterisk here because we assume you have a family and have a good relationship with them. If you grew up in a terrible environment where your family abused you and tried to keep you down… well you’re free to move on in your own direction. And. If your family was nothing but supportive, it feels good knowing that they don’t have anything to worry about. Your trust fund is set up for your kids and your parents are coasting in a comfortable life. Just remember. There is a thin line between giving your kids everything so they grow up spoiled and secretly creating a “just in case fund”. The just in case fund ensures they never have to worry about a place to live or putting food on the table.

***Bonus* Drag Your Family Up:**

For the newer readers… if you’re interested in learning more about making money, staying in shape and doing so without choking off your personality… You’ll probably like . The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality

Quick Math to Keep You Focused On Your Side Hustle

Quick Math to Keep You Focused On Your Side Hustle

One of the consistent things we’ve noticed in our Q&As is that people are much more focused on trying to squeeze an extra 5-10% raise instead of trying to generate 5-10% by themselves in some sort of small business. We used to wonder why this was the case but now have an answer. . In the work force you’re forced to listen to what someone else says to do. Therefore, their brains are wired to take orders and they don’t know how to “start” from zero and hence… they never do. Here we outline some basic math to explain why this doesn’t make any logical sense.

People are afraid to start in the first place

We assume you’re pretty successful already, making around $200,000 a year in your current position (role is not important). The reality is that you’re likely living in a high tax state to generate this type of money and we estimate your tax rate to be around 33% (keeping it simple) so you’re really generating $133,333 or so after taxes.

: Business Income is Not the Same

Why is this important? Well if you do spend your entire year finding a way to get 10% more from a company switch, that’s going to be $20,000 gross which is $13,333 after taxes (likely a bit more due to escalating taxes). This is not going to be as much money as you thought. You’re making just over a thousand dollars a month in additional income.

Instead we assume you start a new basic business (consulting for example where you’re doing time for money exchanges) and you make $20,000. Well… There is a big change here. You can now deduct business expenses as having 100% operating margin is unlikely. You will be able to deduct expenses for your work related activity and this can include basic items such as your cell phone, your laptop etc. Showing a 50% operating margin is actually entirely fine and doesn’t raise any red flags. So you’re generating $20,000 in income, deducing $10,000 (likely items you would buy anyway) and now you’re paying tax of just $3,333. This means your net income was $16,666.

Now you may look at that number and say it is small. That is a big difference over the course of 10 years. Assuming you can add say $100,000 in business income or $100,000 in your career the answer is beyond clear. Also. Would you rather have your livelihood tied to one income stream of $300,000 or one income stream of $200,000 and the other at $100,000. Your risk drops dramatically with the second set up. It isn’t even close.

While true it is still 25% higher than your other option (finding a new career).

For fun if we assume that’s the case: one guy earns $100,000 from a new business and the other person earns $100,000 from his career, the difference is $16,666 after taxes (understated as taxes for the career would go up). In 10-years assuming a basic 7% compound interest rate, you’re looking at a difference of

$230,000… About a quarter million dollars by simply starting a basic side income. This is a huge amount of money for the vast majority of people and could purchase a basic home in many parts of the United States. Oh… And don't forget… So at most you can have a 15% tax rate at the end (long-term capital gains).

This is after tax gains.

From the chart above within just 3 years the difference is a luxury car about $50,000, in 10 years the difference is a normal house and in 17 years it is two homes or one home in a nice area.

Despite giving out a , we might have to start from the absolute bottom. Meaning? You're unwilling to even get up and try something. The good news is that you can start by the time you're done reading this post it is really this simple.

How to "Start": clear zero excuse way to start

Step 1: go to a university near you

Step 2: print out and hang up flyers offering the service you can offer

Step 3: wait

You'd think that this would be an easy task, and yet most people don't even bother. If you have any sort of high quality career, we can promise you that people will pay for your advice/attention/time. This works for the vast majority of our readers since they are largely in high-earning careers (at least that is what analytics tell us).

If you want an even easier version of this replace university with "any place with your target audience". This means you simply need to know what you can offer and where the people will be. This is incredibly easy. In fact, ticket scalpers make money with this strategy and they are definitely not the most competitive or smartest people in the world (but they make money doing it!) A long time ago it was actually quite easy to just go to Costco and buy a case of beers/water and sell them near the stadiums during games. This does work and it's always fun to hear how hard "business is" when all you have to do is take a high demand product to the customer.

With the small tangent aside, everyone reading this just needs to ask two questions: 1) what am I good at and 2) where is the demand for that service/product. If you cannot answer that question then ask yourself why you're employed in the first place. If you're really being paid to do nothing you're in deep trouble since you're first to be cut. After you can answer this question, you then take that skill and monetize it during your free time.

Even if you're not thrilled with the first year of performance and only make $10,000 or so, this is the only way to learn. Instead of wasting time looking for the "best opportunity" you should spend your time making a million mistakes and figuring it out as you go along. This surely beats doing nothing. If you make a ton of mistakes and learn the following: 1) correct pricing, 2) correct marketing, 3) scaling, 4) website design and 5) traffic… You're pretty much set for life.

Start Small:

You're set for life because you have the tools necessary to generate income regardless of what happens with your career. Relying on yourself instead of another person is significantly better than golden handcuffs. The longer you stay with the golden handcuffs… the worse it gets. You end up losing your freedom as you're on call more (the income is next to impossible to replace). Similar to the slow boiling frog analogy. By the time you realize what has happened… it's too late.

Take a look at the below table as a good example of how quickly things scale. We have an annual addition table based on the following markers: 1) $100 a month, 2) $500 a month, 3) $1,000 a month, 4) $3,000 a month and 5) $6,000 a month. "Likely FI" refers to being able to pay all your living expenses at this point.

It is hard to mentally picture compounding but the above chart is a pretty good example. If you're making $200,000 a year, finding a way to add $1,000 a month does not seem like a high hurdle. That said, in just 10 years you're either able to (your own money plus the side income). That's a substantial change to your life particularly if you're only 21 years old. Imagine being 31 years old and having your cost of living actually *decline* because you made a single smart decision 10 years ago. Oh wait… That's exactly how it works! In the more likely scenario (you find a way to generate $3,000 or so which is the lowest number we've received from readers of this blog), that means you'll have three quality homes in 20 years. That should almost be a saying, 3 thousand for 3 homes (about $1.5M dollars).

buy a house outright

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending.

Quick Post on Kobe Bryant – The Result of Incredible Work Ethic

Quick Post on Kobe Bryant – The Result of Incredible Work Ethic

What a wild day. For anyone over the age of 30 or so they know that Kobe Bryant was probably one of the most followed sports stars with a cult following: Lebron, Jordan and maybe Curry for a moment in time really compared. Even though there are super stars still in the league, Kobe was a worldwide spectacle and people in Asia, Europe etc. all knew who he was. It takes a lot to be shocked and for the first time since the presidential election people are shook.

If you're looking for clear proof that lives are not equal you can look at the reactions today. Despite over from a new virus, the entire world is focused on one man and his family. That is the definition of influence if we've ever seen it.

Lives Are Not Equal: 2,000 people infected and 56 dying

This is a general theme we've had here for years. A single ultra successful person generates more value than a larger number of unsuccessful people. Yes we realize that doesn't "read nice" but it's also true. If you reach a point of influence your choices/mannerisms impact the world a lot more. The average person does not have a ripple effect on the world and a super-star in any industry (even sports in this case) can cause a small ripple to occur. Your life-long objective is to become successful enough to have at least a small ripple on the world when you're gone

Unfortunately, we doubt this changes human behavior as most won't learn from it. Instead they will lash out at people who say anything remotely wrong about him. The real lesson should be immense respect for life itself. You can become a billionaire (Steve Jobs was an example) and die within the next few years. If you're wasting your time trying to tear other people down, you've spent a large amount of time wasting your own life (which could be cut off tomorrow).

Human Behavior Won't Change:

Human behavior is sadly predictable despite the answers being firmly placed in front of everyone. If you focus on yourself and improving your life (and anyone around you), you'll exceed your expectations. This is simply how it works. Put tons of effort in focused on improving yourself.

While the chances of a reader being a 6'6" athletic individual with a near 40" vertical leap is next to none, a lot of his mannerisms can be mimicked. As many of you know we bet quite a bit on basketball and boxing as they are the two sports we follow close enough to be educated on the topic. When you look at Kobe's life he actually spent insane amounts of hours in the gym and working out. You didn't see him mentioned in parties or benders like you have seen with other NBA stars. Quite similar to Lebron James in that manner, didn't show up drunk to games like a Charles Barkley or JR Smith.

Some Simple Lessons:

The main lesson you can take from someone with genetics completely unrelated to you? Find what you're good at and become obsessed with it. That's the real conclusion here. No one cares about people who are mediocre and no one cares about people who are lazy. You can be talented and lazy and you'll be absolutely curb stomped by people who are talented and grinding every day. Kobe Bryant was simply the latter. Videos would surface of him running up sand dunes and taking hundreds of shots before and after practice… This doesn't' even include their maintenance regimens to stay in tip top shape. Playing through broken fingers and other injuries were the norm when it was an important game.

If you are talented in something and have the slightest chance at making it big, you should stop everything and focus on that talent. This is not negotiable as the difference between being number 1 and number 10 is miniscule and changes your life by a wide margin.

Another important lesson here is that you're going to have a ton of haters on the way. Even though we are focused on Kobe here we can't help but think about the 2019 NBA finals when people quite literally cheered when Kevin Durant ruptured his Achilles. That was one of the grossest displays we've ever seen (from a sports event) and here we are in 2020 and suddenly Kobe's haters have nothing to say. It seems that people have some sort of interest in seeing people suffer and only go quiet when the person dies. Pretty sad state of affairs in the USA, but it's how it works now. Remember that all of your haters (while certainly smaller compared to Kobe), have horrible lives and will unlikely ever make it in life anyway. Best to ignore.

Health is by far the most important asset you have. Another interesting thing about Kobe is he never seemed to "let himself go" and was in shape despite retiring a few years ago. The vast majority of sports stars end up gaining tons of weight a losing their physique. He wasn't in this camp and had (what appeared to be) great respect for health. You definitely cannot do much about a helicopter crash.

There is no way anyone could have predicted this so we're keeping the post short. It is big enough for us to write on since we've followed the sport for quite some time. Kobe Bryant unlike a lot of pro athletes actually reached his potential (our opinion). Arguing about the best players of all time is less relevant and the more important item is that he didn't "squander" his talent like a lot of other professional athletes (overweight NBA stars or stories similar to Shawn Kemp… Many are probably too young to know who he was). Don't squander your talent, work as hard as you can on something you can become great at and remember that everything can be taken away from you tomorrow. Don't spend a single second worried about what other people think (vast majority are hoping you'll fail) and stay focused on your present and future.

Some Quick Final Thoughts:
****

Quick Suggestions on Cash Flow and Q&A Announcement

Quick Suggestions on Cash Flow and Q&A Announcement

As you progress through life you're going to value cash flow as you can't really spend the money that is locked up in Angel Investments and other high risk ventures (such as private equity deals). This is probably one of the biggest mistakes we made, locking up too much money for longer periods of time and being forced to wait years (yes plural) to eventually exit the positions and turn them into cash generating machines. Since we've had some downtime we looked through about 10-years of income and made a few interesting observations that should be valuable to people who are still working up the ladder.

This is one we'll start with. You can only reach "financial independence" if you are generating enough cash flow to cover your cost of living + some emergency spend as well (cost of home, food, utilities, healthcare and a bit of money for emergencies). If your money is currently in higher risk assets such as FANG, angel investments or private deals with no cash flow… You're not really set yet. You have to liquidate those positions over time and eventually buy a cash flowing asset such as: 1) rental properties, 2) internet income producing websites, 3) stocks with dividends, 4) bonds and 5) high yield savings.

Cash Generating Net Worth:

While obvious when written out like that, it's actually quite easy to count too many eggs before they hatch. If you think it's not a big deal and you can "eventually get out of the position", just ask the employees at WeWork. Overnight, many employees went from "home shopping' to searching for an entirely new career. The major issue with appreciating assets with no cash flow is that you'd be forced to sell when you need cash on hand. So even if you believe the stock market will go up 7% or so per year (as it has done historically over long periods), it does not mean you'd be selling at the tops. It is quite easy for you to own Amazon stock, the company misses earnings (-10% on the day) and you're forced to sell to realize some cash. Take this seriously when building out your portfolio once you're over $1M or so in net worth.

A good rule of thumb we noticed when we looked at failed projects versus successful ones… The failed projects all saw income growth that was lower than your typical high quality career. In a good career, you can get double digit improvements on your total compensation fairly easily if you're an above average employee. So if your "side-hustle" is only growing at around 10%, you are probably better off selling it.

Mathematical Example on Other Income:

A great example is a re-selling business of sneakers. While this is a good market right now due to the popularity of certain shoes, it eventually hits a limit where the growth stalls out. Making more than $100K is pretty difficult unless you've found something special that helps you. We're not sure what that differentiating item is since most of the value is based on creating bots, email addresses and shipping to tax advantaged locations for re-sale. All that aside, we'll continue with this business model as a good example.

Once you've reached a point where you're making around $60,000 a year, you should consider selling it. Why? You want to make sure you're showing large amounts of "growth potential" despite knowing that it will fizzle out after improving a bit. By the time you actually sell it, you'll probably be making around $80,000 a year since the sales process takes time. After this you should sleep easy at night knowing you maxed out the income. And. If you're really nosey, you can track the business a couple of years down the line to see if you were correct and if the person was able to somehow ramp up the business.

To summarize the above, if you're seeing growth in the low double digit range (10-15%) and you're aware of potential scale limits… . We are sure there are exceptions but don't spend time "brainstorming" when it has become clear that the limit has been met. The only reason you shouldn't sell is if you're willing to run the business at 0% revenue growth since it isn't time consuming. Unfortunately (or fortunately) we have one of those on our hands right now.

You want to sell about 2 years before that limit is reached

Another fun way to see if you should take on a new venture is to calculate your total net worth change in a year. If your net worth is say $1 million and you're ending this year with $1.1M… Your net worth change was 10%. If this is you, it's time to start taking on more risk/task or projects since you're going to slowly downward spiral into nilhism thinking. You'll look at the year-end balance and say… What's the point of working since I didn't really move the needle.

Taking on More Risk:

A good metric to stand by is around 20% increases in net worth. If you're putting your best foot forward, it should be possible to move your net worth by around 20% per year. If you're in the $100M+ net worth camp, this is a completely different ball game. We're simply referring to people who are worth $0 to $5 million or so. While moving your net worth by $1M is not easy (when you're worth $5M), you're probably extremely talented otherwise you wouldn't have made it there so quickly.

We're getting a lot more private messages from people who have reached this hurdle and our answer is quite simple. You must start a new project or purchase a new fixable project to have something new to do. If you're really working long hours, say 60-80 hours a week and can only move your net worth by 5-10%… You have to hit the sell button on one of your time consuming income streams. If you don't have anything to sell, it means you have to work *less* at the position you're in since you've very clearly reached a wage/income ceiling for one reason or another. Don't sit on your hands as you'll become bored/disgruntled and lazy leading to the standard downward spiral.

Generally speaking, if you followed our plan in Efficiency, it should look something like this: 1) first cash flow item is around $100,000 a year with your career, 2) after 5-years or so your idea should be working and generating around $150,000 per year, 3) after 10 years, you should either be out of your career or you should have career income equal to your side income at around $200,000, 4) after a couple of years like this you should have a third cash flow – – generating about $30-50K per year. That's the extremely simplified snapshot and if you see your business income surpass your career income, you're free to quit at that point.

How the Cash Flow Should Look: [real estate for example]

The key item to be aware of is that you always have to discount at least one of your cash flow items to zero. That is $0.00. Why? You could lose it all. While we gave a WeWork example for the perils associated with "paper wealth" any high income earning position can be replaced. The more money you make the more likely the firm is searching for ways to replace you. If you're making $150,000 per year in a high cost city, you're not on the radar. .

[Start making $400,000-500,000 and you're 100% on the radar]

For what it is worth, from a psychological perspective, the two largest jumps are when you get your second and then third income stream up and running. As another rule of thumb it is only an "income stream" if it would cover your cost of living. Once you get a fourth stream, the novelty factor wears off as it's unlikely that you lose three different income streams at once, the fourth one was just icing on the cake. As a note, we don't use dollar amounts here as we have no idea where you live, an income stream of $2,000 a month in Thailand is a ton of money, in New York or Los Angeles it's not great (remember we're comparing this to the cost of living in the country/city).

As always, is by being "frugal". You can only cut your costs so far (can't cut food, water, housing and taxes… it Just isn't possible). That said, a good mathematical formula is to never spend more than 10-15% of your pre-tax income on rent/housing. This was probably the smartest cost decision that was made over the past decade. If you make a lot of money due to a or due to a successful career, there is no reason to ramp up the housing expense if you're in your 20s. Most guys in their 20s are forced to live with roommates so having a decent one bedroom or studio apartment is fine until you reach your 30s and can upgrade to a higher quality one bedroom. This is also one of the reasons why it's so important to start making money early. The earlier you do, the more you can take advantage of social expectations that work in your favor.

Cash Flow for Expenses: [the worst way to try and get richlucky break]

Q&A as usual we'll start next month with a Q&A, we'll open it up on Thursday the 5th.
****

Quick Update Post the Riots and "Re-Opening"

Quick Update Post the Riots and "Re-Opening"

It's getting crazy out there. After a couple of months of quarantine we're now seeing riots break out across the United States. The protests seem to be a mix of both the Floyd incident and upheaval around economic inequality highlighted by chants of "Eat the Rich". As the economy opens back up we'll see what the real unemployment rate looks like (our guess is that double digits will remain, somewhere around 10%). Also. We'll see how many companies adopt work from home initiatives and reduce back office jobs.

This is one of the main beliefs we have. Having a programmer work in San Jose, London or a cabin in Colorado doesn't make a difference in the function of their job. In fact, the main reason people show up to offices is for "face time", ie. management is usually insecure/micro-managers. After this experiment the companies have realized employees just wanted more autonomy and are willing to work *harder* if they can work from home. So their initial assumptions were flawed. We stopped tracking it but Facebook, Coinbase, Twitter, etc have all become accepting of the work from home environment.

Technology Will Move:

Looking across other sectors of the economy… Anything that can be done with a phone call is likely going to move remote as well. In short? Knowledge workers. Anyone who earns with their information/insights can simply work from anywhere. Think about the blogging industry as it's the easiest to understand. If someone write a post in China or Australia or New York… Does it make a difference? No not really. Apply this to many white collar professionals and you'll find that many of them can quickly go remote as well. If you're simply being sent documents to review and load them up to a secure work area… Lawyers could easily do this from a home office as well. You're just reading, correcting and loading items to the cloud.

So while Tech will move first, the other white collar professions will move second. Sure. There are several positions where face to face interactions are critical. And. Those positions will still be reduced from a pure numbers perspective. Once you have an established relationship with a client a zoom meeting will suffice for a large number of interactions. Instead of assuming that businesses will operate the same (they won't) look at what areas will be impacted first and follow the bread crumbs from there.

After we're past the first phase or two of the re-opening, it would be wise to think about the "flow of people". Similar to the concept of fund flows. If we can agree that a lot of technology jobs will allow remote work, where will these employees move to? It seems likely that someone living in San Jose/San Francisco would move to a place like Los Angeles if they wanted to stay in California and live with better weather. It seems likely that someone in New York/Boston would want to move to Miami or perhaps the Carolinas for a similar reason. People who cannot afford the major cities would then move to "similar" cities with a "similar culture" – just think of political affiliation for this one.

Physical Migration:

This is probably the most important question for our readers. Forget about what major city you want to live in now, ask "which major city will have the better environment in 2023". This is not the same question anymore. With this much economic disruption, the amount of migration is going to be quite high. We wouldn't want to be living in a concrete jungle with high taxes and poor weather in 2023. As mentioned on Twitter, the weather is probably a good starting point for choosing your new city to live in (if you plan on moving).

This is another concerning issue. With high unemployment and billionaires becoming richer by the day… A wealth tax is likely going to become more and more popular. In fact we think this has a decent chance of going through. When you think about the ramifications here, it is a lot easier to follow the bread crumbs. What items are easiest to tax and track? Quite simple: 1) real estate, 2) bank accounts and 3) stock accounts.

Wealth Tax?

This has a lot of implications for all of our readers. It means the value of physical assets goes up 1) physical cash, 2) physical gold/silver, 3) crypto currencies and 4) rare collectables. Why is this a big deal? It's a big deal because the current environment seems to be pushing for inflation on necessary goods and deflation on aspirational goods. Right now, rich people are not able to spend on much. They are being forced to live pretty standard lives which means the price of basic items like food and drinks are going up while the price of "attention goods" such as a BMW/Porsche are going down.

As usual, we'll jump to the conclusion. Instead of worrying about a wealth tax, it's a good time to go ahead and set up a small home vault/security system. What does this mean? A way to hide physical assets at your home in a safe manner. At the low-end a high quality safe with a couple of cubic feet of space is going to cost anywhere from $200-350. This is nothing compared to the amount of money you can store in there (using a combination of gold and physical cash you're easily storing over a million dollars in value). If you throw a crypto currency wallet like a ledger or nano inside, the number is then infinite by definition.

If you're in the ultra-high net worth camp, call it $20M+, then looking into vaults/secret doorways is another viable option.

We realize the last two paragraphs make this post seem ultra paranoid… that said with interest rates at 0% and no return profile on cash anymore, at home banking solutions are now viable. For example, if you think the price of gold only goes up 1% per year for the next 10 years, then what's the downside of holding $250,000 worth in a completely hidden area? That's a lot better than a safe deposit at a bank since it can easily be seized. In short, we're fine with appearing crazy for this move as we see limited downside in creating a worst case scenario exit plan. If you've followed the advice on this blog for the last 8 years you're making more money now vs. pre-pandemic and on top of that your investments are up anyway. Taking 5% of current net worth and creating a "worst case scenario set up" is pretty reasonable. The real key is the "set up". Make sure you can quickly move more and more assets into your new security system if taxing the rich becomes popular. Again. Laugh if you like, billionaires build bunkers out in strange islands/places preparing for such scenarios so our solution is tame and cheap.

Look no further than Brazil. The country decided to ignore the pandemic and now they have a catastrophic health issue and the Brazilian Real has devalued to 5.33 per dollar from 3.92 per dollar in a single year. This is a substantial issue for them as their ability to import items just went down significantly. Hong Kong is also going through a lot of protests. Individuals are rapidly exchanging as much as they can from HK dollars to US dollars. If there is a decoupling of the Hong Kong dollar and the US dollar, the citizens do not want to suddenly lose purchasing power.

Currencies Are a Mess:

Who knows how this plays out. If we want to place a bet, it would result in more countries defaulting on their debt. Argentina defaulted already and there is a high chance of more to come. This means the carry trade is still alive and well (take debt out in foreign currency and convert immediately to more stable currency and pocket the spread when it collapses).

The chances of some sort of V-shape recovery are slim/next to none as restaurants, airlines, cruises, hotels etc. are all going to be under headcount restrictions. If people can't move around and spend, there is no way for GDP to grow. While the opening will allow for some return to normalcy (an improvement) believing we'll be back to 4Q19 levels any time soon is simply delusional.

The good news from all of this is that e-commerce is going to see structural increases in demand. This has happened for the last 10 years and the pandemic is just going to increase the market opportunity. If you are still on the fence about this we really can't help you anymore. You have riots on the streets a global pandemic and high unemployment. Online sales is going to flourish like never before and there is no reason for you to personally go outside to purchase goods either. What is the point in going to a retailer when you can order the exact same thing, avoid travel costs and decrease exposure to COVID-19 at the same time? It makes no sense to go out, simply order in and wait until the pandemic is officially over. The looting and rioting is just going to spread the virus faster.

Onto Some Action Steps:

In simple terms: Step 1) continue to order everything you can online, avoid going out to any area with serious looting/rioting. Step 2) take up some sports that are isolationist in nature – golf, rock climbing, etc.. Step 3) go ahead and cancel the gym membership and order all of your at home items now. It's clear that the gym will not be a great location for the foreseeable future. Step 4) build your at home banking system, no other way to describe it. Step 5) try to order everything in bulk, this refers to non-perishables, food that can be frozen etc. Step 6) Step 7) carefully package and store your luxury items, you don't want to stand out as rich during a potential riot in a major city. Step 8) set up alerts for housing in any major city with a nice beach or good weather. Step 9) continue to stack up physical assets if you can and Step 10) it is a very good time to lie down in front of friends and family, use the pandemic and riots as an excuse to . Don't be stupid and flex in public.

*begin testing various ad campaigns, when the economy opens up next month people will realize how inefficient retail shopping is; time to take more market share.tell people you're *losing* money*

Not much has changed in terms of preparations: get online business running and begin down playing your success by a wider margin – by an extra 20% or so. That said, we're much more concerned given the amount of riots we've see. The chances of full employment by year end is incredibly small. Too many companies have learned that a lot of fat can be trimmed due to software and the use of new technology. So. We'd recommend doubling down on your internet ventures and taking the more cautious tone to heart for the remainder of 2020. When we're past the COVID-19 situation (officially) it'll be time to get aggressive in buying/investing and riding out the next bull cycle.

Final Note:

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life.

Quitting is the New Winning

Quitting is the New Winning

In a world where money is going to constantly , learning how to quit is likely one of the most important skills in life. While the tone of our blog will not make people happy and they will believe that ego is a big reason for this… Quitting actually requires consistent ego destruction. Quitting means you're giving up on something you thought you'd be good at and being self aware enough to realize you're not going to be at the top of the field. This can range from basic things such as sports to major things such as writing, math, presentation skills etc. With that backdrop we can structure a way to quit before you waste valuable time learning a skill that won't get you anywhere.

flow to the hands of the few

There are a few things that are required for a successful life: decent social skills, decent sales skills and decent comprehension skills. These three are "unavoidable". Even if you struggle with one or two of the three major skills, it doesn't matter. You. Have. To. Learn. It. There are no exceptions to these three items. If you don't have decent social skills you'll fall behind in your personal life and you'll put a ceiling on your professional life as well. If you don't have decent sales skills, you'll lower your long-term earnings as an interview and an actual sales job are the same (Selling yourself vs. Selling a product). Finally, comprehension skills are significant (learning new things quickly). Oddly, the last one is largely ignored. School teaches you to nit-pick and find exceptions to the rule which forces you into poor comprehension skills. Not being able to comprehend is a guarantee that someone will fail. Searching for exceptions that break the framework makes it impossible to build a success framework… since there are always exceptions.

Skills That Must Be Learned:

Athleticism, multiple languages and musical skills. While these three items are all great and amazing to have, they actually aren't as necessary as they appear. If you're staying in shape and can communicate extremely well with the english language… you're perfectly fine. Spending time on these three items should be deemed a hobby not a priority. If you're lucky enough to be elite at athletics, musical skills or other things that can actually create monetary value (scholarships, legitimate chance at being a pro) then it's worth it. But. Please see rule skill number three above regarding comprehension. The vast majority do not fit into the top 1-0.1% in athleticism or musical skills so it's not a *necessity* it is a nice to have. Being healthy (working out consistently and staying in incredible shape are important) being an amazing musician? Not so much unless you are truly talented enough to earn significant amounts of money.

Skills That Are Not Necessary:

With the basic three items out of the way we have to create some guidelines. The first guideline is clear as day, if you try a new activity for the first time and are *not* above average… you should quit. Not kidding. If you try something for about a week or two and find that you're not above average relative to the peer group, you're not talented in that activity. The second guideline is that you should only try activities that will help you later on in life. Being talented at drinking games and bowling is not a good use of time (fun fact, professional bowlers make around $30,000 a year… not worth the time drain). The third and final guideline is to find similarities between your skills, if you're at math, software coding is probably a good idea. If you're good at sales, moving towards presentations is likely a good idea. If you're good at Ethnic Studies, you'll probably be broke forever so you've wasted four years of your life. So on and so forth.

Basic Structure:

With the most important overarching guidelines completed up front we can now go into a step by step process for quitting and moving onto the next thing. For this example we're going to go ahead and use businesses since we hope that's engrained in everyone's brain (no ownership, no equity, no riches for you).

The Quitting (Winning) Formula for Business:

The vast majority of people will never start. They will use 95% of their time reading and "thinking" about how to proceed and never actually begin. This is because we're taught from a young age that reading is "learning" when it isn't. You can learn how to swing a golf club from 100 books but the guy who spent 100 hours practicing will still win even if his swing isn't perfect (learning is 80-90% doing and 10-20% reading to fix problems).

Step 1 – StartIdea:

Once the business is started (does not matter what it is), you want to see immediate growth within the first month or two. This is just how it works. It even works with blogs that gain decent popularity. If this is not the case and you've marketed/bought traffic with no interest in the product/service… you can go ahead and quit now. It is *generally* a bad idea if there is no growth within ~2 months of any new idea. We're not saying it has to make millions, it just needs to grow in terms of viewers/customers.

We'll use this blog as an example. While we have steered away from people interested in getting to the first million (since we're far past that) we noticed a common complaint: people wanted these ideas back. This makes logical sense as the percentage of people who have a million dollars is likely in the single digit range (even in the USA) which made the new ideas un-relatable. For your idea (whatever it may be) you have to figure out what exact item/service they are looking for. Criticism from people on Twitter, your friends, your family do not count for anything. Again. None of those criticisms are worth a penny. The only people you should listen to are the people who purchase your products. If they have not spent any money with your business/service, delete all of their opinions entirely. Smile, nod, agree and ignore.

Step 2 – Find the Interest Point:

At this point you should be moving from "initial launch" to growth. This means you've pinpointed the exact product/service that people want and now you're looking for increased interest due to .This is very important. If you've done this correctly it means that you've found a small area to add value and people will then recommend your product consistently. The graph below does a great job of explaining how this looks in terms of growth… And. If you see no growth after pinpointing what was wanted… it's time to quit yet again.

product quality

Assuming that your first idea was successful (very unlikely so don't be surprised if you quit multiple ventures before succeeding), it's time to look for new ideas. Your first idea will give you a clear sense of the target audience you serve and if you want your business to grow you have to come up with new products/services/offerings. Either expand the total addressable market or expect declines in the future.

Step 3 – Find New Interest Points:

This is a virtuous cycle for a short period of time and usually leads to a big increase in ego. This is also usually the peak. When you see revenues decelerate (no longer going up every year) and begin to turn flattish, you're better off selling the asset. Our guess is you'll make the same mistake we made with our first idea. You'll try to look for other options to expand the market but it goes too far away from your core competency. This leads to no results and you end up having revenues come down (from peak) to a lower level but still heavily in the green. Since you missed your shot at selling for a high valuation, you have to keep it and let it generate money. In short, if you see revenues increase at a rate that is unsustainable relative to your target audience (be realistic!) it's time to quit (sell).

If you didn't sell at or near the top, you're stuck in a weird situation where you're not motivated and you're not willing to sell it anymore. The multiples for a declining business are so low that you're better off doing a mediocre job and collecting the income. If you've ever wondered why so many declining businesses exist… Now you know. They exist because the net income and cash flow is still positive so there is no incentive to shut them down even if margins are low.

Step 4 – The Slow Quit:

This results in what we all the "slow quit". You want to radically reduce the amount of time you spend on the project to the point that it's a bit annoying. You're annoyed (slightly) at the maintenance tasks but when the money clears at the end of the month you're reminded of why it is worth it. This is the right balance. Similar to a private equity firm gutting the OPEX to generate cash flows, you're slowly bleeding out the asset over time. The good news? If this was your first successful product, you're going to be amazed at how much is made over the next 5 years as the business goes flat. Your income generated relative to effort goes parabolic/vertical. Lesson learned, always sell when the knee in the curve is hit.

Many of you likely have office jobs, this isn't anything to be ashamed of. Everyone has to start somewhere and no matter how much we talk about ownership and *event* driven income, starting with an hourly wage or a career is likely. Very likely. Instead of focusing on the hourly positions (not our target audience) we'll outline the Quitting formula for your career. Before beginning, remember that we *assume* you do not have a side income. If you start a business on the side, as soon as it makes about 2x your work income, you're free to quit at any time. If your side income equals your work income, usually better to continue both.

The Quitting (Winning) Formula for the Office:

Before beginning, a large chunk of success in any major corporation comes down to politics not performance. While we've stopped playing these games a long time ago both of these posts are valid today, and . The long story cut short is that you have to get on the right side politically on day one. The two posts with the links tells you how to do this (finding the top performers and attaching yourself to them while decreasing interactions with weaker performers). In a nutshell, if you're not on the right side politically within a year… Time to Quit!

Step 1 – Politics:politics #1politics #2

You'd think that we'd fill this section up with craziness. Such as "try to get into the right group over time". But. It just doesn't work that way. Within corporations you get labeled and marked relatively quickly. So in the case of investment banking for example, you have a 2-year analyst stint so if you're not in the right section politically, be ready to leave when your time is coming to an end.

You know the rules. If you're ever passed up for a promotion it is also time to quit! This does not mean you suddenly walk out the door. It means you're going to look for a similar or better position at another firm. Do not fall for the lies they will feed you about "the next one being around the corner". If the next one is really around the corner, when you turn in your resignation, they will offer you the promotion (hint: 95% of the time they won't).

Step 2 – Up or Out:

Before moving on from this clear sign to leave, you'll be shocked at how many people do not take the hint. Successful companies have many procedures in place to make it seem like you still have a chance. This is by design as it allows them to squeeze more value without having to pay more money. No one wants to have a disgruntled worker on payroll as they are usually loss accumulators. Your new mantra is to do the minimum without raising red flags and fill your weeks with as many interviews as possible.

As an incredibly obvious add-on, if you're ever demoted it's also time to leave. This should be crystal clear but some people are delusional. Any time responsibility is taken away you have to leave.

Another fun one, when it comes to making money you're much better off being tied to a growth industry than a declining one. This is also quite obvious but the execution of the concept is difficult. If you know that your industry is declining and you're making say $200,000 a year (a high income for a good professional job) and you're offered say $180,000 a year at a high growth future Company… You should actually quit.

Step 3 – Dead Industries:

The tough part about this math is that you have to adjust for the *responsibility* of the role. If you are down grading responsibilities and taking a pay cut… you should stay in the declining industry for a bit longer. If you're getting high levels of responsibility and pay comes down a bit for a year, it's time to jump. Why? Getting responsibility and being higher up the chain is a lot harder since it requires a promotion to get back to your original "level". So. If you get a better position at another firm with significant growth, it is time to quit if your responsibilities go up or stay the same.

This is probably the most complicated quitting section. You're at a complete cross roads here as you're forced to either become a manager or remain in a revenue generating role. The easiest example is a sales position. When you are a top sales person and are offered a manager role, you're taken out of revenue generation and are now in "management" responsible for training the other sales people. Tough decision.

Step 4 – Delegator or Revenue Generator:

When we refer to quitting in this context you're "quitting" your future upside in your career if you decide to remain as a revenue generator. Unfortunately, in this situation it isn't easy to give a clear answer. Also, if you've been following the success framework from this blog you're likely going to have a business by this time frame.

For fun, we'll assume this is your situation. Our recommendation would be to go ahead and take the managerial role *assuming* you don't foresee big declines in the business for the next 12-24 months. This is important. If you anticipate a downturn in 12-24 months, turn the conversation to a "slot you're interested in within 12-24 months". Make up something (health issue, family issue, etc. doesn't matter, make it believable). The reason? If you expect a downturn in the division and it won't be due to your management skills.. we know who will get blamed. . So. Before taking that jump, map out the potential consequences.

You

Unsurprisingly, we've noticed that many people lose valuable amounts of time on hobbies. This can range from playing sports, video games, watching netflix and more. Funny enough we have so much free time we do some of these things (change from 7 years ago) since we've made it past our numbers. Back 7-10 years ago we never watched a single movie or watched a single meaningless netflix show. At this point we're beyond that and have enough free time for some mindless entertainment (natural progression of becoming wealthier). That said the framework is simples.

The Quitting Formula for Hobbies/Activities:

The following activities should be deleted: netflix, movies and TV. You get nothing out of any of these items. We're sure someone will jump in the comments about "learning" from ridiculous shows like Crime Scene Investigation. These guys are also notoriously poor. Anyway. This section is pretty clear, no change from our advice from 7 years ago, delete all of them unless already financially independent. We are sure there are obvious exceptions and those comments will be deleted as they highlight how unintelligent the comment is.

Step 1 – Not Rich Time to Quit:

Everyone should work out and have an activity that keeps them healthy. The issue? Taking it too seriously. If you're doing an activity and find yourself becoming increasingly competitive it's time to slow it down. Unless you're rich, you're losing too much time chasing old high school and college dreams. When you're rich you can go ahead and compete in serious events like the World Masters Games etc. Until then, you're working out and staying in shape to maintain a healthy body type without impacting your income generation. Not rich and trying to play 15 hours of sports a week? Time to quit.

Step 2 – Health Items:

This is going to increase a lot as you get richer. Rich people drink a lot. That said, we've got a good proxy of 2x a week as a maximum for a young person who isn't rich yet. If you're 30 and still not rich at all this drops all the way down to 1x a week of alcohol consumption for "partying/fun". If you're rich, delete this entire paragraph as you're likely doing the same thing all other rich people do: invite only rich people and attractive women out to house parties/clubs in expensive areas while kicking out anyone who does not offer one of those two items for attendance.

Step 3 – Partying:

This is pretty simple, you're going to leave a lot of people behind. It is a common theme for any successful person. It just isn't possible to "connect" to someone if they make 20% of what you're earning in a year. The way they think , the way they operate and the way they get emotionally rattled is not going to match with you. Simple rule, . They will cry and complain "You changed man" or "You're an [insert insult] now". This is because you're a reflection of what they couldn't become.

Step 4 – Friends and Relationships: *if they haven't made any progress in two years it's time to move on*

Side Note: Q&A will be on Thursday September 5.

****

Random Musings and a Stream of Consciousness

Random Musings and a Stream of Consciousness

*****As noted in our section we are no longer answering any questions, only during sporadic Q&A's for subscribers and once every quarter or so on Twitter*****Start Here

We held a Twitter Q&A relatively recently and came up with roughly 10-15 topics to discuss. Instead of inefficiently talking about each one in separate blog posts we are going to address them all in one post so we can move on to more interesting topics in the future.

We have covered this already in a long post and people continue to pester us asking why we don't start selling products and why we don't recommend it as a source of income. In short? It is a colossal waste of time. We've contacted many top tier bloggers and have even met with a few personally (we draw the line at $150K+/year in net income as a good blog). Why is this a waste of time? Everyone seems to ignore the *time* it takes to get to $150K in income. In short, it takes roughly 3-5 years to get close to $150K in income. This is not worth it. We reiterate. This is not worth it at all.

1) : Don't Blog for Money

Digging deeper, once you get to a good income ($150K+ as the line) you end up being forced to do *exactly* what affiliate marketers do in the first place. Create content for the masses and click bait type posts. "Top X reasons for XX", "How this high schooler makes $100K+ year and you can too", "Two obvious reasons XYZ company will go bust!", "How this college campus janitor day traded to $XM net worth!".

Again. We have no problem with blogging for money or affiliate marketing for money, just make a decision on what you are doing it for. If you're actually blogging for fun and realize you'll be forced to address larger audiences in the future. Go for it! Making $150K+ for something you is absolutely a success. Making $150K+ doing something solely for the is an atrocious failure of a project. A good affiliate marketer will make $300K+ by year 2 if he's got a knack for sales.

*enjoy**money*

When the market "tanked" ~4% in a day, everyone believed this was the "end of the cycle". In short? Who cares. We've said over and over again we do not care what happens to the stock market. Even if our careers are put in jeopardy, we have multiple forms of income anyway so weNo one with a high net worth cares about the S&P 500 daily movements and yes a 3% move is just a basic anomaly that should be ignored.

2) Multiple Forms of Income: don't care one bit.

For those that are not following along, this is *not* talking out of two mouths. We have said this You take any extra income you have and you just dollar cost average into index funds, bond funds and continue focusing on 1) your business, 2) your career and ideally 3) another business. In our view, by the time you are 30 you need to have at least *three* forms of income. To put a definition around this… it means that all three forms of income could cover *all* of your living expenses. Simple math? If you live on $2,500 a month then you need to have $7,500 of income per month by the time you are 30ish. Therefore if your career goes away for a few months or a year… You don't care. If your business starts to go cash flow negative then you shut it down and move on. In short, you're not putting your livelihood solely in the hands of another person. Anyone who does this deserves to fail.

over a hundred times on the blog.

Here are two fun facts. Roughly 17% of Singapore's population has a net worth of over $1M USD and there are only ~10M millionaires in the USA or roughly 3% of the population. Insane.

3) A Million Dollars is *Easily Achievable*:

The United States has the best economy in the world, yet people spend their money trying to impress the masses (people who don't matter) and cannot see the 7 figure marker until they are well into their 60s (dead).

Knowing these two facts, there is literally no excuse for someone to not be a millionaire by the time they are roughly 35 years old. If they are not worth 7 figures by this time they made some bad life decisions or they didn't want to be well off in the first place. No other real explanation. If someone is middle aged and explains that they never had the chance you know they are lying to you and if they explain that they made some mistakes then they are telling you the truth. It really is that simple. The math doesn't lie. Assuming a person is smart enough to generate 6 figures per year for roughly 15 years, the investment returns will get them there very quickly.

Once you realize that people don't want the truth and they just want to feel better about themselves, you'll become . Many people will read the three paragraphs above and become upset because they think it is talking directly "about them". Being triggered by the truth is a tell-tale sign that someone has made bad decisions and is not willing to admit to them. Blaming anyone but ourselves for our problems is a coward's way out and that's why successful people are incredibly competitive… with themselves.

4) People Want Feelings Not the Truth: a much better sales person

When it comes to speaking with the masses be sure to massage their feelings and when you're looking to hire someone on your team become direct and to the point. There is no need for feelings when you're trying to get something done and it is only used as a tool during social events.

No question this is the only person we would ever vote for and ties very well with point number 4. People are politically correct because they are afraid of offending the lowest common denominator. The haters and losers in life that no one cares about.

5) Donald Trump for President:

The pitch for Donald Trump is really quite simple.

– Do we want a President who has self funded his campaign and has no ties to other entities?

– Do we want a President who is results oriented and doesn't care about being politically correct?

– Do we want a President who is willing to stand up to a notorious Mexican Drug Cartel?

– Do we want a President who has built a multi-billion dollar enterprise by negotiating multiple red-tape transactions?

– Do we want a President who doesn't apologize for his opinions if it hurts a person's feelings?

The answer to all of these questions is Yes.

We realize this recommendation made us lose 10-20 followers. Oh well. Here's an additional music video solely for the laughs.

A lot of mediocre people have a hard time understanding this concept and think that this website is about “screwing people over” and “burning people”. This is what you call an imbecile.

6) If You’re Associated with Them… Drag Them Up:

Instead the message is that you need to have an *extremely* hard filter when deciding who you link up with and after that it is on you to drag them to the top of the mountain with you.

A good example is hiring a person for a job. If you spend 2 months searching for the best candidate and you hire them it is *your* responsibility to make them look as good as possible. That is called being a good manager/leader or whatever word you so choose.

If you hire candidate A and you think he’s going to be an A+ person and find out he’s only a B+… Too bad. You signed off on it. You approved the hire. You are responsible. You have to find a way to turn that B+ person into an A+ person over time and you have absolutely no right to complain because you were the decision maker.

If you can understand the paragraph above you’re going to add a “turbo boost” to your career and your business. Why? You’re forcing everyone in your pool to gain responsibility as fast as humanly possible. If everyone you hire ends up going up the food chain or gaining responsibility faster than his or her peers… Guess who gets credit? You look like a fantastic leader and the junior hires all look like rock stars.

You both do.

A lot of people worry about *some* successful people not liking them. They should stop it right this instant. You’re not going to get along with everyone and as long as your rolodex is *improving* you’re doing it right.

7) People Aren’t Going to Like You:

Lets assume you have 10 people in a room. By default 5 of them are not going to like you too much and the other 5 will give you a shot (hint hint even presidents generally have ~50% approval ratings).

Of those 5 people who will give you a shot the *only* people who matter are the successful ones. The key to getting ahead in life is not keeping in contact with all 5 of the people but only keeping in contact with the one you think is going to be a winner (later) or is a winner (now). That is the only way you’re going to get better in life. No one gets better by keeping in contact with the same old people doing the same old stuff year after year after year.

This is a classic lesson learned in sales. Don’t bother trying to win people over who don’t like you! Move on! There are millions of people in the world and you’re better off going after that blank canvass than trying to clean off the mess that’s already in front of you.

8) Don’t Try to Win People Over:

We really should do a full post on this but it really would be boiled down to two sentences.

“Once someone does not like you it takes 3x as much effort to turn it around. That means you could have three more contacts instead of one fixed contact.”

A great example is our Twitter page, we’ll give people a chance once in a while even if we think they are idiots. But. Once they cross the line, we just block them and move on. Eventually when your life gets busy enough you’ll do the same and… what happens? You obtain even more friends!

Whenever you find out that someone doesn’t like you, simply remove them from their life. Even if you can “fix” the relationship it won’t be worth it. You could have built 3 new ones anyway.

The *only* time you should be concerned is if the relationships you’re winning are from average people while the relationships that are ending are from successful people. Other than that this is how you should operate. Remember the 3:1 rule and you won’t worry about a person disliking you.

If you care about your freedom of speech then you better get your finances together. You do not have free speech if your entire livelihood could be taken away from a Facebook post (hint: have zero personal ties to social media until financially independent).

9) Free Speech is Reserved for the Financially Independent:

In our current “politically correct environment” you’re better off keeping your mouth shut until you’re rocking and rolling. After that you’re free to say whatever you like because no one can touch you.

The key to happiness really lies at that sweet spot. Where you can work alone, live alone and say whatever you like without a care in the world. If you’re in this situation, you’re only going to work with people you enjoy and that will make the project or business operate even better.

We got a lot of questions here, and again it looks like the bonus pool will be flat to slightly up depending on your bank (assuming Q4 is not a debacle). All in compensation levels are around the same level as 2006.

10) : Wall Street Compensation Update

Analyst – Base $80-100K (100% targeted bonus) 160-200K (age 22-25)

Associate – Base $120-160K (100% targeted bonus minimum) $350-400K if you are promoted to VP (age 26-33, wide range due to young talent and MBAs)

VP – Base $175-225K (100%+, call it 125% targeted bonus due to revenue generation) (age 30+)

Director – Base $225-275K (Variable call it 1.5x base salary target due to revenue generation) (age 32+)

Managing Director – Base $300-400K (Variable, call it 2x base salary as a target due to revenue generation) (age 32+)

The only material difference over the past decade is that the mix of income has changed a bit. More and more banks are offering higher salaries and lower bonuses. But. Again. The all in number is roughly the same as it was back in 2005/2006.

****

Re-Prioritizing Life By Stages

Re-Prioritizing Life By Stages

People don't lack time, they lack prioritization. When you talk to regular people, they are always "busy" but then never have any results… year after year after year after year. This is due to a lack of prioritization. If you ask people for investment advice however… they will quickly pitch some sort of investment. Completely ignoring the fact that they aren't even rich. Ask them for a good tax planner and they won't know the answer, they also won't try to BS because they know there is a "right answer" versus an opinion.

So we're going to address the most common excuse and "life debate" in a single post. Your regular guy will say "oh there is no guarantee of success so better to live it up now". Then you ask them …Now they get offended. It doesn't really make any sense so instead we should start with a general life philosophy and work backward to solve for the right answer. Very similar to math class, where the fastest way to learn was getting the answer from the back of the book, figuring out how it worked and ignoring what your teacher was saying (since he/she has to teach to the lowest common denominator in the group).

"Is Budweiser and pizza really living it up?"

Before you begin to prioritize, you have to come up with a general life philosophy. If you're reading this blog you're probably not interested in a lentils and rice diet with a blunt in your hand. Highly unlikely. It is more likely that your "philosophy" is *maximize full potential*. If this is true your priorities should be flipped when compared to the general public.

: Life Philosophy

If we can start there as a basic agreement point then the stages are pretty clear: stage one is wealth accumulation, stage two is protection of health and longevity and stage three is relaxing and paying it "forward" to a younger generation or if you decide to have kids, your kids in that case. As usual, we don't make any comments on your decision to have kids so stage three could be charity etc.

One of the funniest arguments we get on this blog is . Instead of debating the exact time frame, the philosophy is actually more extreme than that.

Stage 1 – Building a Foundation: *"you don't get to have a lot of fun from age 20-25""As long as you're broke "*how is it possible to actually have fun spending money?

That last part needs a lot of emphasis. If you're broke how is it even possible to have fun? Do people really enjoy eating fast food and getting high on the beach knowing that it might cause them to save $0 in the month? This doesn't sound like fun at all. This actually sounds very stressful. Why would spending everything you make be enjoyable when you know that it's going to put you into an unstable financial position. This is one where we still have a hard time understanding the other views from regular people. Working two jobs or working longer hours initially isn't stressful because you know it's pushing you into the right direction. Doing drugs and drinking to lose all productivity the next day when you've got nothing sounds incredibly stressful.

A good foundation is pretty simple, you have enough money to last you about 10 years (only covering your basic needs, food, housing, electricity and your cell phone bill – ie. any recurring costs). Until then how is it fundamentally possible to spend money on things that don't generate returns. Even worse are the people who have a good year then spend $40,000-60,000 on some new car, setting them back a year at minimum. It just doesn't make sense. Sure it's not physically possible to have zero social interactions while you're building a foundation, but the amount should be severely limited since you can't really enjoy the going out process in the first place.

What is a Good Foundation?

The first part of building a foundation is finding something you're good at. If someone has zero talent they won't be good at anything. But. That is highly unlikely. Simply take a list of the things that will make money: sales, tech etc. Find out which one you're best at and that's a starting point. Chasing your passions doesn't work. We know thousands of people who are passionate about dating beautiful women and drinking alcohol. Unfortunately neither of those make money unless you're doing something illegal or conned your way into being a trophy husband.

Find One Skill:

Before looking for a skill you have to ask "will this make money" if the answer is no, then it's not a skill worth pursuing Emphasis on today. When you're rich you can follow any passion you like even if it won't make you money. This is why rich people have weird habits/hobbies ranging from collectables to unnecessary things like a tennis court in their backyard.

***today*.**

Now you're ready for step two of building a foundation. Find a career that pays for your skill. In fact, the bar is so low we'd say you can even start with a job (time for money exchange). Everyone has to start somewhere. Assuming you start with a time for money exchange for your skill then you need to move from this into a career or business.

Turn the Skill Into Profits:

Example: you find out you're good at sales. You have two options a hourly position that doesn't pay you commissions but pays you per hour, the product has a high price point. Option two pays you commission but the product you're selling has a low price point. The answer is clear… Choose option one. Why? Selling high ticket items is a lot more transferable to future positions. Selling low ticket items will move you into the direction of business to consumer transactions versus business to business transactions. Follow the money!

So you've got one stream of income going. While you're at it, it's time to find another income stream. This is going to vary from person to person. For people who are sitting at desk jobs you're better off going into: 1) online sales, 2) design and 3) random tasks on Fiverr. Now, the last one gets a bad reputation because people do it completely wrong. You use Fiverr to figure out what tasks you're good at. Who knows what it is. The good thing about these low paying transactions is that you can get immediate feedback on the quality of the work. Once you figure out what you're good at you branch out and start a actual company. Most simply sit there and complete tasks then complain that they aren't making money.

Find Another Source:

In a secondary scenario, if your skills are more physical in nature, you worked in construction for example. Well in that case, the manual part will be painful but you can probably scale that into fixing houses, walls, sinks etc. This is then naturally going to lead to real estate flipping. Not a hard transition.

At this point you're ready to move into ownership. You get to take your skills (hopefully at least two) and turn it into something that generates . Whatever you do, do not start an informational website such as this blog as it'll tank during a recession and e-book products/seminars go to near zero during downturns. This is 5x as true for anything services oriented like personal training.

Create Ownership:recurring income for you

You take your skills and move them into recurring revenue. If you're selling product X, then you create product Y (similar to product X) and simply out compete them on the sales side. You have to compete with something and it usually comes down to your personal skills or an improved product. Trying to compete on "process" is dying due to the scale of Amazon. It really is that simple. You take what you're doing create a *product* and decide if you can . Ideally you can do both, but we're making it even easier than this.

make it better or simply sell it better

At this point you're pretty much good to go. You have a couple of sources of income, one main one (your primary skill) a second one (your secondary skill) and now you're on step three building something that attempts to combine the two. Please do not message us telling us this is impossible, the vast majority of people who work in office jobs spend more time reading worthless news articles and talking about the latest sports game than doing work.

How long does this all take, and you're going to be on the right path. We've stated here "give me three and you'll be free" because that's how long it usually takes for people who want to be successful. It's not all that fun, but you weren't going to have fun spending the small amount of money you had anyway. When you look back you laugh at the idea of spending money when you're on;y saving 10% of your income. And. As long as you didn't make a cardinal mistake: assuming income lasts forever, going into industries that will die before you get rich or trading your time for money forever… you're set for life.

Time Frame: around 3-5 years

Once you've gotten the money situation figured out, you can now transition into living a pretty balanced life. Don't get trapped into believing you "need" to be a billionaire. No one needs to be a billionaire unless they have severe insecurity issues. We call this stage "health and longevity". For those that are deeply curious, we're certainly in this stage. Making more money is fun but it's not worth chasing in the expense of health. Working 10 hours in a day once and a while is fine. Working 10 hours a day every week will never happen again (unless something extremely profitable comes up).

Stage #2 – Health and Longevity:

If you're rich why are you working, shouldn't you just sit on the beach all day? This is crazy logic from people who aren't rich. Making money becomes a video game where you're simply trying to "level up". Sitting around and drinking all day gets boring eventually and there are only so many rainforests and waterfalls you can see before that excitement dies out. You've hit maximum travel overload when you land into a brand new foreign city and are not excited/emotionally rattled at all. For fun this happens at around the 50-60 city marker.

*Mental Health:*You get bored.

Here is the art to the balance game. If you're going to sleep thinking about work every night, you're working far too much. If you're waking up excited to do something productive, you've got the right balance. It's a psychological game. When you're working too much you think about it all the time particularly when falling a sleep (you'll experience this for 3-5 years or so).

This will need some work after your first 5 years of pain or so. Something will happen. You'll gain a little too much weight. You might have some skin flare up. You might have knee problem. Who knows. Your goal is to get your body back into high quality shape. This is not a debatable topic to us. If you've already made enough money to be set for a decade or more, you want to create quality hours out of the next 20-30 years.

Physical Health:

In fact, you have to build in increasing time for physical work. This is going to to include stretching, more attention to your diet and having higher quality equipment for all of your activities (skiing, running shoes etc.). An extremely small price to pay for having a solid 20 years straight of fun as your peers become over weight and have injuries to deal with.

This ramps up quickly. Long gone are the days of cheap bars, going to "spring break" to party with other degenerates and *cheap* house parties. It slowly turns into private events from your network of successful people. We still get a good laugh when people think this doesn't exist and that all the women who show up are old. They don't realize that they are signaling to the world that they are unsuccessful.

Social Life:

Getting back to the point, you want to slowly merge "the triangle". The higher you go up in any field, the more likely that everyone knows each other. This then leads to a natural screen for successful people. This screen then allows you to figure out who has a balanced life (good social contacts) and then you throw private parties/events. It's just how the game goes.

The last item on the list is something you get to experience with larger amounts of money. Rich people will spend for comfort and saved time, since they know both are finite items. Comfort is a finite item since you can't "reverse" a particular experience. And. Time is naturally much more valuable than money as your quality of life degrades unless you want to make a wild bet on aging being reversed in the future.

Reducing Time Drains:

Here is a good list of time drains: doing laundry, washing dishes, cleaning the house/apartment, long distances to your favorite locations, long distances for flights and time spent in transit. This is actually quite a bit. If you can free up just 10 hours a week this results in around 433 days of life saved over 20 years. A huge number, you would have spent over a year of your valuable time doing tasks that are not fun or entertaining in anyway.

We're not here yet, there is too much fun to be had with money right now. Eventually though, you'll be forced to give it away. Again. Unless you believe we'll "solve" death fairly soon. Giving it away comes in two forms: some sort of charity or family/friends. We're definitely not going to give any advice on which path to take there since it's too emotional which leads to arguments day and night.

Stage #3 Giving it Away:

The steps are quite simple though, you find a way to make sure your assets are divided appropriately when you die. Before this if you're extremely rich you can begin giving some of it away before that happens. While it is fun to say that the ideal net worth to have when you die is "$0" it just isn't logical. You are always going to have money working for you until you die, so a large chunk will be there when the game ends.

One interesting way to begin the giving away process is to do small amounts to people you would consider for a larger donation. This lets you know if they would actually put it to use or not. Imagine giving someone a car only to find that they destroyed it within a year. This compares to another person who takes impeccable care of the car and it looks brand new. Doesn't take a lot of thinking to give more money to person two.

There are three real stages: getting money, stretching out your "prime" and then giving it away. Stretching out your prime is the best part of life (so far), as you're in good health and get a solid two decades or more to enjoy every aspect of life. If someone wants to "live it up" without going through the three stages (attempting to skip them by winning the lottery) we hope they enjoy their beer pong and cheap Tequila shots at age 40.

Conclusion:

Q&A Announcement – We'll hold a Q&A on Wednesday August 7

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality … You'll probably like . The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). Real Estate Investing Continued: An Intro to REITs (Real Estate Investment Trusts)

Real Estate Investing Continued: An Intro to REITs (Real Estate Investment Trusts)

My name is and I'm a money addict.*"Nixon"* From close to 7 figures invested in equities, to multiple 7 figures invested in all types of real estate, if it makes money you have my attention. However, these and other investments are currently side hobbies as my day job entails being one of the primary executives at a Real Estate Investment Trust (REIT).

I've worked at a few different REITs in my career and have probably done some type of business with the WSPs or their peers. I've probably even rubbed elbows with the WSPs in Midtown and didn't even know it. Probably at a property that was owned by a REIT.

Let's get started.

Do you want to invest in a Manhattan skyscraper or maybe even a hotel in Beverly Hills? REITs are your best bet.

What is a REIT?

A REIT is a company that invests in real estate either through owning properties or through providing mortgages, while distributing at least 90% of their income to shareholders (You) in the form of dividends.

There are considered to be four main "food groups" in real estate investing and this is where most REITs invest: multifamily, office, retail, and industrial. Besides the four food groups, there are numerous other types of real estate that REITs invest in: storage units, hotels, single family houses, hospitals, golf courses, student housing, data centers, timber, etc. Most REITs like to specialize in a specific area of real estate, but some will invest in as many types as they can.

REITs are basically spread investors, investing at cap rates that are greater than their cost of capital. The lower their cost of capital, and the higher the return, the more money they are going to make. Note that REIT earnings are referred to as "Funds from Operations" (FFO) and not "Earnings Per Share" (EPS). FFO adds back depreciation (massive non-cash expense for REITs) in order to get closer to a true cash flow metric.***risk-adjusted***

Dividends are typically paid to shareholders (You) quarterly, although some, such as Realty Income (NYSE: O), pay dividends monthly. If you're gearing up for financial independence (), this is a fantastic way to get part of your income. Also, REITs typically increase their dividend payouts every year, and some REITs increase their dividend payouts multiple times a year.or generating passive income

Why Invest in REITs?

1) Income/Total Return: My favorite feature of REITs are the juicy dividends. The average dividend yield for REITs is in the 4% range (some even pay in the double digits!) while the average dividend for the S&P 500 is in the 2% range. REIT total returns have also typically exceeded the broader stock market over the long term when looking over various 20 and 30 year periods.

2) Ease: If you're still nervous about investing in real estate after reading , there is no easier way to get started than buying shares of a REIT. No repair calls, no chasing tenants for rent, no signing on the dotted line for mortgages, etc.OwnMyHood's excellent post

3) Liquidity: Maybe you need to sell your real estate quickly in order to take advantage of another opportunity, or maybe you're feeling bad about the real estate market and want to exit. You can sell REIT stocks in seconds with a couple clicks of a mouse and get your cash out quick and easy. If you're investing in physical real estate, you're probably talking a few weeks to a couple months (maybe more) to get liquid.

4) Diversification:REITs invest in hundreds or even thousands of different properties in various locations (including outside the U.S.), so if one of their properties goes bust, it's only a minor blip on the radar. As mentioned above, some REITs also invest in multiple asset classes, so if one asset class is underperforming, another is likely outperforming. Also, REITs are a great way to get some personal investment portfolio diversification when added to your bonds and other equities. Lastly, you'll get access to properties and areas you wouldn't otherwise have access to on your own.

How do I invest in REITs?

There are publicly-traded REITs and private/non-traded REITs. This post is focused more on publicly-traded REITs, because if you have access to purchase shares in non-traded REITs then you are probably accredited, which means you shouldn't be reading this post anyway (although I know for a fact there are accredited investors that frequent this site!).***numerous***

Nearly 200 REITs are listed on the NYSE and can be purchased through your brokerage just as you would any other stock. There are numerous resources out there to help you analyze a REIT, including if you want pinpoint a certain asset class. Google is your friend.

I personally invest in several individual REITs in which believe in the strategy and long term strength of their portfolio. No, I will not share which companies, as you've read numerous times already that you never give away all your money-making secrets.

. I also invest here due to the diversification benefit of investing in over 100 REITs (in addition to the other diversification benefits listed above), along with the tremendously low expense ratio of 12 bps. However, for the average investor I'd just recommend DCA investing in the Vanguard REIT Index (NYSE: VNQ)

Note: potential inefficiency from inflows has been on my radar and has also been mentioned several times by WSPs. If you don't understand that sentence, maybe WSPs will educate with a future post.towards ETF/passive investing

Taxes and Dividends for REITs

Because REITs distribute most of their profits through dividends, they are exempt from paying taxes to the IRS. Instead, the shareholders (You) pay taxes on that income through the dividends you receive from the REIT. These dividends are generally taxed at your ordinary income tax rate vs. the qualified dividend tax rate. This means the IRS takes a larger chunk in taxes of the dividends paid from REITs than dividends paid from other companies.

However, because REITs distribute most of their income, dividend yields are typically higher for REIT stocks, as are the net after-tax yields. For example, SPY (the S&P 500 index with mostly qualified dividends) currently has a yield around 1.9%, whereas VNQ currently has a yield around 4.4%. After tax yields for VNQ (depending on your tax rate) are roughly 3%, whereas SPY is closer to 1.5% even taking into consideration the lower qualified dividend tax rate.

Note that because of the higher tax rates on dividends, REITs may be an excellent option to invest in within a tax-advantaged account like an IRA or 401K.

REIT Investing vs. Do It Yourself Real Estate Investing?

The short answer is both, however DIY may not be an option depending on your situation. If you're looking for easier, or more liquid/diversified, real estate investing then REITs are probably for you. But if , you can build more long term wealth through DIY. If you're probably a normal person (looking for a magic pill) that stumbled onto this site by accident and won't last too long. you're willing to work hard***absolutely***you're willing to work hard*not*

That's the high-level overview of REITs according to Nixon. Thanks to the WSP for handing over the keys for another real estate post (terrible pun intended)!

As always, I've gotta run, the money's calling!

– Nixon

(Full disclosure: long VNQ)

—-

Similar to the prior guest post from ownmyhood, after vetting their credentials we're allowing to post on Real Estate if they feel like giving blogging a try here and there with their free time. We would love to highlight that Nixon sent us this article during the "Final Four" because as he's mentioned in the past he cares more about making $$ than watching dudes run around with a basketball. Since there is a recommendation by Nixon in the post regarding VNQ we are providing an overview of VNQ below.

WSPs Note: Nixon, RE Guy and Ownmyhood

The Vanguard REIT ETF is set up to 1) track the performance of the MSCI US REIT Index (which covers about 2/3 of the US REIT market, 2) build positions in REITS with a minimum requirement of $100M in market cap and 3) own and manage properties in retail, office, residential apartments & industrial spaces. From a market sub-segment perspective as of this writing the mix of investments is as follows: (Retail REITs 21.6%; Specialized REITs 16.5%; Residential REITs 15.7%; Office REITs 13.9%; Health Care REITs 12.3%; Diversified REITs 7.8%; Hotel & Resort REITs 6.1%; Industrial REITs 6.1%)

Vanguard REIT ETF (Ticker: VNQ):

1) Dividend Yield of 4.4% today, 2) 0.12% expense ratio, 3) ~$65B in net assets, 4) 158 holdings, 5) Turnover rate of 6.70%

From a ETf Overview Perspective:
****

Real Lifestyle Inflation – A Guide to Expectations

Real Lifestyle Inflation – A Guide to Expectations

If you're young and broke, you've got a better chance of reaching $100M+ when compared to someone in his 40s with a million or two to his name. This is because the older person has much more to lose (likely has high expenses, Career to give up and many other ongoing costs). Oddly enough, we've noticed that many people don't get to even $1 million largely because they spend at the wrong times, ramping up their expenses when the ROI doesn't even show up. So we'll go ahead and highlight some milestones on when to do a lifestyle upgrade.

Someone in their early 20s shouldn't have high expenses. The expectations of you are low. You don't need to go to the club and drop $10K on bottle service. You don't even need to spend a lot of money for entertainment purposes. Using the classic example of a "date" you can easily get away with going to the beach and drinking wine/beers. This is entirely acceptable since no one expects a 21-24 year old to have a lot of money.

Basics:

Another interesting psychological note that we think goes unchecked. Even if you do make good money, there is no point in showing it. Generally speaking, people do not like it when you have "more money than you should". If you want to experience this first hand, it is quite common to get "bad looks" on your first couple of business class flights. They look at your face and assume that you have money from "mom and dad". Instead of being annoyed by this social taboo, use it to your advantage and simply upgrade when you realize

you can upgrade your entire lifestyle.

The underlined section is critical. If someone decides to upgrade their lifestyle in sections, something always appears off. If they buy Gucci shoes, but don't own their own apartment… this doesn't make sense. If they do buy an apartment but can't afford to go out to a decent dinner ($100 a person), this also doesn't add up. From what we've seen the people who end up with a lower net worth despite having high incomes try and upgrade in "bits and pieces" versus overhauls every 3-4 years or so.

For the sake of starting a debate here, this is a rough outline on how to increase spending and what we would consider the bare minimum (major city).

Our blog targets people in the 21-35 range for a reason, it's the easiest time to get rich. Most people will overspend because they are making a few bucks (~$100K/year) and think they are now "rich". This is when a smart person will realize that spending at such a young age is largely a waste of resources. If you're going to spend all of it then you're going to negatively impact your social life. It sounds counter intuitive. But. If you're trying to show how successful you are when you're young,

Age 21-25: all it does it damage your relationships with older successful people.

There are always exceptions to the rule but a good rule to follow is If you follow that basic rule you'll realize why people are so competitive. They truly believe if you're the same age as them you are somehow "equal" especially if you meet for the first time in a neutral setting.

"No one wants to see someone younger than them (or the same age) succeed".

This was a long introduction to say that "you should spend like you're a young graduate". This means you shouldn't even bother upgrading your life through your early 20s. Even if you hit it big (and many of you will) by age 23 or so… There is no reason to spend a bunch. Why? The ROI is just too low. For what it's worth we've found that age 27 or so is the inflection point and by 35 you can essentially do whatever you like.

With this backdrop we'd say a good framework is to live with roommates your first 3 years or so, 21 to 24 years of age. You can eat at basic healthy places and avoid going the bottle service route (bunch of college people chipping in to sit around a cheap bottle of vodka doesn't have a high return profile). Find some basic brands that fit your frame and spend more of your time .

building revenue streams

Treat the first 3-5 years after graduation (if you went to college), as a very difficult video game. You want to live as cheap as possible because it's socially acceptable (take advantage of it!) and you won't have much time to do anything else besides build revenue streams and go out a couple times a week. Finally, no girl you're interested in will care if you live with roommates under the age of 24/25. If she does care… not a good catch anyway.

Roughly speaking, in an expensive city, you're looking at rent of around $1,500-2,000. Your food costs and drink costs should run around $1,000. Then you're left with another $1,000 for transportation, a vacation/trip and miscellaneous costs. This will get you to around $70-90K in gross annual income being spent. If you're a banker you're essentially saving your bonus. Unless. You're a smart banker who created a second form of income adding a few thousand dollars a month and growing.

The Financials:

To reiterate, the chart is just a guideline. Some people may end up living alone a tad earlier but our point is that around this age bracket it starts to damage your social life. If you live alone at age 26-30 this is going to help your social life the most. You don't need to buy anything or upgrade to a massive high-end apartment, all you need to do is live in a good area of town alone. If you've taken your early 20s seriously, you should have two solid forms of cash flow (at least). You should also have a good amount of money invested which means

Age 26-30: the income you make from investing (stocks/real estate) should add another "0.25x".

Pausing here, a solid form of cash flow is something that covers all of your *necessary* expenses. This should be 1) rent, 2) food/drinks and 3) utilities (internet included). If you're in this situation it means that you're able to invest at least ~50% of your income into new ideas, stocks/bonds/real estate etc. Also. Our 0.25x assumes that you've already done this. You should have some investment income coming in that results in about 25% of your total living expenses being paid for. Ideally it is higher (closer to 50%) but 25% is a good minimum goal to hit by this age bracket.

From a social perspective, you can still get away with a relatively basic lifestyle. Instead of trying to "flex" on everyone at this age, go ahead and fly under the radar again. The reality is if you try and push hard into the spending category you'll run into big competition (guys in their 30s) with 2-3x the spending power. It just isn't a fun game to play. We'd recommend taking this time for a lot more traveling and simply upgrading the venues a tad.

If you travel in this age bracket you'll know what countries are enjoyable. You'll have a better feel for your own personality and you will get a lot more life experience. Some of them will be good (learning a language) some will be terrible like getting robbed or tricked the by locals in some form.

At this point, you should be putting significant distance between yourself and your peers. The chances your peer group took the time to build a second stream of income is under 1%. Seriously. Under 1%. Your lifestyle is going to upgrade at the same rate as everyone else. While they got income bumps of 20-30% like you did (Career), they will spend it all to upgrade to this next tier of living. You on the other hand, had a 100%+ bump since you created a second form of income.

The Financials:

The monthly spend goes up a bit but nothing crazy, the two biggest benefits to your social life will be 1) living alone and 2) the change in suits from basic off the rack clothing to made to measure (at minimum). Each month you'll spend about $2,000-3,000 on rent, $1,500 going out, $500 on traveling and $1,000 on the rest. This gets you into a range of about $5,000-6,000 a month or low six figures in spending per year (gross income basis).

This is where the "money hose" turns on. Compounding is an amazing mathematical phenomenon. If you've gone through and followed the rough 9-10 year guideline you should be set. You should be and more importantly your is now over 3x what you can spend in a year. If you were spending about $5,000 a month, you're likely making $15,000 a month net at this point (again could be much higher depending on how hard you worked).

Age 31-35: worth well over a million dollars**cash flow**

The best part about this age range? It becomes acceptable for you to be "well off". If you check into your business class flight, you no longer get a strange look from the passengers. No one believes you were a spoiled kid who inherited money and you can drive a nice car/wear a nice watch without any social repercussions. The only downside of this age bracket? You'll get a lot of questions about how you were able to "make it". Just deflect them and say it was luck since there is no point in having these conversations with people your own age (".

No one wants to see someone younger than them (or the same age) succeed"

Now the fun part begins, since you can cover 3x your old living expenses you can easily decrease your multiple to ~1.5-2x. This means you can increase your spending to at least $8,000-12,000 or so per month. We don't know about other people, but if you've got $10,000 a month to spend and you're a single person… you're doing well practically everywhere. This is 100x more true if you're location independent. Even if you decided to work a Career, major cities are quite easy to live on with five figures in monthly spending (~$200K gross a year).

Depending on how you want to change your life, essentially you move to the "ideal" part of the city for you. If you were there already? There is no reason to move. The next two biggest upgrades will be your flights (moving to business class at all times possible) and the change to services (freeing up hundreds of hours per year, cleaning/cooking/stretching etc.).

Each month you'll spend about $4,000 on rent, $2,000 going out, $1,000 on traveling and $2,000 on the rest. "The rest" is quite variable here. We don't know if the person decides to buy a home. They could rent and live a location independent life. They could also give up traveling because they love the city they are in. We just don't know. What we do know is that the flexibility is there and the gap between you and your original peers will become so wide it becomes uncomfortable. The good news is that the other people who made the correct life decisions will stand out like Ferraris parked in front of a 7-11 (obviously out of place!). These individuals will end up being your new normal contacts.

The Financials:

We're only putting this section in here as a bit of a warning sign. When you start getting closer to 40 or so the "assumption" is that you did make it. This is the exact opposite of the beginning of the article! When you're young people assume you're broke and give you a pass. At 40? People assume you're rich and don't give you a pass for anything.

Age 36-40+:

If you want to continue going out frequently it's much more likely that there is a "group" environment associated with it. While there are always exceptions to the rule, it's more likely that a rich guy will show up with a group of people versus solo. The times you'll see him going into a club alone are next to zero. You'll find these individuals go into cocktail bars, hotel bars and other nice venues alone but the clubs are now reserved for pre-planned events since the days of going out hard all night are slowing down.

Ideally there shouldn't be any checking of any spending at all. If you want something you get it and move on.

The Financials:

There are a few interesting conclusions here. Spending a lot of money can actually hurt your social life. Not only does it make it harder to get rich, it doesn't make your social life much better. If you make it financially it is smarter to build out that passive income flow from real estate and stocks before turning on the "money hose". You're going to be well off buy still relatively young so you can be a bit more cautious. All of the age brackets are certainly guidelines. If for some reason you make it to $10 million by age 30 for example… you can just jump the spending to the 40+ level since it's irrelevant. There is something odd about turning ~30 years old, where spending is no longer seen as taboo. your social life will change. This is not something that is preventable in our opinion. If you're not changing social groups over time it usually means poor decisions were made. Attrition alone will take your original group of colleagues and dwindle it down to 1-2 of them. The good news is the other people who made it will stand out. money is just a tool. Unless you make it to huge numbers of $20M+ it's hard to tell the difference between someone spending $15,000 a month and $20,000 a month. This is why your preferences will change quite a bit (working less) .

Key Conclusions: First:Second:Third:Fourth: Fifth:unless a large opportunity presents itself

Q&A Announcement: The next Q&A will be held on Monday the 13th. To participate please keep your purchase of either Efficiency or Triangle Investing.

Realizing Time Can Be Saved and Comments on December

Realizing Time Can Be Saved and Comments on December

We're witnessing a second wave of COVID-19 shut downs. This is something expected over six months ago. Instead of worrying about what is happening now, it's better to take a look at the positive side of this development. The positive? Everyone learned they were wasting incredible amounts of time. Commuting to work is a waste of time if your job requires a computer and telephone number. Ordering perishable basic items online is significantly faster and isn't worth a trip to a store. Sleeping during the day as a "lunch break" is more efficient and more effective. And. All your friends consolidate into a smaller pool.

As we've stated many times here, health and time are worth significantly more than money. Without health, your time on this planet is shorter, more painful and prevents you from making any forward progress. Also. Time is the only finite item in the world. Even a billion dollars cannot buy you more time.

New Time Saving Purchases:

This is a good time to take a look at the items we can throw out the window starting in 2021 (if the economy opens on January 1). 1) all consumable items with no shelf life should be ordered online. This saves time and money. There is no reason to go to a retail store in the future for items that are the same off the shelf vs. in person (things like fresh produce may require a trip to the store); 2) electronics. There is no reason to buy these items at a retail store. The new smartphone or computer is going to be better, simply measure out the screen size and click buy and ship to your home; 3) Basic clothing. Socks, shirts and even shoes are easy to order online. The one exception is custom clothing. This should reduce all of your shopping time to mere seconds from 30-45 minutes; 4) all cleaning and healthcare supplies. Another easy one, this includes everything from soap to medication and 5) digitized information. The days of saying "I prefer physical books" is dead at this point. Physical books are now physical maps, inefficient if you've spent a full year operating off of remote documents.

For fun, while unrelated to saving time, you can see that commercial real estate is going to be in a world of hurt for the next several years. There is no reason to bet on that industry for now. Retail is simply being shifted online at an incredible rate and it's smarter to avoid catching a falling knife for now. With businesses closing during the most profitable month of the year, online sales are going to balloon for the month of December.

Hopefully, you do not work for a firm that is stuck in the past. If you're in a knowledge based industry or work in technology you should be entirely set. There is no reason to return to long commutes ever again. Perhaps you need to live relatively close to an airport for important in person meetings, however, that should be about it. Also. You should go ahead and cancel that gym membership. The industry is going to be forced to raise prices or shut down entirely. While there are some exceptions for certain people/groups, generally if you can afford to buy a bench and have the space for weights… Go for it at this point. Painful to write but shutting down an industry like that for 12 months is not going to result in a "v-shape" recovery any time soon. Support your local gym if possible… it's just unlikely that most of them survive

New Time Saving Equipment/Adjustments:

While we've covered this topic a few times, we'd go ahead and expand everything. Your usual outsourced services should be done at home going forward. Adapt or die. The majority of service businesses (massage, facials, spas etc.) are going to be out of business quickly. No. We are not happy about this and have stated many times that the decisions made have crushed the middle/lower-middle class for a long period of time. Appalling. That said, you have to adapt to the situation. Look into the following: 1) at home skin care routine – spend more for quality, 2) at home massage items like electric pulse massages, massage chairs and bands to help you stretch at home and 3) brand new cooking equipment. These three items should improve your quality of life the most. If you're forced to "rely on yourself" you may as well have the best items to do so. Most younger people will end up eating a bunch of junk food (while simultaneously smoking a bunch of weed). Naturally, you should do the opposite and become efficient at cooking and maintaining your health.

Similar to the prior section, pausing to talk about investing, we're positive on the future of drug use/marijuana. Not because we recommend it but because that is what people will do (weed and other recreational drugs won't help you get ahead if used frequently). Think about it in two ways. What will people actually do? They will eat unhealthy foods like burgers and pizza while smoking a lot of weed. What should you do? You should *invest* in the companies selling burgers/weed/pizza and spend your *time* living a healthier, cleaner and more independent life.

To make sure this is phrased correctly, we're not thrilled about the results of the government intervention (shutting down business etc.), this is a statement related to the results of the actions. The result? Your social circle likely shrunk and depending on how your business was running your quality of life went up 2-3x or went down 3-4x. This movement of 2-3x increase or 3-4x decrease has caused a fast and severe bifurcation in your social circle. You're able to distinguish the beneficiaries from the pain takers based on their reaction to the COVID-19 situation. (Notice we don't use the word winner vs. loser here since this wasn't their fault, they were forced to shut down).

New Habits and Social Circles:

For those that are interested in keeping their social circle unchanged, the most you can do is avoid talking about money. We'll go ahead and bet that this won't work. But. It is your best shot. Once you eliminate discussions on income/expenses you can minimize the friction. In the end… There will be a split. This will lead to a smaller social circle (for better or worse).

Assuming you have an online income of some sort, you've had a great year. While work hours were longer, you were able to sleep during the day and you were able to increase your profit margins by at least 30-40% (IE. a dollar earned no longer led to 30c in profit but closer to 40c). Also. You learned that variable work hours reduced stress and led to similar productivity levels. These changes are structural at this point, meaning you'll never go back to the past even if your business slows down a bit in 2021. One thing is for sure, you've learned that sudden surges in demand need to be accounted for instantly. If you miss the boat on a sudden surge your potential annual income drops significantly.

In similar fashion to the prior sections, the final sentence also alludes to our belief in Q4 results (investing/generating revenue). Since the US is shutting down retail outlets during one of the busiest months of the year, the impact to them will be even more severe. Q4 results are usually significantly higher than any other quarter in the year (just look at the P&L of a Company like Apple and compare Dec-qtr revenue to Jun-qtr revenue). If you run an online business we *strongly* recommend sending out a promo/sales offering right now. This should last through Christmas as you can capture more sales than usual (all of your competitors are not allowed to compete). Before anyone jumps in and says the "prior sentence is too cut-throat"… Just look at your inbox over the next week. You'll be bombarded with new offerings from e-tail companies as they recognize this as well. Don't miss the boat.

Outside of the positive changes that COVID-19 is bringing *for a select group[* (ability to save tons of time and increase margins), we can look at the implications of the December shut down which are as follows: 1) more restaurants/retail will be shut down for good, 2) this will cause online sales to see a significant boost in December, 3) companies that were on the fence about remote working, will likely make it a permanent option, 4) major cities will continue to see outflows for example SF -> Nevada/Texas, Boston/NYC -> Miami/Carolinas, and preference for lower cost cities such as Nashville, 5) executives will be paid a *lot* since they know their workers won't be able to move easily and 6) additional loss of trust with the government will make a vaccine deployment harder as citizens will not trust the initial solution.

Separate Note – December:

Putting feelings aside, that appears to be the impact of the decision to shut down businesses in major cities. It is quite depressing to see companies that were alive for 20 years go out of business. That said, you (yes you the reader) has to adapt or die. Keep your costs at near zero (especially if you own anything related to brick and mortar) and continue to build an online business/presence. The big will get bigger, but at least e-tail/online sales is a growing market.

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life.

Reminder Post: Rig the System in Your Favor

Reminder Post: Rig the System in Your Favor

Sometimes it is good to take a step back and realize who frequents this blog. It is primarily younger men in the band of 20-35 or so, the only reason the age band expanded is because of the long history we have here. That said, one of the key things we try to keep in mind is that the average reader is still "trying to make it". So. We can put up a brief summary of what we'd do if we were starting all over again. Luckily a lot of the things have not changed.

While education will be disrupted long-term (VR class rooms etc.), we're still several years away from full disruption based on what we're seeing. People still view degrees from Ivy League schools and other top universities as valuable (status signaling mechanism). Therefore, the same strategy applies. Get into the best university you can without incurring debt (or any real amount of debt). You can then start working part time jobs while at school and obtain internships.

Good Ole Career Stuff:

Most of you are past this stage so that leaves you with three options: M&A banking, Technology and Sales. At this point the clear winner is technology. If you can get any remote job in technology you're in a great position. Tech is most likely to be "ok" with remote employees and they pay quite well. The second best option is likely M&A banking. This is close to sales but the reasoning is as follows: no travel. If you can play the politics game and work efficiently, you don't need to work 80 to 100 hours a week. Better to work at a Tier 2 investment bank than a sweat shop like Moelis. The $30K difference doesn't matter because you're trying to start a second income stream. Finally, that leaves us with enterprise sales. This is practically equal in attractiveness in our opinion since the income is similar and work hours are much much lower.

So there you have it, which gives you a deeper explanation of how to choose your skills and what industry you should go into.

much hasn't changed from Efficiency,

One of the problems with high achievers is that they want to be the best. This is a death sentence for you in the corporate environment. The #1 performer gets slammed with extra work and makes maybe 5% more than the #2 guy at the junior level. Both guys end up getting promoted anyway so there is no need for this type of competitive craziness.

Bleeding the Career Dry:

Your goal: do the bare minimum to get the promotion. This means you have to pretend to care about the industry (politics, sucking up to the few people who matter) and you have to do good enough work. That's really it. If you know that 5/20 people get promoted you want to be #3/#4. If you're exceptionally good at playing this game you can target #5 but the first go around… #3/#4 is safe.

Broadly, when someone likes you they don't want to blow up your weekends as much. When someone likes you they will also give you a little bit more leeway when it comes to your work product as well. Again. The goal is to skate into the next slot without doing much work. The problem with being a bottom performer is that you will be forced to do even more work (they will treat you like garbage and make up things that don't occur – hence why politics are so important). So better off playing the game "good enough" and moving on. Politics > performance and don't let some boomer or 18 year old tell you differently. People have huge egos in these massive organizations with extreme amounts of bloat.

Once you've done this well, you can implement operational systems to appear busy. Good examples are time stamped emails that go out late at night. Automated products using software. Fake conference calls to free up time – point to headphone and say "sure 30-45 minutes". So on and so forth. This frees up time for you to move to project #2!

You don't need much, you just need validation. Again. Most high achievers are risk averse due to massive amounts of social pressure. So you can start small if you're really scared. Start reviewing resumes for people or doing some cheap consulting service. Once you realize that online income is possible you then move into affiliate marketing, consumer sales or otherwise. The goal is to build something that earns money 24/7/365. Even if it's only $10 overnight. That is still better than $0 overnight. Then it's just a scale game.

The Second Form of Income:

This sounds easy but it isn't. Anyone selling you $200 courses on getting rich is scamming you. It's not that easy. It is hard, difficult and grinding work. You have to figure it out and honestly some people never do. A bit of luck helps.

Once your second income is up and running you want to make sure it is stable. Stable by definition of this blog is around 2x what you make at your career/job (remember a career is where you're paid by performance, job is anything hourly wage). Once you've successfully reached 2x your income you can quit… Or see the bleed it out part below.

Everyone has a different "success arc". This means some people can make a killing in year one and make $1M online out of the gate. Other people struggle to make $5K a year and it takes them 10 years to figure it out. We're not here to discourage either person. Eventually you do figure out a way to make a secondary form of income and it pushes you along your road to financial independence. The key is "when".

Bleed the Career Out:

If you knock it out of the park on day one, you should just quit. It is clear that you're an anomaly. If you're in the second camp and it takes you 5-8 years to really figure things out, you should take a calmer approach to your decisions. If it took you 5-10 years to figure it out, there is no reason to leave your career if you haven't taken your foot off the gas. If you're a middle of the pack employee you're actually important to a company. Anyone who is generating operating profits for the firm is an asset. You just want to find a way to improve your operating margins while reducing your time.

The best way to do this is with a slow fade approach. For example, if you work in sales you want to simply maintain your best clients and give up as it relates to finding new ones. There is no reason to get new clients since your goal is to drop your working hours. Once your revenue is stabilized (ideally the same amount every year), you can play less politics and drop your take home pay by 10-15%. You won't get fired. You will be seen as someone who "hit a wall" and just stagnated. This is perfect for you since you only need to make the same amount of sales and spend the rest of your time on your own projects! Keep this in mind.

The only reason you should quit entirely is if you've knocked it out of the park or your career is hindering your side income. This is quite rare. If you've successfully built something over 5-10 years, is is much more likely that dedicating 2-3 more hours will lead to more income. So you're already increasing your exposure to your side income without giving up the steady pay check.

If you want to visualize this, imagine two business lines with revenue streams. If you invest more R&D in the second one you might be able to keep the first business line flattish for the next few years without any time spent!

If you work in tech you can also attempt to outsource work that you're supposed to do yourself. This is actually happening all over the place. Unfortunately, we were never able to do this.

Another Level of Optimization:

If you work in tech, you can take 2-3 jobs and simply outsource them for a lower amount of money. Then you review it and turn it in to the 2-3 people you work for. This sounds "shady and questionable" however, this is happening all over the place. We know of a few people working three "tech jobs" and no one has noticed. Since the majority of the work can be done in 15-20 hours per week, if they outsource it and simply check… they are done with 35 hours a week or so. It's insane that this much inefficiency exists in the market but COVID-19 and work from home really highlighted it.

For those that are not in tech you should continue to think like this. If you are able to get a second income stream up and running (even barely), you can then begin outsourcing your own work. If you're in the 23-29 age band, there is a zero shot that all of your work is "necessary". A lot of it is mindless which you can outsource. This frees up more time to scale your second income stream.

People in highly competitive fields focus far too much on "prestige" when they should be more focused on productivity. Since we have a banking background we'll give a concrete example. If you have the choice between a sweatshop like Moelis or a solid BB with less work, you should choose the solid BB. If you are in the industry for more than a year you will find which groups have easier hours and simply lateral over to that firm. Why? You're not there for an extra $20K. That's the dumb way to try to make it.

Pause and Zoom Out:

You're there to be top bucket, be around 10-15% of the highest paid people and work 20 hours less. Those 20 hours will build up a second income stream so you don't have to panic before your annual bonus hits. The standard move on wall street is to spend your base salary and save your bonus. This is why they end up becoming miserable as a 5 year career will have a terrible bonus year at least once given the secular decline of the industry.

Well we gave out highlights in our book It's effectively the same except for a much more bearish outlook on real estate due to 1) evictions starting in April/May and 2) the likely tax target aspect since it's easier to tax RE. There is no way we could have predicted a global pandemic and we certainly got lucky predicting a recession by 2021 in our book .

What to Do With Your Money: triangle investing Spending for Maximum return

That is neither here nor there. As usual we focus on the present. All that really happened is that triangle investing accelerated. Crypto is taking off, Tech is taking off, healthcare is taking off and we remain positive on the other markets we highlighted there. The only thing we would do is reduce real estate footprint if you have a lot of it. Since most of our readers are young we'd recommend the same: 1) rent to remain mobile or 2) if you found a place you love, it's best to only have one spot and keep underneath 18btc (also known as $1M USD token).

The rest of your money is going to be put into your online income ventures . While everyone is absolutely hyped about the future of tech, we would like to remind everyone that having multiple forms of income is most important. Hence why we created this post here. Remember to play the game intelligently and all your free time will then be tossed into the investment angle highlighted in Triangle Investing.

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life.

Newer Readers: 1) Efficiency2) Triangle InvestingSpending for Maximum Return**We hold Q&As 1x a month for purchasers only.**

Resume Template

Resume Template

It's the beginning of the year and many people have the same goal, make more money. Not surprising. Since the vast majority of people have jobs and are looking to tier up platforms or up their position title. With that said, lets take a look at how your résumé will be screened.

Many firms will run your résumé through a word search filter looking for specifics such as "investment banking" "equities" "investor" "AUM (Assets Under Management)" and many more specific words. The more finance experience you have the more likely your résumé will pass an electronic filter. Once it goes through this scan your résumé content will be boiled down to the following (in order of importance)

Content:

– Location (switch with College if you are in school)

– Title of most recent position (switch to #1 for higher level jobs)

– Prestige of firm

– Results delivered/rank

– School/credentials/GPA etc.

We start with location for non-college grads because its usually faster to plug and play. Some firms are also trying to avoid relocation payments at the lower-level. Once your career is well on its way, firms will pay up for the right experience so this becomes less relevant. Notably, the higher you go the more likely you're being referred into positions rather than cold applying to positions in the first place. This of course is the best possible way to break in – direct referral.

Another notable takeaways is that your job experience increasingly determines if you will get an interview and yourThis is because the oldest secret of all time is this…

academic history becomes LESS relevant. **If you can make someone money they will hire you.**

Let's assume that you're cold applying. In that case the last three things that can ding you are Since typos are a no-brainer lets skip that step and focus in on format and unprofessional content.

Errors:1) poor format, 2) typos and 3) unprofessional content.

A correctly formatted finance résumé is one page long starting with your personal information followed by three main sections in order: 1) Relevant experience, 2) University information and 3) Miscellaneous interests. Flip number one and two if you are applying from school. In addition to these basics your résumé should be in bullet format and should not use a generic Microsoft office format. The reason why all of these things are key is as follows: 1) If you cannot format a word document we'll question your attention to detail and knowledge of finance, 2) We want to know if you are working or coming out of college immediately, 3) so we want to throw you in the yes or no pile quickly. Three common mistakes below:

Format:We look at your résumé for less than a minute

– Month or year format: No gaps should be shown off (months), gaps should be hidden (years)

– Not PDF'ing your résumé causing it to to have a poor format

– Not using left and right align functions in the document

Many candidates get burned here as they divulge too much information about their interests or personality. . If you competed in a college sport like swimming we will assume you are hard working. If you won a prize for playing the violin we will assume you're smarter/harder working than average. Some examples of bad things that have actually come across

Unprofessional Content:Saying you're hard working, smart, dedicated, and persistent is an immediate bad signIn short.. show do not tell.

Photos of the candidate… No interview. Not even if you're a dime piece.

– "Invented" something… We'll think you're a liar, prepare to be grilled.

– "Significant Interest in Nazi Germany"… scary and disturbing all in one

– "Favorite Sports Team is the Boston Red Sox"… Bad risk. Wall Street is in NYC

Instead, here are some acceptable interests: Fluent Mandarin (implies smarter), Conversational Spanish (implies smarter), Running marathons (implies hard working), Surfing (implies normal), Piano (implies smarter), Rugby (may imply hard working), Proficient in C++ (implies smart). Anything that shows you are "normal" hard working, dedicated, passionate. Notice, surfing gets a lower mark than say marathons. Why? The stereotype is an Iron Man/Marathon runner would be harder working. If you won a legitimate surfing contest, then do not worry about it.

Now we're getting to the home stretch. Lets take a look at how you can show skills versus having clutter:

Good Messages/Skills Shown:

Ranked Top Tier in Analyst/Associate class of 20XX

–

– Completed $XXX billion/million on M&A, Equity Raises, Debt Raises (Usually getting to VP level)

– Worked on Dual Source M&A and Financing deal which lead to Sale/IPO of XYZ company

– Initiated coverage on X companies and attended management meetings to the IPO of X company

– Managed $XXX billion/million in 20xx which grew to $XXX billion/million in 20xx…

– Fund returned X% over last 3 years, bench-marked against X Index

– Obtained coverage of XYZ region which lead to X% increase in marketing meeting requests

– Pitched XYZ Idea to PM which lead to third/full position generating X% returns over 12 months

– Ranked #X in Greenwich, Institutional Investor, StarMine… in XYZ coverage space

– Worked directly with CFO/CEO/CIO on Sales Deck/Financial Model/Board Presentation

– Managed team of X analysts or X associates as lead staffer for Consumer group

– Worked with XYZ sales team, contributing to an increase in monthly trading volume of XM shares

The main take away is this

1) Quantifiable items, 2) Results from your work or team work, 3) Individual responsibility

Weak Messages/Weak Skills Shown:

Worked for an analyst covering XYZ space. (Too vague and can be inferred from job title)

–

– Created pitchbooks and spread comps (Not acceptable for anything but an intern/1st year)

– Helped manage a fund of funds in the technology space (Does not show how much or results)

– Completed two M&A transactions in XYZ space (Does not show any details)

– Worked with 10 person team in XYZ sales and trading desk (Does not show responsibility)

– Managed relationships to generate road shows/meetings (Does now quantify)

Simply put, bad bullets are vague and do not show quantifiable results. Instead of loading up a sample of a good resume right now we will wait for the weekend as we hope you can take these basics and to see how well you did.

apply them today

Conclusion and the Template

ets see how everyone did. To keep this short lets go over the main ideas. As usual

keep it short, concise and helpful to the potential interviewer.

1) No template is perfect, you simply need to make it break into a few sections 1. Name Address, 2. Jobs and Titles, 3. School, 4. Interests

2) You want to show you can use MSFT word, this template screams competence (small caps, large caps, bold, italics, alligns) it can be simplified if necessary

3) As you move up the ranks your specifics become less important as your workload is large, you make sweeping accomplishments

4) At the low end you're proving you learned a lot, note this is the opposite of above where you're "showing" you can make the firm money

5) Even your interests and schooling should be moved in order of finance relevance, Case competition in finance is more important than knowing C++

6) Your resume will be looked at with a magnifying glass… by 10+ people who want nothing more than to find a mistake to joke about

7) Feel free to add awards to job experience as well (Deal of the year, Institutional Investor, Ranked #X in your analyst/associate class, etc.)

8) This is tailored more to the sell-side since the buy-side is less likely to need help in the resume department

9) If you are a college student, education should be above work experience, for people currently in finance work experience goes above education

10) If you are on the fence about an interest veer on the side of leaving it off, particularly if it is not applicable to Wall Street

Risk Management: Politics, Bitcoin, Basketball, and Stocks!

Risk Management: Politics, Bitcoin, Basketball, and Stocks!

You'd think that all of these items have little to do with one another but they do! They all follow the same pattern. Heavy emotions with strong conviction on both sides. This means you will be laughed at and ridiculed immensely for a strong opinion on any side of the market. This is great for you as it allows you to manage risk and ideally see significant outperformance over many years. While we realize many are upset about the election as it *looks* like Biden will win, the reality is that there are hundreds of opportunities even *if* he does. Notice we put emphasis on the word looks and if because people really get upset over politics (which we took 3:1 odds on over 3 years ago and are sleeping easily with the outcome even if he loses – ie. Good risk management and not debatable unless looking at it with 20:20 hindsight vision). Before we begin, there is still a 2-3% shot Trump comes back and we realize this but we're going to go ahead and continue under the assumption he has lost.

The only real thing we learned from this election is that there are a lot of swing trades during the election. If we decide to make a bet on the next one, we will *not* try to make an early bet. The reason is that neither candidate is strong. Why do we know this? Well Biden will be over 80 years old and the chances that he's the same guy running for re-election in 2024 is slim. We took trump in 2017 at 3:1 ($100 wins $300) because we knew he would be the person running for president. We had no idea we'd see the worst pandemic in history, but that is life.

Political Stuff:

Polls are useless. This shouldn't be debatable as no one can really believe this was a landslide by any means. Polls are astrology for men at this point. The quality of the information is more important than the information… "garbage in, garbage out". Therefore, we know going forward that the spreads will make *no* sense in future elections. The spreads went +/- 400 during the election! So emotions are flying extremely high.

What is the conclusion here? After this election, we've concluded that it actually makes sense to trade the lines based on which states are reporting. There was a time when people were worried Trump would lose Texas which was one of the craziest theories we had heard. This digression aside, instead of thinking "people are crazy" the real answer is "massive opportunity here". In conclusion, the main thing we learned from the election is the spreads are actually wider during the vote counting vs. needing to wait three years to get the 3:1 payout (or zero since it is likely he loses). It would have been wiser to close the bet when trump was at -400 during the "trading" of the election. Lesson learned!

Absolutely hilarious. When the election was getting close in October we received many many many emails saying how dumb we were and that Trump was going to lose and on top of that Bitcoin was going to zero. You'd think that the groups would be unrelated… But here we are.

Bitcoin/Crypto:

As you can see from the chart below, there are <20 days in the entire history of Bitcoin where you could have lost money. If you are actually down today, we recommend seeing a psychologist (joke) or simply dollar cost averaging. Dollar cost averaging is probably the best bet. If you simply bought a few bucks worth every single month, you're up massive no matter when you started.

(Pretty Tough to Lose Money Here…)

The other interesting thing you should notice is how the "negative" people believe that they were right. Not sure how this is possible but what they are really saying is an asset/stock/price *must* be at an all time high for anyone to be right. The same people believe that Tesla is a terrible investment because it is at $429 instead of $442 (yes seriously, the ones who were short since $40 split adjusted still believe they are right since the stock was down in 2019).

With the explanation out of the way, we can zoom out to our standard recommendation for Bitcoin only. We cover investing in our book but for fun we'll leave the simple math here again. If you believe in Bitcoin (you don't need to), then you can run the math on the necessary amount to hold. Starting with the total number millionaires. There are about 47 millionaires in the world. Of these 47 million, about 10% of them are considered ultra high net worth, this would represent 4.7 million people. Take the total number of BTC available at 21 million divide by 4.7 and you get 4.47 bitcoins.

There you have it, currently if you own about 4.47 bitcoins there is no way for you to own less than the top 10% richest people individuals in the world. Yes, we know this math isn't perfect as we suggested 4.2 before (number of millionaires has skyrocketed over the past year). If you're extremely worried, then you can move to 5 coins and you're guaranteeing that you're well into the top top top of the richest people in the world. As a final note, we also realize that institutions are now buying it and that is not an issue. If 100 coins represents "institutional level ownership" then your position will be enormous as you're 5% of an entire institution just sitting at home reading this on your computer screen.

For fun, while this article is extreme the numbers give you an idea of just Before you click the link, we are not saying we agree with him. The author states "When, not if". Like any good writer you have to make a bold stance and type in an aggressive way otherwise no one will read it.

how much money institutions have. They have a lot.

We also recommend checking out this website .

for interesting charts

As many of you know we've made tons of bets over the years, trump twice (one win, looks like one loss), 10+ boxing bets, 2 failed MMA bets and 5-8 basketball bets (Toronto, MVP bets were some highlights). In good news, sports are coming back and while we realize many of you have no interest, sports are similar to crypto and politics. Everyone has an opinion, another massive spread created every year.

Basketball:

What we've noticed over the past couple of years is that the boxing industry is seeing shrinking spreads while the basketball industry is seeing widening spreads in terms of the "correct" outcome. IE. since boxing is losing steam relative to basketball (this year an exception due to COVID-19 related ratings drops), it means you should probably shift your interest a bit to the mainstream sports. Why? The more mainstream something is… the more that average joe bets. If average joe bets you know he's a net loser 60-65% of the time and you will be a winner 60%+ of the time if you simply use stats and math instead of emotions. As these new online betting platforms ramp up and gambling grows significantly as an industry (as we suspect it will), we'd steer an emotionless/intelligent person to look at the major events for spreads.

The final item here is stocks. You never want to tell someone you dislike their stock (or like a stock they are short). As Voltaire has said "it is dangerous to be right in an area where established men are wrong". Since the stock market is primarily driven by institutional investors and accredited HNW individuals, if you tell them the opposite opinion they will attempt to rip your jugular out.

Stocks!

This has been a fun one as the tech trade has gone parabolic over the past few days. With contentious elections and all of the noise, it is becoming clear that nothing is getting done over the next four-years (is anyone really surprised? Life hasn't changed much the last four years outside of the forced pandemic/quarantine).

As we move forward, people have entirely forgotten about COVID-19 as the election has created a massive veil/distraction. Meanwhile, those who have no emotions tied to the election have made good money (tech, healthcare, crypto have gone straight up for clear reasons). The other thing we can conclude is that stimulus is practically guaranteed at this point. If Biden wins (as it looks likely) he may lock us down again and that just means more bills. In the *extremely* rare case that Trump wins, he has to send out checks and try to help the lower middle class again with direct stimulus. Tough to see how that won't be the case. Dollars will be printed.

It has been a great week (even if it doesn't feel like it for many Trump supporters). Looking across the spectrum of emotional topics, we can clearly see that there are many asymmetric bets/investments to make over the next 5-10 years. We're still quite bullish on the future even if we have to change physical locations (seriously we are). In the end, life is about winning and you deal with the circumstances you're given. As a final note, we will hold a Q&A once the elections are over. No one is going to be interested in the Q&A until that point anyway because… emotions are high! Good luck and have fun out there. Keep looking for asymmetric ideas/bets.

Concluding Remarks:

Savings Rates Are Worthless and What Real Net Worth Is

Savings Rates Are Worthless and What Real Net Worth Is

All of our previous posts have focused entirely on earning. This is because there is no ceiling to the amount you can earn and there is a floor to the amount you can save. No matter what you do you're going to have to pay for food, shelter, utilities, taxes and other necessities. That said… We're going to outline our views on saving money in general since the topic has come up many many times. To reiterate. We don't care much for saving because all of your energy should be spent creating recurring income. If you're working 60-80 hours a week you wont have time to waste your money in the first place and by the time you make your money… well you won't need to worry about saving. Funny how that works.

Five Point Summary

The general rule of thumb is to save 10% of what you earn. What they don't tell you is this sets you up for a very long and dire path to mediocrity. The math doesn't help you because you're constantly increasing your annual spending in the 10% scenario. Lets look at the simple math.

1) Saving 10% is a Scam:

Joe makes $90K per year. To make the math simple lets say he sees a take home pay of $60K. This means he would save $6K a year. He is going to see a wage increase of 10% per year and he will continue to save 10% of his income. This sounds logical until you put the numbers into a spreadsheet.

In Year 1, he will save $6K… fast forward to year 10 and that

$6K is just 4.3% of his annual spending habits.

Our readers are smart so everyone can see the problem with a fixed percentage savings method. The fixed saving percentage because it accounts for a smaller and smaller percentage of your new standard of living.

makes every *prior* year less meaningful

If joe was making $60K and gets a 10% raise each year he is now making, ~$155K. If he is spending 90% of that income, his annual spending is now $140K… the original $6K is just 4.3% of his annual spending habits.

This is the fastest way to see an acceleration in your real net worth. Your real net worth is how many years you can live if you don't do anything. It does not matter if you're making $50K or $500K because your real net worth depends on your annual spend. To put some brackets around it, 20x annual spending is rich, 10x annual spending is comfortable and 1x annual spending is an abysmal disaster.

2) Focus on Annual Spending Multiples:

There are many families that have high incomes and practically no net worth. If you're in a major city with a $400K income. But. Are forced to send your kids to private school and have a $10K/month mortgage… You're going to be saving a dismal amount of money.

We get this question a lot. Our answer puts point 1 and point 2 together to come up with a general rule of thumb. You should find a way to increase your standard of living and you should never see a decrease in your savings (in terms of annual spending). A good and aggressive rule of thumb is this:

3) How Much Should I Save? <u>every year you work should result in a year you do not need to work.</u>

This usually means you don't get to spend a lot of money when you're young. Specifically, if you're out of college with a good income (lets call it $100K gross), then you're not allowed to spend more than 1/2 of your take home pay from day one. In about two years you should see income acceleration from the 60-80 hours a week you've been working and you'll be expanding your real net worth rapidly.

Assuming you start earning a living at age 21, you'll be rich at age 41. You'l have 20 years of living expenses. If you start a business and create multiple streams of income you'll reach this mark significantly earlier (it won't even be close to 41).

If you're following along and don't quite make it to becoming rich by age 31… it's all but guaranteed (just don't mess it up!). Sure there are no guarantees in life but it becomes quite difficult to fail. If you have 10x your annual spending in investment vehicles this means you're going to put another 0.5 years away if you do practically nothing. A 5% return, which is extremely reasonable in a basket of bonds and equities, will lead to 0.5x years of annual income for you. If you simply save your allotted 1 year of income you're at 11.5x already! Compounding becomes a rigged game… In your favor.

4) 10x Annual Income as the Inflection Point:

While everyone else enjoys blowing their paychecks at the bars and the clubs you'll be busy visiting the bank and your local brokerage for a couple of years. The funny thing about the math is you won't miss out on much because 22-24 year old kids partying in the club are not interesting to 1) the owners of the club and 2) the most attractive women at the event. So you're not missing out on much at all.

5) Pay the Price Upfront:

In addition, the amount you can spend will accelerate after you simply pay the toll up front. If you can put away 2 years of living expenses in your first two years out the gate, your discretionary spending can ratchet up without much impact to your future.

If you save $40K and spend $40K.. in 3 years you'll have roughly $150K and your income should rise 25% or more, meaning you're now spending ~$50K that year. In just 2-3 more years you'll be able to spend in the $80K range and the game is over.

While the above paragraph is rough math, it clearly shows the power of annual living expenses. You're going to be spending more and more each year. But. If you started with a high foundation or base amount put away, the compounding and wage increases (your career and your side business) will propel you into the 1% in short order.

Ramifications

We've really outlined a basic plan to get relatively rich. You simply work each year to never have to work another year again. That said there are a lot of underlying assumptions about how to make decisions with your personal life based on this philosophy or world view.

Everyone wants to live in the cool city. New York, Miami, etc. Does it make sense for everyone? Probably not.

1) High Cost of Living City:

If your main skills are not going to accelerate your earnings in a major city, it is best to avoid living in them. There is no right or wrong skillset. You've invested in XYZ skillset and cannot change the past. What you can do… is run the math.

If your line of work is going to cap out at $100K a year… We'd suggest living in a low tax state and decreasing the total cost of living. There is no point in living in a vibrant city if all of your income is going to taxes and rent.

Make some basic guidelines:

– Spending 33% or more of your income on rent is a catastrophe. You want to shoot for 10-15%.

– Commuting is also a fixed cost, add this number to your rent number

– Time spent commuting is also a fixed cost, you cannot do meaningful work on public transit or while you're driving so multiply each hour by your hourly income (approximate it)

– Take your rent and double it. That will estimate your actual monthly spending to account for necessities, leisure and one time negative events (life is a roller coaster and many things may go wrong)

We're told to always keep a broad skill set. This means being good at multiple items so you will always have income. The problem with this logic is very simple. If it is easy enough for anyone to learn why will there be openings? If anyone can learn it you could very well find yourself competing with many people for the exact same position (hint hint, if it's a rule based position that will be automated sooner than later).

2) Does a Broad Skillset Make Sense?

Lets put the pieces together, if we know savings rates are a myth and you'll be choosing your geography *carefully* you'd be a fool to have a broad skill set. Why? You're not creating a long-term edge over your competition and mathematically we only need to see ~20 years of income in a worst case scenario.

Make Basic Industry assumptions:

– Will my skill set be valuable in this geographic location for the next 20 years?

– Will this geography be the primary hub for the next 20 years?

– Can this skill set be automated in the next 20 years?

If you answer yes, yes, no to the above you're going to be safe. You're setting yourself up for a The future cannot be predicted perfectly but life is probabilities and you're making the right decision based on your skills.

***high probability*win.**

If you have done the two items above and ascribe to the general world view we outlined in terms of "savings" you're making it painfully difficult to reverse course after Year 1. If you decide to veer off course, every single cent you spend dilutes your .

3) Mental Investment: real net worth (annual living expenses saved)

It is really that impactful.

If you put away $200K and decide to start spending $200K instead of $50K… you just wasted three full years of your life.

Your net worth is simple a 1 instead of a four or a 75% reduction.

The mental pain will make it a lot easier for you to avoid making useless material purchases until you can officially afford it.

The only real skill if we read between the lines is consistency. If you've ascribed to becoming rich, you only need a modest amount of will power. "is this going to impact my ability to put away 1x of living expenses this year?" If the answer is yes, it goes into the garbage.

4) Consistency:

As your income rises, you're also consistently rewarding yourself because it gives you much more wiggle room. Your investments will allow the next egg to grow and this will make it easier to put away another year of expenses every single time.

We really didnt have a fifth point because we've become in describing complex topics into a few points. If forced to add a final comment it is simply to run the math. Compound interest is only a tool if it is *relative* to your annual spending. Otherwise it becomes meaningless in a hurry (broke NBA/NFL players as an example).

5) Math Doesn't Lie: extremely efficient

In summary, getting rich only has to do with multiples of living expenses and consistency. Choosing skills that cannot be automated and a geography that will maximize your skill set is really all that is needed. The rest is filler given that the multiples continue to expand rapidly over a short 5-10 year time frame.

****

Short Post On Why it Is Good To Be Extreme

Short Post On Why it Is Good To Be Extreme

The only way to get anywhere in life is by taking things to the extreme. For some reason the average person believes they can have a "balance" at all times and somehow make it. This simply isn't true. When you look at successful people, they have all lived "extreme lives" by definition. How can you become a billionaire without taking massive risk? How can someone really make it to the top of the athletic pile without extremely lucky genes combined with an incredible work ethic? How do you generate various streams of income without trying anything and everything in sight until something stocks? The answer to all of this… it isn't possible without extremes.

This is probably one of the rare comments that regular people will make that is actually a complement. They think it's an insult but really it should be music to your ears. If people believe you're extreme, that means you're at least trying. That's more than 95% of the population can say. Being extreme means you're pushing the limits somewhere.

"You're Extreme":

On that note we'd actually avoid people who are not extreme. They don't need to be extreme in every aspect of their life. But. At least a few areas. How can someone really say they enjoy living life when they live it in "moderation". While moderation is good when you're set, it isn't all that good if you're trying to force your life to change. In short, if you're not living an "extreme life" it means you're disrespecting the short amount of time you have on this planet. You think you have another "shot" down the road. Unlikely.

Extremes *force* change into your life. We can use a ton of examples from those popular weight loss shows to fixer upper homes. Extremes allow for the most change since they put the most pressure on the situation. If you're struggling financially and try to work 16 hours a day, we can all but guarantee your income will go up that month. If you're struggling financially and try to find opportunities to resell products or start a time for money exchange business… we can all but guarantee some money will be made. If you're out of shape and decide to suddenly drink nothing but water and calorie free coffee while walking an extra 5 miles a day… we can all but guarantee weight will be lost. Finally, if you're not a stylish person and decide to spend 10 hours in a changing room taking photos of hundreds of different outfits… we can all but guarantee you'll learn something.

Before drowning on and on about the examples, if someone really wants to change part of their life they will be taking it to the extreme. If they are not taking it to an extreme they don't really want to improve that part of their life. If you're following the "dogma" of this blog, that means your twenties are spent working like crazy making money. Your late 20s to early 30s you're transitioning to social circles of other successful people and triple checking your health. And. By your mid-30s you're doing whatever you please (these are rough time frames).

Now an interesting part about extremes is that many people take the "wrong end of it". The easy way to tell if someone is taking the wrong end of an extreme is if it results in ego and attention instead of results. Some people hear "fake it till you make it" and spend their time blowing thousands of dollars in the clubs trying to "network". The chances of this succeeding is practically none but the average person will hear about the 1/1,000,000 success story and foolishly try to copy it. Why? Well partying in a club wasting thousands is a lot of fun so they can rationalize any excuse to make it a common occurrence.

The Right Type of Extreme:

An example of a good extreme is anything that results in significant near-term pain. Since the brain is hardwired to dislike pain and suffering it is generally the right answer if you're looking to build something sustainable. Good examples of this are 1) living well below your means, 2) working long hours trying to learn tasks that "could be outsourced". But. You don't have a lot of cash flow yet and 3) skipping lots of parties to have a better workout at the gym on Saturday and Sunday. Simplistically, things that make you uncomfortable are typically correct when it comes to choosing an extreme.

There are two ways to become financially independent: 1) the extreme frugality way and 2) the extreme income generation way. This is where our blog departs from the standard frugality movement we've seen over the past several years. Frugality teaches you to cut quite literally everything until you're in a monk like state of existence. This *will work* by mathematical definition. By living off something insanely low (say a couple of thousand per month), you will eventually be financially stable.

Two Different Extreme Financial Examples:

Now take the other side of the coin here, our approach, which is the work like crazy generating approach. Since you're actually generating money at all times, it means that your expenses are somewhat limited. You probably spend a bit more than the frugal crowd but not by much if you're really spinning up a lot of forms of revenue. First it's a basic online biz which is a "terrible failure" generating $4-600 a month. Then it's some time for money exchanges based on your profession generating $1,000 a month. Then its some fixer-upper real estate deal that is sub-par at best leading to $400 in additional income per month… then you finally get one real income stream to work that generates $3,000 a month… only to look back and realize you're now generating around $5,000 without including your career income. You've passed the frugality crowd's entire annual spending.

One group decides to jump into the latest fad of cross fit. This of course leads to immediate near-term results. Why? Well the average person does not really push their body to exhaustion. They have never competed serious in their lives so by going all out their body suddenly feels physical stress. Resulting in immediate results but strange body composition. Fast forward and this likely leads to an injury for the vast majority of people and a modestly improved body composition. That said we don't know many people who have *not* gotten injured with this type of extreme training (maxing out constantly).

Two Different Extreme Fitness Examples:

Compare this to the "correct" extreme which requires significant dieting and exercise routines. When you feel "good" you attempt to push the limits (maybe 1-2x a week). The rest of the training periods are done at 90% (not 100%) to continue building up the base foundation levels. This is combined with serious dieting where you're avoiding all poor nutrition items (sugar, boxed foods, pasta etc.). Funny enough if you do this you'll be labeled more "extreme" than the cross fitting person! The general population will call the cross fit guy extreme but when they see you're actually changing your daily habits you'll be "crazy". This is another good indicator that you're onto something.

One guy decides that he's not good with women and decides to go ahead and go out of his way to meet tons of women on his free time. This then eats into his actual production as he is both 1) hungover from nights out and 2) tired from going out to numerous events to meet people in the day. Combine this with a and you're looking at good near-term results (numbers game) with long-term loss of success (never asked himself "will i attract the right person given the person i am"). That last part is heart breaking for most as people really believe that they will date the same woman with a net worth of $100K + out of shape versus $2M + in great shape… It isn't true and it's comical to believe. No one would teach their own daughter to date a poor man so why would your options ever stay the same?

Two Different Extremes in Dating: lack of self-awareness

Compare this to person number two who has self-awareness. He is too busy making money and getting into shape and realizes he shouldn't "sell" now since he's still going up and to the right. What does this mean? It means he should simply get used to rejection by talking to people in his day to day life and the rare times he goes out at night. These individuals are also seen as "crazy" as they are not scared of talking to anyone. This is even shocking to the guy in the first example as he's unwilling to go for low percentage chances. Why? Someone doing it right doesn't have time to go out for more than a few hours so even low percentage chances are better than 0% chances. To conclude this logic, since it's a rare night out, the chances of anyone remembering (negative experience) is next to zero anyway.

The theme? Good forms of extremes are never fun. If it's fun it's probably not a good way to do the task. So lets go ahead and list them out: 1) Want to learn how to improve your wardrobe? Sit down and read five books, one on color combinations, one on suits, one on business attire, one on casual attire and one on how Hollywood productions choose outfits. Combine this with two hours a week of looking at color combinations online or in a store. 2) Want to make more money? If you're not rich you're forced to work a minimum of 60-80 hours a week if in your 20s and 50-60 hours a week if late 20s to early 30s, 3) want to get in shape? cut your entire diet to just water coffee fruits vegetables and meat/fish. Discard everything pre-made. Also spend an hour per day exercising – running or lifting heavy objects and 4) the one that requires the most self-awareness… If you want more friends/colleagues ask "what type of friends do I want?". If you know the type of people you wish to hang out with, you have to combine this with a painful question for most "why would someone hang out with me?". Until you can answer that question with a clear answer "people in X group should hang out with me because of Y and Z…." it's time to fix your life first. Take a list of qualities that fulfill Y and Z and get to work on those in an extreme manner.

Long List of Good Forms of Extremes:

Now for the fun part… is it possible to name anyone of note who *isn't* extreme? Probably not. In sports the top athletes are seen as extremely competitive (Michael Jordan, Lance Armstrong who even took doping to an extreme, Michael Phelps, John McEnroe, Tiger Woods…). In business the ultra rich are known for being extreme and "crazy" such as Steve Jobs, Elon Musk and our favorite . In the popularity contest world, Kanye West, Kardashians, Justin Beiber… All seen as extreme and crazy. So on and so forth. In short, it's good to be extreme it's your only shot at success anyway!

Short Trading and Long Trading Your Life – Erik Finman

Short Trading and Long Trading Your Life – Erik Finman

Today we have a guest post from . Erik is a bit of a teenage prodigy and we thought it would be a good change of pace compared to our older guest posts on and other items. Erik became a millionaire at the ripe old age of 18 by investing in crypto currency back in 2011 and more importantly selling a company (which you hear less about). In fact he sold his first company Botangle in 2015 and that was reinvested into bitcoin. After this he started a virtual reality headset company, moved into robotics and is currently planning to launch a satellite (more on that below!). With that, below is Erik's post, unedited as usual! (note hyperlinks were added by us)

Erik Finmanreal estate

If you're reading this article, that probably means you're someone who desires a certain level of freedom and autonomy in your life. One of the surest means to achieve this level of freedom and autonomy is through financial independence. This concept of financial independence is best found through avoiding debt and building capital; but actually achieving both of those can be incredibly challenging for some. Our entire society seems structured around keeping people shackled to debt and distanced from capital.

However, and coming out on top isn't impossible. Most often it depends on you making the right investment decisions – which for some people can seem impossible. Nevertheless, we try to make sound investments every day, and not just with our money. We invest our time in certain tasks, while we avoid investing in others that don't seem profitable or desirable. We invest our money in certain products that seem like the best deal or what we want, while we avoid investing in others that seem like a poor value. Investing isn't hard, we do it every day.

beating the system

There are three things you should be investing in, or not investing in, to ensure you have the most freedom and autonomy in your life. To help explain these three ideas, I'll use the investment terms "Short" and "Long." Read to the end, and you'll see exactly why I've taken the stances I have, and how it has worked out for me so far.

1.) Go Short on Higher Education

This is controversial for a lot of people, but higher education system has proven to be highly detrimental to many young people. There are few things you can do at 18 years old (short of breaking the law) that will do more to harm your future self than taking on massive amounts of debt at high interest rates. Yet, this is precisely what so many high schoolers are encouraged to do. This is a hope-to-despair pipeline; students graduate high school full of hope for their future, and four years later graduate from college full of despair and desperation.

Those loan payments are due just a few months after you graduate, and the job prospects for someone with a 4-year degree are becoming increasingly thin. Faced with this grim outlook, many recent graduates decide that they have no other option than to pursue a graduate degree, in hopes of increasing their job prospects and overall pay. This works for many, but it also drastically adds on to their total amount of debt. The result is spending the remainder of their youthful years paying off high interest loans while working the first job that was available. Most people in this position have given up on that lifestyle they once dreamed of, settling instead for a sedentary lifestyle of being just comfortable enough to not complain too much.

college

pursue hands-on experience and independent education. Unless you're planning on pursuing a specific career field that requires a highly specialized degree (like becoming a doctor or lawyer), most career paths can actually be obtained without a college degree. It's counter-intuitive to everything you've probably been told, but it's becoming increasingly true every day. I've met a number of executives who have told me, flat out, that they prefer hiring someone without college degrees, and that college degrees are beginning to signal qualities that they may not want to hire.

The alternative:

: I've recognized that this is a systemic problem that has started from the middle school/high school level. To combat this, I'm working on creating a school that will give students full autonomy over their education. With no strict parameters, no politicians demanding a certain curriculum, and the complete freedom to pursue what they are most interested in, students at my schools will be able to gain hands-on experience in the field of their choice. Students will graduate from my schools with the technical skills, detailed know-how, and passion for their field that employers are looking for. You don't have to go into debt and spend 4+ years of your life at a college to be competitive, and my hope is that more students realize that.

My plan

All of the truly unique resources I learn from are too controversial to say publicly. Dark . That really says something about the world doesn't it. How many other people are hiding excellent resources that if shared they would be fired for but are actually useful and helpful. My resources are too controversial to say or not in public. So not including those I'll say this blog!

Resource: arts

2.) Go Long on Cryptocurrency

By this point you're probably well aware of the insane hype we saw last year around Bitcoin, culminating at an all-time high price of nearly $20,000 per Bitcoin, before dropping down to where it is now. This left a lot of people feeling jaded about the idea of cryptocurrency as a feasible idea, and many people who had just entered the market quickly left it just as suddenly.

But while the news cycle has moved on from talking about Bitcoin, many cryptocurrency projects are quietly making significant progress and setting themselves up for the next bull run. Big banks are trying to start or acquire their own cryptocurrency projects, some governments are considering moving to blockchain-based currencies, and the cost-per-transaction of most major cryptocurrencies are dropping fast. This means that the ingredients are all there for the next bull run to be one that lasts. The previous all-time highs seem premature, mostly due to a media blitz and people not wanting to miss out on profits. The next time it comes around, the projects being funded are more prepared to do what they promise to do.

ignore cryptocurrency. You likely won't directly lose money (at this point) by not investing in cryptocurrency, and your hard-earned money can stay safe in a bank account while inflation eats away at it. Investing in cryptocurrency may seem too high risk for some people, and you need to be honest with yourself if that sounds like you. But if you're at all hoping to earn your first million in the coming years, investing in cryptocurrency is probably one of your most direct routes.

The alternative:

I already have holdings in various cryptocurrencies, but my hope is to spread the wealth by spreading information. I've recognized that there seems to be a significant entry barrier to many people getting into cryptocurrency; the industry seems confusing, too many people are shouting contradicting opinions, and predators lurk for their next victim to rob and scam. To counteract this, I'm working on a basic crash-course on what cryptocurrency is, how to invest in it, and how to keep it safe. Cryptocurrency represents the largest transfer of wealth our generation has ever seen, and I hope to see more people move towards financial freedom through cryptocurrency.

My plan:

Simplicity and good design. We need an iPod to make MP3 players mainstream. We need an iPad to make tablets useable and mainstream.

Increasing Adoption:

3.) Go Long on Emerging Fields

In addition to cryptocurrency and blockchain technology, there are a variety of other emerging fields that hold great promise for the future. Developments in Artificial Intelligence (AI) are progressing rapidly, Augmented Reality and Virtual Reality (AR/VR) are quickly becoming profitable industries, and nanotechnology will likely be part of the building blocks of the near future.

These are all industries that may seem hard to enter if you're just in your late teens or early 20's, but you can start laying the groundwork now for a future in these industries. All of these technologies will require some level of coding proficiency, and a rudimentary understanding of electrical engineering and robotics will also be extremely advantageous. Most college majors aren't teaching the skills needed to thrive in these fields, so any learning you do on your own will make you hyper-competitive on the job market compared to your college-educated peers. These emerging fields will be where the high paying jobs of tomorrow are, and you'd be wise to start moving in this direction ahead of the crowd if you want to have gainful employment in the coming years.

stick with the fields that are in-season currently, like psychology, business, nursing, and education. Skills in these fields are adequate to get a job currently, but they also put you in jeopardy of being replaced through automation, or by a new worker who not only has the skills you have, but also the skills of an emerging field that is becoming more in-line with your field. Focusing on these fields will pay off today, but likely won't help you for too long down the line.

The alternative:

I'm working on launching a satellite that will incorporate AR/VR technology, allowing students around the globe to experience space in real-time and hopefully inspire them to think bigger for their futures. In addition to this, I've enjoyed creating a robotic suit that improves strength and coordination, and I can definitely see ways that this could help more people going forward. Circling back to earlier when I mentioned the new schools I'm planning to build, I intend to make emerging fields a centralized theme for students, with plenty of classes offered in formats that will help every student succeed and grow into talented professionals ready to build the future.

My plan:

There's a lot of noise out there, and it can be hard to figure out what's worth your investment and what isn't. I'm confident that if you invest your time, energy, and resources based on my three recommendations above, you'll be well-situated for what comes next. Good luck!

First of all we'd like to thank Erik on his guest post today! Lots of interesting items and unfortunately one that stands out is "the dark arts" comment where we think we know what he is referring to (but will never know for sure!). We agree with the majority of comments and do think it should be noted that Erik is at the top percentile in IQ. This means some of his decisions are not going to work for people in the top 10% or so. Hope you guys enjoyed it and we'll be back with our normal post soon along with another Q&A announcement.

WSPs Notes: Don't forget to follow him on Twitter by clicking here as well!
****

Significantly Improving Personal Productivity

Significantly Improving Personal Productivity

With the economy practically shut down, we think it's the best time in history to get ahead. Most people are getting fat and watching television re-runs all day. If that is the decision making tree for the majority, you couldn't ask for a better set up. Sadly, we've found that most people enjoy memorizing random facts and asking redundant questions instead. So you've really got 98% of the population doing nothing productive either 1) pure laziness or 2) wasting time on things that don't increase personal productivity. Since the first group is a lost cause we're going to focus on the second group.

For the people who are well read, this does not mean you've learned anything. This won't come as a surprise to anyone who has created anything. If you read a ton of books and simply memorize a bunch of facts at best you can recite facts. This isn't useful at all. We're taught that this is "intelligence" based on how the school system operates. And. Unsurprisingly, this doesn't translate to real world wealth. Why? Comprehension is what matters not memorization.

Memorization is Not Intelligence:

The next time you decide to pick up a book to read, you have to ask yourself if you're going to apply anything. If you're not going to apply anything, you should immediately put it down and move on. There are millions of books that simply provide a laundry list of facts. This isn't useful unless it's a fact related to tax reduction strategies or supply chain management. Think about it like this. If you know something that can be googled, you're just a worse version of a free global service. There is a zero percent shot of you memorizing more facts than google, a massive super computing system designed to look up facts, so you shouldn't burn your time on these types of activities.

For fun take a look at professions that primarily rely on memorization: history, language teaching, biology, physics and even chemistry. Notice, we threw in some sciences because they have no application. If you decide to focus on something like math and physics but never learn to apply it, you're just a computer system! You'll never beat a professional computer system when it comes to calculating or memorizing anything. Sticking with the math example, you're better off learning advanced statistics so you can apply analytics to predict events (generating a profit for yourself)

Well the vast majority of learning requires effort and personal interest. So if you want to start an e-commerce business you should probably learn the following: how to set up a server/website, how to mimic the design of a brand that has been successful, how to build a social media profile – for profit and of course how to run and make advertisements. Most people just ask meaningless questions like "how do i start". This just means they don't want to succeed and are too lazy to do anything by themselves. This guarantees failure in two ways: 1) they require hand holding to get started or 2) they can't think for themselves to a point where it's not possible to figure out basic tasks. Failure is certain in this case.

What to "Learn"?

This is why it is easy to tell who is learning and who is looking for a handout. Even if it was a simple task, such as setting up a website, they might have questions about spam filters, ideal website design etc. Instead? The majority of questions are about "how to start a website" even though this can easily be googled.

So while the above sounds "rude" it is simply true. So we're going to write, once again, the easiest way to start. Don't try to start a consumer business on day one. Start a services business. This could be fixing iPhones, reviewing resumes etc. Once you have a basic service you can offer, you will break even on year one (likely make a decent profit). This won't be exciting and will be a painful learning experience (which is the point). The other reason for this? If you have a basic service that you can offer, the website design won't matter much. You'll have a decent number of customers through your own word of mouth. Promote your website on other forums on the internet after establishing yourself as a trusted source. This will lead to at least a few hundred customers, which leads to at least $10-15K a year. (Yes this is nothing but this is also an extremely low risk way to pay some basic living expenses)

If you want to improve your productivity, everything should be focused on earning more. You shouldn't focus on "learning" as you will end up going down the rabbit hole of meaningless factoids that are not applicable. The way to focus on earning is by aligning everything you do to either 1) building a reputation or 2) generating a profit. Most people ignore the first step and just want to make money "now now now". Well, in order for people to trust you… Value needs to be added and a reputation needs to be built. The "freemium" model is one of the best ones to follow if you're a newbie.

Try to Earn or Don't Bother:

Assuming you are a good golfer, you could go on golf forums and begin providing free advice on golf swings. We don't golf seriously but you get the idea here. If you were a Division 1 athlete (at minimum Division 2) then you are in a good position to teach/provide input to the general public. After doing this for a few months, people will respect your opinion and you should have a link to your website at the bottom. Congrats, you are now on your way to providing online coaching/teaching for golf. That is really all it takes. If you do well, this is actually a great long term business. You can sell golf products (affiliate), sell your own instructions/packages and even create camps as your audience grows. We are using golf as an example here because the people who play golf are rich which gives you a wider range of pricing (offer a low cost one to attract a new population or a premium one tailored to the wealthy).

Another good example of earning is what you do with your free time. If you're on social media and it is not making you money, it's time to shut it down. Unless you're already rich, why do you have the time to troll the internet with $0 of income associated with the activity? It makes no sense. This is a structural lack of priorities. By forcing social media to make you money, you will also follow different accounts. You're not going to follow celebrities or athletes. You will follow accounts related to your niche/sector which only makes you more informed on important changes in the industry. Use social media a tool to get ahead, not a tool for entertainment. Most choose the latter.

We're fine with trolls since they are entertaining from time to time. That said, eventually you have to give up the trolling if you've got no results. If you notice, we don't really engage much with people on twitter and only once in a blue moon troll someone hard to emphasize how ridiculous their rebuttals are. Why is this? It's not a good use of our time. You should think the same. Asking meaningless questions that can be googled are not a good use of your time. Our time is less relevant in this situation since we dedicate a certain amount no matter what. The issue is the user, why would he/she waste his time with this stuff? We have no idea. So below is a step by step on avoiding meaningless questions by various forms.

Meaningless Questions and Time Drains:

It is not a useful question if it can be googled. This is because you should have looked it up already. If someone cannot look up basic items by themselves without asking for help this is equivalent to asking someone to pick out the clothing for them to wear on a night out. After becoming self aware as a kid, you shouldn't need mom/dad to pick out clothing. This is quite literally how sad it is to see someone ask a basic question that can be found on google. Questions like "how to buy bitcoin" have been available online for just under a decade and there is no excuse for asking these questions.

Able to Google:

This is common amongst people in college. They sit around with their buddies and talk about "scenarios" that never occur. What if you get job offer A and B "what would you do" or if they got a million dollars "what would they do". The answer is you don't know because you've never been in that situation before so don't worry about it. You should be more worried about putting yourself into those positions. Unless there is an actual event, the scenario question is just a form of mental masturbation. This is also common among people who were "successful in high school" and never amounted to anything. " Avoid these individuals like the plague.

No Scenario Questions: Oh man if i did this i wonder what would happen, what that would look like".

This is another crazy and common one, if you are simply asking for a handout then you should seriously consider entering into an insane asylum. No one is going to give away their IP and no one is going to invite additional competition into their industry. Real questions are live situations that need a solution. Real situations should not directly compete with the person you are asking. It is comical to believe that a competitor would help you in any industry and we have no idea why it would be any different online.

No Handout Questions: "please give me your supplier all your materials and the formula… and your ads"

The above three are going to get rid of around 90% of the bad questions that we've gotten over the past couple of years. While we can't fault people for the second one as many readers are young, the people who fall into the first camp have a zero percent shot of making it in the future. We don't even have to guess. If you can't solve basic problems without hand holding, you're not going to solve real ones when it is actually a unique situation that less than 0.1% of the world has experienced.

The final comment we'd make here is that you should never ask the same question twice. That is a never. No exceptions. If you are serious about getting better, after you get an answer you should write it down so you never have to ask it again. It is an embarrassment to ask the same question over and over again. This is probably the #1 reason why we stopped giving any and all dating advice. We concluded that most people are never going to accept reality. Besides, if you can't even get dates in the easiest environment in the history of mankind, it just means you're not successful. Again. Not a group we want to attract or care about. Having endless conversations about "hypergamy" when the same guy would choose a better looking younger girl with a similar personality is a colossal waste of time. Humans all want the same thing, the best they can get.

We've written about this in the past and lots of people said we were joking. It was not a joke. Every single day write five sentences on what you did to actually improve your life. You don't need to ramble like a teenage girl in her personal diary. You write five sentences that state your exact actions. If you cannot come up with five sentences that means you wasted the day. Do this every day for 30-60 days and you'll see if you're on the right track or not. Don't write results. Write action items that make you more productive or move you in the right direction.

Create a Basic Journal:

The key part of a journal is that it does not include results. After the age of 14 or so you should came more about doing things correctly and improving the right way. If you're improving by short cutting things, this means you're unwilling to take a long-term view on your future. Not a good thing. So. Every single day you'll write five sentences, no more no less and see if you're actually maintaining accountability.

A good example could be as simple as this: 1) sent out daily newsletter to customers, 2) updated servers and back-end for next product launch, 3) lifted or 1 hour and biked 10 miles for fitness also did 20 minutes of yoga/stretching, 4) cooked own food to reduce sugar and salt intake and 5) read 50 pages on sales. As you can see, the productivity can address various items. Perhaps you're trying to learn how to play piano/guitar, that could also be an example of improvement.

If all of the above seems mean or intense, you're probably not going to make it in life. We're not here to lie to people. If you cannot keep yourself accountable it just means you're not interested in improving. While you don't need to follow everything here to the exact T, the framework is simple. Successful people don't day dream about scenarios that are unlikely. They don't need hand holding to get started. They don't ask questions that they can answer themselves in a few minutes. They don't burn tons of time with entertainment. When you're set for life you can increase the amount of entertainment (since you are no longer in the accumulation stage of life). Until then, best to focus on productivity. Oh and by the way… You'll end up enjoying the winning/work. This means the good habits formed above will unlikely change even after you make it. That's simply how life works. Winners continue to win for a reason.

Concluding Remarks:

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life.

Simple Examples of Thinking Differently.

Simple Examples of Thinking Differently.

There is nothing wrong with thinking like the masses in a survival situation. In reality, most people follow the herd because it is a survival instinct. If we dropped a random reader into a remote area of the world with no contacts, no social media (God forbid) and no electricity or access to shelter… The correct move would be as follows: 1) observe other living animals eating/moving towards a source of water and 2) consume similar foods and ration out water to survive. Pretty simple right? Unfortunately, this tactic only works to survive and doesn't get you much further in life. Eventually, you'll be forced to think differently and avoid doing what everyone else does to get ahead. In this post, we'll go ahead and outline numerous examples since it is not possible to teach someone to think exactly as we do.

Throughout your life you've been told to "treat everyone equally". This is horrible advice. If you follow this motto in life, it will be nearly impossible for you to build relationships with the right people. Instead, your goal is to find the winners and link up with said winners. We've said it numerous , but at the end of the day, winners like winners and losers like losers. Never, under any circumstances do you work *with* or *for* a loser. You will get 100x further in life by working *with* winners (emphasis on the word with and not "for" as they are unrelated).

People are Not Equal. times on Twitter

If you do what everyone else is doing, you will end up like everyone else. This certainly prevents you from becoming homeless and living on the streets begging for change, but it also prevents you from living a better life

Utilize Probabilities. than the masses.

For our non-finance readers, unfortunately, the best example is Wall Street related.

If you deem yourself to be more intelligent than your peer group then there is no reason to follow the herd. You have to come up with a differentiated strategy. In the world of finance, most junior employees focus on "financial modeling". But. Less than 10% of junior employees (Analysts and Associates) will ever see a single day as Vice President at their firm. Let alone Director or Managing Director. This means you should probably be focusing on other tasks (not financial modeling) which would be… Every single position on Wall Street (excluding Quants) becomes a sales role at the end of the day. Even the buyside becomes a sales position as you need to raise funds. In short. Stop wasting time learning how to build a complex model (something that can be mastered in 6 months) and get busy getting connected.

Sales.

There is no point in playing defense. Staying on offense is actually the number 1 rule to financial independence. If you follow our advice on (*easily achievable for intelligent readers*) then you will realize this immediately. The path to becoming rich is paved in consistent *offense*. You're busying working a career and at the same time busy building a sales business. As you continue working on both your career and business, time becomes a leverage point for you and you can delegate tasks at a rapid rate freeing you up to do anything you like.

Stay on Offense. becoming a millionaire in 10 years

In short. The best way to save money is to spend your free time making money. You won't be able to spend and you're increasing your income.

Talk to a (disgusting) and you will find that their lives are extremely boring. They will also believe that your life is extremely boring as well! While making money is just a game for you once you have enough to be financially independent, they will not understand why you want to grow your company/career/(insert anything else that is difficult). Why? They are more interested in watching other people live interesting lives.

Fun for You Should be Boring to the Masses. regular person

The biggest joke is reality television where 20+ contestants compete for $1M while the host of the show If you want to go the fame route (), your goal is to become the creator of a show or host of the show. You do not want to be one of the contestants hoping to make less than the host… After embarrassing themselves on television for multiple weeks in a row.

makes $1M+ per season. not recommended

After creating multiple products that do not sell well (you will quickly realize that what you want is unrelated to what the masses want) you'll be forced to realize that perception and branding is just as important as the product itself. Laugh if you wish. But. Having a celebrity endorse your product will add more value than actually creating a product better than your competition.

Perception is Reality… For Most.

The previous sentence is not a joke.

Once you realize perceived value is equal to real value… You're going to immediately change your sales technique and your marketing technique. You will obtain superior traction from "quick fix" and "Celeb X recommends" than you will from creating a product that is 2x better than your peer group. As long as your product is roughly equivalent, spend your time selling the perception.

Most people have huge egos when it comes to living life. No one is willing to ask for help and the difference between being arrogant and simply having an ego is this: No one has time to be the #1 player in every single sport, the #1 banker, the #1 brand in clothing and the #1 doctor. It just isn't possible.

Pay for Help. realizing when help will accelerate the process.

Instead of wasting time choosing to become an expert in 10 topics, choose two or three and hire consultants for the other seven.

The power of 1% is on your side.

Find the winner (top tier professional) in the seven topics (piano and tennis as examples) and simply take lessons. You're going to learn more in 2 hours a week than you would through self learning anyway. Asking for help is perfectly fine. Pay the fee and save yourself the headache. Besides. The topics you focus on will generate a lot more cash flow than the hourly rate for an instructor.

This is the hard cut off. By thirty you should not work *for* anyone. The emphasis on the word ** cannot be strong enough. You may work "with" people. But. Under no circumstances will you be in a position where you're taking orders all day. You are either contributing to a project (working with) or you are running by yourself. Notice… If you're working with someone, you're essentially working for yourself and throw your contribution into the pool at a stated deadline.

Stop Working for People by Thirty. for

If someone does not know the difference between working “with” someone and working *for* someone, they should no longer read this blog.

They do not have any idea how revenue generating roles work. And. They have never generated a meaningful amount of money.

As many of you are aware, the typical person is an expert on everything. They know how to make money, get girls and lift more than professional body builders.

Ask Questions… When You Know the Answer.

All jokes aside, you can use this to your advantage. When you are meeting new people you should ask them questions you already *know* the answer to. If for example, you are an expert in three topics and the new person claims to know one of them… Ask them 2-3 questions and use the following phrase:

“I don’t know anything about XYZ can you explain the basics?”

Jackpot. Instead of being forced to waste time (IE: seeing if they are full of it) they will now be forced to show their cards. Most people will ask them about topics they do not know. This doesn’t work. Why? You won’t know if the person is legitimate or not and you’ll be forced to back track and research the topic yourself to confirm the statements.

People do not speak to each other equally. If you are speaking to a family member, friend of 10 years or a client… you will not use the same tone of voice, verbs or nouns. This is why you should never waste your time getting information from mainstream outlets. The targeted audience is too wide and the speaker is going to *change* the message to resonate with the people in front of him.

Focus on the Audience.

In addition, this works for advertising as well. Most people focus on if an ad would work on “them”. This doesn’t work! An ad working on you is irrelevant compared to an ad working on the masses.

Think differently and ask who is in the audience? Then find an advertisement that appears *repeatedly* for many days, weeks or months. The ad must be good because the space they are paying for is not cheap and if it is converting at a high rate… then you are certain it will be re-run until unprofitable. Take notes.

That’s right. We get a lot of questions on “how to make friends” and this section will solve every single one of your problems.

Let People Tell You How to Succeed!

In short. People are insecure and have a superiority complex.

Knowing this as a fact, here are the two rules to making a new friend (note this works for casual acquaintances and is not to be confused with business). Ask for advice and let them tell you exactly what to do (remember they know everything). Regardless of what they say to do, report back and say it “absolutely worked and that you appreciate their time immensely!”.

Rule #1: Rule #2:

Congratulations. This will work every single time as long as you avoid correcting them when they say something foolish in the future. Let someone believe they are better than you and you can bet everything you have that they will happily hang out and give you more of their advice.

****

Simple Ways to Improve Your Life

Simple Ways to Improve Your Life

Instead of focusing on earning money we’re going to shift to saving time. This will not only improve your money making abilities long-term but will also improve your health and well-being. By saving time and improving your mood, success will be easier to come by since you’ll efficiently work through your day. It’s unlikely that all of these improvements will be made instantly, instead, we recommend referring to them any time a basic premise is broken.

<u>Social / Mental</u>

Yes we know the irony here. We’re writing an opinion related blog. That said, we’re . Unless a person specifically asks you for advice you’re essentially digging your own grave. When you meet a person they will generally think they know everything about: 1) health, 2) fitness, 3) money, 4) dating and of course 5) sports – since it’s all they watch. Instead of trying to help someone “move in the right direction” you’ll end up creating an enemy. As an example, we laugh when people try to help “strangers” in the gym (even if they are blatantly working our incorrectly) because they are not going to listen. Instead, operate similar to this blog and only write for people who are interested. Don’t bother seeking to change people.

#1 Don’t Try to Change People: referring to people who never asked for an opinion

The good news here is that you *can* help people if and only if you are asked. If you’re a good volley ball player that plays on weekends, it’s likely that other people on the team will ask for tips. This is 100% fine. Give legitimate and real advice. There is no reason to give them bad advice, give them legitimate information since only 1% of them will actually execute on it despite your advice. Notice how odd this is. ! For anyone in their 30s/40s they will confirm this fact and remember their 20s. At a younger age, if people asked for advice the assumption was that they would execute on it. This is clearly not the case.

<u>Even the people who explicitly ask you for advice won’t execute</u>

This is excruciatingly difficult to master. Arguing with strangers on any topic is not worth your time. If you argue with them all you are doing is making regular people trust you less. Remember that the president of the United States has a ~50% approval rating so there is no way that 50%+ of people will agree with you. If the most powerful people in the world have half the population fighting against them… this means the percentages are lower for everyone else.

#2 No Arguments With Strangers:

If you avoid arguments with strangers you’ll also protect your reputation. If someone attempts to attack your reputation you have two choices: 1) point to a proof point or 2) ignore. Ignore is usually the best option since the attacker unlikely has any influence. If a homeless man decides to call you a liar, no one would bother responding because they have no social weight. Similarly, if an average guy who makes $150K a year does the same, your best course of action is to ignore. The one time you can choose the flight response is if the person has weight. If they have more influence than you do, take the time to prove them wrong with facts and take the credibility away from them. This increases your influence and offers no downside since he’ll never like you in the future anyway.

This is applicable to business and friendships. If someone doesn't want to buy your product and says no two different times, don't bother. You're better off starting fresh with a new person since it is unlikely you'll take someone who said no twice into a yes. The only time you'll go back to the people who said no are if 1) they reach out, 2) it is a major account that you want to penetrate later and 3) if you have run out of new people to call for the day. This is a good way to avoid calling the same "no" person over and over again. This is also no different for dating. No sane male would go back to the same girl desperately looking for her affection if she wasn't interested the first time around. There are billions of people in the world and it shouldn't be worth your time.

#3 Go for Low Hanging Fruit:

This means you're going for low hanging fruit first. A basic economics terms which says you should grab the easiest items of value first. Notice, this does not mean you take the path of "least resistance" at all times. It means your first course of action is to go after the easiest targets before moving on. This is similar to a time-based test. If there are 100 questions on a test you want to answer the easiest ones first since they are weighted equally in value. So when you look at the ways to generate revenue for the day, go for the highest revenue vs. time items. Then you can work on the harder projects.

While consequences are real, the chances of a current worry is likely small. We realize this won't work for 99% of the population. But. Try to think of everything in logical terms. It is highly unlikely that you would die in an airplane crash which makes "flight fright" illogical. Similarly, even if you were to get laid off from your current position, the unemployment rate is just 4% and the chances of being unemployed for more than a year is closer to 1% assuming you're working hard to get another position (you will likely come out profitable!). While these are two extremely different fears, we can logically walk through them and realize the worry is not worth your brain power.

#4 Realize 99% of Worries Are Fake:

A good way to see if your worry has merit is to calculate the impact and percentage chances. Quick math is a savior. While it is true that you're likely to suffer some small physical injury at some point in time (break a leg or arm) and it is true that you'll likely lose a stream of income at least 1-2x in your life, this is par for the course. Look around and realize that if you're in the top 5% of the population there is just no way you'll be stuck in a bad situation for long. After all, average people offer mediocre performance across the board in every sub-segment of their life and yet they end up living till 85-87 with a comfortable living standard.

While we have used comparisons to help get through worries there is a clear line in the sand. There is no point in comparing yourself to other people. We use averages to figure out if something is likely or not (eliminates worry) and then use the rest of our time operating on the only metric that matters: personal happiness/. At the end of the day, it is unlikely that you'll be number one in any specific item. This could be a sport, making money or winning beauty competitions. The math just doesn't work. There is however a 100% chance that you can improve every year!

#5 Only Compare to Yourself: utility

This is where we focus. Each year you can choose a few items to focus on. Given the target audience we think focusing on money in your early 20s is the right choice (we are biased). After that you're essentially set for life and can move onto other items. If you disagree that's great, it worked for us and that's what we recommend. Going forward you then focus on specific items you hope to improve. If you're rich and unhappy it is likely that either 1) health or 2) relationships have failed. If both of these work then we're calling your bluff and saying you're not unhappy if you're rich, healthy and love your friends/dating life. The great thing about life is that all three of these things, money, health and relationships can improve every year. Choose one of them to focus on each year and make notes to see if you're progressing or not. In less than 5 years you'll laugh at all the problems you had in the past since we underestimate how quickly we can improve.

Health

If you're a night person you struggle here. Instead of trying to drink a ton of coffee in the morning which creates dependence we would recommend a concentration exercise. This can range from math problems to playing a complex game such as chess. We don't have a clean recommendation since we're unsure what you enjoy doing but we have a clear answer. The answer is to wake up with a high cognitive activity. Instead of trying to chug caffeine wake up and do a task that requires you to be alert. Ideas include: 1) cross word puzzles, 2) chess, 3) a phone video game, 4) an IQ test etc. Choose any activity that requires you to think and ideally requires faster reflexes (create time constraints for the games you are playing or the test you are taking).

#1 Waking Up:

The second rule here is to avoid looking at emails. If it does not require fast reflexes and cognitive effort it is not going to jump start your brain. This is also why it is common to wake up, flip through twitter and fall asleep again. The task did not require your brain to work so it never had to wake up from the morning fog. As an additional boost, we'd recommend a citrus drink such as lemons or limes.

Some people enjoy meditation in the morning. This causes many people to fall asleep and we think it is directed to morning people. Instead we think meditation in the middle of the day works the best. Since you'll wake up and get working on your first task, we would put time aside for meditation once your first task is officially complete. You'll be somewhat tired but alert. This is the perfect time to reset your brain for the next part of the day or next task at hand.

#2 Add Meditation:

The type of meditation is largely irrelevant. The tricky part is being able to hold zero thoughts. This is not easy particularly during the day when you're officially awake. This is also beneficial. If you're able to meditate when your brain is supposed to be alert, it'll give your mind a much needed quick break and you don't risk falling asleep (which likely occurs if you attempt this at night or in the morning).

Depending on your age you will eventually jump into a normal sleeping pattern that adjusts naturally for moderate jet lag. For what it is worth we think 6 hours of sleep is enough for someone who is 21-26 or so then it ratchets up to 7 hours for 27-31 and then stabilizes at around 7-8 hours after that. Surprisingly we don't think it's really necessary to sleep exactly 8 hours particularly if your life is in order. This is probably due to higher dopamine levels. If you are the road to success you're happy to wake up and have more energy (which is another reason why success is a self-fulfilling prophecy once you clear your first $1M or so).

#3 Sleep Consistency:

We're making this clear since younger readers tend to worry about "health" too much while people in their 30s worry about it too little. As usual do the opposite. People in their 20s who worry about 80 hour work weeks are largely soft people who won't succeed. There are millions of people who have done the exact same thing and the standard 99.99% see no health deterioration since they put the work in at a young age. Funny enough the same people who complain that working hard is bad for their health are found at terrible dive bars drinking low quality alcohol consuming Hamburgers and French fries. The rough numbers for sleep we gave are a good guideline and consistency is most important (falling asleep at the same time 6 days a week with a typical longer night out once a week).

We have no proof. All we have is experience. From what we have noticed some people will respond differently to specific types of vegetables. While Spinach and Kale may have similar properties, it can cause stomach issues for one person while the other person sees an increase in energy. This is important to us since your body is essentially telling you which ones are most impactful. Below we provide a quick strategy to figuring this out.

#4 Find the Right Foods:

The first step is always the hardest. Do a significant cleanse where you eat no manufactured sugar for about a month. This means nothing but veggies, fruit, fish and a ton of water. We doubt you'll get through a full month perfectly but once you your body adapts you then start focusing on each food group. Generally speaking: citrus is for alertness, greens are for your brain and carrots/tomatoes are for skin. Go through each food group and see if one works better than the other. One person may prefer Kale, Lemons and carrots while another will react better to spinach/broccoli, limes and beets. The only person who will know is you. This is not a debatable item, since your health is going to allow you to live longer and look younger. A major status symbol particularly past age 35-40.

Similar to sleep, if you're under 30 years old, working out too much is largely a myth. Anyone who has real experience at a high level athletically knows that top athletes at that age train for 6-8 hours a day. If you want evidence of this just look at the bios of some of the top athletes in the world .After age 30 you can then start looking into timing out workouts so that you're in the gym for about 4-5 days a week. A good rule of thumb is that three days will allow you to maintain your current physique while 4.5 days a week is needed to improve.

#5 Work Out Consistency:

The best way to create consistency is to find someone who is better than you. Find a single person who is stronger than you in a couple of areas so you can be pushed in that specific region. Then begin your normal stretching and massage routines (this is for older people). If you're consistently being pushed (at least 2x a week) while 2 days are for standard workouts, you'll develop knots that need to be worked out. There is a reason why every single professional athlete requires a lot of deep tissue massages. They don't do it for fun, they do it as "pre-habilitation" to make sure they are always at 100%. If someone thinks that muscles don't need work, ask them why trainers and pro athletes all use these types of services. If they didn't work they wouldn't burn their valuable time with them.

Time

Remember that money is just a tool. Given the name of the blog people expect this to be about materialism but it really isn't. It is about getting rich as fast as possible to then do exactly what you want to do. That part is none of our business. What is odd is seeing people who want to get rich and then have no reason why. If someone is incredibly boring and out of shape… what is the money for? Having a bank account with a high number doesn't do much so make sure your values are in-line with where you're spending your time.

#1 Changing Values:

If you need $XM to live your ideal life forever, spending your free time increasing this digit is simply illogical. As we mentioned it isn't possible to win the money game for 7+ billion people so let someone else dedicate their life to that game. Take a good look at your values and remember that when you build your farm you eventually need to consume to crops to live. Otherwise what was the point?

Every rich person will say they "worked hard" and got rich. The reality is that a lot of luck is still involved. If a tech expert was born in 1900, they would have a net worth of zero since none of their skills would be relevant. Similarly, a lot of ideas are great they just haven't hit the market at the right time. I.E. Lady Luck.

#2 Avoid Unhappy and Unlucky:

The good news is that luck favors the same people. We have no idea why. But. It seems to be the case. To surround yourself with lucky people. This is a common theme in a book called the 48 laws of power and we agree. Another thing to remember is that if you're a happy and low stress person you will likely attract these people. Why? Well if someone has a lot of good luck they are probably in a good mood and have little stress! So if you want to continue down this path just surround yourself with happy people and slowly fade away from the miserable ones.

create more luck

A standard approach to saving time is to fast forward. Always look 10 years down the line and ask what will you regret? This is what you should be doing now before it is too late. If you want to combine number two and three you easily can. Why? Well people who have little regrets are typically… you guessed it… happy and lucky people.

#3 Fast Forward:

Fast forwarding is done in two ways. First decide who you want to become. Second find someone who largely has what you have. We don't even know who is reading this but if you're working in an office we bet there is a 1% chance you want to be like anyone in the office. Remember. When you change places you have to live with all of their life choices and not "re-do" them. So it's up to you to find someone who is a decade or so older than you and figure out how to follow a similar life arc with your own personal twist.

If you are not rich yet, this doesn't apply. If you're close to "making it" it's time to transition. When you're still building and accumulating you can work some positions you never wanted to do because you're just not where you want to be yet. After that you have to look at how much time you use to generate money. As we tweeted out before it's a lot better to see an . Most are glass half empty type people and think that you can't work at all if you choose the $10K stream (which of course is illogical). Take a hard look at the "ROT" Return on Time. You'll make significant adjustments and probably make more money. When you turn down income streams you'll be surprised when people bid up the number when you didn't even try to negotiate.

#4 Focus on Return: income stream of $10K a year that only takes 1 hour a week than have an income stream of $100K that requires 40 hours a week

Ideally, once you make it your schedule will now be more flexible. You'll find yourself making some interesting economic decisions. While logically you should always choose the highest income stream this will no longer be the case if you're bright. Is it better to make $500/hour or $400/hour? The natural answer is $500. But. We would then ask "when does the time occur?" If you can make $500/hour but are forced to be somewhere every single day on Saturday night from 9pm -1am… we're going to say no. If the $400/hour can be completed at , that is a lot more attractive. Flexibility relative to the income is what matters and you should be on the look-out for these opportunities even if you can make a few more bucks doing something else. The key is time preference.

#5 Flexibility: *any time*

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality ()… You'll probably like . The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by

Simple Ways to Make Your Life Easier

Simple Ways to Make Your Life Easier

Since we're entering into the economic recovery phase (over the next 6-9 months), it's a good time to revisit decision making for your typical reader. For better or worse, the typical reader here is high income (over $200K per year) which is in the top 10% or so. The top 10% is always in a different zone as they are trying to leverage their time and don't view life in terms of dollar/hour trade offs. So with that we can make some general/broad statements. The nit pickers will be deleted instantly.

When it comes to headache avoidance, you want to avoid receiving favors from someone. This is not the same as a gift. If someone wants to give you a gift you simply provide a genuine thank you and move on. If you're going out of your way to ask for a favor we would recommend paying for the activity/service instead. There are exceptions but this is the ideal path.

No Favors to be Taken:

Why? Well if you ask for any favor (big or small) the person will respond by asking for*a bigger favor* in return. If you received a favor that saved you an hour, you'll be asked to help the other person for 3-4 hours (yes seriously). So you're better off paying for a service that is rendered by an organization.

*Hint: reading between the lines you can see that the major issue with working with friends (favors or money) is that you *assume* they are good at their jobs (they might not be to your standards).*

The exception to this rule is when you've known each other for at least 10-15 years. In those situations you have easy ways of re-paying each other and you know the character of the person.

For everyone else, assume that you have not received a favor you've received In fact, you don't want to work with friends in general as

***debt*.** !*payments might come back*

For example, if you give your friend a task to do and you pay him for it, later on he/she might come back and say he "did it at a discount" and deserves more money. Yes… This happens a lot. Given the state of the economy and split of haves and have-nots… You want to try to keep favors/asks to a minimum for the foreseeable future. Keep friends and money separate when possible.

If you give someone money during this crisis, assume it is gone forever. You will not receive a penny back and you should assume it has evaporated into thin air. This does *not* mean that you shouldn't give it away. It means that you should never expect the money to return.

Assume Cash is Gone:

In the rare case that the money is returned, take note as this individual is extremely organized and grateful (likely to become extremely successful in the near-future). This life rule will allow you to avoid headaches and help people that need it. If you break this rule, you'll be disappointed and likely over extend yourself in the process, creating more long-term headaches.

We give a lot of our recommendations out for free. What you learn is that people will rapidly change their opinions on everything: who's going to win the election, if they should buy or sell a stock and who is going to win the next big championship. Seriously. They will change their opinions based on a whim: a missed quarterly earnings report, a poll that says they are losing badly and a random statistic they saw on a popular website. Some people even change their opinions based on a single player having a bad game in a playoff series, refusing to look at statistics.

Avoid Arguments About Investments/Bets:

To no surprise to readers of this blog, we don't really change opinions. We have a high hit rate and don't waver. We don't "shift positions" three days before an earnings call. We don't change views on who wins the next election (we don't even vote) and we don't make emotional bets as it relates to sports. For fun, we still think Trump will win (for those that have followed the Q&A's closely, we bet immediately after the 2016 election since he was priced at 3:1 a good enough return. At 1.6 to 1.0 it's still worth a swing with some money you're willing to lose (incumbents usually win and Biden doesn't seem to have any real charisma).

People have too many emotions tied up in every single event so they think you will change your opinions as rapidly as they do. Why? They have zero emotional control. This is also why they will go broke over the long-term and will do everything in their power to point out when you're wrong (which is ideally less than 25% of the time, a high hit ratio is all you need).

One of the other major issues in 2020 is that people are developing bad gambling habits. This is currently underway. Gambling addiction has been around for a while but with people sitting at home all day, they are turning to crazy stock and crypto currency bets. To provide examples, look no further than Hertz and Dogecoin.

Avoid Developing a Gambling Mentality:

This is a sign of quitting. There are: 1) significant risk and responsibility through ownership and 2) consistent cash flows that are reinvested as you save more than half of your income per year (rough number). Both of those strategies lead to wealth over the long term and of course the ownership route can lead to billions while the second route will get you close to around $10M or so.

two simple ways to gain wealth

When someone veers off of these two paths you can see it in their gambling/addiction for highs. They will see a specific stock like and be visibility frustrated … despite owning zero shares. Meanwhile the people in camps 1 or 2 likely own a small-medium position and participated in at least some of the upside. You can take a guess who wins over the long term. One guy goes broke and the other two get rich over time.

Tesla go up 5x*"I knew about this stock i knew it would happen!"*

When two people have a "conversation" it usually revolves around both of them complaining about something to one another. Next time you meet someone new, see how quickly it devolves into 1) series of complaints or 2) a series of brags about prior accomplishments. At least the second one gives you an idea of what an accomplishment is (IE. if they brag about making $150K a year, they probably make closer to $125K and you know they think this is a large sum of money).

Get Used to Complaints:

There is no way you can change the complaints. In fact, if you don't complain about anything they will actually feel uncomfortable. So get used to that and steer most conversations into neutral territory. If you are looking for complaint fodder, just find any world activity that is in the news and say its "sad". For example "I'm sad that XYZ sport has been cancelled". This steers the conversation into a neutral territory about sports where their sport team is the best – allowing you to easily agree with them.

Since the majority of people are not successful, they do not know how to deal with people who talk directly. No frills, straight to the point. This is because they haven't had to manage large tasks. Managing tasks requires direct communication since it reduces errors and focuses entirely on solving a particular problem. You can guess where this is going… under no circumstances do you tell them "stop complaining". This is the biggest way to make a social enemy. The truth is that complaining about anything just puts you in a bad mood and doesn't solve the problem. You cannot say this publicly without making enemies so don't do it. You'll be tempted… but over time you'll see it's better to *say nothing*. Smile, nod and agree.

One of the common complaints we get here is that our views on high finance have not changed. M&A related positions (PE/M&A banking) are preferred to practically everything else. Guess why? It is the truth that is why.

Accept Reality – High Finance Example:

We're not going to go back in time. Companies are . So our opinion isn't going to change since it is the truth. The reality that no one wants to hear? Finance is largely a skill-less industry built on politics and relationships (like practically every other industry).

opting for more direct listings and alternative methods for funding

If this is bothersome that's great, it's also true. Collect as much money as you can if you're still in the industry since it is in secular decline. The real talents will end up making a large sum and they will primarily go into those three sub-sections (since they are performance based)

The good news is that there are still options in high finance. M&A, PE and successful hedge funds. If you attempt to go into wealth management, capital markets and other industries being attacked on all ends (robo-advisors, cheaper ways to raise money etc.) that's going to be a declining industry.

Yes you can still make a good living (today). And. That industry is in secular decline. Both statements are true. The guy making $800K a year will be making $400K a year 10-years out. Should he quit? Of course not! Keep the money flowing and focus on a side business instead.

Now that we've reiterated the same point… the good news? If you go into M&A you get to learn how each business is run. This should allow you to develop skills to start your own business! That is why M&A is still a great career path (along with PE/good hedge funds). The skills you learn are directly translated into real world application if you're smart enough to take advantage of the information you're given (learning about business models).

As a rule of thumb you want to scale as much as you can without any humans. Since you (an individual) should care the most, you can move the fastest by yourself. Use every single tool at your disposal to scale up without any hired help. Outsource, outsource, outsource until it's no longer feasible.

Headaches Always Have Two Legs:

At that point, you should be in a position to pay *above* market rates. Why would you do this? You want to create stickier employees and you want to make sure you can always hire the best person for the slot. This is easier said than done. Also. Every single direct report you get is a massive massive headache. You have to learn how to delegate, deal with varying personalities and work on your own teaching abilities. Just remember, when you pay for quality, you only cry once.

One of the main takeaways from the prior two paragraphs is that you should always be open to new technologies. It is your job to stay on top of new developments that can help you scale without additional overhead. Do not fall behind and allow your competitors to scale with less employees as you'll be driven out of business long term (they can cut prices and drive you into the red).

Some key items include the following: 1) the divide between the rich and poor is going to continue. Even in areas like finance with high wages… you will see a divergence between the winners and losers – easier to see which people are really outperforming the market and closing deals; 2) stay on top of technology. Even if you hate it, it's for survival; 3) remember that you want to scale as much as possible without people, adding people always adds headaches; 4) don't take favors particularly in this environment, people will ask for 4-5x more in return and 5) goes without saying, do not flash wealth. This does *not* mean you should be frugal. In fact you should spend a ton on marketing, ads etc and push your competitors out of your industry. We're only referring to public displays of wealth in an economy with double digit unemployment.

Some High Level Summary Comments:

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life.

Slight Update to Growth Industries and Ways to Be Employed in the Future (Q&A announcement as well)

Slight Update to Growth Industries and Ways to Be Employed in the Future (Q&A announcement as well)

Following up on our post of observations, we thought it would be good to figure out where the next big industries are. Some of the clear ones have been related to technology: blockchain, AI, Robotics, video games etc. However, if we take it a step further, we can take advantage of industries that will boom *due* to the impact of automation/decentralization. In simple terms, people will gain more autonomy, they will either be rich or poor and the same mistakes that were easy to recover from in the past won't be easy snap backs anymore.

Assuming someone has zero talent, it likely makes sense to enter the healthcare field at this point. Before we would have recommended going into housing or something similar where one could flip homes (repair them) for large amounts of money. When we originally suggested this, we didn't realize that many people won't be able to run the numbers correctly. House flipping "gone wrong" is just as bad as levering up into the wrong investment. So. With this new assumption in mind, we'd go straight into health related services.

Zero Talent Industries:

Home health type services will allow people to get paid with limited risk to automation/robotics. You're not going to send a robot to take care of an elderly woman (checking her blood pressure, taking her places etc.). You're going to send a human being with good social skills which can be learned over time. Also, by working in healthcare related industries, we'd bet that the individual would be less depressed. Seeing how hard life can be if your health is taken away and how grateful people are to be alive is going to prevent your average person from slipping into depression.

The most basic items we can think of here within health care are: X-ray technicians, phlebotomy, nursing and home health services. We're certain there are many more, we're just listing a few quick ones that require next to no education and pay a living wage. The goal here is to find a profession that allows someone to live a basic life without any special talents.

Scale this idea up and we think Psychologists will become more popular over time. Look around. People are starting to believe in stuff like numerology and astrology. They are starting to take their pets on planes more frequently for "emotional support". They are suffering from more and more panic attacks as they graduate from college and don't have the career they expected to have. All of this points to more psychological issues in the future. We're not trying to "make fun" of these people, we're simply pointing out the truth. A lot of people are entering adult life with very little to look forward to so they either get depressed and need support or they start believing in hope based items like astrology.

Psychologists:

If we can agree that people will struggle in early adult life, becoming a psychologist is likely a safe profession. We'll write that out again. Only do this if Unlike standard healthcare professions we listed above, this area only rewards the best people. If you're able to help someone break out of depression and get their life in order, you'll be doing them a huge favor while also being paid handsomely for it. You're not taking advantage of anyone if you're able to deliver results. Similarly, if you're not good at it, you won't get clients and they'll all go to the small handful of people who are actually talented (just like everything else in life).

Assuming you're good.you will be good.

summarizing the two above from the very basics of just x-rays and phlebotomy to scaling it up to psychological help and "life coaches". The ideal would be a life/psychological coach for people who were born rich but are not very talented. As a note, we actually expect this to be common as rich men become more shallow over time and their mothers are not that smart which leads to "normal" functioning children with a lot of money but not a ton of talent. (yes this is judgemental as we assume the extremely attractive woman isn't that smart… which is ***GENERALLY*** true. As they say, rich men and attractive women never have to deal with reality.)

Key examples:

Moving onto the second section, we think the world is moving into two economies. The well off and the not-so-well off. While people will always make excuses saying that you need to be born into money to get rich, hundreds of studies have already proven this false. Since your average person has zero talent but thinks he's a genius he'll ignore all of them and complain that he's not getting his fair share. . ()

Services for the Rich: For fun the math is about 70% off of families lose their wealth by the SECOND generation and 90% by the Third*Note this applies to the USA*

As usual debating with unsuccessful people isn't a good use of time… instead… time to sell services to the rich! The rich will pay for practically . Seriously. They will pay for dog walkers (even if they are overweight), laundry, cleaning and of course faster travel time (Clear and Pre-check are popular for a reason). If you're willing to grind out long hours before scaling up, anything that is "direct to consumer" and related to time saving will work in major cities (San Francisco, New York, Miami, Los Angeles etc.). The one downside here is that it won't scale past the major rich people centers of the world. That said. Successful D2C services for the rich is a large enough market.

anything that saves them time

Dog walking business, tax filing for the rich – if you worked for the IRS before you have an immediate edge, laundry/cleaning/cooking, direct to home tailoring, shoes, designed clothing… Rich people also get bored and you could even come up with a D2C alcohol product (rich people collect wine and "rare whiskey" is appreciating rapidly) could expand this.

Key Examples:

As mentioned in the prior post, since the average person is getting more insecure by the day, it means that we're seeing a rapid rise in drug abuse (steroids) and plastic surgery for men and women. If you've got good sales skills but don't have the ability to become a plastic surgeon (without incurring mountains of debt), then you could help create/sell ads for these services. If you've been on a plane lately you have all seen those ads for face lifts, grey hair etc. This is probably going to be one of the most profitable industries over the next 20-years. People really believe they are making a "more secure" decision by trading the lambo for the face lift and liposuction. Despite costing tons of money (both options) there is a new trend to not "flash wealth" so they are moving into body reconstruction.

Scale Up the Insecurity: *both*

The "looks" industry is still growing rapidly. While you want to avoid the whole personal trainer route as revenues fall off a cliff in a recession, anything related to making people appear youthful is on the rise. We're even seeing women in their early-mid 30s trying to go to the high-end night clubs (unsuccessful). Seriously, a few of them are doing tons of surgery to try and keep up as they are still single. (hint this is another reason to get rich and throw those classic house parties or bring your own group of people to the clubs where there is an unwritten rule of not showing up "empty handed").

If you're talented at sales, then we'd go ahead and enter the mens cosmetics/grooming industry. This is not a troll. If you're already good at selling womens cosmetics, selling to men in the future is certainly on the table. Instead of selling makeup/skin care you'll be selling grey hair remedies to insecure men along with facial/grooming products (can also be masks/trimmers etc.). There is a reason why "Hims" is growing rapidly and it has much less to do with the product and has 100x more to do with a shift in demand and marketing. Online dating is still popular according to all metrics, so you could also venture into photography for men as well. Yes. All of this sounds "kooky" but if you look around this appears to be a trend. Trends make money.

Wide range again but start with trying to help sell expensive items, creating ads for plastic surgery liposuction etc. The most popular upsell appears to be lip injections for women and botox/dysport. Second to this will be hairlines for men and liposuction. If you can help "normalize" more expensive procedures you'll make a killing.

Key examples:

This isn't something we're interested in as it requires a lot of start up costs (brick and mortar). That said, when men settle down (around earl 30s) their Instagram pages suddenly turn into photos of food constantly. Even the guys who are loving their personal lives tend to do this. We don't know why but it happens right around that age and doesn't slow down (well into 40s). This is also something that women do all of the time from age 20 and up. There are pages dedicated to "Food Porn" and other such catch phrases to make everything seem cooler than it is.

"Cute Food":

What does this mean? Well it means you can create a "cool experience" around food and charge an extra 100% for it. Does it really cost $14 to make "organic avocado toast"? No. Does it really cost $5 to make a latte with a foam heart on top? No. Does it really cost an extra $1-2 for toppings at your local desert spot? Nope. As you can see it's all about making it look cool.

Since budgets will be smaller (not rich category), the average person will spend more on something that looks cool and makes them feel special. On a somewhat related side note, this likely means we'll see more creative customer service in the future. Could be an opportunity as well. If you can pay your waitresses/servers a bit more but make them do something entertaining to improve the experience it'll probably pay off. Places like Benihana grew rapidly by offering a new experience and while it has plateaued for now, there are other options (fancy deserts, fancy millennial avocado toast etc.)

This can range from the most common items like ice cream and pizza to more expensive items like customized cocktails. You can also go the millennial route by offering trendy items like avocado toast and selling sushi. Come to think of it, since people will be a bit more depressed and men will be more upset ("rage"), marijuana is a great industry for the next several years as it will act as a "cure" been seen as "cool".

Key examples: **and**

We're leaving this for last since its still extremely popular. As mentioned the new status items are plastic surgery and high quality travel experiences. Since there are two groups here: rich and poor, we just don't see how anyone is going to start a private jet company from scratch. If you're balling that hard probably don't need to read anymore. That said, here are some ideas we've been thinking about.

Travel Bucket:

New variety of a travel pillow or lower back support. Since most travelers will be in economy, there has got to be a way to fix the experience. If you're traveling in economy, the way to sleep is by getting a window seat, placing a pillow on your lower back and angling with your head on the window and legs in a diagonal direction towards the middle seat. This maximizes the leg room you'll get if you're flying economy. Everyone has to fly economy at some point unless they're in the $100M+ camp.

So. Instead of complaining about this, we've been tinkering with a seat adjustment product that would be placed on the seat (low back). Currently, trying to test this with various pillows but there is certainly something there. The neck pillows don't work well since the headrest forces you to lean slightly forward at times (not sure who designed that thing to be so big). Essentially, the key is finding a way to create a "plank" that goes backward so you increase the angle of your body as much as possible. If we can figure this out we'll attempt to sell it since it would make flying 100x better.

we gave out one item we're trying to figure out, but anything that'll make the flight experience more enjoyable would be huge. Most flights are just terrible for the vast majority, at the end of the day unless it's an international flight, there are are not a lot of first/business class seats so the regular economy section needs significant improvement.

Key examples:

This is not related to making money. More general information. Since we know we've moved from "materialistic items" to "plastic surgery and grooming", you can imagine that the easiest way to stand out is by doing the reverse. If you're sporting a nice watch or expensive shoes you'll garner more attention than the person who paid for the improved hairline. This is just due to math as the trend is to get "cool tattoos" and focus on non-materialistic experiences. The funny thing is that if you make it to the real top of society (we'll draw the line at $5M+ net worth) all of those things do come back anyway (nice clothing, shoes, watches). So. You'll be sending a differentiated message.

General Unique Stand Outs:

We needed to make this clear as the trend does not necessarily mean you should "do them". Instead the trends are there to make you money while you spend said money on improving your personal life. The best example of this is people who sell $50-100 sports jerseys to super fans but don't even enjoy the sport. Or the statisticians who bet on sports without any interest in the game. Unsurprisingly those two people win the most.

Q&A will be available on Friday June 14 for purchasers only.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality … You'll probably like . The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). Smile Nod and Agree It May Save Your Life Also Q&A Announcement

Smile Nod and Agree It May Save Your Life Also Q&A Announcement

For the next 18 months we'd strongly recommend that you begin mastering the art of "smiling, nodding and agreeing". At this point, many people have seen their net worth drop by 10-30%. While most just focus on the stock market, the cash flows for a lot of individuals went negative or to zero. Imagine paying $10K a month in rent for a local Bar owner, and suddenly you have to pay the rent while getting $0 in revenue for 2-4 months. That's a massive negative margin hit and has to be funded by cash you have on hand. You have to pay employees or fire them, pay the rent and utilities and pay your own bills while getting $0. This is a massive massive hit to any cash you have. The only solution here is to "smile, nod and agree" a lot more particularly if you're benefitting from the downturn.

If you want to get far in life without burning a lot of time, you're going to . Most are familiar with this concept (if they have followed us for a few years), but for the newer readers it means that you're not going to voice any opinion. You simply smile at the person, nod and agree with the point they are making.

Smile, Nod and Agree Basics: *"smile, nod and agree"*

Why would you do this? It saves you a lot of time. So when people bring up the main time wasters: politics, gossip about someone else and sex/religion you just agree. If you don't agree… you agree anyway. You've saved yourself from a long argument where no one will change their mind. No one gets into an argument about any major topic like that with the following conclusion: . Does not occur despite what people will tell you. They just go back and stew on the topic and solidify their current view.

"Great discussion you've really changed my mind"

You'd think that this is an easy skill to master. It isn't. It's a life long skill like sales. Even if you think you've got it down pat, there are some people that will prod and prod and prod trying to get info out of you. Do your best. You can usually avoid these types of conflicts for 5-6 hours or so (usually enough to avoid any debates). No need to take down their phone numbers and you're set.

With the main premise out of the way, it's time to apply this to finances. No matter what, you should no longer disclose how much you're making and you should *no longer guess* how well the other person is doing. This is a huge change from what we've said in the past.

Economic Impact of 2020:

In normal economic times, you are free to "lie down" and say you make about 80% of whatever the other person makes. It is fine to do this in normal economies because the chances of being wrong is quite low. When employment is high, you get an idea of what the person does, you can easily just lie to the downside. This creates no animosity and they feel like you're still in their "economic class".

This is out the window in 2020. You will now run into people who are actually up this year and you'll run into people who are at zero, went negative or worse. Better to avoid the topic all together at this point. When people try to prod just make blanket statements such as "This COVID thing really negatively impacted my life". Don't need to say anything else beyond that. They will fill in the blanks by themselves and you won't have to get into an uncomfortable conversation about making money. In fact, they will avoid that topic out of "courtesy".

The second one we're seeing is significant personal life changes. You do not want to ask questions about where a person is living, where they were living before etc. This is a standard topic of conversation when you meet new people at a particular social setting. Where you're from what you're doing now etc.

Personal Impact of 2020:

Why do you want to avoid this? Their personal lives may be uprooted entirely and you might hit a bad nerve. It's a big one to be aware of (very big). If someone gets laid off and decides to move abroad for a bit… when they come back it's unlikely the same. Life just doesn't work that way. Some people may have to go back home as their family members are getting crushed by the pandemic. The list of potential issues is long.

As a point of emphasis, this only applies to new people. No need to be a psychopath with no emotions for your friends/family. We're referring to new people you meet for the next 18 months. As you know, first impressions are incredibly impactful so you don't want to leave a negative feeling behind. The same rule of life applies:

_*People do not remember what you said they only remember the way you made them feel*

This is common knowledge yet it is frequently forgotten. If you think you might be steering the conversation in the wrong direction, always choose the smile, nod and agree approach… and cap it off with something positive for extra safety. You do not want to trip an emotional trigger in the current economic environment.

This one is going to get very very ugly. We usually don't type in that fashion "very very" and other wasted words/content. That said… it is going to get very, very, very, very ugly. This is because the haves and have nots have split quite dramatically over the last 3-4 months. Anyone who was able to maintain their income was able to get ahead, anyone who lost their income fell back dramatically (can't even interview to replace their old jobs/careers) and anyone who made more money just put a year long gap between them and their peers.

Socioeconomic Impact:

The math is simple. If you usually make $10K in a month and spend $5K (again keeping it easy), then you're saving $5K. Now if person A runs a small business that goes negative, his cash flows are -$20K for four months. Person B who somehow made more money, say $14K… Also saw spending go down (due to closures) and has saved $10K per month for four months. So one person is + $40K while the other is minus $20K creating a $60K spread… which is equal to $5K multiplied by 12 ()

a full year

There is no easy solution here. We've talked about a few: 1) variable consumption tax – tax rates on a Honda Civic should be way lower than a Ferrari, while taxes paid on a $250K home should be way less than a $10M mega mansion, 2) instead of using UBI – blank checks – we should have universal basic food and water to prevent the funneling of money into nefarious activities and 3) a change in executive incentives to avoid share price focus and instead drill down on head count growth, revenue growth and stable profits. This would cause spending to go from buybacks to R&D which creates jobs and also forces the Company to create value additive products at a faster rate.

While we love solutions, we stated up front that it's not going to end well. There is no way we can suddenly change from the current structure to UBI, luxury taxes (not wealth taxes) and a complete overhaul of executive compensation. So the road to a better future is going to be long and arduous, we'd wager that it won't be solved for at least 3-5 years. We're praying some good solutions do come up… if a socialist takes the helm over the next 5 years or so we're really out of luck as a Country.

Back to the point. You're going to see an even steeper divide in the haves and have nots. CEOs have learned that a lot of their employees really weren't adding anything and a lot of their employees were doing 2x their normal workload. This is the light bulb moment where income for the performers can go up and the non-performers can be removed… permanently. Since high-performers stay on the job, the remaining positions that open up (later) are going to be lower wage positions (need to prove value). So if you're liked politically at your Company and you have a good paying position, don't rock the boat. Keep collecting and working on your dreams at night since you're working from home anyway (no commuting excuses anymore!).

This is obvious from the past month or so. Lots of social unrest. It has reached a point where people believe that "silence is violence"… Which means "you're with us or against us". When massive issues like this occur there are usually three options: 1) agree, 2) say nothing and 3) disagree. The people promoting the phrase "silence is violence" are saying that you only have one option: agree or disagree… with their opinion.

General Social Unrest:

Now you see why you must smile and nod. If you find out someone is aggressively on one side or the other you *must* smile and nod. If you do not smile and nod, you're going to get into an argument even if you have no opinion on the particular social issue. Play it safe.

More and more issues will arise over the next 2-3 years as industries transform rapidly. Some because they have to and others because they are forced to. Imagine having no online presence (any company) over the past 3-4 months. You'd see zero revenue and have high fixed costs. An absolute nightmare. In addition, imagine not having an emergency fund for 3-6 months. You'd end up in credit card debt due to the expenses incurred once savings are depleted. So on and so forth. As these companies evolve and change, the work functions shift to knowledge and production. The days of repetitive tasks are dying at a rapid rate.

As these issues ramp up, remember to smile and nod in all new environments. Take the time to come to your own conclusions and contribute in a way that you see as productive. Don't let the masses decide for you. Simply agree with whoever you are talking to and contribute in a way you see fit. No reason to tell them what you are doing.

We will hold our next Q&A on Saturday June 20. This one will be shorter due to an extremely busy June. With things opening back up we expect to be back to normal on this blog by mid-July.

Q&A For Purchasers Only:

So You Just Got Hired… Revisited

But it looks like it needs to be revisited based on questions that have been coming in.

We already covered the topic.

Some people are extremely interested in moving up the ranks in finance so as soon as they get a job they decide the best thing to do is buy an expensive $2,000 modelling course and pay up for training.In fact, in the future we may load up actual LBO, M&A and Accretion Dilution models if the questions keep repeating themselves.

Unfortunately these people are just stealing your money.

Before we explain what you should do, lets sell you on why you shouldn't be learning foreign tax laws and complex merger models. With an example.

Lets say you're the Vice President of a prestigious Investment Bank, you have worked for well over half a decade to get where you are and you know what is important and what is not. A new class of Analysts and Associates roll in. You find out you just won an M&A deal, it was the first one you sourced and this is your new baby. Are you going to give this important work to a fresh face or at minimum a second year analyst who you've worked with before. That should pretty much answer the reason why you're not going to spend $2,000 on "modelling and training" courses. In addition, this applies to research, hedge funds and any other high finance job. Finally, we already have templates for M&A models so why would we ask a fresh face to create the document? At minimum you ask a more senior analyst or low level associate who has bandwidth.

With that all said and done what should you do. The answer is practice extreme excel speed.

1. Go to SEC.gov and choose a Company. Create an income statement, balance sheet and cash flow statement from scratch and update for the latest earnings call (8-k document)

2. Repeat step 1 with for 6-7 historical quarters, however by the end you must be able to update the document with ALL new quarterly numbers in 45 minutes.

3. Create a forward looking 3 statement model, out 11 quarters.

4. Google excel short keys, memorize 10 of them and practice using them, repeat this process up to 100 keys. Start with "alt e s" functions then move onto using F5 religiously and training your hands to use home and end keys as well. Finally, practice navigating the internet without a mouse as well, backspace runs you to previous pages, tab to change web address etc.

5. If you're extremely motivated go take an excel course.

6. Throw away all advanced accounting and advanced financial algorithm text books

7. Repeat steps 1-4 with graphs of Revenue, EPS, EBIT, EBITDA, EPS, incremental gross margins and any other metric you would like. Format these charts fast.

If you can do the above you'll likely avoidbecause you'll be fast and efficient.

rookie mistakes

Once your excel work is much better than usual, you are going to spend the next 6 months getting into the best possible shape of your life. This is not a laughing matter. Lift extremely heavy, eat healthy, be in 100% tip top physical shape. You want to be well rested so you can be productive and happy at work and avoid the The keys to politics will be introduced relatively soon.

30 lbs most people gain in year one. This is a key to being the most political person in the office which will net you more money than any course you have ever taken in your entire life.
****

So… You Want To Be a Trader?

Dimes and Lines.

Suits. No, not your Hugo Boss, that's for consultants. I'm talking Pal Zileri, custom fitted and tailored straight from Italy. to Chicago, New York all paid for by your firm. Box seats to games and concerts… and working towards that F-you. Yes! Trips in party buses from your billionaire clients to go see his favourite band. Five star food on board. $1000 bottles. More … and the ladies, you don't even have to tell them what you do because you look so good.

Trips bonuscoke.

I loved it. I had enough.

I worked commodities. If you're not on your game EVERY. SINGLE. F***ING SECOND. You lose or clients lose. I'm talkin your net worth in 3 minutes for one client (happened) F***ing DAX.

Commodities is F1 racing beside equities Fast Five rice rockets.

You cant fake it in trading. Everything is taped. If its not the clients fault, (acknowledging and order repeated back even though he wanted something else done) it's your fault. And you pay for it. Your boss asked for a rundown on certain figures and asks you in the most vague way.

For a certain time I worked overnight, trading the Asia and Euro opens. During the crisis in 2009 and 2010, it was exciting to watch the world implode before your eyes while everyone was asleep. Figure that out. He doesn't care. To know what he's thinking.

That's why he pays you.

Back to that billionaire.

One night. He was trading AUS/YEN cross' (he sucked) and he didn't like that his stop hit. Typically I pretended to call the trader, then put them on hold and pretend to yell at the trader for the hit (or bad fill). This usually satisfied his ego and it made it look like I was going to bat for him. Not this time. I took a 3 hour berating that continued on to the morning guys.

My boss asked me why after he listened to the tapes. I was confused

I didn't quit

"For what?"

"For the way he was yelling at you"

"That's every night"

Every single rookie broker that I saw come in bright eyed thinking he's going to be playing golf everyday and have liquid lunches, while the money rolls in, is gone. of them were gone before their first 12 months.

Ninety Nine percent

One common theme with the vast majority of all of our clients is they all lost their money. . There weren't many smart ones.

The smart ones never let their emotions get in the way

The markets used to be orderly. It was either an up day, or down day. After 2008 it all changed. Gold can be down $40/oz and 15 minutes later be up $25. That's a lot of money per contract. Accounts wiped. I did a lot of hand holding. Some of the most successful businessmen ever… Got crushed.

Moving on to the present.

In the Olympics past, there was a controversy that the Chinese women's gymnastic team was underage. You have to be 16 to compete but they were forging their documents and 14 year olds were competing. They wanted this because the younger they are, the more risks they take. They fly higher, do bigger flips and spins, which wins them gold. To be a successful trader, you need to be a non-violent sociopath. Even

more competitive than A-type Navy Seals.

I eventually made it to where I wanted as an Institutional metals trader with the largest trading firm in the world. I declined. After so many years in this race, I wanted different things. Its a young mans game, just like the gymnasts. I know too many that are still in it wishing they were out.

The lure of money forces them back in if they cannot control their lifestyle.

****

Solving Alcohol "Confidence"

Previously we wrote about the and more importantly, many men out there rely on the effects of alcohol. This is liquid courage. It's not real. While we can drown on and on about the "effects" of alcohol such as "lower inhibition, lower motor skills and smiles to the brain" its important to take a serious look at what alcohol does to the brain itself. First a quick look at our brain:

simple drinks you should keep in your home

To prevent delving into the physiological elements of the brain this will be a simple split. There are two functions. 1. Reptilian and 2. Cognitive.

The Brain:

This piece of the brain is for survival. Your heart is beating. You're breathing. You're blinking. This is the natural work of your Reptilian brain, you don't need to think of these signals, your body simply sends them.

1) Reptilian:

This piece of the brain is deep thought, logic and processing. You're reading these words, you can forcefully make your breaths larger and smaller, you can forcefully blink and close your eyes. Effectively it is the logical processing piece of the brain.

2) Cognitive:

Now for the important part, what happens when alcohol is introduced?

We're all human, and the reptilian brain will be chosen over the cognitive. Alcohol is introduced and suddenly you're "losing" inhibitions. What is really going on? Your reptilian brain is coming out. Alcohol is a type of poison, changing our blood circulation. Our brain is the most important part of our body and it knows, when there is limited oxygen flow?

Shut down the cognitive brain first and choose the reptilian brain for survival.

Given that this site is up to give actionable steps, what does this all mean for those that feel alcohol gives them an edge? It means you can mentally turn on your reptilian brain and much like everything else in life it takes a significant amount of work, below are the steps that should be taken to see how you "act and feel" when you're drunk.

- Get a video recorder flip it on
- Drink 2-3 strong drinks of your favorite alcohol with music blasting, walk around
- Call a few friends up listen to your tone, record it and limit the call to just a few minutes
- Practice a few dance moves (no one is looking but you anyway)
- Shut off the camera and feel free to head out, your body will want to anyway
- Repeat the above steps next week … dead sober at the exact same time

Here's the cognitive part, compare the videos side by side. Your voice. Your walk. Your arm positioning. Your smile. Your dance moves.

You now have the solution.

As previously mentioned, as they are unable to physically bring up their reptilian hind brains, their logical side is strong and must look for something concrete. This forces the cognitively intelligent to generally rely on booze to get them through, but it is in fact unnecessary. Instead we can build ourselves up by using our own cognitive brain to force body language, tone and positioning upon ourselves. Use your logical side to analyze every detail and replicate those details, it will feel extremely awkward but over time your entire body and mind will act as if… you're in a relaxed drunken state without any of the negative effects. Mind blowing.

cognitively intelligent people have a tough time learning "game"

Instead ofspending too much time trying to figure out exactly how the brain works, it makes more sense to accept the principles of your brain. In addition, if further proof is needed that all of the changes in tone, voice, body movement is needed look no further than actors and musicians. Put on metallic music you "feel different", watch a horror movie you "feel different", listen to XYZ… you "feel different". Notably, all of this is technically just noise and fake movements from characters on an electronic screen, neverthelessevery man must learn to control

Conclusion: his mind.
****

Solving Some Rich People Problems

Solving Some Rich People Problems

The richer you get the more likely you are to suffer from these "problems". In fact many of you reading this, likely a larger portion than most assume, will find it entertaining. In standard fashion, instead of just listing out the issues we'll attempt to provide a few solutions as well. They aren't great but hopefully they will help. If you have a common rich person issue please feel free to comment as well as we're interested to find common threads and fix them. The more rich people problems that are fixed, the better the world will become (exact opposite of what most believe).

If you take a step back and think about the majority of conversations, they usually involve one person complaining/telling their life story and the other person listening and telling them what they want to hear. Once you make it financially, conversations are harder to have as you have no interest in hearing about another person's complaints. This then leads you to cleaning out your contact list as no one wants to listen to complaints all the time. This leads to a significant reduction in conversations in general. This is less of a problem and more of a "by product" of success and is something to be aware of as your net worth increases. It also prevents you from complaining unless there is something significant that has recently occurred. Even if this is the case you end up referring to it as an "annoyance" and move on quickly since it doesn't change your life either way.

Less to Talk About:

Since there is less to talk about you inevitably look for people who don't have problems. Unsurprisingly, rich people have less problems! So you're naturally drawn to richer people who then fill conversations with topical items like investing, golf and other successful people. One thing that doesn't change as you move up is the amount of gossip. Everyone wants to gossip and we'd suggest doing the opposite… Only gossip positively about other people. As soon as you join in on the gossip game (you'll invariably be asked about someone) always say positive things. There is no real upside in saying negative things unless you're 100% certain the person wants to hear negative feedback and will reward you for agreeing with him (99.9% of the time we've found being positive as the only real long-term solution). Either way, the solution to fill the void outside of investing, and casual talk is to partake in gossip in a positive manner. Only highlight the good qualities of everyone you know (except the competition of course!).

Once you reach your financial number, it's incredibly difficult to stay motivated. In fact, we're shocked at some people who are able to earn small amounts of money relative to their net worth (they somehow still do quality work and care quite a bit). As an example, if you reach $5 million in net worth but are still working for $200,000 a year after taxes… We're impressed. Not a joke. The person is somehow motivated despite his entire year of work being worth *less* than his investment income. It's insanity really as he can only increase his net worth by 4% and that is if he saved every single cent with $0 in living expenses (unrealistic).

Significant Change to Motivation:

The only solution we've come up with for people in this situation is to either 1) never sell your business or 2) build enough skills to do something you enjoy for money. These are the only two major items that seem to work consistently. If you sell your business with nothing left to do, you're going to be unmotivated by anything around you. By way of example again, if you were making $500K a year from the business and sell for $5 million… well now you have nothing to do and in order for you to be motivated you must find something that earns a minimum of ~$500,000-$750,000 after taxes. Hard to justify working for single digit net worth increases. In the second example you would build skills related to a fun activity. You click the sell button and move into a new position that doesn't pay well but is actually enjoyable (hint: unless you're extremely lucky, making large amounts of money is extremely stressful). The clear message here is to avoid being caught in the middle. Don't do something you "love" unless you're rich and don't need the money and don't sell a business unless you absolutely know what you're going to do next. Otherwise you'll just be an unmotivated guy with a heavy bank account (a lot more common than people think).

As you amass a larger and larger net worth, you're forced to think about death taxes, estate planning and minimizing your own tax burden. It is insanity. We strongly recommend hiring an accountant who has worked for the IRS and has strong knowledge of business structures. Asking rich people just isn't enough as you need a professional who does this for a living. They will know every single hack, trick and loophole if they are good. Taxes are up there with the most annoying things in life. You end up giving the government more money than you would personally spend in a year. By way of example, it's not uncommon to spend $300,000 in taxes and yet your total annual spending came in at $200,000 or so. This is crazy as you're spending less than you're giving away (to a wasteful government… where you use nothing except security/defense).

Taxes and Assets:

Assets begin to have real meaning as you get richer. Anything that is "tied up" becomes less valuable as you don't need to play the appreciation game as much anymore. While you preferred the 20% annual gains with no dividends before… Now you're annoyed at anything that doesn't generate positive cash flow for you on a quarterly or monthly basis. Why? Well the and having millions of dollars to spend today is a lot better than having hundreds of millions when you're 70-80 years old. Things like your old 401K plan and Roth accounts become meaningless since they can't be used until you're old and gray. The people who are still interested in locked up long-term investments (no cash flow and long holding periods) are generally looking for something to pass along to their kids (or additional tax avoidance). If you're single and trying to live it up, this is just not attractive anymore as you unwind your assets to invest into cash flow vehicles (with a low probability of future headaches).

value of life diminishes over time

For those that decided to go with no second source of income and made it… the one issue is this… what happens if that position goes away? There are countless stories, particularly on Wall Street, where someone could be earning $500K+ per year and then transition quickly into structural long-term unemployment. Why? Well there are not many positions that pay this much money. If the sector you're in falls out of favor or too many people enter the field, wages go down and it becomes difficult to tell other people "I'll work for less". If anyone thinks this cannot happen to them we suggest looking into any industry that has moved into declines, working at places like Blackberry used to be high paying high growth positions. The same could happen in any industry not just smartphones and computer equipment. Another example. As AI advances and machines can write better code than 99% of programmers… what will happen to their income? So on and so forth.

Difficult Income Replacement: all in on a Career

The one downside of being rich and having a high paying career is that you're going to have a difficult time replacing it. This also applies to any business you create. Luckily, we put this as a "rich person problem" since the typical rich person will realize this quickly and invest/save aggressively… Realizing the party/money train could stop at the drop of a hat. Generally speaking, anything high paying or high income generating could go sour… FAST. No risk no reward and at the high-end it means the risk is actually higher. Besides. If something pays a lot of money now you have two constant issues: 1) everyone wants to do it increasing competition/supply and 2) anyone who is writing that check wants to fire the person since they are a high cost line item. Before signing off here, we realize this does not apply to the ultra wealthy, CEO's of fortune 500 companies for example.

Another rich people problem is the loss of trust. You'll be asked for jobs, loans and many other forms of help. This is probably the second biggest reason to remain under the radar when possible. As soon as people know you're well off, suddenly everyone will be your best friend and ask for help since it is "no big deal to you". Only the ultra rich reach a point where everything is free as people pay them to show up. Trusting people who are not rich becomes difficult as you look for them to angle at something. As they say, rich people are friends since they don't need each other. Tough to create a one way relationship with people asking for things. The same dynamic is seen with famous movie stars/musicians as they typically date one another.

Loss of Trust:

A good way to deal with this problem is no different than hiring someone for any type of job. If and this is a huge *if* they could add value to your life, you simply give them a small project/opportunity. At the end of the day, if someone tries to burn you on meaningless items, they are going to burn you on the big items with *certainty*…. As a side note… this is also why . All of them try to "game' the receipt system in some way to offset a few dollars in cost per day (could be meals, travel expenses etc.). If they are willing to risk their employment for a $20 change in receipts, they will happily toss you under the bus for a $10,000 raise. In fact, most people like this get enjoyment out of other people failing.

[your co-workers are never your friends]

Unless you're aiming to have your obituary show up on the front page of the Wall Street Journal, one thing that changes over time is your interest in Prestige/Status. When you're starting out it's some sort of obsession, the special career at FAANG, Goldman, an Elite Boutique etc. The people who actually make it aren't even interested in the name of the place you work for or own. In fact, you'll find that they avoid the conversation entirely and give vague responses such as "Random stuff here and there" when asked about their work. This is because anyone with real money isn't interested in announcing to people that they have real money. It's only the people who have very little money that are itching to hand you a business card that says "XYZ company – low totem pole position".

No Interest in *Work* Status:

This change in demeanor usually happens around 30-35 years of age. If someone works at a name brand firm and is still excited to talk about it… They are unlikely rich. If they were, then they wouldn't want to add to the pile of emails/messages they receive every single day/week/month. Mathematically, this is also where you see the separation between the have and have nots. If the person only made an average of $250,000 ($160,000 after taxes!) a year the past 10 years… there is practically no chance he's even a millionaire unless he was able to spend less than $60,000 a year in a high cost city. The ones who made it will have a net worth closer to $3-5M or more. As you can see, the ones who make it earn more off of their investment income than the hard worker makes in a single year after taxes (5% on $4 million is $200,000). Before moving on… status in this case does not refer to material items, all of those things are still an obsession: "the best schools", "the best zip code", "the best brands" so on and so forth… That stuff is always around.

The richer you get the more responsibilities you will have. Even if you don't want them… it is going to happen. Since it's the only real way to earn more money. Employees, contractors you name it. At the end of the day as you move up the ladder more and more people rely on you to support themselves (you're delegating tasks to move onto something else more profitable). Unless you're a true psychopath, this is a large amount of pressure since you don't want to ruin someone else's life. Your failure isn't just on you… it is on multiple people at the same time. There is not a single person in the world that you want to be in contact with that would actually enjoy firing someone. This is probably the most legitimate rich person problem.

Significant Change in Responsibility:

Speaking of responsibility, even if you find a way to make many millions alone, you're going to have to hide your success to the best of your ability. People close to you will inevitably know you're well off but having more and more people know creates a compounding number of problems. If you want to sue someone who do you sue? A rich guy or a broke guy. Everyone knows the answer to this. Similarly, if you're going to try to scam someone who do you go after… so on and so forth. There is a delicate balance here as you're essentially being forced into cynical thinking which is also unhealthy (stressful as well)! So even if you don't want responsibility with other people (unlikely) you'll have significantly more personal responsibility. Solution here? None we're aware off. Just a tradeoff in life.

****

Some Fun Social Tells and Q&A Announcement

Some Fun Social Tells and Q&A Announcement

We try to do these once or twice a year and its a good time for an update. Noticing these types of things can help you save time, meet the right people and avoid arguments. During the pandemic, people are forced to communicate remotely and the word choices that people make will highlight how they feel about certain topics. Keep these items in the back of your mind and you'll be "SHOCKED" at the results.

Any time a person says, you can be certain that this person is not successful. Why? Well the assumption there is that it is extremely easy to hire the right people, pay them enough to be motivated and simultaneously generate a profit. If you want to burst their ego you can snap back with the following . This will deliver a crushing blow to their ego as they won't be able to tell you who they would hire, for how much and what they would do.

"Backs of Others": *"So and so built his wealth off of the backs of others","I will give you $1M to hire anyone you want, the catch is if you lose money that's on you, deal?"*

This is a standard belief of unsuccessful people. If someone "makes it" they have to create some sort of excuse for them. They can't be successful alone, because that would mean the person is better than they are. And. As a reminder, everyone believes they are the best – even if the facts say that is false. AS a fun note, we've noticed that the people who say this phrase are typically overweight as well. Something like 80% of people who use this phrase are not even in good shape physically. That means they can't even build their own physical backs, arms and legs. A bit of an embarrassment to say the least.

This is another common one for unsuccessful people. If a person is unsuccessful they need to have "something" to protect their ego. So they assume rich people are unhappy or mean. The unhappy part makes little sense as no one would ever choose to be poor if given a choice. The "mean" part is due to direct communication. You'll find that rich people tell you "reality" a lot faster than poor people. Most people do not enjoy hearing about reality because that requires an increase in personal responsibility.

"Rich People are Unhappy":

As a fun note, how does anyone expect to get rich if they think it will make them "unhappy". Not only are they hating on people who are better than they are, they create a mental barrier as well. In the back of their mind they think it will make them unhappy so it is best not to try. Unclear how anyone can live like this as it makes no sense at all. Anyone who has succeeded in life knows that winning is the best feeling in the world. Only a loser would prefer to sit on the beach drinking alcohol vs. winning at something incredibly competitive. The high you get from winning can't be replicated by drugs and alcohol on the beach no matter what the DJs in the club tell you.

"If someone makes a comment about you being a smart guy then inserts his own belief/suggestion it really means he think he's smarter than you. You're just "smart enough" to understand that he's right. This is what passive aggressive people do particularly when they are in the $200-300K income range. Since the majority of people think he's the greatest success story in his town, everyone must believe that. In this situation you must resort to smile/nod/agree.

You're a Smart Guy (insert Opinion/Suggestion)":

If someone actually believes you're smart, they will ask you a specific question and then show you they took your advice. They will follow up with a text, email, photo proof etc. They won't waste your time with a convincing story to change your view on XYZ. If they really believe you're bright, they will try to use your intelligence to benefit them without wasting your valuable time. In this situation you should definitely help out, they are not wasting your time and they actually want to improve without hand holding. This is about as common as finding a $100 bill on the ground in Manhattan.

If you meet someone for the first time and he/she immediately announces his/her accomplishments it means the person is mediocre to upper middle class at best. No one elite needs to "sell" how important they are. It makes no sense. If you're elite and you go to an event related to your industry you don't need to announce who you are. Everyone would know if you're really successful. No need to "sell it"

Announces Accomplishments Guy:

Another example of this is trading/investing. If you're actually good, you don't need to post screen caps (easily edited) and you don't need to validate the decision making process with attention. If someone is building a big position in anything it is important to say *when* to get in. Not post a screen cap of the results after the stock already moved. Unfortunately, the average person is not intelligent so the screen cap idea works.

Unless your job is to generate noise for a political party (you work for the Biden/Trump Campaign), you shouldn't have a lot of emotions tied to politics. The reality is that you are just one person and while a large group of people can impact an election, a single guy trying to make millions by himself should have better things to do. Simply have your opinion, vote and move on.

Politics is Important Guy:

You'll notice, over time, that people who are most vocal about politics are always mediocre. The range is standard, lower middle to upper middle class. Instead of wasting your own valuable time arguing with these guys, you have to smile and nod yet again. There is no winning here. Even if they believe in crazy things like defunding the police in major cities that are homes to gangs/high crime. You won't change their mind. Smile nod and agree. You'll save a lot more time. This is important as you should have better things to do anyway.

If you meet someone new at a house party and they don't give a lot of details about their life, the chances that they are rich is high. Back in the day people used to "talk business" to strangers. "How's the biz going these days". In the new world environment, this is social suicide. So the people who are doing well hide their accomplishments (initially) with strangers. They recognize that there is little to be gained from the conversation in the first place.

Limited Information Provided:

Think about it like this, if things are going extremely well and you don't need anything what is the point in talking about it? You will only get questions and beggars at your door step asking for handouts. If you needed something then you should steer the conversation into something you're looking for. Otherwise best to keep quiet and talk about meaningless things like the latest baseball game or the latest world event that everyone can agree on "The wild fires in Australia were terrible, so glad they are fixing it!".

If you ask an expert an opinion on a specific item you purchased or created and the response is "It's ok, it's alright, it's decent" that really means it was extremely good. Why? Well if the person believes he is an expert on it and cannot even provide a single tangible item to upgrade/change it means you've successfully reached the same standards. Remember. This only applies to experts. This is because experts have big egos and love to correct other people. Just think about how much college professors love to tell people they got something wrong.

"It's Ok":

As an extra point of emphasis, this does not work with strangers. Strangers have no idea if a product is good or not. How would they? This is especially important if the product is complex (say enterprise grade items) as they would have no specialized knowledge in the industry to provide feedback. They will simply think it is strange and say it is "ok" or "alright".

The guy who constantly wants to "catch up" with you thinks you're going to somehow hire him. It took us a long time to figure this out. The strategy is to essentially talk to you all the time in hopes that you'll eventually give him a job/career position. This makes zero sense as being a friend has nothing to do with skills. In fact, hiring a friend is a terrible idea as you assume they are competent at something when they are likely not competent at all.

"Lets Chat":

If you find that someone is always looking to "catch up" with you and it results in a bunch of life ramblings you have to cut the person off as soon as possible. Delete the number, don't respond and simply move on. The only way to get them to give up is by not responding at all. Don't respond to a single email, text message or phone call. Slowly fade away and close the door.

Q&A will be held on Friday August 28

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life.

Some Interesting Notes on the Last Couple of Weeks

Some Interesting Notes on the Last Couple of Weeks

At this time, the USA is a complete mess. Hard to argue against that with the media calling the election for Biden, Trump stating that he won and hundreds of thousands of COVID-19 cases coming in by the week. Meanwhile, large parts of Asia are completely open and have minimal cases (50) or even zero per day. Europe is already back to lock down and no one knows when the vaccine is going to eventually work. Notice, we're not taking any side on any of these things and attempt to remain neutral.

Somehow, people that follow our twitter are upset that we are calling the election for Biden while we simultaneously say election fraud is possible. Why? It depends on what the *reader* believes. We've already stated we bet in 2017 at 3:1 odds ($100 gets you $300) back in 2017 on Trump. No matter how this election shakes out we will be happy with the outcome and for some reason it befuddles everyone. Again… Why? Because it depends on what the *reader* believes.

People Will Spin What You Say Related to Politics:

If the reader is Pro-Biden he'll say Trump has nothing and if the reader is Pro-Trump he'll say it is "for sure" election fraud. Neither is correct at this time since nothing has gone through the entire electoral college process. This is simply a fact. Nothing is "official" and that comment seems to upset both sides.

How does this help you? Well we don't have any interest in politics. You don't need to have any interest either. All you need to take from these events is that people will make strong assumptions about you if you even suggest things can move in the other direction. This means the nation is quite divided. Hence, our opening statement that the USA appears to be a mess.

Beyond that statement (which should sound reasonable to both sides), it means you should never ever talk about politics with someone who is strongly in favor of any candidate. Why? Well we just described it above. If you come off as neutral, you'll end up getting attacked from both sides. They will both "assume the worst" about you (IE. You're against them) and this will severely impact your relationship with them. Instead? You should use the following cheat phrase So far this seems to be the only way to obtain a neutral view of any major election. Also. If you can figure out their political stance in the very first sentence, you know that they are strong left or strong right. When in doubt, use the quote we provided to neutralize all political conversations and turn it to something you can both agree on.

"I wish i knew what was going on but unfortunately i cannot legally vote so i block all political debates from my search queries and social media accounts".

On both sides of the fence you can find many examples of conflicting beliefs. Just glancing through Twitter we see people on the left say that there was no voter fraud while simultaneously saying we should not do an audit/recount or something similar (a fun and hilarious example is the CEO of Twitter who is pro-Bitcoin but blocks and flags links/tweets relate to election fraud). On the right you find people who believe Trump has it for sure (with his tweets suggesting he won) while simultaneously saying he won't win officially on January 20, 2021 (instead he's setting up for 2024! So which one is it? Did he win or is he preparing? Can't be both). These are pretty interesting statements. Essentially both parties are actually saying they don't know how it will shake out but refuse to admit it! Interesting indeed.

People are Inconsistent:

We're not going to make any prediction since we already made our wager back in 2017, pre-covid at 3:1. instead we're going to go with the same old neutral stance. Since *both* parties believe they won, when you decide the winner you *need* to prove that this was done correctly. If that means delaying the official announcement, that is fine. If that means you have to recount, audit etc. That is also fine. Hard to see any disagreement with that logic.

The last thing you want? 49% of the country believing the election was stolen.

While the election craziness has continued, Bitcoin has made a pretty big comeback now somewhere in the mid $16,000 range. Who knows where it will be trading by the time you read this post since it has been moving quite a bit. That said, there are only ~11 days where you could have lost money investing in Bitcoin. Remember this when anyone on twitter, real life or in the virtual office say it's "dead/down". They were the only ones buying at the absolute peak (for now!)

Tulips and Crypto:

The crazy part? The negative people still haven't changed any of their arguments! Crypto has been around for over 12 years and people attempt to compare it to Tulips. This is beyond pathetic. There is no way that analogy holds any weight and it shows they did not do any research over the past four years. If you gave someone four years to look at something and they came back to you with the same conclusion, they are simply slow. Tulips never came back. You know what came back that was a bubble? Technology in 2001. Perhaps technology stocks also go through a bubble phase as well. But. We can all agree it will be a foolish bet to "short innovation" over the long-term.

If anything, the crypto currency community is exhibiting a lot more parallels to the dot-com evolution. Similar to the dot-com bubble, new ways of using the internet sent prices up *after* the bubble popped. Currently we have decentralized finance, new on ramps, new non-fungible tokens, new betting networks and more. Feel free to bet against it. That said, you don't even need a large position to hedge against being entirely incorrect in a big way. The decision should be clear!

When it comes to anything big, love, religion, politics etc. People already believe what they believe and expect you to validate their suspicions. Even extremely logical people have odd superstitions. When it comes to those big emotional topics, remember that everything you say is going to be "interpreted" in a different way. If you say something factual "elections can be rigged" you'll be labeled as a Trump supporter. If you say "I bet on Biden after COVID-19 hit" you will be labeled as a Biden supporter even if you really just thought it would swing the election his way. This happens time and time again in our day to day lives.

People Want You to Validate Their Suspicions:

This is why it is more important to know "what someone thinks about you" vs. "what you know you are". The second part is less relevant which is why self-awareness is important. If you can figure out what someone "thinks about you" then you know how all of your words will be interpreted even if there was no interpretation. No one is 100% certain. Meaning, even if you're extremely self aware and are good at predicting how someone perceives you… you won't always be right. That said, you should continue to look at it from that view point. It isn't about what you say (words) it is about how you make them feel and how they perceive you. This is probably 90% of the communication and the other 10% is what you actually said word for word.

Before moving on, the last item to remember is that it is difficult (extremely difficult) to pivot a perception. In general, it is 10x harder to increase your perception in a positive way for every 10% decline in your perception. Said another way, if you had 100 hours to spend with someone, you could at maximum increase your perception by 10% while you could potentially go to zero (they end up hating you). While we cannot prove this mathematical formula we hope the big picture comes through. It is easier to lose positive perception than gain positive perception. IE. Credibility is gained over long periods and lost rapidly in many cases.

One of the last items we'd like to note about the human experience is the step-function up in standards. If you are successful, every single year, you will have to remember that your standards are being raised. If someone is less successful than you, they expect you to act in a perfect manner. If you go higher and higher, your wiggle room only declines. This is why you end up giving away some of your money by default. Anyone who has helped you move up needs to be pulled up the ladder in some way.

The Bigger You Get The Higher the Standards:

This is best described with an example. If a person suddenly gets $10M and comes from a poor family, would you respect him if his parents were living in section 8 housing? Probably not. Unless they did something wrong to him (kicked him out and disowned) it would be a bad look. Rightfully so. Remember this as you make friends and move up the socio-economic ladder. If there are people who really helped you along the way, you should set aside a "reserve fund" to bring up these individuals.

This relates quite a bit to the USA today. If you look around, take a look at which people are attempting to keep their communities/groups afloat. If they are simply "running for the hills" this says quite a bit about who they are. Yes there are exceptions. We are not saying that recent college grads should stay in cramped apartments shelling out $5K a month. Instead, we're saying that it is wise to take note of the individuals who *care* about their communities. This is the way you can filter for the right type of people. The ones who are trying to support the community are the ones you want to be associated with. Not only are they well off, but they are clearly willing to send the elevator back down.

What should you do at this point. Well, if you learned nothing from this, it is that you should take copious notes on your *perception*. Perception is reality to the entire population. If someone thinks you're a smart guy, it doesn't matter if you have no experience related to something, they will likely listen. Seriously. People take health advice from overweight guys simply because they have degrees (no real life experience). Similarly, if someone thinks you're an idiot they will happily bet against anything you have to say. In that scenario, you know who to go to for your wagers =)

Back to You:

We don't live in a world where results matter for 99% of society. We live in a world where perception matters. Industries have been created where *prestige* must be present… which means they don't require any real skill. If an industry required real skill, it wouldn't matter if your degree said "Harvard" or "University of Nebraska"… The only thing that would matter is your performance/product.

This opens the door and you get so show your performance. Without the perception the door remains closed.

When it comes to getting ahead, focus on how you're perceived by the "right" people.

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life.

****

Soo… We Were Right. No Surprise!

Soo… We Were Right. No Surprise!

We predicted that Donald Trump would win the presidency and here we are. Over a year ago we laid out large sums of money into online gambling websites and in addition, leading up to the election, shorted the hell out of the Mexican Stock market.

While we have nothing against Mexico or its people, in fact we love some of their cities,. This election cycle has proven once again that people are not rational creatures, emotion drives all decision making and you will incur a financial gain if you can remain unemotional when it comes to money. We'll highlight a few items. took the stance that people were rational creatures and we bet a dinner as seen from the below exchange. Our quick Twitter interaction summarizes the difference in opinion quite simply really (back in December):

the writing was on the wall (double entendre on purpose)

unnamed-3 unnamed-1 **1) Free Dinner from Financial Samurai:** Our friend Sam

Interaction

There should be no doubt in anyone's mind after this election that people are not rational. If there is, we suggest a review of the entire election and the turning points which were all based on emotion. We haven't collected our dinner yet but we will soon and he has graciously paid the $100 wagers to the individuals in our comments section.

Everyone who bet against the Donald is taking that L train for commuting purposes at this point.

For those that were following our Twitter handle, we sporadically made comments around the election and noted that Trump would take a large hit in October followed by a win in November. That is exactly what happened. The reason why? Elections are emotional. Each camp has their own special guns set up for the end and we know there would be a whopper coming. The problem was simply in the timing of the information, too early and too much time for Trump to recover (he did).

2) Unfolded as Expected:

The two parties (Trump and Clinton) both know that the election had nothing to do with rational thought. They had their game plan and bullets, however, Trump is simply too crafty.

As we stated in While this sounds like an oxy moron since we wagered a large sum of money on his election, we were talking in broader strokes. The presidency does not determine a person's ability to succeed. YOU determine YOUR ability to succeed.

3) We Let Others Do the Work: our original post,**from a financial perspective we did not care who wins.**

unnamed-2

We didn't bother getting too involved in the election, we sat back and let the heavily involved run the show. As long as we got our money that is all that really mattered.

Importantly, while this may feel like a "complete overhaul" of the system, we think that would be a stretch. Yes it will have an impact on our culture over the next 4 (we think 8) years, but the same winners will be the same winners. As the saying goes

"If we took all the money in the world and divided it equally, the same people would become rich over the next 100 year cycle".

To reiterate, if you believe you have a winner, you always let others do the work so you can focus on more important tasks. The stage has been set so its time to move on.

You heard it here first. Wall Street Playboys is saying that humility does not lead to money. Don't be humble when you're trying to *Market Yourself*. The only time you should be humble is when you are in the company of someone largely superior to yourself. You get no brownie points for insulting clients or a person with more weight than yourself.

4) Being Humble is for Idiots:

With that one caveat out of the way, being humble will cause you to *lose* money. If you want a good example look at professional sports. The ones who are louder and more exciting generate more attention, more endorsements and a higher percentage of people in the seats (filling the stadium). If you're attempting to get attention, being silent and nodding your head is not going to get you anywhere. You need to create noise, don't be shy. You can always temper it down when the situation changes.

Back in August we explained that people will not show up to vote for Hillary. That is exactly what happened and we have the proof of this prediction below.

5) We Even Predicted the Vote On Election Day:

unnamed

The problem with polls is enormous. You have selection bias as many people are not going to be watching much Cable anymore and you're asking about their opinion. Opinions are not action. Action is what leads to results. If we ask people about the value of their smartphones or their TV subscription they will say "it's over priced for the value"… Yet they renew every single year. Sometimes even paying more than they did before!

You could easily get a sense that people were emotionally fired up to vote for the Donald and the Clinton vote was more passive "better than the alternative" type of polling. It's just not enough to move the needle.

Instead of posting on Facebook and Twitter, one should spend the next 100 days and figure out exactly how to *profit* off of this change. It will be difficult to determine how far he will go with each policy… But… There is money to be made. We may announce a few predictions if people are interested, however, that is the first thing that everyone should be doing. Forget about the celebrations (we already had those) and get ready to put your nose down into some company filings. You'll have to track down the exact companies that will benefit and the ones that will not. It is not enough to say "XYZ" sector will benefit. This is herd mentality as all the companies will unlikely benefit. As with any policy changes, a select few will see outsized positive gains while other companies will see minimal benefits causing a correction in their value as expectations did not live up to reality.

6) Do Your Research:

Who cares who you voted for. Yep. We are telling you to put that aside. If you voted for Trump great, if you voted for Clinton great. *It does not matter*

7) Use the Election to Build Rapport:

What does matter? Who you "say" you voted for to each individual person. The saying is that you never talk about politics but this is simply foolish. The key is to figure out who the person voted for and once that is dialed in you just agree! It doesn't matter because if they are going to be a huge customer or client of yours it makes no sense to fight them. Re-read the first part and remember that people are entirely driven by feelings.

"Smile, Nod and Agree"

Once you find out who they are positive on, try to spin it. If they are positive on Clinton, then you try to talk about how the president has less control than everyone believes and that you can't believe the Electoral College exists. If they are positive Trump, explain that he is not a racist and he won't burn down the country like the rioters who are currently burning down the country.

Finally, if this is not business/money/client related, feel free to troll all the Clinton supporters if you were positive on Trump for the laughs. Just remember. If its related to something that matters (business) then you should find the candidate and agree.

You never win when fighting with a client. NEVER

This is extremely important so we'll add a second way to remember these rules. Don't talk or have a conversation with someone to change their mind, you're wasting your time. Even if it works, the amount of effort it takes is simply not worth it.

You will never change a person's opinion on politics.

Well we are not doing ourselves any favors since we're primarily anonymous although and Sam both know us in real life. That aside… It was clear that the Media was in the tank for Hillary Clinton.

8) Question the Source of Information: Mike Cernovich

If the entire mainstream media was in the tank for Clinton… What are some other items that they may be lying about. It is clear that they were not unbiased so there must be additional biases within those same walls.

Take stock of all the items you believe to be true. Back track. Where did this belief or information come from? Did it come from your college professor who has his entire paycheck come from the good old government? Did it come from consensus building from mainstream information? Did it come from a large corporation? Did it come from some anonymous douches on Wall Street Playboys? Question it all.

Instead of assuming that something is true, take action to find out if it is true and build your information data bases in this fashion. It is much smarter to go back to the well that didn't poison you than to assume someone will "change". They typically don't.

—

Anywho, this was a fun experiment and even more fun with all the parties and money. Most importantly the money. We are working on our book beginning December 1 and but we will hold a Q&A within the next couple of weeks and the Q&A will be on twitter so be

as usual no questions (email subscribers will be alerted)sure to follow us there!

Happy Trumpening.

S&P 500 Surpasses 1,700. The World Is Not Ending.

S&P 500 Surpasses 1,700. The World Is Not Ending.

This is an appropriate time to write an article on the impending doom of the economy. The tone is likely going to be a bit harsh as talking about this subject is beyond annoying for us if you have been doing this for 60-80+ hours a week for multiple years…. but it needs to be done.

Back in 2007 the market was roaring due to a real estate bubble and everyone expected the bull market run to continue. Fast forward to March 2009 and everyone you knew was ready to buy guns and write off the entire equities market as a sustainable investment prospect. Fast forward again… and the S&P 500 is at all time highs of 1,700+. Needless to say the herd is always wrong.

What is everyone else doing? It's probably a bad idea.

With that said lets go ahead and explain why you should always ignore the doomsday prophets, a handful of them are intelligent (Roubini for example) but the vast majority do not understand investing. This is going to be a rudimentary introduction to dollar cost averaging.

For this example lets use the 2007 to 2013 time frame (roughly six years – 5.833 years to be exact). To make the example difficult, we are going to assume that you started purchasing shares at the peak of the last bull market. On June 1, 2007 the market was at 1,536, in addition we will assume that you survived until the market roughly broke even on March 1, 2013 at 1,518. This is terrible market timing, you began investing at the peak of the market.With that said here are all of the assumptions laid out, again this is assuming your timing was terrible and you bought at the peak and quit at break even.

Buying the S&P 500 Monthly:

– You buy $1,000 of S&P 500 (Simply use the ticker SPY) on June 1, 2007

– You buy $1,000 worth of S&P 500 the first trading day of each month after you receive your paycheck

– You never sell

– You never reinvest dividends

With that here is the chart of SPY.

The chart doesn't look that great. However this does not take into account dollar cost averaging. Over the next 70 months you are purchasing $1,000 in shares so lets go ahead and see how that works out.

asd

Capital Appreciation:

– You spent $70K

– You obtain 583.5 shares of SPY over the course of 7 months

– 583.5 Shares * 151.82 = $88,585

Below is a chart of exactly why this works, the answer is relatively simple: consistent buying patterns allow you to lower the average cost per share.

You made money.

We’re not done yet. We haven’t accounted for the dividends you’ve accumulated over the past 5.833 years. Lets go ahead and include them. We don’t want you to spend your time running these numbers so here is the table for you.

S&P 500

Dividends:

There you have it over the last five years and we will go ahead and assume that you have not reinvested this money, it is sitting collecting dust in a savings account or under your mattress.

dividends **you have accumulated ~$4,250 from dividend payments**

Here is the final break down. You begin investing in the worst time possible, late 2007 and you purchased $1,000 worth of SPY for 70 months giving you a net investment of $70,000. In return if you decided to quit investing when the market was near break even you would have

Final Calculation: $92,837.

If we use a CAGR your total return was (($92,837/$70,000)^(1/5.8333))-1…. should no longer seem impossible particularly given this example.

5% annualized return. 7% returns

Now that the numbers are laid out, why exactly do people continue to lose money? They attempt to out trade algorithms (will never be successful), they live in fear of a possible world collapse (check their bank accounts they are likely broke) and they have never run the numbers.

Concluding Thoughts: They are unable to control their emotions.

While this post is much more blunt you'll be happy to know our next will be more upbeat. With that said, remember this, if someone believes the world is going to end, 9 times out of 10, their life has already ended. and refused to put in the work.

They chose to live in the moment

Update 2017: The S&P 500 is now at new record highs ~2,400.

****

Spending

Spending for Maximum Return

Since many of our readers have made it financially. For that reason we've created a product that explains how to scale your spending the "right way". You're going to make a huge number of mistakes (just like us) but it will all be worth it in the end. We give opinions on Hormone Replacement Therapy, LSD, Mushrooms and a few other grey market drugs as well. Yes. We include our recommendations/routines in here where possible.

We also provide examples of how to use status goods. You can certainly live an amazing life without purchasing status goods. That said, they do work and we highlight the right ones that provide a leg up on the competition (so to speak).

The book is organized into three distinct sections

This breaks out spending into housing, food/dining, clothing/accessories, travel/vacations, services, events/dating and finally how we would rank the "utility" of each upgrade.

1) Segment on Spending Type:

This section breaks down the items we would be buying in a peak market cycle, bottom of the market cycle and middle of the market cycle. There is no way to know when we're at the top or bottom but we provide our framework in here as well

2) Segment on Economic Cycles:

Our products only cater to people who are already successful, on the path to success or those that will be successful in the future. So we try to highlight how your life will change as your income ramps up: 1) completely broke, 2) able to save 30%+, 3) millionaire, 4) financially set for life and 5) some income brackets we think most will fall into.

3) Segment on Ages:

Since spending is more of an art than science we also separate out dating/social life at the end. It's just not possible to understand until you've lived it and we continue to get the same comments on our blog . So. Just take a read and see if it lines up with your future.

"I didn't understand the message until 1-2 years later after I achieved XYZ"

We include the three most relevant posts in the appendix and write up some spending bullets to be aware of.

Appendix:

The book is 126 pages. Unlike other internet products, it is written in standard 12 point font (Garamond) on a standard 8.5″ x 11″ page. Exact same way as Efficiency and Triangle Investing, majority is new and we do need to revisit some concepts people already know.

Length: Key note: we also provide a clear direction of what we'll be researching in the near-future.

Click Below to Buy the E-Book (PDF) for $7.00

Notes: 1) please save down to your drive 2) we also take Crypto if there are payment issues, email Admin@wallstreetplayboys.com and 3) keep your email and receipt as we'll hold Q&A's for buyers only…

Email us for the address to send to (BTC, LTC, XMR, ETH are accepted).

To help prevent constant stealing, we're only going to host Q&A's in the future for people who have purchased the product (either one). If the product was not purchased 1) we're being forced to answer repetitive questions and 2) we don't want to burn time on people who didn't have a few bucks to invest into their future. We realize we can't prevent all theft, however, there is a ton of value in Q&As when specific questions come up in the future. By cutting this off, the thieves will be forced to struggle on their own.

Keep Your Receipt:

The writing style is practically identical to the blog. We write to the point and with some incorrect grammar (to get to a point faster). It should hurt to read, not designed to be a fun read and ideally we've added the most value we can on a book related to spending.

Writing Style:
****

Spending for Maximum Return

Spending for Maximum Return

Two quick notes: First, thank all of you! It has been incredibly fun writing for all these years even if we've slowly adapted and changed the content as our interests have evolved. We still remember writing about getting into banking and now we're not even sure if that's worth it outside of M&A. We've considered quitting many times and events like this remind us it can be fun knowing your writing is actually worth something. Second, we apologize for the email issue. We haven't launched anything in 2-years as we don't spam people with the same stuff in 7 different formats for $25-50 each so it was dated.

That said the good news is that you can simply grab it now!

In the book we do giveaway our specific psychedelic routine. While some will see that the routine is basic and to the point… that is how anything successful works when it comes to routines. We optimized that exact set up and "zig zag" over the course of 5-years or so. We already regret giving it out since we've taken hundreds of hours of testing time out of the game and you can start with it and make small tweaks later on. The good news is that the vast majority of people won't figure it out and realistically most people don't even read books so we're in good shape.

Some Highlights:

We still can't believe how many people have successfully executed on . Here are some highlights to remain nameless: 1) first year out the gate made $82,000 in e-commerce while working in investment banking at a mid-tier shop, 2) a person 3-years out and is now making $20,000 per month, huge move for him, 3) a guy who failed *three* different times but kept iterating, now making $4K a month while working in enterprise sales clearing six figures on his day time career, 4) easily 100s of people who have successfully gotten into investment banking – many pushing into M&A and 5) two people who successfully sold their first 7-figure assets, one went on a massive bender blowing $75,000 in less than a week – don't laugh you'll end up doing this too! We highlight several of these people on Twitter since we don't' want to give away their private info.

Lots of Success Stories: Efficiency

Since we don't spam our readers with tons of offers and upgrades every year (at insanely high prices), we're still surprised at how effective email lists are. They are 10x more effective than social media and general traffic. This is a good reminder for anyone who is foolish enough to skip the email sign up for a real product based business. The key to any business (even a hobby blog) is that you need repeat customers. As a fun note, some people have been following for over 5-years and it has been fun to watch that 1) they are okay with us slowly changing the content and 2) their own success over time.

Basic Sales Type Comments:

On that note, there is nothing we can really do about evolving interests and content. Several years ago we used to be against psychedelics and here we are now using it as a performance booster. Several years ago we used to waste time with dating type advice and have now realized that was foolish and lost several hours on something that could be learned in a year at maximum. This is just how it works. The fun part about all of this is we know with certainty if people are actually taking our recommendations and doing them. Why? It works and we have too much proof. Sure it may not work for talentless or lazy people, but that percentage is small at probably under 5-10% of people.

Content and Change:

In a time of immense turmoil we're revisiting why we don't engage with negative people. We realize tons of people hate this blog and attempt to troll, we can't help but laugh since the chances of them being more successful is already incredibly low. Also. There is nothing gained by interacting with people who dislike you (much higher chance they are incels/future serial killers than future winners). So. Never waste time picking a fight because similar to the crazy story surrounding Aaron Hernandez. If you go out searching for drama don't be surprised when it finds you in a bad way.

Final Note: *"they might have nothing to lose",*

As a reminder, not everyone is going to like you. This is a good thing, you can go spend your time finding people who do. The worst is when someone is "indifferent" then you're losing time and don't know if you're getting any progress (classic sales issue!). So embrace the negativity, they are saving you time and sending more attention to you which also helps.

Here are the links to our three products. We attempt to do something never every 2 years or so. Best of luck in 2020! , , .

Three Books: EfficiencyTriangle InvestingSpending for Maximum Return
****

Spending for Maximum Return – On Track for End of December

We were hesitant on creating a book on this topic but decided to do so (popular demand). The funny thing about this book is that we can't think of many products like it. If you're rich it is actually quite easy to go broke (look at professional athletes and lottery winners – emphasis on most to avoid the nit pickers). Maybe this is one of the reasons why no books are written on it. People simply assume that once they have the money, they will be "set"…. and of course… this ends in tears. The only competing products we can think of are related to frugality where people talk about maximizing every single cent. A terrible strategy for anyone who gets rich as they lose valuable amounts of time waiting to save a few dollars (waiting in line 30 minutes to save $20 should never be worth it).

most

In addition to the above paragraph we'll happily admit that this was painful to write. We couldn't think of a single way to organize it and there are no real viable competing products out there. Our three ideas were as follows: 1) organize by spending type – housing, food, entertainment etc. 2) organize by after tax income and 3) organize by economic cycles. All three would work but all three have repercussions (they miss the bigger picture). So what did we do? We decided to do all three and a bonus fourth where we tie it all together. This is the only valid way to do it (so we think!). If your business collapses or you lose your career, you have to adjust to a different lifestyle. If you end up getting a good chunk of money and suddenly have $3-5M to your name, your ability to spend goes up (essentially forever). Either way…. the point is clear… your ability to spend is entirely driven by cash flow visibility.

Cash flow visibility is knowing how much money you'll receive per month. That's not all. It also depends on how likely the cash flow will hit your account. By rank order the safest to riskiest is as follows : 1) risk free yields, 2) career or business income, 3) Real Estate and 4) Equities/Dividends. We're almost certain no one will agree with the rank order we just provided. That's a good thing as no one reading this book is interested in "normal" opinions. So that's how we'll rank the cash flow items. If you're looking for a trend, we value "forced" value creation the most – I.E if there are ways to use your own time and skills to generate money, it's the safer one in the group (only exception there is the risk free yield that starts the list).

in our opinion

Unless you're able to generate a living income off of risk free yields alone, there is always a discount applied to your earnings as things could go sour in a day, week, month or year. You never know. What you do know is that your principal should never be touched. Bonds, equities, real estate etc. The goal is to never sell to spend. You can sell to rebalance your book… But… You cannot sell to spend. That's essentially the punch line before we jump into the details.

This was the only reasonable way to organize the product. The reader gets to choose how they view spending. If you view spending in terms of net worth, the second section will be better for you. If you view spending based on product category, the first chapter will be better for you. The key here is to maximize utility. While utility is a boring economic term it is the most useful as it encapsulates cycles as well. Utility gained by spending on luxury items in a booming economy is *lower* than utility gained by spending on luxury items in a recession. Utility gained on housing decreases rapidly unless you're building a different lifestyle (house parties, family gatherings etc.). Utility gained on dining and produce actually changes based on your age and cash flow as well. So on and so forth.

Three Segments for the Book:

Before jumping in, this is probably a good time to remind the readers of our life framework. In general, we do not think you need to be worth $100M or even $20M to live an amazing life. We think the risk reward to get there is becoming difficult to justify. That said, we do believe that anyone can get into the $5-15M range without taking on significant "life risk"… I.E. missing out on many years of fun and potentially getting nothing out of it. Keeping it simple at $5-15M this means you're generating $250-$750K a year forever *regardless* of location at a 5% rate of return. Even if you decide to have kids, this is not going to lead to a stressful life as the location independence part kills the cost of living argument.

General Life Framework:

How You Get There in General Bullets (No Particular Order)

- When you're young you focus on making money as we assume you start with $0 to your name
- To avoid developing poor social skills you go out twice a week in cheaper venues (if you're broke and young, being in shape and going to dive bars is completely fine)
- You kill off the biggest cash drain item which is taxes and housing, if you need to live with roommates to save serious money… You live with roommates, no exceptions
- You kill off taxes by building any sort of small side income while at work, if you don't have two streams of income you don't get to have much fun
- Rough math is you should focus on income generation until you're able to save/invest half of everything you make (everything is calculated after taxes). Until then you're not earning enough or you're spending too much due to lifestyle inflation
- Take the amount you spend per year, multiply this by 25. If you're happy with the amount you're spending per year… Working harder and killing yourself for more money is a fools game
- When you get to $1M+ in net worth within 10 years… you're going to be able to make the decision "Do I want to be worth $20M+ or $10M"… Rich people problems. We have no view on the choice, people have different life objectives
- Health is the only thing that is more important than money when you're young. That said, working 60-80 hours a week between ages 21-27… Really doesn't do anything to your health despite what unsuccessful people tell you. Working 80 hours a week past age 30 is something you want to avoid
- As a framework you want to utilize your "competitive advantage" by age band. Not having much money is fine in your 20s, not so much in your 40s. Making a lot of mistakes in your 20s is fine (you're young) but making wild mistakes in your 40s, not so much. Think about what the world's "perception" and you is and you can find areas to exploit the biases
- Avoid comparative analysis. There is no point in being jealous of people who go up the stack faster than you. Also avoid all *unnecessary* conflict. I.E. no point in participating in gossip/drama as it just leads to negative attention and a large time drain. You should have better things to do. The standard "What do I gain from this?" should be asked before doing anything. .
If it's nothing positive and just an ego boost, better to skip
- You have to live an "extreme life" by definition. If you're going to get into the top 1% you're by definition an extreme outlier. It is not possible to get there by following the crowd
- To wrap it up, we avoid all family/life decision type conversations as those are personal in nature. As long as you're not risking everything you've worked for, there is no point in the debate.

We'll also talk about performance enhancing products. Under no circumstances are these comments meant to be recommendations, the entire product is opinion based. Your average person has limited will power and self-control which makes addiction higher. There is no such thing as a magic substance that makes you "better than average" in a single day. Instead performance boosters are for people who want to remain in top shape. Two extreme examples will help: 1) if you take a wide variety of steroids, the chances of competing with pro-athletes is less than 0.01%… the only people who could take them and potentially get close are people who were "on the line" before taking PEDs – typically D1 athletes who were extremely close and 2) if you take a bunch of psychedelics, you're unlikely going to become the next Steve Jobs. The typical person who takes psychedelics doesn't use them properly (similar theme for PEDs for guys at the gym)

A Quick Warning:

With the warning out of the way, our opinion is that you can use a lot of substances to make your life better. Yes we've started tinkering with some of them lately. It doesn't "change you as a person" if you use them correctly. It simply allows you to run at full speed for longer durations when you need to.

One last item of importance. While the phrase "you can't take it with you when you die" is true, that phrase is usually an excuse to spend everything… putting your health and well-being at risk later down the line. We take a different stance. You should earn aggressively which will cause you to save aggressively by default until you hit the "cross over point". If you can easily live off of ~$5,000 a month (this is just an and would include shelter, food and utilities), there is no real point in saving massive amounts of money beyond this level. At that point you can ratchet up the spending as you'll never touch the principal in the first place.

Final Note on Money: *example*

For those that think the above is risky, there is yet another catch. After being intelligent and saving for almost a decade, you won't spend all of the money you make anyway. Our guess is that you will still save around 30% of what you're bringing in and the principal will actually grow significantly over time. In short, once you are completely free, your stress levels will likely come down and your spending will go up without any issues.

Spending Money To Maximize Life

Spending Money To Maximize Life

Most personal finance blogs talk about saving money and frugality, we're going to go to the opposite end of the spectrum and outline ways to spend your money… Maximizing the quality of your life. The main problem with frugality is that your life becomes too plain and boring and when you're older the things you wanted to do are unlikely available anymore. While life never really ends and you can always find things to do we think it makes a lot of sense to highlight ways to spend your money with minimal regrets. We'll also give some ideas based on age bracket since hardcore activities become more difficult as we age.

This is not only . Anything where you're exerting physical effort to learn a task gives a very high return on investment. This could be anything from basic weight lifting to more serious items such a high intensity sport. It also extends into lower impact activities such as musical instruments. Investing in this arena with at least three items offers the highest returns. We suggest a muscle building activity, a speed training activity, a coordination activity and finally a rhythm activity. Life is long so there is a good chance you can have high quality skills in at least four items. As an example it could be: standard weight lifting, swimming, yoga and the piano. Alternatively it could be: power lifting, sprinting, golf and dancing.

#1 Muscle Memory and Skills: low cost but also offers the highest reward

The natural issue here is you'll unlikely be good at all four of them. The reality is that your body will be designed more for one of the four activities. If this is the case, definitely focus on it if you can become elite. But. Once you're older… it is better to be balanced. If you're simply "very good" at four tasks instead of Great/amazing at one, it decreases the chance of injury and you end up having a very healthy physique. The most polarizing items would be a body builder and long distance swimming/running, these contradict each other so finding four different activities that make you look well rounded and balanced will be the sweet spot.

The last thing we would highlight here, is that you can absolutely spend as much as you would like becoming "good/great" at any of the four items. It does not matter if the cost is a bit higher (professional trainers). At the end of the day, This is a great way to maximize your life experience. You'll be healthy every single day (knock on wood) and you'll have muscle memory that allows you to be "solid" at a variety of tasks. This is probably the best place to start given all the major benefits and there is no need to "feel bad" when you spend more money on equipment, training and nutrition in this arena.

spending on these items will increase the length and quality of your life.

The second big item to spend on is "hormone optimization". As you get older you do not want to age like everyone else does. Find a doctor on the edge of health care and get all of your numbers maxed out. This is exactly what professional athletes and celebrities do and there is no reason to skimp out on healthcare. It is much better to have 50% more energy at age 40 than your competitors/peers. This takes a lot of work and we would suggest reading multiple endocrinology books in addition to finding a leading edge .

#2 Health Items: private doctor

Is this cheap? No. Ideally it is affordable for you and there are many options that are available. From what we have seen there are options in the range of $500-1,000 a month or so. Yes this isn't "cheap" for the vast majority of people but the good news is that it improves all of your metrics: ability to think, physical capabilities and of course appearance. The only downside is the cost but that was the point of this post! If you can afford it this is the next area to spend because it increases the quality of your life by many leaps and bounds. Ideally, by the time you're looking into this type of spending, you're already financially well off as most people jump on this train at around 35-40 years of age (yes this is a general comment and there are always exceptions).

The two biggest items were unsurprisingly related to health. Now we're moving onto a broader topic of "fun". Mainstream advice suggests spending more money on materialism… This is yet again the opposite of our strategy. While it is perfectly fine to have a few key items such as a few high quality suits or watches… Going down this route results in a lot of small hits of dopamine followed by crashes. The good news is that there is a solution, which is spending on life experiences that cannot be replicated.

#3 Experience:

The best way to explain the difference is by looking at two major expenses. Vacations and Car ownership. These days, owning a car can cost you hundreds of thousands of dollars and at minimum it could cost you $40,000 or so. The real issue is the cost of: 1) gasoline, 2) maintenance, 3) insurance and 4) depreciation. To really kill this, it almost guarantees that you'll have some sort of run in with law enforcement: speeding tickets, parking tickets, accidents etc. While it sounds logical to have a way to get around faster, if you can live in a major city you'll actually save thousands of dollars per month and decrease the chances you'll have a negative experience with law enforcement entities (lost time and money).

Now we can compare this cost to something like two or three vacations. For $40,000, even if you're on the expensive side, you can quite easily take a very good high-end vacation. If you're cheaper this would likely result in multiple vacations over the course of a year (maybe even two years depending on the destinations and how much you spend). Your life experience will go up a lot, learning about a new environment versus driving around in a vehicle where you're simply burning time and unable to learn anything (at best a podcast which could have been consumed during your plane flight anyway).

You can extend this same concept on a dollar for dollar basis when comparing multiple activities. Comparing expensive clothing to concerts/sports events/festivals (insert anything) and you'll see a much higher ROI. The problem with a ton of high end clothing is you'll unlikely use it all and just end up with a ton of clothes you never even use. So you're better off spending more on "events" that you may not want to go to later. A good example would be boxing fights and concerts where the typical shelf life of each artist/athlete is under a few years so if you don't go now it'll unlikely be the same quality in a few years.

There is absolutely nothing wrong with partying hard while your body can take it. This isn't a contradiction to the same idea of making your money first. You're not going to work 80 hours per week for more than a few years so there are many years where you can go out and (from mid-twenties through at least forty). While the scenery may change the ability to go out and party does diminish over time. Contrary to popular opinion having a "partying hard phase" is almost a pre-requisite to living a fun life. From what we have seen the people who are living the most enviable lives in their 30s/40s/50s have had a history of going "all out" at least for a duration of time. People settle into different life styles after this phase but it is rare to see someone who really understood the nightlife/party scene and ends up with a terrible personal life. The major upside to this hectic part of your life is that your social skills will go up in parabolic fashion.

#4 Partying Hard: have the time of your life

Additional good news. You'll learn the ropes quickly and realize that there are many ways to optimize the chaotic part of your life as well. Basic ways to spend more while maximizing output are as follows: 1) heavy tipping, 2) restaurants, 3) extremely good logistics to the areas you like and 4) avoiding bottle service like the plague unless you're throwing an event or are located in Las Vegas. When you spend with these four items in the back of your head, you can increase spending and see consistent improvements in your social life.

Another item to cover in partying hard is the groups of people you'll meet. This is probably the most misunderstood benefit. Very few (more likely none) of the relationships you develop here will be "significant" however, the soft touch skills will be of immense value to you in the future. Soft touch skills are used when trying to maintain a position with a client/customer (instead of selling more to them) and are easily transferable to many other dimensions in your life. Just remember to stick to the main four items we listed and you'll see significant "utility" when you go down this path. As a side note, many people who become successful also go through an addiction phase so we hope everyone is mentally prepared to battle that one when the time comes.

While partying can be done for a long period of time as long as you adjust your "go to places", outdoor activities are probably the toughest to continue over time. By outdoor activities we're not referring to basic "camping" trips, but higher intensity items like rock climbing or other extreme climate/weather activities. Many people are not interested in these types of activities but if it's something you wanted to do, it is significantly safer and smarter to do when you're younger. Who knows… going to space might even be on this list in the near-future and going when your body can take a lot of punishment will make a lot more sense.

#5 Heavy Outdoor Activities:

One good and underestimated benefit here is this makes you a lot more interesting. Generally, people who get "bored easily" ask questions about how to "be more interesting". They are like this because they are boring in general. By forcing yourself into the extremes it becomes impossible to be boring in the first place. Looking for someone who is extreme yet boring is like asking for a tall midget (doesn't exist!).

Our favorite spending item! Instead of those cars and clothes, focus on cooks and massage therapy. Anything on the services side not only saves you time but improves the quality of your life by leaps and bounds. Driving that 911 Carerra feels good for the ego boost (attention) but at the end of the day it just draws unwanted attention. Paying for high quality food, fixing back/muscle issues and remaining flexible will be worth many millions of dollars in the future. If you can extend the quality of your life by 5-6 years, that will be worth much more than attention from random people on the street. As usual if you're interested in material things go for it (you're rich!) but we're simply outlining our take on it. To wrap up the ideas here, we would include things such as hot tubs, saunas and steam rooms as examples of services (Spas generally have this as well).

#6 Services:

A good way to calculate if you're spending on the right items is to do a dollar per hour spent on the item. If you spend money on a chiropractor for example, figure out how much that improves your general quality of life relative to the cost. For other items like cars and clothes, you'll see an immediate decrease over time. If you enjoy having the latest and greatest vehicle, the returns come down pretty dramatically (you adapt to it, the car becomes less relevant over time and of course it does not extend the quality of your life). Continue with this calculation and you'll see your net worth slowly go up as you invest in the correct assets:

Calculating the Value: Triangle Investing.

If you've followed all of the spending patterns above (never went knee deep in materialism) and still have money to burn… Feel free to go "YOLO" and spend on anything you'd like. This can now include large houses and fancy cars. The same rule applies… As long as you never have to work again, feel free to buy it. If you're levering up to buy "too much house" like a mansion with large recurring costs or a super car thats costs many thousands of dollars to maintain… Then you may be in trouble. If you can cover the costs? Then enjoy the ride and go for these bigger items. The key is to spending appropriately is finding way to 1) buy long-term quality of life, 2) go through experiences, 3) go through activities that are easier when young, 4) buy time with services and 5) making the final switch to "YOLO" purchases. We have no doubt you'll make at least 3-4 of these and they will be worth it assuming you've spent correctly!

Going "YOLO":

For some reason we got a lot of questions about meeting successful friends after college. The easiest answer for everyone? . No unsuccessful person spends $200+ a month on a high-end gym membership. If you've made it financially, change your gym to a nicer one and you'll realize this is where well off men go to work out. It also typically has a large number of attractive women as well.

Side Note: Upgrade your gym membership
****

Spotting the Fool in the Room

Spotting the Fool in the Room

In every situation (where money is involved), there is always a fool in the room. As you can see we're zeroed in on the fun fight we're going to watch on Saturday since the quote is derived from Poker: The most important part of this quote is the word "poker table" since the two words could be replaced with "boardroom" or "office" or "social setting". Since life is a game of status optimization (without developing inferiority complexes like many rich people) you'll want to avoid being the fool in the room.

"Look around the poker table; If you can't see the Sucker, you're it".

The Fool in the Room

Before we highlight many situations… we have to define "fool". The reality is that a bright person could be a fool in the room depending on *who else* is in the exact same room. Put a rich man with poor social skills into a room full of attractive women and he'll likely lose some money without obtaining much in return (hello strip clubs!). Put a brand new multi-millionaire athlete into a boardroom with "Sports Agents" vying to get him the best contract deal after his rookie season… Now you know why many of them end up broke. The list goes on and on. Overall, there is always someone taking the "L" for then day and this is just not avoidable.

Social settings are always the most interesting. A nightclub, bar or lounge can tell you a lot about a person. We're sure most of our readers can figure out who the "fools" are based solely on how they dress and where they place their hands. Once you recognize a handful of gestures it becomes clear as day… If the guy does three or four mis-steps consistently, you've spotted the bottom 10% in the room. For newer readers, you can google the phrase "closed body language" and that's all you'll need to see to recognize the sitting ducks in the room. Unfortunately, the fools are unlikely to learn because when it comes to dating everyone is an "expert". If you ask anyone (including one of the fools) they will jump all over the chance at giving you advice (despite having no skills at all). We're starting with this one since it's the easiest and least valuable, spotting the fool in the room comes down to just two items: 1) clothing fit and color and 2) body language that appears closed off. It's not important because these guys won't get in your way at all.

Social Setting the Fool:

Here we're getting into more important territory. You're going to go to conferences (trade shows, exhibitions, meet-ups, etc.) in the future and you'll want to spend your time wisely. The big problem? There are just too many people. Unless you want to rely , it will be difficult to connect to the key players in the room with no strategy. So we'll go ahead and give you ours. What you'll do is target the tier 2-3 players in a major event. Every single person wants to connect with the CEO of a major company so he'll be swarmed all day. Unless you're already up the chain and can command some weight, this won't help you too much. Instead you'll focus your attention into two areas: 1) tier 2-3 and 2) cocktail mixers. If you target tier 2-3 you'll have a chance at developing rapport with an individual . The underlined section is critical. If you find a ** individual at a company who is decently up the chain… Your connection can carry value in the future. You'll target the tier 2-3 people (those that work directly beneath the speakers – typically CEO/CFO etc.). Grab the corporate map which will be on their website, get onto linked-in and find the important individuals.

Information Settings: entirely on luck with weightpolitically well liked

The second strategy is cocktail mixers. At these major events and conferences you're trying to do two things: 1) make a contact and 2) get information. It is clear that the tier 2-3 targeting (we assume you're starting from zero), would fall into category 1. Unfortunately? This just isn't good enough. You'll need information as well. If you're looking for specific information, attend these meet-ups. If there is a cocktail mixer for say design, then go to that specific mixer instead of the advertising mixer if you need design help. Once you get into the setting, sit back and relax. Why? . The guys who are running around looking to meet people don't have a lot of value otherwise they wouldn't need to "mix it up"so aggressively. Take a quick mental note of the quick talkers and begin interacting with the quiet people after 10-20 minutes. So now you have two ways of spotting the fool in two different situations. The people B-lining it for the CEO are typically fools (or already connected) and the people talking immediately to "network" at a meet-up are also the fools.

The people who socialize the most aggressively after entering don't know anything

Exciting stuff. Your first negotiation happened and most people didn't even realize it… remember those interviews!? That's right, there is a fool in the room in that situation as well. While you'll likely work for less than you are worth for the first 1-3 years out of college, we hope that all of our readers recognize that the interviewee is getting the bad end of the deal. The problem? There isn't much of a difference between the guy who got the position and the guy next in-line since the number of seats is small (surprise, surprise, corporations run their business models intelligently by systemizing all of their employees!). The reality is that the interviewee becomes the fool in 90% of situations. The good news? As you build up your , the roles begin to even out because you have tangible value that is portable.

Your First Negotiation: actual career

How to avoid becoming the fool in a career? We're glad you asked. As expected, we think you should *always* find a way to work by yourself but have nothing against having a career for now. So we're going to assume you're happy working a career…. For now. In this situation, the key to avoid becoming the fool is to direct their attention elsewhere. What does that mean? It means the interviewer needs to be distracted by the carrot (the skills you offer) to allow you to. Most people focus on money, but we'll focus on time allocation. If you decide to join a new firm (negotiation) you're only going to move if you can free up *more* time. This is our own strategy. If you can't free up more time and really have no interest in ever having a business, then you'll of course just go for the money and future career options. The foolish people 1) jump around from company to company hurting their long-term market value, 2) are willing to kill all the political capital they built for a few thousand extra dollars and 3) they aggressively look for greener pastures. All three are not good for long-term earnings because Careers are actually a lot like poker… You're just trying to get to the final table because even if you fail, you'll end up with a heavy check anyway.

While this was more choppy (art than science) we'd summarize the strategy as 1) obtain a carrot – negotiation item before playing the game seriously and 2) remember that any jump or change needs to offset a lot of good will: politics, time and lifestyle. If you're making your decision with this paragraph in your mind you'll win out in the long-run. (Yes we know you guys will end up quitting in 5 years due to the purchase of … But just in case!)

obtain something you wouldn't be able to do in your current situationEfficiency

Now we've moved into more important matters (when money is on the line). While gambling, social settings and basic contact building is low risk (unless you're insane better the house on low probability events), earning money is a whole different ball game. While we realize there are several geniuses who just seem to win out the gate (see billionaires who started with nothing), our own experience suggests it's better to lose and . While it hurts to see someone else get the better end of the deal the first handful of times, it sure beats wasting valuable time. Think of "paying to be the fool" as a form of success payment. In order to be successful in the future you need to recognize where you can win (get the better end of the deal) in the future.

Paying to Be the Fool: lose early

We'll keep it simple with key points and examples: 1) try to make your own basic design, 2) try to hire a design team after, 3) try to sell someone else's product after reading a copywriting book, 4) now try to actually hire a copy writer, 5) interview for a new career and obtain the offer, 6) see if you can leverage the new knowledge to change your market rate, 7) hire your first contractor… you'll get taken for a ride, 8) try to buy a cheap website and fix it without knowing anything about website monetization, 9) learn how to gamble and go to Vegas – you'll likely lose at your first attempt "grinding" at the poker table and 10) try to scale a business without help – no advice. All of the items listed will likely result in lost money and failures. This will force you to be the "fool" in the situation but really… you're paying for your own education as we described in the prior post. Before becoming the "smart person in the room" you have to pay the tax of being the fool as well. You can do your best to learn from the mistakes of others… but it's just not that cut and dry.

Now we've reached the end: avoid being fooled. We've dropped several easy clues in this post and the next set will be items to add to your repertoire. Watch what other people say and you'll notice the following: 1) in an office… the person everyone believes is a "nice guy" is typically the snake… to get everyone to like him he'd have to be a snake because he's just tilting the political cards to himself – don't trust him. The only way the whole office or firm likes the guy is if he's playing to both sides of the fence. 2) don't give out financial information. If you're making money with your Company never give up the financials. You'll get 100 people trying to "help you" as soon as you do. Keeping track of accounting can be done by yourself anyway… no need to tell anyone a word and always lie down if you give out some basic info. 3) offer enough to be seen as intelligent but not enough to be seen as a threat. No one likes to see someone smarter than them (insecurity goes up in lock-step with your improvements financially) so you're better off fitting in until you figure everyone in the new group out. 4) don't give people your background information. If it's possible to remain low-key then you can consistently use the same old trick … Once they tell you the answer, if they said something factually incorrect, you know to move on; 5) create a clear brand so when you negotiate you can obtain better terms. Exclusivity in any form can allow you to change the pricing contracts which will likely save you more time than money… which is what you want to do if scaling is the goal (hint, hint, for those that know the industry well) and 6) create a consensus in the group. Any time its a bigger form negotiation you have to create a consensus around what you actually "want" this will make you appear to be less savvy than you are. You're creating group think this way when all of the other people agree.

How to Avoid Being Fooled: *"I don't know anything about XYZ why don't you tell me a little about it"*

From the list above if you're seeing a pattern… you should. The first is to never give out information that can hurt you later, the second is to never give out information unless you need to, the third is to create a false positive for why you have more weight in the contract and fourth creating group think makes it harder to reverse an opinion because they have to admit they were wrong (). There you have it… You're either playing the part of the fool (on purpose to learn) otherwise… we suggest learning how to appear harmless. Just remember, if you see someone else as harmless… the read is probably wrong.

note, no rich person ever thinks they are wrong, when they are they'll say it was "luck" or not as clear
****

Spotting the Mediocre: Ten Common Types

Spotting the Mediocre: Ten Common Types

For the past couple of years we've had a lot of fun talking about . They are easy to spot as they are entirely driven by emotion, root for the "underdog", look to gain without adding any value and see everything through two dimensions. Generally speaking, they see the short term gain and lose over the long-term. This results in a constant negative feedback loop where they feel great for short moments in time that are fleeting as the decisions do not compound and don't give them any momentum. Now… Looking at the bigger issue… lets see if we can spot the mediocre. These guys are much more difficult to catch but once you see it… you can't "unsee" it.

regular people

Ten Common Mediocre People

There is noting wrong with mediocre people, they just don't have the risk tolerance or belief to really take full responsibility over their lives. Generally, they need more "hand holding" and try to do things through partnerships (never realizing that partnerships almost always fall apart). Instead of actually starting they look for some sort of "angle" in and think there is a class or school that will teach them everything (they've followed the rules to the T for the past 25+ years). Again. Nothing wrong with it, the only problem is you'll have to avoid them when it comes to your actual work. .

They'll eat a lot of your time

The first tell-tale sign is the angle. If you've started something successfully it always goes like this. "Hey i am starting something" the angle person… he says ok cool (thumbs up). Then… After you succeed… Suddenly he wants to know how he can help and obtain *Equity* in the business. Instead of doing the hard work he's trying to get a slice since he does know that ownership is better than a salary. But. He typically doesn't have the skills required to be in a position that deserves an equity stake. So the cycle continues for him, just don't make the mistake of saying ok and offering it to him. You're better off finding the best suited person. Hiring a bad team member is suicide.

1) The Angler:

Low scale hustlers are not the same as big ones. The big hustlers find ways to leverage every idea they have and run around like mad men scraping up every deal for their business. They make it. The low scale hustler is always onto these "gimmicks" that make a few hundred dollars here and there that add up to maybe $15,000 a year or so. Think of the guys who resell hot goods on the internet, or the guys who sign up for rebates for random lawsuits from major corporations. While they do find ways to get a few dollars they are never willing to take the time to build anything or take on any actual risk. These guys are some of the best soft contact people you'll run into here and there. Shoot them a message once every month or so and they're full of small ways to make $500-1000 without any effort. Just don't give them responsibility or else they will shy away from the idea.

2) The Low Scale Hustler:

This guy looks to make small arbitrages all of the time. You name it he'll be making the similar amount as the guy above. Around $25K a year in extra income. Scalping will range from sporting events to concerts to electronics and collectables (and god knows what else). Instead of creating a product with built in demand (the guy can already tell when things will have demand for crying out loud) he'll play the spread over and over again. This is not a scalable business since they rely on continuous mini events and if this was done on a bigger platform the inventory risk would run wild. The best part about the scalper is he'll know when solid products are coming out. If a new gadget is coming out and you want to know if it'll have a good reception give him a call.

3) The Scalper:

This guy is an amazing employee. We would say he isn't even mediocre, if he learned to take risk he would be rich within 5 years easily. The only reason we're including him in this list is because we'd avoid taking advice from him in terms of scaling an actual business. If you want to know how to move up in the rat race at a rapid pace… he's your guy. Again. We're only including him in the mediocre category because he lives a much more predictable and boring life: the bmw 3 series, fast promote to revenue generation and standard house with 2 kids. Nothing to say on the partying and reckless side of life since he's followed every instruction to the T. Another tell-tale sign for those in banking is the guy who always does everything correctly, he doesn't even cut corners during "fire drills" everything is somehow perfect triple checked and he has a cabinet of perfectly organized projects for reference. No errors. Just textbook execution. The positive? If you want to know how to succeed in the corporate world he's your guy. Do not bring up "grey area" topics with him, he'll point out the ways it "breaks the rules". One last note, he ends up becoming a millionaire at least.

4) The Rule Follower:

These guys end up being "well off" but never get much further than that. They value their time at nearly zero, however they will go above and beyond to save 3% on any item. This means they'll spend hours searching for ways to cut their cell phone bills, their grocery bills to their electrical bill (no joke). This constant focus on "guaranteed returns" and ignoring the fact that they are losing money (could be earning instead since they typically make ~$75 an hour or ~$150K a year) causes them to grow "slow and steady". They believe that all improvement is made in "tiny steps" over time and don't understand that the focus should be on *event* based income (where you see a one day windfall of say $500K+ due to an *event*). The reason why the penny pincher is so well liked is that anyone can do it. If you make slightly more money than the average person and find ways to cut your costs by 2-3% a year and invest in boring stocks and bonds (5-7% return)… you'll be well off in a decade or two.

5) The Penny Pincher:

This is probably . This individual has everything the above people do not have. He has risk tolerance, an ability to take action and he focuses on earning money. The problem is that he does too many things at once. He'll try to start three different websites at the same time. He'll jump from company to company (ignoring the loss of political capital). He'll invest in higher risk investments but never get concentrated on one he knows extremely well. This guy ends up becoming well off but never rich because he just never gets scale with any idea. Think about this person as a "mediocre" decathlete. While he ends up being good at 10 different things, he never makes it to the top because very few people are good at 10 events at the same time (most people are good at maybe 2-3 events). This is less to do with talent (he has that) and has more to do with building blocks and . The base/foundation was never built correctly so he has to redo the foundation for all of the different ideas over and over again. If you have a friend like this, help him because he has the highest chance of getting rich out of the all of the people on this list. Help him figure out where his real talent is, convince him to quit the ones that don't work and watch the exponential growth.

6) The Juggler: *the biggest trap of all of them*focus

Heavy spending is relative. If you are a billionaire and spend $5 million dollars every year, that is 100% meaningless. And. The real definition is tied to income relevance. The best way to spot the heavy spenders is to read between the lines and see if they are still earning a high income. The typical heavy spender gets a one time *event*… But. Then takes his foot entirely off the gas. While he can take some time off, going from 100 mph to zero for more than a few months leads to minimal long-term income. He lives a good life but it runs out over the next 10 years or so. The great thing about the heavy spender is he has a much higher risk tolerance. If you have decent ideas (ones he cannot steal) you should run high risk ideas by him and see what his thoughts are. This allows you to think a little bit more aggressively. Just don't fall into the spending trap ().

7) The Heavy Spender: sometimes even twothis is more of an art than a science

This guy actually gets really rich. In fact the extremely successful boring guys are typically tough to beat on the financial side of the equation. They are always on it. They don't party. They don't date attractive women (they are boring after all) and they don't enjoy anything but reading. If you're trying to compete with this guy on the money side of the game, best to call it a day because he's able to stare at a blank wall for 24 hours straight if you paid him enough. The issue with the boring guy is that he's typically out of shape (typically with a weak frame and body structure) or simply fat. He'll own tons of homes around the world… However… they will be rented out since vacation properties don't give him the best ROI. The boring guy wins on the financial side… let him win it's not worth the money in this case (death of your own personality). If you get the chance to work with him on a project for a short period of time… jump on it. It'll succeed.

8) The Boring Guy:

These guys are quite interesting, maybe they do have it right but we'd argue against it. They typically get a one time event, around 7 figures and then call it "a life". They spend the rest of their days doing random activities from low end traveling to outdoor activities. These are guys who almost seem like hippies but they have just enough to not worry about money. This is more of a lifestyle choice we disagree with (hence we include them in "mediocre"!). If you find a guy who lives "close to a beach" or out in cheaper areas with lots of outdoor activities… and he doesn't work… you may have touched on these guys. They also smoke quite a bit of weed.

9) The One Hit Wonder:

This is a new breed, the two problems with this person is 1) he never starts a company with his skills that can scale and 2) he typically spends too much time on his technology related tasks at the expense of his health and personality. This is becoming much more common, a specialist is called in for outsourced work and he charges them a fee for a project or based on an hourly rate. Overall, he is talented. He is talented enough to start his own company and teach others while scaling his own talents. The problem is he prefers being alone. Too much time alone means minimal ability to scale. This gives him a heavy wallet and a location independent income. It does come at a cost of scale and his personality since he typically takes on a ton of similar projects at once. The good news? If you need to contract out technology work, now you know how!

10)The Tech Contract Guy:

On a side note, we started has been phenomenal. The questions are significantly better and each person only has 1-2 questions and is set. What we've found is that the best questions come from people who read in full. After that they typically have 1-2 *specific* questions that we can help with. After that they move on. Some of the other decent questions have been more basic around 1) investing and 2) crypto currencies. What we've found is that the specific questions (a near-term decision coming up) adds the most value.

****

Stand Out As a Non-Target Recruiting Into Wall Street

Many of the questions that have come in surround recruiting for front office Wall Street careers from a Non-Target so we'll start with some ideas for recruiting, move on to interviewing, preparing for the job and finally long-term career management advice.

Before we begin, it has been beaten like a dead horse many times, but whatever you do, attempt to transfer to a target school if possible. Do anything and everything to get into a target school if you truly want to work in a FO Wall Street job as it is the best way to improve your chances. 1) Get a 4.0 and apply to a different major not offered at your current school, 2) get job experience, 3) write outstanding entrance letters. Everyone knows the basics laid out above and with the importance of attending a target school out of the way lets go ahead and run with the assumption that you are at a non-target and want to recruit.

<u>Recruiting</u>

Even if no banks recruit at your school one of your best options to at least speak with a bank is to go ahead and attend target school events. Many schools close these events off however, many firms also hold informational sessions and you can likely find the rooms and attend them. In fact when you recruit at target schools, you will likely see a few non-targets at the event floating around the room. So it is certainly a viable option, particularly if you have strong salesmanship.

Attend Wall Street Events:

Notably, your best bet to obtain interviews is to gain access to a banker's time and attention. What this means is you likely have a much lower chance of making a strong impression at a GS or MS event as hundreds of people will be in attendance and you may get lost in the pile. Instead find small to mid cap banks as well where a minimal number of students will attend (think 10-20). Here you will have more time to make a positive impression, make sure every person in the room you speak to remembers you – in a positive light.

Find Niche Banks:

After the above remarks this is an obvious next question which can be summarized in five key items: 1) Job Experience, 2) Knowledge of the Job, 3) Knowledge of the sector, 4) knowledge of the bank and 5) Coursework/Academia. An example of a decent greeting would run something like this.

Making a Positive Impression:

"Hi I'm [name] from [university] graduating in [date] and I am interested in working for [specific] group within [specific] sector because of [reason]. I think I'd be a good fit because of [reason – usually job experience related] and was wondering if you could provide more information on [specific question regarding the bank]."

(Caveat, if you are recruiting at truly small banks, not public/regional/unknown an elongated email may be of use, this would be equivalent to a cover letter)

By phrasing your intro in two quick sentences you can quickly convey that you know exactly what the bank does and why you want to work for them. If the Company is a boutique medical device M&A shop and you have a degree that is medical related and have worked in private wealth management, you could be a good fit for their internship program. Essentially your job is to shine the spotlight on your positive experiences, if you are asked why you did not go to a target school have a strong back story and do not apologize for it, good back stories include: 1) Financial reasons, 2) Family reasons, 3) Change of interest post college (example went into medical but then decided you wanted to do finance your junior year).

We already posted an email example of how to cold approach banks so use the template located below and tailor it for your personal experience internship/full time recruiting:

Cold Email:

"Hi my name is [name] and I previously worked at XYZ bank doing XYZ and YXZ tasks. Given my previous experience in XXX and XXX I believe I could be a good fit with your organization. In particular I am interested in your company because of XX, XX ,XX. If possible I would like to set up a quick phone conversation regarding any openings you may have at your earliest convenience."

You should again find niche banks in your area and use the same pitch 1) Who you are, 2) Why they should hire you, 3) What you can bring and 4) Exactly what position you hope to obtain. Again keep this short, 3 sentences or so and send them out on a Friday.

With the basics out of the way here are some key things to avoid when you are recruiting as a non-target (a lot of this can be applied to targets as well).

Pitfalls:

1) Do not ask questions that can be obtained via a simple internet search. As a simple example you should know at least 2-3 product groups or sectors within each firm for each city you are applying to so asking if a bank covers financials when you are speaking to a bulge bracket bank would be an immediate ding. Instead focus in on **specific** questions such as completed deals and offerings at the bank.

2) Do not have a single error on your resume, while verbage is debatable mis-spelling words and poor formatting is quite common, a simple example is using periods for bullet points on some line items and not including periods on other bullets (we recommend excluding all periods).

3) No bragging. This is the most common of all mistakes on resumes and during the recruiting process, achievements are vastly overstated. We already expect an exaggeration factor but writing down accomplishments that are over the top will prevent many interviews. Here are a few examples: 1) C-level of [insert] company, 2) CFA Level 1 Candidate, 3) Returned X% above market for X years straight (while still a college student).

The problem is if you are a true C-level executive you're not going to interview for an investment banking analyst or associate position so it is better to stick with the duties such as "helped design a website for X company".

CFA level 1 candidate means you nothing was accomplished (yet) and anyone with a CFA charter is going to immediately ding you for placing that on your resume, CFA level 2 Candidate is certainly acceptable.

Finally, the stock portfolio performance comes off as too confident so it is best to say "investing" and when you receive questions during the interview simply let them know you do invest in stocks and they will likely ask you to pitch one.

4) Veer on the side of professionalism/conservatism during any interaction. Better to give a correct response that can pass than an incorrect response that will ding you immediately. A good example would be your hobbies, unless you are certain you have made a friendly relationship with the person choose interests that won't get you dinged such as "played football for the college you are attending for the past 3 years".

TL;DR: 1) Be humble, 2) Show you've done your research by highlighting specific bank information, 3) Do not waste the time of a Wall Street Professional, 4) If you have not accomplished something, do not include it on your resume.

<u>Interview:</u>

In this piece we are going to do a quick walkthrough on how to stand out assuming you have landed the interview.

The first thing you need to know before you walk in the door is the type of personalities that are generally on Wall Street. In two words, Risk Averse. What this means is that in general, a Wall Street firm will choose the least risky candidate time and time again not all is lost as you'll see later in this post but we'll begin with some common myths.

The Setup:

You are not equal when you enter the interview room. This is going to rub some people the wrong way so here's the quick explanation: Knowing that you are interviewing with risk averse people if you have a Non-Target candidate and a Target candidate all else equal you are choosing the Target candidate. Why? Well if you and another candidate have the same answers to questions and the same work experience why should they take on additional risk by going with a non-target? They shouldn't. With that said it should also emphasize the point that you should always shoot for a high level when you are networking (IE: networking with an MD would give you a much better shot than networking into an interview through an Associate).

Myth 1:

Lazard/Quatalyst/Moelis/Evercore are boutique banks… This is simple mis-understanding of the space, boutique banks are small firms that people on WSO would unlikely recognize. That's how you should classify boutique. For one reason or another some people still believe they are boutiques when in reality you should consider them "Elite Boutiques" (term seen on WSO) which essentially means just as difficult to break into as a bulge bracket bank. The truth is a firm like Moelis/Evercore etc. may actually have tougher standards than a bulge bracket bank. Why? If a bulge bracket bank hires 100 analysts, an "Elite Boutique" hires much less maybe just a handful per office. So if a bulge bracket hires a few poor candidates they do not lose as much by training them and subsequently firing them on a relative basis. Again Wall Street is risk averse so "Elite Boutiques" have to carefully handpick the best they can find to make sure they don't have underperformers as each candidate is likely going to see a wide range of responsibilities where bulge bracket banks can manage a few poor hires.

Myth 2:

Many people on here get this last one, however getting all technical questions correct is not important. While you cannot miss easy ones such as how to calculate enterprise value or how to run a DCF, many interviewers simply push your technical knowledge to the edge until you admit you do not know more. This is for two reasons 1) they want to see if you are going to lie and 2) they want to see how much finance you know and of course the more the better.

Myth 3:

With the setup out of the way how exactly do you "stand out" when you answer questions? The answer to this is again two words: Make Connections. What this means is you should tie in all of your work experience, bank knowledge and Wall Street knowledge into all of your interview answers. To avoid beating around the bush here are three examples (feel free to adjust wording, the message is the same in bold).

Samples:

Your average target is going to have a cookie cutter answer such as XX internship, XX interest in banking, hard working because of XXX. So you'll have a similar answer but you need to spin it and avoid making any comment that suggests you are "smarter" than the other candidates as this will only highlight that you are at a Non-Target, instead highlight your positive points such as work experience and bank knowledge, something like this.

Why should we hire you?

"I'm sure there are a lot of highly qualified people interviewing today and I believe I would be a good fit because of (specific reasons linked to group you are interviewing for such as medical experience if interviewing with healthcare group). In addition, I am primarily interested in XXX space for XXX reason (reason is backed up by resume line items) and have a strong interest in expanding my knowledge in the space where (job position) will offer a steep learning curve. Overall I believe my experience/knowledge in XX will be helpful and am willing to put in the long hours necessary to add value as quick as possible."

Message: I have experience that is useful, I am humble, I know what I am signing up for and I have a passion for the job.

The answer to this question for most people will be the finance courses offered and other general target school answers. This is actually a set up for you to sell yourself if you went to a non-target. The worst thing you can do is say "I did not get into a Target" again you need to spin your reasoning. Some good examples are 1) financial, 2) location and 3) family.

Why Did You go to XYZ School?

"I went to Non-Target as I was fortunate enough to receive a XXX scholarship in XXX for XXX reasons. I saw that the school offered XXX finance courses and felt that I could take XXX courses and network into a Wall Street position. Given the cost savings and curriculum I felt that it was a good decision for me to make and I have enjoyed my time at Non-Target":

Message: I am not apologizing or complaining about the school that I went to, I do have an understanding of finance and I have a legitimate reason for making these decisions

Here you have a good chance at standing out. Generally speaking most candidates do not know much about investment banking deals/transactions so if you did your homework you can give a standout answer.

Why Our Bank?

"I want to work for XXX bank because I believe my experience in XXX, XXX and XXX fits into the Company's long history of XXX (type) transactions. As an example I am interested in XXX space and the Company has recently completed (transaction 1, transaction 2, transaction 3) in the last twelve months and this is the type of work that I am interested in."

Message: I know exactly what the bank does, I know deals that have been completed recently and I know how my experience can fit into the group.

TL;DR: As a Non-Target your goal is to 1) highlight your strong points on a resume, 2) connect with the highest possible person in the firm, 3) have strong answers that explain your decision making over the past 4 years and 4) stand out by knowing and understanding the bank/space better than the Target school students.

Give answers that would sell well to a Risk Averse person and be sure to Make Connections between all of your positive characteristics and those that will make you appear to be a strong fit for the firm.

<u>Job Performance:</u>

Below is your guide to standing out, not getting fired and diluting the importance of your alma matter.

When you begin on the Street you'll be sent off for a training session at your firm's head quarters (usually NYC). Here you will have to pass a series of tests, take accounting courses, Training the Street modeling courses and the classic excel formatting classes. When you begin training there will be two sets of groups 1) the extreme go getters, 2) the extreme partiers. Generally, you don't want to be a part of either of these groups, instead you want to strike a balance in-between with a slight lean towards being an above average go-getter.

Training.

Why do you want to do this? Here is the reasoning below:

Your training results matter. Your scores on all of the accounting tests, Training the Street material etc. will all be passed along to Senior Members of your group. What this means is when you return from training they will already have a perception of how good you are. If you come back from training and you had the lowest scores in the entire group and the company needs to lay off workers… You're gone. So as a Non-Target given that they already had slightly lower expectations of you, don't be at the bottom of the pack shoot for being in the 75-80% range (top quartile)

This leads to point two – the most important job advice you will ever get before joining – because you're likely wondering why don't I simply get ranked #1 in everything?

<u>"Never unnecessarily raise expectations, lower expectations, deliver higher results"</u>

Now that you know your MD's will have the results of all the tests you also do not want to be the Rock-star analyst/associate. The reason why is you'll enter on day one and you'll immediately get staffed and grinded. You've unnecessarily raised expectations too high. You want to leave some room for error so your MD/, Director/VP all see improvements from their criticism of you. This does many things for you 1) you have now set a bar that can easily be beat, 2) your bosses will now believe you take criticism well and are able to improve and 3) this lowers your hours slightly out of the gate. If you are getting ranked on the all time list for speed in the excel formatting exercises… You've gone too far.

Now that you've entered your first Wall Street gig with your light blue t-shirt and oversized suit, it's time to start taking notes regarding the hierarchy within the office. Being from a non-target you want to do everything possible to link up with the highest ranked MD. All MD's are not created equal. Instead of explaining in a long-winded fashion how you can flush out the bad MD's from the good ones here's your step by step guide.

Political Management.

1. Find an Analyst who is getting promoted to the associate level (3rd year)

2. Do not ask the third year analyst any questions, leave work related questions for year two analysts

3. Befriend the third year analyst by talking about non-work related items

4. Become proficient at the job by continuing to ask smart questions (that cannot be answered by Google searches) to the second year analysts

(Replace Analyst with Associate being promoted to VP if you are a first year [A1] Associate)

The four steps above will quickly give you an idea of how you get promoted because you will have a direct line of sight to success. Find out who he works for, these people were the ones who made sure he got the promotion and of course they are also ones who will help you get promoted in the future if they like you as well. If it isn't broke don't fix it so follow the path of successful people before you.

With the politics and general perception out of the way all that is left is correctly performing on the job. At this point people in the office should have the following impression of you 1) Hard working, 2) Not the star in the office but above average (both in work ethic and intelligence from you top quartile scores) and 3) easy to work with due to social skills. From your perspective at this point you should have a direct line of sight on who you want to work for and who you do not want to work for. This will also help you decide which projects you will prioritize during the 120+ hour work weeks.

Now that you've set the stage it is all about work performance. Here's your bulleted list on how to impress your higher ups.

Work Performance.

1. Don't ask dumb questions (notice a trend from the interview advice). If you did not google the question at least three times and have not at least attempted to solve the problem yourself you cannot ask a question

2. When you have questions write all of them down and ask them all at once, send a single email with them clearly laid out or knock on the door and have them answered. The key is to not waste their time.

3. Respond immediately to emails, "Will Do" is the classic response, so send this immediately when an item hits your inbox. Notably, you should have an email flash for new items that hit your inbox.

4. Write down mistakes. You will mess up several times on the job and make sure this does not reoccur and always admit fault when you mess up state the following "I am sorry and it won't happen again". Note when you say it won't happen again it should not, this will create trust.

5. Triple check work. Take a highlighter and highlight every item that has been completed. This way you never have to worry about missing a task. After you're certain all items have been completed now you can move onto mundane tasks such as triple checking formatting. The key is to check your work in order of priority 1) Tasks completed, 2) Numbers match, 3) Key Questions/issues with the model/book/project, 4) Formatting. If your first project has perfect numbers and the instructions were followed to the T they will not fret about formatting errors as you will learn this over time.

TL;DR. When you join the Street 1) Stay within the top quintile but avoid being the Star from the get go, 2) Lower expectations if possible, but out perform, 3) find the important people within the firm and 4) Prioritize appropriately, do not make the same mistake consistently and avoid asking questions you can answer yourself.

<u>Long-Term Career Management</u>

Here we'll address some opinions on long-term career management and how you'll be compared, on a line item basis to a Target entrant. Notably, a lot of this advice can also be applied to Target entrants as well.

We previously outlined how to perform on the job 1) lower expectations, 2) stay in the top quartile but avoiding being the "rock star" and 3) correctly prioritizing tasks. With that in mind, we would estimate that roughly into your job, you will be equal with all of the Target students.

On the Job:*6 months*

The reason why is after roughly 6 months, the firm has a strong understanding of how good/bad your work performance has been. Up until this point, banks will remain risk averse and likely still lean towards keeping a Target student. Once you clear this 6 month marker however, you will see a move toward more meritocratic upward mobility.

This is the biggest part of a Wall Street career, correctly navigating your moves on the Street and here is where many people make severe mistakes both as Targets and Non-Targets.

Job Mobility:

This one is going to garner a lot of negative feed back but it needs to be said: . Before all of the down votes come in, this also does not mean all buyside jobs are bad, what it does mean is that getting promoted to say an Associate or VP may be the better long-term move. If a person simply says "buyside is where one should go 100% of the time" you should be next to certain the person has never worked on Wall Street. Below is how you should really view switching firms, ask yourself the following:

"Always Go To the Buyside": *"Going to the buy-side is not always the right move"*

Do I have a chance of being promoted to an Associate/VP? If the answer is yes you should be careful when you consider a jump to the buyside for the following reasons 1) Your pay is about to increase in a meaningful way 33% at minimum, 2) you have built trust with your firm and they may be considering you as a long-term asset/banker meaning they will treat you better, 3) You will unlikely ever need an MBA, 4) Your pay is more stable.

If you have considered all four of the above and truly have an interest in the buyside then by all means jump. Notably, if you track candidates who blindly jump to the buyside many end up returning to the sell side, they catch a patchy year and see pay decline substantially or end up joining a group that is a bad fit for them.

To end this short rant on why leaving the sell-side isn't always the correct decision remember to write down the following: "If everyone else is blindly doing it, it is probably a bad idea". As a quick example, going from an Analyst to an Associate position at say an E-boutique will likely help you more (again long-term pay in mind) compared to simply jumping ship to a mediocre buyside shop.

For an intelligent reader, you can read between the lines and realize that if you are able to receive an associate promotion or VP promotion, the stigma of being from a Non-Target quickly goes away. The reason? Investment Banks and businesses in general are about driving profits and adding real value. If you are promoted this will trigger a large signaling effect as banks realize that you were outperforming within the firm. It is relatively rare to see Analyst to Associate promotions or Associate to VP promotions for Non-Targets so the change in title would quickly dispel any concerns regarding work productivity.

Non-Target Stigma is Relatively Short:

This is where many Wall Street Professionals slip. When you join an Investment Bank if you can develop a strong personal relationship with a Managing Director you'll unlikely ever be unemployed again. This is a bold claim however it is relatively true. If you have worked well with a Managing Director he will help you with your career in ways you never imagined. The Managing Director would 1) take you with him if he switches firms*******, 2) help you join a corporate finance job, 3) search for private equity slots for you and 4) alert you of hedge fund opportunities.

Develop an MD Relationship:

Notably, things are changing rapidly and less and less high end professions want to hire unproven candidates, making a Managing director relationship of utmost importance and why the phrase "don't burn bridges" is used profusely on Wall Street.

The TL;DR of the entire elongated post would be the following: 1) Get real finance experience, 2) Network appropriately and stand out in the interview by showing your expertise/research, 3) Stay in the top 25% of your class but don't be #1 to avoid raising expectations and 4) think long and hard about long-term career management as many professionals will make the mistake of following the herd.

Concluding Remarks:

******

One last caveat to relationships is a low end analyst/associate would unlikely move with the MD, however the point stands that a MD would help the analyst/associate switch into a new career if he has helped the MD make money in the past (IE: strong work within the bank).

****

* Start Here *

Welcome new readers! You're probably surprised by the name of the website. That is because we have been around for over a decade now. For some quick history, we started by focusing on investment banking… ditched that to make money using the magical powers of the internet and then… ditched that to go full into crypto with all free time.

Many will read the website name and think it makes no sense that people with Wall Street backgrounds could "understand crypto and tech". Well who is in a better position to understand that disruption is coming than the person who used to work in the industry (back in the mid 2010s).

That is neither here nor there. Our purpose here is to make YOU rich. We've already secured our bag and the purpose of this blog is to help people who want to succeed. Why you ask? If you start at the lower end of the economic spectrum it is almost impossible to find good information. Most people in the lower income bracket are only surrounded by people who didn't make it (otherwise they wouldn't be in the same region). This website attempts to level that playing field.

If someone wants rainbows and unicorns they can go to a Tony Robbins seminar. Michael Jordan did not got to a Tony Robbins seminar before he laced up for the NBA Finals. The point is clear. You have to be self motivated and we'll help provide all the tools you need to succeed because in the end….

"Well done is better than well said" – Benjamin Franklin

TOPICS COVERED

Generally speaking we've already made our money so the focus is much more on investing at this point. That said, we have ten years of posts and on top of this we still track the most lucrative careers and industries. You can find that by simply checking out the three books on our website. While strategies do change a bit over time, the vast majority of the content is evergreen (around 90%).

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life.

1) Efficiency2) Triangle InvestingSpending for Maximum Return**We hold Q&As 1x a month for purchasers only.**

In terms of the tone of the blog? The below sentence is a great summary.

"It is better to be punched in the face with the truth than kissed with a lie"

Welcome and good luck! If you grind it out, you won't need it!

DISCLOSURES – Privacy Policy

Per FTC guidelines, this website may be compensated by companies mentioned through advertising, affiliate programs or otherwise. Any references to third party products, rates, or websites are subject to change without notice. Please do the appropriate research before participating in any third party offers.

Your privacy is very important to us. Accordingly, we have developed this Policy in order for you to understand how we collect, use, communicate and disclose and make use of personal information. The following outlines our privacy policy.

Before or at the time of collecting personal information, we will identify the purposes for which information is being collected.

We will collect and use of personal information solely with the objective of fulfilling those purposes specified by us and for other compatible purposes, unless we obtain the consent of the individual concerned or as required by law.

We will only retain personal information as long as necessary for the fulfillment of those purposes.

We will collect personal information by lawful and fair means and, where appropriate, with the knowledge or consent of the individual concerned.

Personal data should be relevant to the purposes for which it is to be used, and, to the extent necessary for those purposes, should be accurate, complete, and up-to-date.

We will protect personal information by reasonable security safeguards against loss or theft, as well as unauthorized access, disclosure, copying, use or modification.

We will make readily available to customers information about our policies and practices relating to the management of personal information.

We are committed to conducting our business in accordance with these principles in order to ensure that the confidentiality of personal information is protected and maintained.

Web Site Terms and Conditions of Use

By accessing this web site, you are agreeing to be bound by these web site Terms and Conditions of Use, all applicable laws and regulations, and agree that you are responsible for compliance with any applicable local laws. If you do not agree with any of these terms, you are prohibited from using or accessing this site. The materials contained in this web site are protected by applicable copyright and trademark law.

1. Terms

a. Permission is granted to temporarily download one copy of the materials (information or software) on wallstreetplayboys.com's web site for personal, non-commercial transitory viewing only. This is the grant of a license, not a transfer of title, and under this license you may not: i. modify or copy the materials; ii. use the materials for any commercial purpose, or for any public display (commercial or non-commercial); iii. attempt to decompile or reverse engineer any software contained on wallstreetplayboys.com's web site; iv. remove any copyright or other proprietary notations from the materials; or v. transfer the materials to another person or "mirror" the materials on any other server. b. This license shall automatically terminate if you violate any of these restrictions and may be terminated by wallstreetplayboys.com at any time. Upon terminating your viewing of these materials or upon the termination of this license, you must destroy any downloaded materials in your possession whether in electronic or printed format.

2. Use License

a. The materials on wallstreetplayboys.com's web site are provided "as is". wallstreetplayboys.com makes no warranties, expressed or implied, and hereby disclaims and negates all other warranties, including without limitation, implied warranties or conditions of merchantability, fitness for a particular purpose, or non-infringement of intellectual property or other violation of rights. Further, wallstreetplayboys.com does not warrant or make any representations concerning the accuracy, likely results, or reliability of the use of the materials on its Internet web site or otherwise relating to such materials or on any sites linked to this site.

3. Disclaimer

In no event shall wallstreetplayboys.com or its suppliers be liable for any damages (including, without limitation, damages for loss of data or profit, or due to business interruption,) arising out of the use or inability to use the materials on wallstreetplayboys.com's Internet site, even if wallstreetplayboys.com or a wallstreetplayboys.com authorized representative has been notified orally or in writing of the possibility of such damage. Because some jurisdictions do not allow limitations on implied warranties, or limitations of liability for consequential or incidental damages, these limitations may not apply to you.

4. Limitations

The materials appearing on wallstreetplayboys.com's web site could include technical, typographical, or photographic errors. wallstreetplayboys.com does not warrant that any of the materials on its web site are accurate, complete, or current. wallstreetplayboys.com may make changes to the materials contained on its web site at any time without notice. wallstreetplayboys.com does not, however, make any commitment to update the materials.

5. Revisions and Errata

wallstreetplayboys.com has not reviewed all of the sites linked to its Internet web site and is not responsible for the contents of any such linked site. The inclusion of any link does not imply endorsement by wallstreetplayboys.com of the site. Use of any such linked web site is at the user's own risk.

6. Links

wallstreetplayboys.com may revise these terms of use for its web site at any time without notice. By using this web site you are agreeing to be bound by the then current version of these Terms and Conditions of Use.

7. Site Terms of Use Modifications

Any claim relating to wallstreetplayboys.com's web site shall be governed by the laws of the State of California without regard to its conflict of law provisions.

8. Governing Law

9. Legal Age

Start Talking To Yourself Today

Start Talking To Yourself Today

We received an interesting email this week which is summarized below:

"I notice a lot of your posts have repetitive sayings… Is it safe to assume that you encourage people to talk to themselves?"

In short the answer is yes we strongly recommend that everyone talk out loud to themselves. There are many benefits to and both word choice and tone can have dramatic long-term impacts on your consciousness.

rewiring your brain

The next time you wake up and walk to work start singing out loud. It sounds stupid. If you are afraid that people will look at you (they will) then you can also try this as you're getting ready in the morning. As much as we like to believe we are in control of our environment, your environment which includes sounds will tend to dramatically influence your mood. If you can wake up and sing a happy song, such as James Brown's "I Got You (I Feel Good)" we guarantee your day will start off better.

Waking Up:

When you spend a serious amount of time improving your body or becoming an elite athlete you quickly learn that talking to yourself changes your level of concentration. When you lift you should mentally focus on parts of your body, a great example is to say the word "load" three times as you come down on a one legged squat focusing on your glut and hamstrings. Subsequently saying "explode" as you come back up from the contraction.

Lifting and Sports:

This will also work if you've ever stepped up to the free throw line in basketball, prepared for a serve in tennis or practice penalty kicks in soccer. Focus in on the task by drowning out the noise with a useful repetitive saying… Just don't go overboard collecting violations like Karl Malone.

(Racking up 10 second violations)

(Racking up 10 second violations)

For those of you working on Wall Street this piece is probably the most important. You will get reamed out. A lot. Since you're more likely than not a highly educated and competitive person you'll likely react as follows: 1) you will state out loud "I know I messed up", 2) you will go silent and stir in your chair as you angrily replay what went wrong in your head, 3) you will say "I'm sorry and it won't happen again".

Receiving Criticism:

Option one will likely happen to you at least once and should not be said again. When you say you "know" this implies to the listener that you don't care. If you knew of the error it would have never occurred in the first place. Strike this response from your vocabulary.

Option two will happen when you either 1) hate the higher up or 2) got thrown under the bus for that – yes both will happen. This is better than part 1 as you can hide your emotions, but it will cause undue stress as you replay in your mind over and over how much you want to crack the person over their head with your keyboard. Instead if you're getting stir crazy repeat the following phrase: . There is a lot going on in this sentence but to summarize you need to 1) know you put your best effort in, 2) recognize you cannot control the actions of a sycophant VP/MD or otherwise and 3) you do not harbor hostility.

pitchbook error*"I know that XYZ happened and there is nothing that I can do to change the personality of XYZ. I did my best and I'll continue to do my best and watch out for XYZ in the future"*

Option three will happen when you're in the wrong, care about your job and take full responsibility for the action. Any time an error is made and you make the statement and mean it you will immediately diffuse the situation. So long as it does not occur again. Simply go back to work and add item X (the error that occurred) to your checklist of things to watch out for and do not stir reprimanding yourself over something that you can easily fix going forward.

"it won't happen again"

In short when it comes to work, taking responsibility and positive affirmations will help you avoid an eventual eruption of emotion as you bottle up negative feelings. We all know this person in the office and he never gets promoted once he is known for being unable to .

control his own emotions

We know you likely read the title and said "start talking to myself you mean like a crazy person!" Actually that is a great idea. If you ever find yourself in a sketchy party of town and don't want to be harmed, begin acting like a loony cartoon character. Not even criminals want to mess with the crazy people as they 1) could do something harmful to them and 2) likely do not have anything of value in their possession. We're certainly not suggesting you go looking for trouble, but we've all been there before and remember that no one wants to mess with a crazy person.

Safety:

This one goes without saying, constantly talk to yourself in the language you are learning. If you're walking to work and don't want to sing like a crazy person since you're already in a good mood from doing so in the morning, you should start naming objects on your way to work in French/Spanish/Russian etc. As much as we like to believe that we can simply memorize words and phrases speaking will accelerate your learning as you practice tone, accents and hear yourself repeat the vocabulary lesson for the day.

Learning a Language:

The longest conversation you will have in your life will occur alone. With this in mind you should practice having the correct conversations… starting yesterday.

Concluding Remarks:

"We are what we repeatedly do. Excellence, then, is not an act, but a habit." – Aristotle
****

Street Personalities

Seeing attrition in finance over multiple rounds of layoffs, firings and people leaving the industry all together, we believe there are really only two types of people who stay in finance beyond a couple of years. They are 1) type A personalities with huge insecurity issues and an obsession with perfection/hard work and 2) type B personality who . The end of that statement is huge as type B personalities have much less room for error as they will be perceived as "lazier and stupid", remember perception is reality. If you try to be type B, remember to maintain a tight rope around the items you send to clients and work you turn in.

do not make errors

The Insecure Wall Street Professional

This does not pertain to the work environment as they will adjust accordingly after being in the office for 70+ hours a week but if we take them out to a social scene with the general public they'll stand out like sore thumbs looking uncomfortable, sweating like a pedophile in a day care center. They cannot understand any conversation that does not revolve around the following: investing, recent transactions, items in their sector, personal finance and failure with women. Everything else is completely foreign. Goose bottle service anyone?

Terrible General People Skills:

The insecure people are not happy as they continue to work through the pain. They hold onto their need for that next bonus check or that next promotion or that next condominium. Think of this as an extreme version of delayed happiness, but since they are extremely insecure, never ask them if they are happy because they'll go on the defensive.

Unhappy:

If you are an attractive person, you're setting yourself up to get more interviews and possibly awkward conversations when you start to realize you're being checked out constantly. Truth. Disturbingly, the insecure professional will do anything and everything to fit in but you'll quickly notice they are uncomfortable in their own skin. No swag, just a drag. To win the game use something like the following when the lies of hooking up spew out "Wow you're crushing it! Keep the stories coming!". Hard sell. Any sarcasm and you'll be getting BCC'd within the hour.

Shallow to Fit In:

With a whole slew of stubborn people in one place it is no wonder that the competition heats up as people want to continually prove their opinion to be correct. Therefore, there is a passive aggressive environment in finance and examples will range from a bcc email sent to your boss to throw you under the bus to outright backhanded insults. The last one is the most common and you should be wary of anyone who points out your bad points in "a joking manner" this is the most commonly used tactic. A great example is after you hang up the phone someone will say something along the lines of "Woah someone doesn't sound too happy today! (fake smile)"

Stubborn:

If forced to spend a month with this employee with no other forms of communication, you'll likely be depressed. By now you've likely seen how this builds on itself, bad normal people skills 1) unhappy 2) explain beliefs based on failure 3) get high from bonus 4) blow money to make up for their lack of pussy and try to get it 5) unhappy due to lack of pussy 6) reiterate belief system… Secular decline.

Boring:

The Extrovert Wall Street Professional

By beingaroundmanytype A's you'll resort to your phone… for everything. An extra $100 a month to keep outside contacts is necessary for your sanity. You'll navigate towards other like minded people in your office and will be somewhat separated from the other type A's. This is great for your mental and physical health, but awful for your perception. Point two lets you slide.

Keeps a Social Network:

The absolute key here, with all the bcc emails and politics blah blah blah you must be error free. If you make no errors no one can get on your case for going out on weekends and generally being Type B. The real issue here is the Type A personalities aren't happy so they will feel the difference and leverage that perception to try and get a better bonus. They will try to drag you down, don't let them. Vocalize that you've "never met someone you didn't like".

Error Free:

Naturally, to maintain your balance you'll be going out with non-finance people and having fun with your free time. This means you'll spend the majority of your time networking and avoiding advanced

Less Money Saved:

This is the one bond that keeps the environment together, both have a love for making money for very different reasons. One group wants to save to retire, live it up when they are 50+… the other wants to leave a pretty corpse… Hopefully STD free.

Believes Money is Very Important:

The older people in the group will prefer having this type of worker in the office over the type A, assuming work is error free. People can sense happiness and will certainly move these individuals up the ladder over time. Strike hard during the right years, trying to be the rock star in year one is setting yourself up for disappointment. "Mature" at the right moments to please the Type A's and after that promote, start that cycle again.

Well Liked and Happy:

Overall you'd have no problem going out to drinks with this person, they can hold a conversation and are genuinely happy. The cycle looks like this: 1) great social network 2) perceived as unproductive 3) error free, wins more trust 4) party more and save less money 5) continues to be error free as money is important 6) continues to be happy and outgoing7) larger social network…

Fun:

While there are always exceptions to the rule and you may have some mixed qualities here, these are the two people who last a long time on the Street. This is the reason why you have two conflicting stereotypes of the unhappy Wall Street Professional and the other extreme of the partiers/womanizers.

Conclusion:

You know what to do. Get paid make it rain get on that night train.
****

Studying Advice

Studying Advice

One of our readers came up with and we're answering the question immediately. Many people are likely young and in college trying to learn the ropes as quickly as possible. The format will be best served for but you can certainly change it to focus on any topic you like. With that in mind lets get to work.

a great idea for a post people in college

While this can be an entire 3,000+ word topic alone, we're going to keep comments here at a minimum. Finding the right teacher simply means "find someone who walks the walk".

Find the Right Teacher:

This is best served in examples…

Are you going to take financial advice from someone who is s?

not even a millionaire in his 30*Of course not.*

Are you going to take fitness advice from someone who is out of shape?

Of course not.

Are you going to take pick up advice from someone who is significantly better looking than you?

Of course not.

Cut the garbage out and find the best teacher you can with the 80/20 rule in mind. Three steps.

1) Does he have what you want? Yes.

2) Did he have less resources than you? Yes.

3) Did he earn it himself? Yes.

Then you're good to go. If they do not pass this test, you know what to do "Smile, Nod, Agree… Delete contact and explain that you are a Manager at McDonalds… so he never contacts you again". With the teacher out of the way lets get to work.

The easiest way to improve your studying habits is to get rid of all distractions. This means you do not text on your cell phone, you do not rev up the instant messaging system on your laptop and you do not bring any entertainment objects (magazines, hand held games and otherwise). Instead you focus on absorbing the information at hand. If you had the opportunity to meet your idol (Warren Buffet, Wayne Gretzky, Muhammad Ali, etc.) the last thing you would do is get on your phone to text message your friends about the next party you're going to attend. Treat a meaningful class in the exact same manner.

No Distractions:

The no distractions rule applies to meeting someone you respect as well. If you're more interested in your phone than talking to the person in front of you, the implied message is that they are of lower value than you. Stop wasting your time *and* his, move on.

To avoid confusion, being locked in and focused for class only applies to the ones that matter. Ethnic studies? Sociology? Yep… you guessed it… they do not matter. Practically every single general education course is a waste of your time so the best bet is to do the minimum to maintain your 3.5+ GPA. Focus on what matters in obtaining an A- or better. All you need to do is agree with their main points, highlight a few touching sentences from the curriculum and walk out of there with a solid grade. If you want to ensure that you obtain an A-, find out who is grading the tests and be sure to show up to their office hours a couple of times. If you go to a large university, you no longer have to go to class (friend(s) will sign you in for attendance). You're welcome!

Does the Class Matter? Do the Minimum. *Their political affiliation.*

If you are forced to go to class (small university)? PDF the work from your more important classes and take notes, they will not know that you are studying for a different course.

Now that you're out of the classroom, only attending the courses that matter and doing the minimum in the ones that do not, you should develop habits to improve your memory. The best way to create a physical connection between the material and your memory is by 1) writing information down and 2) eating similar foods with each topic. While the first part seems quite easy the second one may seem tedious. The quickest way to trick your mind is by buying 2-3 different types of gum. Chose gum type 1 for class 1, etc. You won't take more than 4-5 courses in a quarter/semester and chances are only 2-3 of them will matter in the first place.

Create a Physical Connection: with an actual pencil/pen

If you want scientific studies on how eating similar food (or chewing gum) improves memory you can do the work yourself. Or even better, just do it and watch it work on your own mind and body. Yes, you should also chew the same gum type during your exams or even in class.

(Side note: yes drinking the same beverage works as well)

This is a solid ratio for studying. If you're a relatively fast reader the goal is to read/consume information for 15 minutes and spend the next 5 minutes writing the biggest takeaways. As mentioned above, typing does not count. Write down the main items (formulas, concepts, theories) onto a notepad and reflect for 2-3 minutes. Repeat this until you feel like you are no longer able to focus. Once you hit "the wall" or you feel that you understand the material, switch tasks entirely. Our recommendation is to .

Fifteen and Five: hit the gym

Do not waste your time with a highlighter. When you see a concept or item you wish to recall, underline it and flag the page with a written note. Having a 100 page document with highlighted items will not help. You will be forced to remember why you highlighted the sentence in the first place. Make it easier by picking up a few post its and naming the page "Duration Explanation" or "Game Theory Example" are going to be much easier to refer to when you go through the book.

Flags Not Highlights:

Ever wonder why it is hard to find a specific "section" even though you remember highlighting it before? Now you know.

If you are having a hard time remembering a concept you just learned, attempt to apply it to real life. Keep a simple note card in your pocket with items you continuously get wrong and remind yourself to try and find a connection in your day to day life. Unfortunately we cannot do this part for you as you need to come up with the connection yourself. Positively, a good example would be the application of economic or financial concepts. Simply pick up a business magazine (or WSJ etc.) and try to apply any new concept you learned to an article. In the worst case scenario, none apply and you simply learned more about the latest transactions.

Real Life Connections:

In our we explained that it is always significantly harder to Sell something than it is to Buy something. This is because it takes less information to understand something than it does to teach something. If the class is important and the topic is important for your future, find someone to teach. You will learn more about the topic by forcing yourself to teach the material. By helping the person learn the material, you're going to have a better understanding yourself.

Teach the Topic: article on sales

(Hint: now you know why this blog is alive)

At this point you should know the material pretty well, despite what they say, cramming certainly does work. If there are certain concepts you are having trouble internalizing and the test is around the corner, simply memorize the examples/formulas with no application. It is always better to get partial credit on any exam and have perfect examples lined up than to get a 0 on the question.

Cramming:

You can read between the lines here. You're going to do quite a bit of cramming for the classes that are irrelevant to your future. All you need to do in the meaningless classes is regurgitate the opinion of the grader. While it will take a lot of willpower to write down information you do not believe in… better to get high grades and

get rich than die poor.

There you have it, a quick list of items to follow in order to improve your studying habits. 1) find good teachers, 2) focus only on the topic at hand, 3) cut out material that is not applicable to improving your life, 4) make a physical connection with eating/drinking, 5) 15 mins consume/ 5 minutes write, 6) flags not highlights, 7) real life application, 8) teach the topic and 9) cramming is fine.

Recap:

To be clear here, we're not wavering from our initial opinion on college (only go if you can generate a return and only go if you can attend an elite university). The entire post assumes that you're going to a college ranked in the top 20 or so in the USA.

Some Final Thoughts:

Second, you can apply this same logic if you are already out of college. Play the same game as above. Make sure you're listening to someone of value. Take notes, avoid wasting their time and if you can help them out in any small way… Do it.

Finally, as we have warned many many times in the past… When you decide to study/learn from someone, make sure it flies a little bit against the grain/consensus. If the masses are impressed by it, you know it is a set up for a con. The masses are impressed by $100K (can't even live in a major city), quick fixes (diet pills that ruin their health) and of course entertainment (study for rate of return not for Snapple facts).

Good luck gentlemen! Hopefully, this answers the question!

****

Take More Credit for Your Work Legitimately

Take More Credit for Your Work Legitimately

Being a team player is over rated. When you're being told to "do the right thing" it usually means do what is best for the person making that statement. You hear this all the time from poor managers in Companies and you also hear this from your parents. They mean well. The problem is that many times it ends up hurting you more than helping you. If you create a product for example and you quite literally did all of it, you should not allow other people to take credit for your work. This requires a lot of effort as everyone will want to associate with your product to the point that you'll be forced to shut people out. Emails stating people didn't contribute to full on face to face conversations making sure someone doesn't use your product on their website. Being a team player essentially means underselling yourself which will cost you millions of dollars.

5 Basic Pillars for Getting Credit

Before we jump deeper into this topic we're not saying to go and "hurt people" taking credit for their work. Most people think like this and that's the exact reason why they are not successful. When we say you shouldn't be a team player it means that you should take full credit for what you provided and contributed. No overselling, no underselling. The higher you go up the more you'll be asked to "take one for the team" and give credit to people who don't do anything. Even if you jump this step and start your own product, people will still attempt to take more credit (claiming for example that their design is the only reason the product is selling well… even if you have A/B testing proving that it wasn't a meaningful driver of revenue). So before we go further along we're going to say it twice. Do not go out of your way to screw people. Do not go out of your way to screw anyone. All this does is waste your time, decrease your trust and increase your competition. Nothing beneficial.

1) Performance, Not Sabotage:

For anyone in the work force it will resonate loud and clear. Since you want to associate with winners you want to make sure you're contributing (getting your fair share of credit) and that This is a good way of emphasizing the prior paragraph. It is pretty difficult to scale anything with a single person so the other people you add should be contributing a lot as well (and getting their fair share of credit). The nuance in how you are seen as a leader? You want to be the person who was in charge of making the hire. If you and the person you hire contributed 50/50 on a project… Well, you'll get the promotion since you figured out who to hire and correctly got him in the right role. He'll then hire someone to work for him and the scale game begins.

2) Associate with Winners: This is what office politics is all about.*anyone on your team also appears to be a winner.*

On the business front, assuming that you already moved on from being an employee… The game is associating with growth companies. You do not want to associate your company with a company that is considered "passé" and not up and coming. You want to be tied to the winners (surprise!). This then elevates your profile as people are more attracted to what is new and growing versus a sizable business with flat-lined revenue. We're not sure why this is the case psychologically as we'd rather have $1M guaranteed for 20 years, than have an asset growing at 100% but generating $50K a year. But. The game is the game.

If you have been following our blog for a long time, you notice that as soon as a prior fan turns negative on us (usually their life starts going down the drain) we ignore them. Why? We don't want to associate with that negative energy. There is a big difference between fans and employees since you should expect ups and downs in performance from an employee but when it comes to customers/viewers you want to have a hard stance of avoiding engagement. This blog is a great example since we do it visibly. As soon as someone gets upset with the blog or is socially inept to the point that they think the blog "changed"… we cut them off and ignore them.

3) Don't Fix People:

There is a basic psychological reason for this… Customers come and go. Unless you messed up an order (immediately offer something free), it is usually the customer who had their life go in the wrong direction. It's just a simple trend we've noticed. Maybe they are moving in a different direction in life (99.999% of the time it's down particularly if you're still going up in a massive way). So. You're better off searching for people who will like the direction you're currently going in. In fact… We'd apply this to your regular life as well. Don't try to make someone like you in general. If someone doesn't like you there are over 7 billion other people who haven't met you yet. We'll go ahead and wager you'll find too many people within that 7 billion.

One of the most important "business" or even "career" tricks is to avoid sending meaningless messages. Everyone remembers the long email chain that wasted an entire day for some issue that should have been solved in a single one sentence email. This is bad practice not just for your career but your future business as well. If you don't have anything meaningful to say or add… Don't say anything at all. This forces you to become a valuable asset as you *must* have something meaningful to contribute at all times. This is also why smart people don't talk much, they only talk when they have something to actually add.

4) If It Isn't Meaningful Don't Send a Message:

A good example is when you're working on a project and you're asked to "add to the discussion". Essentially you want to wait until you can add something that will allow the project to Unless your contribution is going to make your company (or the company you work for) more money or save them time… it won't be remembered. In addition, if you're creating a traceable history of value added performance. You can point to the emails you send and won't have to go through hundreds of useless emails to track down the ones that matter… Since you don't waste time.

make more money or save everyone time.

This is a quick last item for people who are still working in careers. We've really lost touch with reality in that aspect (having people to report to) but one of the main items to be aware of is consensus building. Even if you do all of the above you can still get killed by not building a "clear consensus". You don't waste time, you generate money, , you don't try to fix broken people and you focus on yourself. Still. You can get burned. Why? Well when you build your consensus of people who approve of you… You're always going to get a negative from someone. This person is simply someone who dislikes you as a person. If there are 12 people in your group who are important, we can all but guarantee at least 2 of them will never give you approval. So. What you need to do is build a consensus around 10 of the 12 and most importantly the final decision maker (whoever that is… i.e. the most important person). This way when the two people see that all 10 approve of you and the most important guy is signing off, they won't be able to say anything without looking foolish.

5) Clear Consensus Building: you associate with winners

5 Areas Where Things Go Wrong

This is the only piece that will reference the office environment (many readers still in this part of their career/life cycle). In short, if a person "two rungs" ahead of you dislikes you… You should leave the firm. This is because the credit you receive will be diluted. Why? Well once everyone in a particular group realize the top guy dislikes you, they will downplay all of your contributions. Most people get frustrated and wonder Well you have your answer. What happens is the rest of the group takes credit for your work and since the last guy in the line does not like you he will believe the consensus that is taking credit for your efforts. This is one of the rare situations where it is almost impossible to fix so you're better off leaving and putting 10x more effort into your side business.

1) Heavy Hitter Disapproval: *"Hey I did all this and made all this money for the firm why am I getting no credit?".*

This is where it gets real nasty. When you start making your own products and selling them you're going to get a lot of band-wagon people. Even if you're outsourcing most of the support work, the outsourcing people will attempt to charge you much more saying their additions represented the actual value. We can't stress this enough: take control of your ads. We've noticed that people attempt to skip the whole copywriting part and outsource it. This almost guarantees their company will be a long-term flop. Why? Well when your support team (outsourced) tries to charge you more… You won't actually know how much value they were adding. You're stuck.

2) Product Development:

The conclusion here? Do your own ad campaign. It doesn't mean that you need to do all of it, but you need to be in charge of the paid traffic. If you're in charge of the paid traffic you can test various ads and see if the person "helping you" is really generating a lot of value. If they try to claim that their additions are improving conversion rates by X%… You can test it yourself and see if that is true. 99.99% of the time you'll find out their full of it. As usual. When this happens you can then ask them to leave or work for the same rate you were paying them since you have proof that the value they add is not a game changer. In a sentence, .

if you lose control of your paid ads, you've lost control of your company

Eventually you'll have to hire someone. We know it's the worst possible process in the world. Would rather pull out your own teeth than work with someone since the chances of picking the correct winner is low. That said, if you're going to create multiple products the only way to maintain control is by running the ads for both products but having a person in charge of the lower selling SKU. For example, and the lower income producing product (25%). This way you're always in charge of the flow.

3) Multiple Products: you'll run the ads for both the cash cow product (75% of revs)

To incentivize the person in the lower selling product you can tie his income to revenue/profit growth of the SKU. He will be in charge of doing everything (including the ads) but you'll be This is an important distinction. If you can still test his ideas against your own ad ideas, you'll see if he's doing a good job with the product or not. Over time, you want to see the lower income producing product generate 30-35% of the total revenue before you can give him a new product line to run with more monetary opportunity. Again. To incentivize him on the next product you do the same thing and include a guaranteed kicker for the project he already completed ($X for the profit of SKU number 2).

in charge of the running of the ads.

Ah yes. The worst part of any business in the world. This is an area where you're . There is a reason why high-end restaurant servers are typically the most fun people to be around (outside of work). This is because customer service is absolutely awful and you need to have the patience of a monk to be "in the zone" every day. Now what's the issue here? Most people spend too little on customer service.

4) Customer Service: *hopefully taking no credit for the work*

Customer service is an area where most people spend little and hire mediocre talent. It's the reverse. Since you know how awful it is, this means there is usually a lot of value by having higher quality customer service. As a rule of thumb you should pay 2x industry rate for your customer service representatives. This makes your product stand out and the "experience" better for all of them. On top of that you don't have to worry about it ever again.

There is no real debate that customer service is better at a fancy restaurant than your local Taco Bell. This is due to pay and the experience level of the person. The same goes for any product be it on the internet or brick and mortar. Pay up, get good customer service and reduce those grey hairs (lower stress).

This is the last area where you want to be an expert. It unlikely matters for 99% of readers but if you end up going down the multiple SKU business route… you want to make sure there are no product holes. Part of your job in an industry (say clothing) where there are multiple products for the same "issue" is keeping up with the competition. In multiple SKU arenas, there is a solution for everything and you want to stay on top of potential trends where two products merge into one.

5) Identify Product Holes:

This sounds vague so we can point out a specific example here. If you offer computer products you have two options: one with very fast processing and one with slow processing. The most obvious example everyone can relate to is a hard disk drive and a solid state drive. When solid state drives became popular (macbooks) the hard disk drive started to die out. During this transition period, there was a time where hybrid offers were available. Technically this competed with both the slower computers and the faster computers. That said, it was a clear product hole that may impact sales on both sides. The important item? Without a hybrid offering you were not able to tell which product the user was most interested in. Fast forward a decade and practically no one is running around with hard disk drives in their laptops.

There are a few key items: 1) always make sure you're given full credit, 2) focus on what matters – being in charge of the revenue line, 3) pay up for things that cannot be scaled easily – customer service, 4) focus on product holes and 5) have an extremely clear trail of value addition via emails while associating with winners. We probably missed a few but you'd be surprised at how many people screw this all up. There are thousands (hundreds of thousands) of people who are more talented than people ahead of them "in the game of life" and we'd argue they break something within this post.

Concluding Remarks:

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality … You'll probably like . The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). Ten Rules for Getting Started in Real Estate

Ten Rules for Getting Started in Real Estate

Thanks to the Wall Street Playboys for allowing to shed a little more light on the real estate game. I've gained quite a bit from their articles and am grateful for the chance to give a little back. Before we begin, I want to clarify that this is written from the perspective of an individual who started out in real estate the "old fashioned" way: working a job and saving up their first down payment. Some of these rules won't apply to institutional investors and those with billion dollar trust funds. If anyone reading is involved in RE investing on an institutional level I'd love to hear their perspective as well.

I've decided to put together a list of rules that you should follow when contemplating getting into RE to begin with and then a few guidelines for looking at your first investment. I don't delve much into actually doing deals and building an RE Investment biz in this post because it would take up too much room. If the WSPs ask me, I could potentially do a second post covering this.

Should You Invest In Real Estate?

1) You be a Jack of All Trades Must

Real estate investing requires a broad base of knowledge, so plan on spending quite a bit of time learning the following skill-sets: : You should be able to manage tenants, contractors, employees and create effective business systems. Most areas of RE investment require a good understanding of the following: property law, landlord-tenant law, contract law, tax law, zoning, codes compliance Etc. Real estate investment generally involves purchasing and maintaining some sort of structure, you should be able to understand, evaluate and to at least some extent repair the different components and systems that compromise a building. As the WSPs say, . RE investment involves quite a bit of selling, from convincing people to lend you money or sell their property, to knowing how to effectively market properties for sale or rent.

1) Managerial2) Legal:3) Technical:4) Sales/Marketing:*you don't want to sell? Too bad*

A lot of the bad advice you'll read online says something to the effect of "If you don't like something, you can just hire somebody to do it!"… Yeah, ok Skippy… In addition to this being wrong in many cases, the people who say this are missing the point. You don't learn how to fix a leaky faucet, write an effective ad or draft an eviction notice so that you're stuck doing it the rest of your life. If you think you can make real money in this business without having to acquire any skills you might as well stop reading now because clearly you've already got it all figured out.

You learn it so when you do reach the point that you can afford to hire someone, you can train them to do it or at least evaluate their work.

2) Choose Areas of Real Estate That Cater to Your Strengths

Though real estate requires a broad base of knowledge, we all have a . To increase your odds of succeeding, figure out which areas of the RE game best utilize yours. Are you "the guy" people call when their popcorn popper stops working? There's plenty of opportunity in fixer-uppers. Do you always read the "terms and conditions" in their entirety when purchasing a new product or service? After getting your head checked, you should consider some of the more legal oriented opportunities like judgement investing or buying properties with title issues.

certain type of intelligence

3) Go Big or Go Home

Learning the skills listed above takes time. A lot of time. It also takes experience and while some skills are transferable from other professions, you inevitably have to learn many things by actually doing them over and over again. With that in mind, though certain areas of real estate can be tackled as a side hustle (some of the more legal oriented strategies come to mind), the more commonly known strategies like flipping, managing income property or RE development are generally full time gigs.

This isn't to say you can't do them part time to start as you certainly can maintain a couple of small income properties while working a full-time job. It's just that there is so much learning and network building required to become a legit RE investor that it doesn't really make sense to put in all that effort just to cap your progress at a few apartment buildings or the occasional flip. If you want to get into one of the more time consuming aspects of the RE game, plan on dedicating a lot of time and scaling up to a point where you become financially independent from it.

Do people go to school for 8 years to become part-time doctors?

4) Everybody Has Advice When it Comes to Real Estate. Ignore it.

I have worked in a few fields, but none compare to real estate when it comes to regular people telling you how it's done. Every knucklehead either knows someone that has "made bank" in real estate, or has done so themselves. These stories take on a few variations from "this house was the best investment I've ever made" (Oh yeah? So you've compared your home's % increase in value to investments in other asset classes during the time you've owned it, making sure to subtract expenses…) to "I just bought a duplex and the rent pays my mortgage" (Don't Get Me Started). The truth is, the vast majority of the money made in real estate isn't due to shrewd investing, it's from boring old market appreciation. The buy high, sell higher crowd that make their money in these situations are the same sheep who get slaughtered as soon as the market turns south. Intelligent investors can hold their own in almost any market.

In short, the only people you should take advice from on RE investing should meet the following criteria: 1) They are financially independent from investing in real estate; 2) They did not inherit it; If you question the second point: There's a guy in my area who inherited hundreds of residential and commercial units from his father. The last time one of my friends saw him he was wearing a backwards, flat brimmed "Monster Energy" hat. Need I say more?..

When You're Ready to Buy

5) Cash is King

The get rich quick gurus that dominate the RE advice biz love to talk about "nothing down" deals. You know why? They know there are a lot of broke clowns out there who are willing to swipe their credit card because they think they can get something for nothing. In the real world, nothing down deals do exist, but they are rare and often aren't a bargain to begin with. Which gets me to my next point:

<u>Cash is king.</u>

Though different investment techniques require differing amounts of cash, the general rule is: the more cash you have on hand, the easier your life will be. If you have a significant down payment, it will not only be easier to get a loan (lower LTV), the seller will take you more seriously. Also, bargain purchases often require quick closings. Applying for a loan, waiting for an appraisal etc is rarely a speedy process… And don't forget to have some of those greenbacks left over after the closing as well, because bills need to be paid and stuff breaks.

<u>I know this first hand as I've lost a deal where a cash buyer paid significantly less than what I was offering with bank financing.</u>

6) Cut Out the Middle Man

I'd be lying if I said real estate agents haven't brought some good deals to my attention. They have. Also, since I'm on good terms with a couple of them (IE: referred them clients that made them $$$) if they are selling a property that they think I'll be interested in, they'll reach out to me before listing it publicly, which is nice (this benefits them as well, since if I buy they can now work both sides of the deal).

Those benefits aside, I think it's usually a good idea for buyers and sellers to deal with each other directly. This is due to: 1) Better communication between parties; 2) Lower transaction costs (don't have to pay agent commission); I can't stress enough how important #1 is. As I've mentioned in my comments on prior posts, real estate can be a very emotional arena and the less direct communication the two parties have the more potential there is for misunderstanding, which can kill deals. Having agents involved turns a real estate sale into a game of telephone which benefits no one (well no one except the agents!)

My actionable advice is: This will help you convince the other party to like you and ideally swing the deal more in your favor ("Aww shucks, he's a nice guy, I guess I can hold a $500k note for him"). Regardless of whether there's an agent involved in the deal, get in direct contact with the other party and get on good terms with them. Don't totally ignore or piss off RE agents as they can be useful, especially in the beginning when you're still learning how RE transactions work.

1) Learn to sell:2) Direct Contact:3) Be Nice to Agents:

7) The Real Money Often Lies in "The Borderlands"

Yeah, you might impress your date if you're walking down 5th Avenue, point out a building and say "Check dat out girl. Alllll mine." But the fact of the matter is, prime properties rarely offer the best returns and though many owners wouldn't admit it, . Ego is a powerful thing… The inverse is true as well. You could buy some beat-to-hell 20 cap on the corner of Skid Row and Mug Street, but then not only are you going to have to earn every cent of that rent money (and then some) managing your property, your prospects for adding value are limited as regardless of how nice you make your building you won't be able to increase rents or attract decent tenants.

<u>are often bought for status rather than pure profit</u>

So with that in mind, often the easiest places to realize a decent return (Double digit cap or close to it) without dodging bullets are The Borderlands. I'd describe these as areas that are generally run down, but show some signs of turnaround. They are usually located near the real bad neighborhoods, but within a reasonable commute to the more desirable areas of town.

Credit to commenter RE Guy for "The Borderlands" term, it articulates perfectly the type of area I'm trying to describe. See his excellent discussion of this concept in the

previous real estate post for more details.

8) Real Bargains Are Tough to Find and Are Rarely Pretty

When you hear words like "foreclosure," "OREO" or "short sale" do you automatically think "bargain?" If you answered "yes" then get your credit card out, because I have a bridge to sell you… What I'm getting at is: properties priced significantly below market value are rare. Just because a property for sale is owned by a bank doesn't mean it's a good deal. Oftentimes it just means it's a POS and this is already reflected in its price being lower than nicer properties for sale in the same area.

For a deal to truly be a bargain it usually has to meet one of the following criteria: 1) Nobody knows about it; 2) There is no market for it (in its current form) 3) There is something about it that scares most buyers away, Where do you find these types of properties? All I'll say is: don't bother asking me in the comments section. (Why give away a business, no one would!)

<u>which can be corrected for a significant amount less than the discount that it's currently selling at…</u>

9) The Numbers Don't Lie

In the RE game it's easy to get irrational, you may have just walked through a beautiful property that you would love to own or you could have heard a trendy new bar or coffee shop is opening up in a particular neighborhood. Maybe you just met a seller and he's willing to give you some sweet financing terms… Regardless of any of this, it's imperative that you run the numbers on a deal. And I don't mean "what the rents might look like once all the nanobrew swilling hipsters with their trust funds move in to live near that bar with the chalkboard drink list that may or may not open up down the street."

I mean what you can rent the place for currently. This doesn't mean you can't factor in increased return (along with the associated costs) due to improvements you plan to make in your hypothetical numbers, you certainly can and should. It's just that you need to stick with known variables, not bank on an uncertain future event to increase your property's value to a point where the numbers make sense. If you do that you're just a speculator, not an investor.

You may ask "how do I know what a property will rent for or what the utilities cost?"… Well, if you're a fool you could take the seller's word for it. But I'd recommend doing the research and learning independently (finding out what utilities cost in your area, how much energy it takes to heat/cool a given amount of sq ft, Etc). Again, these are hypothetical numbers, so you're just trying to get in the ballpark. This becomes far easier as you will have access to data from your existing properties.

once you've done a few deals

10) What's the Best Way to Learn RE? Doing Your First Deal.

Commenter Nixon brought this up when discussing Real Estate in a previous post and it couldn't be more true: The best education you can get is doing your first deal.

I've noticed that there is a loose pattern that most first time investors follow when searching for their first property:

-They figure out the geographic area they want to work with -They establish their ideal criteria for what they want to purchase -They look at a bunch of properties, making a few offers, none of which are accepted -They get frustrated "Why aren't any of these jokers signing on the dotted line?.." -The become fired up and look at a few more properties and make some more aggressive offers, oftentimes bending their initial criteria a bit -Someone finally bites and the have a property under contract -They haggle about small stuff "I need $1000 cash back to fix this AC condenser because the building inspector that I just paid $500 said so." -They may or may not have trouble getting financing "Whaddya mean I can't only put 5% down?" -They close.

Welcome to the Jungle.

Anyway, there is quite a bit to be learned during all of the above steps. So if you're interested in getting started this is generally what I would recommend: 1) Work at your current job until you have enough for a decent down payment all the while studying different RE related topics in your downtime (Law, finance, building trades Etc); 2) Figure out where you want to invest and the logistics surrounding it (if you have to move or not); 3) Do your first deal

Good luck, you'll need it.

The 20 Laws For Online Product Income Success

The 20 Laws For Online Product Income Success

This post is directed 95% towards product sales online (not content based). You can earn an income with content based websites (blogs etc.) and we only touch on it for a second to make sure we hit all the forms of income. To emphasize these laws primarily refer to product websites.

There are two distinct markets. The masses and the rich. If you're looking to make money you have to make a decision on which market you will cater to. The masses will focus on anything that does not require them to do any work and the rich will look for status symbols. This is overly simplistic but it's a good starting point. Trying to target both markets is extremely difficult as they have business models that are largely unrelated (an exception may be the shiny new iPhone). Products that sell to the masses typically have *lower* margins with high volumes while products that sell to the rich have *high* margins with lower volumes.

Law #1 – There Are Two Markets:

If you go down the masses route you're going to sell them with the following tactics: 1) external motivation like Tony Robbins – "Unleash Your Inner Beast with This Product" or "Fire your Boss!", 2) magic pills that will fix their life – "This solution has doctors hoping it will be banned!" (modafinil/provigil is one of the latest fads), 3) minimal work for sudden riches – "work from home and earn $100K tomorrow with no work!" and 4) celebrity endorsements – "XYZ celeb uses it!". The theme here is that they are not responsible for their own actions and there is always some "hack" to getting what they want (without building any skills). When you're selling to the masses do not put anything logical in the sales pitch. Keep it emotional and Sure you can get away with bad products but that just leads to non-recurring income.

Law #2 – Sell the Dream to the Masses: *make sure your product works.*

Get rich by selling them on the status of the item. The product can be largely the same but it needs to be *exclusive*. The best example is black and white balls and other such "filters" for rich people to go and meet. The cost is practically the same just sell those tickets for hundreds of dollars a piece! Another great example is the classic "bottle service" experience. No doubt about it that pricing alcohol 300% above its market value is going to be profitable. Notice, these can be done online, offer exclusive "packages" to people.

Law #3 – Sell the Prestige to the Rich:

There are three primary ways to earn money: Paid Traffic, Niche and Content. Paid traffic requires you to purchase traffic from Facebook/google and more importantly other sources (we can't give you more than that). Niche websites rely on a specific product that has enough "keywords" to generate ~30K views a month (you're selling a product). Content websites have an enormous number of ways to make money (selling books, ads, affiliate partnerships, consulting etc.).

Law #4 – Three Ways to Earn:

It's either on or it is off. There is no "time for money exchange" this is because you're either paying to target a specific group and sending them to a website.. or you're not. This is why you can go from $0 to suddenly making $10,000 in a day (or losing money!). Think of it as a faucet, you turn on the traffic and it converts or it doesn't. Assuming it is converting you must keep the faucet on until it loses money. No customer left behind.

Law #5 – Paid Traffic is a Faucet:

If you're selling a product (niche, not a content website) then you should be able to generate a living wage off of 30K organic visits a month. Assuming you convert at 2% that would be 600 sales. If you're doing 600 sales at just $5 in net income that is $3,000 a month. Sure it is debatable if this is a living wage in a place like New York but you can certainly live in many parts of the world off of a niche site doing $3,000 in net income a month.

Law #6 – ~30K Monthly Views is a Living Wage: *The key here is a 2% conversion rate.*

We don't do content websites (this blog is a hobby) however if you want to do it you must build a full platform. You must build a massive following and never lose their trust. You can then expand your website into multiple directions (consulting, products, affiliate sales, etc.). The only problem with this (and why we avoid it) is you must constantly be "on". Letting a website die will kill the returning visitors. If you go this route it is essentially for life since they are hoping to increase their interactions with you over the long-term. (others can chime in on the long-term strategies here since we don't focus on it).

Law #7 – If You Do Content Build a Brand:

There are millions of products out there that are largely the same. There is no reason to create a product that is vastly different. Take an existing product make a couple of tweaks to the product and kaboom you have a new item to sell. This eliminates the need for a "light bulb" moment. 100% unnecessary for generating income online today. Coke and Pepsi are not that different and the gym equipment you see (45lb plates) are not different (slight change in shape).

Law #8 – You Don't Need to Be New:

If you have a solid product there is no need to make it perfect. We'd take a product that is the 3rd best on the market with the best possible sales and marketing over the #1 product in the market with terrible sales techniques. Logic never sells. Stick with having a clear execution (sales) strategy. Once your product is good you're going to live and die from execution. The worst feeling is when you create the product and someone does it better than you later (after you give up). This has happened before and is a life lesson.

Law #9 – Execution is Everything:

Pretty simple for online sales. There is no reason to have a partner. You can pay someone (a major company) to help you with practically anything you need. without having a partner (ever). Partnerships are only good when you're not making any money and are awful when you start making money "Who's pulling the most weight?". This is human nature, so there is no point in doing partnerships for a basic online venture.

Law #10 – No Partnerships: You can make hundreds of thousands of dollars (even a million)

If you're serious about earning a living online, you cannot have multiple projects running at the same time. It is comparable to pouring water. If you pour water into 100 different swimming pools none of them will be full. The water will evaporate and you'll be stuck with nothing. If you constantly fill one (maybe 2) pools with all the water you have (every single day), you'll see progress and eventually it will be functional. Spreading yourself thin is death in online sales because someone else is going to be 100% focused on that market.

Law #11 – Singular Focus:

Debatable we know… But… We view debt as an . If you are going to take on debt for any venture you should see a positive return in the first month (immediate cash flow). If you borrow at 5% for a venture and don't see a positive return every single month you've made a big, big big mistake. You're going to be eating into your cash flow which will kill your long-term opportunities.

Law #12 – Debt Needs a Return: *immediate return profile*

The last thing you want is to be cash strapped. If you find out that market XYZ is giving you the best return… you want to buy as much traffic from that demographic (There is no exception to this rule (none). You must have cash on hand to throw at the right demographic otherwise you're going to miss out on an opportunity someone else will jump on. , this is like not having money for a deal that you absolutely would love to have. Someone else will find it and buy the asset before you get the chance.

Law #13 – You Need Liquidity: *buy every single one of those users!).*For the Real Estate guys

You need to have a system that tells you if something is going wrong. Lets say you're set up to constantly run traffic while you're sleeping because it is profitable. This is great… Until it goes negative. You do not want to be asleep for 8-10 hours while the traffic is giving you a negative return. Have an alert set up so you'll be immediately woken up if the returns are largely negative for an extended period of time (lets call it 2-4 hours).

Law #14 – Always Available:

There is a never ending supply of fools in the world. The saying is a fool is born every minute but after years of seeing terrible (shady) campaigns work… We're increasing that to every second. Those emails that say a "nigerian prince" is ready to send you money… They work! Yes people are still fooled by spam even in 2017. It's amazing but true and we should never underestimate the number of fools in the world.

Law #15 – A Fool is Born Every *Second*:

Keep a soft touch relationship with anyone who can help you. While we recommend going solo, you'll have questions and if you pay someone for the answer (and it works) you should keep that person in your phone forever. Continue to do this for years upon years. Never under any circumstances do you waste their time. A simple hey how is it going 1x a month is more than enough.

Law #16 – Always Build Contacts:

The vast majority of people are risk averse. As an example, people are "scared" to like our current Facebook page even though we get 2 million visitors a year. That is quite a lot for a hobby blog and we have no doubt every single reader is less than 2 handshakes away from someone else who has read or seen this blog. What does this mean? If someone is risk averse but has a bunch of skills you need, you just pay for his skills… There are many people who get rich that are not bright, they just hire people smarter than them to do what they cannot do.

Law #17 – You Don't Need to Be "Smart": It means if people have a risk tolerance that is extremely low, the number of people willing to become Entrepreneurs is extremely low as well!

The one thing that we've seen in common with people who earn a living online? They hate losing their freedom. Many people who make money online will say they would rather earn $40K alone online than earn $200K in a corporate job. This may be some sort of personality disorder but it is a personality trait we have noticed. People will walk away from a career that pays more in exchange for their freedom.

Law #18 – : You Will Hate Loss of FreedomThey are not lying.

It costs about $50K to start your own item. That's our own rule for keeping cash in a checking account at all times. We're not sure what industry you're looking to crack into, but… We've found around $50K is enough to go into a new direction. Under no circumstances do you put yourself into a position where $50K is not readily available in liquid cold hard cash (no revolver no nothing).

Law #19 – The $50K Rule:

No one will be happy for you. If you make $200K a year in a corporate position people will be jealous. If you make $200K a year working off your laptop? They will hate you. In the first position they can laugh behind your back and say "you're still being told what to do". In the second position… They will loathe you and hope you will fail. Live off that energy!

Law #20 – Everyone Will Hate You:

Concluding Remarks

If we were to outline the most important items here it would be as follows: 1) if you are earning money you buy all of the traffic from the demographic until you have tapped it out, no sleep for you if it's pouring in, 2) choose your demographic be it the masses or the rich, 3) niche sites are ideal for people looking to learn the basics, 4) do not work with anyone, partnerships end in tears, 5) you don't need to be smart and 6) always have $50K in cold hard cash to go into a new venture.

****

The Best Forms of Passive and Semi-Passive Income

The Best Forms of Passive and Semi-Passive Income

To start, *pure* passive income simply means "you are rich". The only way to earn income without doing a thing (ever) is by having a large sum of money. The good news? There are hundreds of other ways to earn income in both a semi-passive or passive way. Specifically, you can create semi-passive streams that tail off, you can invest in higher risk passive income that *may* generate a return well in excess of inflation and you can always work part time to generate "semi passive" income. Below is an outline of streams of income (what we view as best to worst).

Semi-Passive Income

This is the best form of semi-passive income. It means you have a website that *does not need to be updated*! Now we have to repeat that phrase. You create and set up a website that sells a product and If it needs to be updated then it's not longer in the tier one semi-passive income segment.

A Landing Page with No Updates: *does not need to be updated*.

Any website that sells a product that does not require updating could include anything from: vapes, electronic cigarettes, retail clothing, protein powder, cosmetics, jewelry etc. Quite literally anything where you go to a website and the same products are being sold day in and day out. Importantly, the reason why this is the best form of passive income is because of the

return profile.

Roughly speaking say it takes about a year to get enough traffic to earn $2,000 a month. This may not seem like much, however, if it only took a year to get done correctly you're now getting $24,000 a year or the same value as having $600,000 (in a single year!). If you create two of these you can now focus on bigger ventures. This is the primary reason why we recommend online sales as a starting point. If you can just create two of them you're now free to build something more meaningful and have the money to both live on your own or reinvest the money into paid traffic to a more important venture (important ventures are not semi-passive income as you'll be grinding away to get past plateaus). In short, a landing page that converts is your best form of semi-passive income.

While we prefer having other people manage rental properties for us, there is money in this game as well. If you want to become a landlord you're going to be forced to commit time (interviewing new tenants, repairs etc.). This means it's not quite passive income but the time spent can be *leveraged*. This is a key part of this semi-passive income stream. If you own properties with a high cap rate (meaning annual rental income over value of asset) then you can obtain some leverage to boost the returns. This is secondary to landing pages for a key reason…

Management Income: *If you go down this route use the static income to cover the cost of the mortgage payments by 2x.*

Lets assume you have $4,000 a month in semi-passive/passive income. This means you can take on a mortgage payment of around $2,000 a month (we take a conservative stance and assume your $2,000 payment includes everything). To keep everything simple, this means you can put $80,000 down to obtain $400,000 in real estate value. Assuming your interest rate on the debt is around 4%, your payment is going to hit right around $2,000 a month (we include home owners insurance, taxes and some wiggle room for repairs in this $2,000 estimate). Now you can sleep well knowing your payments are protected and can look for the best possible tenant giving up a few bucks (slightly lower rental income) for a stable semi-passive stream of income.

Yes you can make some money from blogs, but the real money is in . We are including this as a form of semi-passive income because we're sure everyone visits at least one website with updated information not classified as a blog. Let use as an example. Now certainly, no one here is wasting their time clipping coupons. But. Remember that there is a LOT OF MONEY in selling to the masses (hence why motivational seminars always work! Never ending supply of always broke dudes looking to get "amped up!" or "fired up!" or "Hyped!!"). The masses are always looking for ways to cut costs, so you can offer a website that does just that (like the coupons website).

Updated Information Websites: *paid traffic product websites*Coupons.com

Another good example of information based websites is credit card offerings or something like million mile secrets. No one wants to actually do the work and they correctly advertise with the slogan "Big miles. ". This barely makes our semi-passive stream since there is a lot of updating here. It is possible to run a smaller scale website like this without working a 40 hours per week. (not easy but doable).

Small Money

Return Based Passive Income

Now we're moving onto pure passive income. All of these forms of passive income will not require you to do anything. We'll ignore you being forced to set it up (less than 4 hours) and assume that you do absolutely nothing going forward. There are many many ways to make money if you have money and that's a good thing. The reason why this segment is separated out is you should be willing to lose some money if things go south. This is called "higher risk return" passive income versus "risk free" passive income. There is an important distinction because the return profile is higher and you shouldn't bank on 100% of it being stable every single year.

Now the difference here is you're handing over the keys. Unlike the management income where you do it yourself you're going to outsource everything. You throw money at the property and hand the keys over to someone else to deal with it. This is not a risk-free situation given 1) potential debt load, 2) trust in property manager, 3) interest rate environment and 4) any one time hazard/maintenance issue that kills your yield for the year. We peg a solid return at . This includes a management company eating into your yield and of course the natural reserve fund for any maintenance issues.

Owning Properties, REITs and Private Equity Real Estate: *somewhere around 6-9%*

The second option is a REIT which certainly has risk associated to it. While they do offer high yields (distributing 90% of earnings to shareholders), the REIT is exposed to 1) tax rate changes – you're taxed based on your personal income bracket vs. dividend distribution rate, 2) reliance on debt, meaning more leverage is needed to boost returns, 3) real estate can be extremely location dependent and is prone to cycles just like we saw in 2008 and 4) since it's an equity product and as a shareholder, we have to realize they can only re-invest 10% of net income since the rest is being distributed. Take a look at REITs and you'll see they move around in ways un-related to the stock market.

The third option is working through a private equity firm such as a Blackstone, Lone Star or Brookfield. You're locking up your money for a longer period of time (typically) but the returns should be notably higher as well (double digits). Now there is certainly a wide range of private equity transactions from low to extremely high risk… But. Locking the money up for longer periods of time is generally the theme here. Unless you're in the Ultra Rich group, it's one of your best bets to get exposure to).

commercial real estate (apartment buildings, offices etc.

Overall, we'd say if you looked at this group in aggregate shooting for high single digit to low double digit returns is doable with the right background research. Many people make a handsome living in the real estate industry (there are even executives who read this blog and have emailed us!) and there is a clear reason for it.

If you know your industry extremely well, you can start dabbling into higher risk bonds. We wouldn't recommend going into the low end of junk bond territory unless you're extremely savvy but you can begin looking at items with a yield closer to the BB range. We'd emphasize that high yield bonds are for a special type of person 1) a person who is looking for additional yield given that they are or 2) a person with significant domain expertise that knows the industry's cash flow dynamics like the back of his hand. If you're in one of these two positions you can find yields that are around 6-8% or so (sometimes even 10% if you're extremely savvy and know the space well!). Importantly, our view is to wait on this one since rates are likely going up a few more times, but it is good to get your hands into the mix now to figure out which corporate bonds are good investment vehicles.

High Yield Bonds: *already financially independent*

This is another interesting one since the risk profile is not well understood today. You're essentially lending to other consumers or you're piling in your money with other smaller scale investors into specific projects. This is a hot topic today given the advancements in social networks and trust amongst strangers online. The key to this investment vehicle is you're making a call on the risk profile of the investment vehicle versus the printed sticker return. If the return is the same as a high quality corporate bond the only thing setting your idea apart is the assumed risk (a clear example would be Lending Club).

Crowd Sourcing and Peer to Peer Lending:

The basic items include: car loans, mortgages and credit card debt. You're essentially acting as the bank and again, we think the real differentiator is the spread on the assumed risk you're taking on. The yields are somewhere in the mid-high single digits.

The last bucket is another one for long-term investors that we have already spoken about in the past. Buying index funds that mirror the S&P 500 (ticker: VOO) or dividend yielding stocks (ticker VYM). You're taking a long-term view and are willing to take the sharp downturns during an equity market pull back. The main risk here isn't that the stock market will stop going up over the long-term… the real risk is emotional distortion when the selling begins. The vast majority do not understand what it means to invest in an index fund as you're assigning equal weight to the same old set of 500 companies. To explain this in extremely basic terms "The answer is of course not. Sure companies move in and out of the S&P 500 but everyone should see the point, with more money in this strategy the downturns will be more severe. Related:

Dividend Paying Stocks and the S&P 500: *If everyone decides to buy the same 500 companies every month is that an efficient market?"*. Explaining The Warren Buffet Passive vs Active Bet

Protection Based Passive Income

This is the most basic form of protection based Passive income. Specifically, protection based passive income means you're only protecting the principal values (more or less). If you generate a low single digit yield of 3-4% or so, you're essentially getting nothing back once the year is done. You're taxed at your normal tax rate and on top of that you have to strip out inflation of somewhere around 2% per year or so. We don't think inflation is that low (1-2%) so we'll go ahead and say all 3-4% of it just goes to stave off inflation. Boring stuff guys. This is to be used for asset protection. Instead of putting money into a savings or checking account where the value is being eaten up by inflation every year, you can throw that safety net amount into government bonds instead.

Government Bonds: *No we don't own these today.*

Now in theory, many of you read the prior paragraph and said "well buying TIPs will protect me the best from inflation" this is certainly fair in practice. The problem is the long-term view on allowing an instrument to be pegged to what the government says inflation will be! Since we don't even believe the current inflation estimates we wonder if the future adjustments to inflation numbers every single year will really make any sense. If you're interested in protecting assets and have a more positive view on the assumed rates of inflation on a year to year basis then these instruments may be useful for you (ticker: TIP).

Treasury Inflation Protected Securities (TIPs): *No we don't own these today.*

A whopping 2% return! Honestly that is where the higher end CD rates are and if you want to track them yourself then you can check out they have a solid overview of the interest rates. Notably, the of CDs is your ability to stagger. This means you set aside one chunk of money, lets say one 5-year CD at 2% and then every year you buy the same one. This way once you've done this four times, you're constantly getting back the investment and the return as a safety precaution. This means once you have a healthy financial portfolio you have about 2 years worth of income earning a small return but peace of mind that every single year you can take a 6-month living expense hit and not worry about it. We think this is an extreme safety precaution and it can be done with much less in a money market account.

Certificate of Deposit:bankrate.com*one benefitWe do stagger CDs at a rate of 4 months of annual income expenses.*

If you're not ready to set aside 2-years worth of income like a pack rat then you can also go down the money market angle. gives a solid overview of the money market options and also provides basic overviews of credit cards, mortgages, loans and insurance. We don't operate with a money market account but we'd use this as a “worst case scenario” area for safety. If you’re in this camp, 3-months of savings is likely good enough because you should be reinvesting thousands upon thousands of dollars into your real business.

Money Market Accounts: Nerdwallet.com

Concluding Remarks

Your entire net worth and income stream is no different than a sales funnel or building a pyramid. We’ll say it once and we’ll say it again. You’re either building someone else’s dreams or you’re building your own. With that you should be looking at the framework as follows:

1) You and put every cent into making it grow whenever you see a risk reward opportunity that favors you

build a business

2) During your free time you build a few landing pages to sell products that are known to be high quality and get them to generate a few thousand dollars a month

3) If you struggle to do step 2, move to a managerial or information based product where you’re constantly updating, it’s a grind but all the money is being invested in item 1 where you’re looking to buy traffic

4) With excess money flowing in, start building out a recurring income portfolio of “return based” passive income. We have no major preference at this time (we used to prefer dollar cost averaging) between the four items but we do recommend a mix of at least two of the ideas

5) Depending on your risk profile look at protecting a couple of years of income by investing into low risk passive income items.

There you have it every important as it relates to passive income into a single post.

****

The Brutal Truth About Friends

The Brutal Truth About Friends

Everyone is trying to show the good side of their life. On Instagram people will take hundreds of photos in the exact same location and place the one out of 700 that match their “perfect life image”. It is a joke.

The truth about friends is really simple. If you have more than 5 tier one friends you are a very rich man/woman and should go to sleep with a smile on your face every single day. We repeat. Every single day. Why? A “real” friend is someone you have known for at least 5-10 years, does not waste your time and consistently looks to improve himself (also a millionaire or better). Good luck!

With the harsh backdrop out of the way here is how we look at friendships. Feel free to disagree.

Tier 1 – A “Real Friend”

No different than a ranking system in a Company, your friends should also have tiers. This is not sunshine and rainbows. If someone can be your “bestie” in less than 9 months we all know you’ve burned hundreds of bridges in the past. A smart person will take mental note and realize that you may not be the best person to spend time with.

It is called having high standards.

Anyone worth knowing is not going to spend every single weekend hanging out with the same person. In fact, a tier one friend will unlikely talk to you every single day and once a week is more than enough. We are being extremely loose with this definition and would say once every two weeks is probably more than enough as well.

1) A Tier 1 Friend is Busy:

Why? Simple. Anyone who is dedicated to being the best person they can be is not going to spend his time drinking with you at Starbucks everyday debating the meaning of “life”. This is what hippies do and if you’ve seen a hippie you sure as hell do not want to end up like them.

A real friend does not have time to console you every single day and is too busy to ever do such a thing. This is a positive. If you’re interested in becoming “the best you” (cliche we know) then you’re not going to have time for this either. Both of you are on the same page and realize Most will be severely disappointed.

In Short: *“when we all die we get to meet the best person we could have become.”*

A smart person knows his words should have weight. This does not mean your message should be “perfect”. We live in a world where nit-pickers will be looking for you to “slip” on 140 character tweets (no joke people do this!). However. A good friend is more than happy to have your back (you will have his as well) in any battle of *reputation*.

2) Doesn’t Force You to Bend Your Credibility:

A great example is when someone challenges your friend’s knowledge base. We’ve laughed extremely hard when we see people arguing over fitness and we are 100% certain that one of them is a top 5% athlete in the United States. It is a joke!

This is extremely similar to running a business. Your Company is your reputation. As they say you can replace the CEO with a man who has a stellar reputation and suddenly the Company’s image will change.

A tier one friend has enough personal information about you to have your back. In addition, you will *never* put *their* reputation at risk. The best way to do this is to prove your credentials to them through multiple sources before making claims. As they say

In Short: *“If you’re good at something, others will say it for you”.*

In order to be a tier one friend,No exceptions. Elitist? Yes. Reality? Yep. Pretty simple reason as well. If you are rich and your friend is rich…

3) Must Be Financially Successful: they must be a millionaire. You don’t need each other.

If a person is 1) financially independent, 2) does not work in the same industry as you and 3) consistently tries to improve his/her life… You’ve met a 0.5%er. You have read that correctly. Not 1% but less than one half of one percent or ~1.5 million out of the ~300M people in the United States [Yes we know the population is now about 330M you nit-pickers! We know you're reading!]

It is extremely difficult for someone to break into the tier one friend arena. It should be. If you are financially well off, physically in great shape and consistently improve your own life… You're well into the 0.5%.

In Short:

Why is the filter so harsh on finances? Simple, if you're rich …

You will not know if people are interested in you or if they are parasites.

That is the real reason why it is "lonely at the top". Fortunately, it is better to have a handful of friends and be at the top, than be at the bottom.

4) Will Shut You Down (Keeping You Honest):

Second chances are for people who have no options. If your girlfriend/boyfriend cheats on you and you do not leave immediately you're an idiot and have low self esteem.

A loser.

A friend is no different. If they make off color remarks and people are too brain-dead to see the point of the remarks, you step in and explain it. However. If your friend ever backstabs you or forces you to lie… You leave forever. It goes both ways. A real friend is not going to have your back when you are dead wrong. Differing opinions and deceit are certainly not the same and a bright person will know the difference.

we will butcher the quote, . See there's an example of a mistake (joke).

As a friend of ours says, *"You can look past a mistake, you can't look past a character flaw"– Mike Cernovich*

A friend is not willing to lie for you when you've shown material character flaws and second chances are for people who have no options. You should be rewarded for *not needing* a second chance in the first place. Don't surround yourself with "yes men" because they will be the first to ditch you when your company has a bad quarter.

In Short:

You can be a narcissist () and you can be a prima-donna but you absolutely cannot ask for other people to solve your problems. If that sentence appears to be contradictory the distinction is subtle. You can make noise, be boisterous, be aggressive but you cannot *ask for other people to solve your problems*. Some people are extremely extroverted at all times but the one thing they do? They solve their own problems.

5) No Complaining: we are admittedly narcissists!

If you want to to live life that fast lane life to the top… You better be prepared to change *a lot* of tires.

Notice. This is exactly why a good friend will *not* work in the same business line as you. If you end up competing with one another or being forced to work together the tension will rise since both of you are incredibly aggressive individuals.

The difference between a complaint and a hilarious loudmouth is simple. Follow their actions. If they talk on the phone all day about their frustrations and do nothing about it… Throw the phone number into the garbage. If the person goes off once and a while about the problems he's solving and tells you *how he solved it* about three months later… Save the number carefully into your rolodex.

In Short:

Summary of Tier 1:

Exhausted yet? This is the baseline for having a friend be anywhere near the tier one category. It is up to everyone reading this post to decide where their standards are but these are ours. We do not trust individuals who are not millionaires. We do not lie for our friends (vice versa). We do not talk to our close friends daily. We do not enlist "yes men". Finally, we do not have tolerance for complaints while we are more than happy to enlist prima-donnas.

Pro-Tip: You will find that average people will call extremely successful people "cocky or arrogant". This is because they have no idea what it takes to win and they go into battles thinking they are going to lose (loser belief system). As long as other successful people view you as extremely competitive (not arrogant) you have balanced the see-saw appropriately.

Tier 2 Friends

Many many people will end up living in this area for long periods of time. The real hurdles to overcome are 1) finances, 2) watching the ups and downs and 3) time. From a historical stand point, over the course of 10 years you will watch a Tier 2 friend go through both a terrible failure and an amazing success. If he/she is running on all cylinders for 10+ years straight he's going to both crash and burn and win one of those races no doubt. You'll see their responses and get ready for the fireworks!

A positive mindset is not going to make you rich. Sorry. If you think happy go lucky thoughts all of the time no one is going to pay you a dime.

1) The Financial Makings of a Winner:

A future financial winner is going to do two things: 1) Solve problems aggressively and 2) learn to sell.

If you can solve problems and sell there is practically no way you will be broke for a decade. The problem?

You will be extremely *inefficient*! (our favorite topic by FAR is efficiency).

If you or someone you know appears to have the makings of a winner then your only goal is to help improve their efficiency with your knowledge! After providing basic advice their skill-set should soar and they will clear the financial hurdle in a hurry. Oh. By the way? They will go through a binge drinking/drug/partying spout just like you did when you made your first million dollars. You did it as well so don't be a hater!

From a financial perspective, if a person is smart and knows how to sell and solve problems… he will eventually succeed. You can bet on it. The main difference is the person will lack efficiency wasting hundreds of hours of time. This is exactly why older men and women tend to work less but their time spent is extremely efficient.

In Short:

You will learn a lot. Both the good and bad about someone as they go through a full up cycle and a full down cycle. You will not know what type of person they are until you see a full cycle. Some individuals go completely silent in a down cycle and ignore the rest of their life until the problem is solved (business issue, career issue or an other personal issue). Others will start networking… So on and so forth.

2) Watching the Volatility:

The real key in watching a volatile "full cycle" is simple… Do they reveal any materially negative character flaws? If the answer is no then you've met a 0.5%er. We all have negative personality traits, but a character flaw is not fixable. Never has been and never will be.

A full cycle, something that feels like rock bottom and something that feels like being "king of the world" will give you a full glimpse of their personality. From bottom to top you'll find many good and bad personality traits but if there are no material walk-away character flaws… You're good to go.

In Short:

We strongly suggest you look for a handful of friends when you're young and in your 20s. Why? You've given yourself enough time to build a meaningful friendship. *And*. You will both be extremely busy since

3) Time: you've just graduated College.

Time is an important aspect of life. You don't get it back. Similar to health you cannot buy health and you cannot buy time. Yes you can buy the best *healthcare* but you cannot buy the time wasted getting said healthcare due to bad health! Health and Time always defeat money which is why 10 years is an enormous amount of time spent with a single person (albeit sporadic).

In Short:

Summary of Tier 2

There is not much of a difference between Tier 1 and Tier 2 to be honest. Finding people who can be added to tier two is really the most difficult part of the process. Notably, the people in tier 2 certainly do not need to be the same age as you. It is almost easier to find a younger person who has similar qualities as you, help them with their inefficiencies in navigating life and create a friend that way. Hence the whole reason to give back (to future successful people only of course).

Tier 3 – Search Process

Finding a good friend is about as likely as finding a good spouse. Now that you're done laughing you'll realize the dire odds of finding people who fit the bill.

We don't even have a solution here to be perfectly honest and if someone has a good way to filter we're all ears. Here's a high level suggestion (a terrible one at best)

– Hang out in the expensive part of town. While many people are certainly there to be *seen* you'll eventually learn how to spot people who live in the area and distinguish them from visitors

– Assume success for the first thirty minutes. Many successful people are not great with first impressions if they've had a long day running a company or selling xyz all day long. Once you've gotten a feel for their knowledge base hit them with the tried and true "Hey i know nothing about this can you tell me about it". Make sure you are a top 5% expert on the topic and you'll see if he's a liar. ().

typical hedge fund move we know!

– Ignore emotions and word choice. Easier said than done. You're much better off looking at the *actions* of the person than anything that is said. Why? Most people who stab you in the back will happily tell you to your face "This is why we get along so well! (smile)". Typically they are about to throw you under the bus. Hard.

– Act 5-10% dumber than the people that are around you.

Acting dumb to get ahead is real.

****

The Declining Value of Money

The Declining Value of Money

One of the main items we attempt to portray here is that there is an actual decline in utility when it comes to money. We definitely don't agree with mainstream advice that "utility" ends at $70,000 a year. But. There is definitely a line. We'll walk through multiple ways to use money. Up front we'll give you our two benchmarks for being "set" and emphasize that this assumes you are single (no family). It also assumes that you can be in a relationship or you can be a perpetual bachelor, in either case, the numbers are roughly the same.

There is no hard answer here but in terms of 2018 dollars we'll throw out two metrics: 1) $15,000 a month and 2) $7,000 a month in disposable income (). Why is there a huge drop off in the second one? Well the second one assumes you are significantly younger and the first one assumes that you are in your mid 30s or later. You'd think that the numbers should be similar… Yet… they are not. . While going and partying in college bars is great when you're 21, doing the same thing at age 40 just isn't going to cut it (walking around on sticky floors isn't on the agenda). This also makes a lot of logical sense when you think about the transfer of status. Even if you're able to spend $20,000+ a month and are under age 25… the return still doesn't work out. The only place it would help is probably Las Vegas. Otherwise? You're better off just going to the young/hyped places instead of the upscale bars/lounges.

Where Does Utility Drop Off? excludes rentThis is because "utility" changes as you get older

The other alarming thing to notice is the amount of spending power you'll need in a short decade. We all know the guys who spent their 20s doing nothing but partying… they end up struggling by mid-to-late 30s or so. This is because they were unable to evolve and social Darwinism catches up. It is ugly to watch. The last thing we'll say on this topic is to remember that the numbers always reflect living in a high cost tier 1 city (, Miami, Los Angeles etc.). A common spending number for single guys living a great life in these cities is around $10,000, so if you're at $15,000 you're probably older and if you're at $7,000 or less you're generally younger.

New York

Why the big change in a decade? There is no real answer but we'll give a few explanations. From a dating perspective no half way intelligent attractive woman wants to date a guy trapped in the "good old college age". From a health perspective you're going to distain low quality beers, alcohol and food. From a living point of view you won't enjoy noisy places and commuting. And. Traveling on 8 hour flights in economy is going to give you nightmares. These are some big items that change over the course of a decade since your body can take immense amounts of punishment from 18-25. Doing the same at age 35-40 is just not going to make a lot of sense.

Overview

We'll start from the bottom and work our way up in terms of expenses. When you're 20-25 you can eat practically anything with no real impact to your body. We can remember eating instant ramen noodles, low quality burgers and fries along with high amounts of pasta. This was due to a high metabolism and lower quality taste buds (yes your taste buds changes over time!). If we tried to do any of that today it would result in a painful day of feeling awful and sleeping horribly. Long-story short, you're not going to be eating garbage past age 25 or so.

Food Costs:

What does this cost? It costs at least a few hundred dollars a month extra. If you're a busy person (you should be) you'll be buying juices in airports, ordering the salmon instead of the burger and drinking tons of water. It also impacts the type of alcohol you will be drinking. The days of drinking "jungle juice" and vodka out of a plastic bottle are long-gone (okay no one drinks the plastic vodka we hope). This quickly turns into: Champagne, wine and high end vodka. There is a range here depending on your tastes (could be whiskey for example) but the point stands. The major difference is going to be the quality of food/drinks.

Another major change over the course of a decade. Going to grab drinks at a local bar just isn't going to cut it anymore. When you're young you can get away with stuff such as drinking wine on the beach, a basic Italian restaurant and bars in general. When you're past 35 or so this is just not going to be congruent anymore. Nothing sadder than a guy who has to "think about" going to eat sushi for dinner when the total cost is only going to be $75 or so per person.

Venues and Dates:

A more standard expectation (your own expectation as well!) should be ~$100 a person for any sort of date/going out to eat set up. This is pretty standard as you'd expect to spend around $50-60 for food and another $20 for a drink + the tip (rough math). Since eating low quality food would make you sick anyway, there is no reason to cut corners when going out on a date or with friends. Roughly speaking, this should result in an increase of about $100 a night. When you're simply partying at college bars, the bill for food was coming in at around $50 a person since you didn't really worry about the high quality food.

This is surprisingly bigger than venues and dates. Traveling on red-eye flights are essentially impossible. Going in economy for flights over 5 hours or so is "questionable" at best. Staying at "cheap" hotels is not on the list either. This is going to add up quickly. Before, it was possible to drink a ton, get on a red eye flight and still feel completely fine. Something happens along the way and suddenly this just isn't going to work out. Luckily, when you sleep on a lay-flat bed, you feel rested so the additional cost is well worth gaining the extra day (it isn't even close to be honest).

Travel:

So how does this add up? It means your cost on long-distance flights goes up by around $800 at least. If you're doing extremely long distance flights (9 hours or so) the cost of that ticket is going to be up at least $4,000. Naturally this won't be a common occurrence but it still adds up anyway. For those that plan on travelling a lot we'll go ahead and give the main items out: 1) if there is no direct flight always make the first leg as long as possible, meaning the second leg should be short. Shorter flights typically have more daily flights so if there is a delay you'll still make it, 2) unless it is a lay flat bed there is no point in booking business/first class, the larger seat doesn't do much for you in terms of rest unless you can go horizontal or extremely close to horizontal and 3) unless it is for a vacation, you want to stick with direct flights. Direct flights allow you to save time and is worth the pain. Only avoid them if it is a red-eye.

Generally speaking, we think there is a large movement towards experiences/services over materialism. Now if you're in the $100M+ net worth territory all of these status goods come back in play. Either way. The point is the same. When you move up the socio-economic ladder you're going to find yourself spending a lot more disposable income on services and experiences which will range from massages/high-end gyms to better tickets at the next Knicks game (alright they are awful still but you get the point).

Services and Experiences:

Looking at the decade, "services" have no real meaning and then accelerate. Services in your early 20s consists of some ride sharing service, low end gym and maybe some laundry (that's about it). Fast forward and suddenly you're looking at some big changes: 1) blood work – anti aging protocol, 2) laundry consistently for dry cleaning, 3) some sort of cleaning/maid service, 4) massages – muscle protection protocol and 5) an upgraded gym. Adding the costs up, you're going to see an increase of around $1,000 or so (rough math). The good news is that most of these items will either improve your health (much more important than money) and save you a lot of time which will be used to generate more money than the cost of the service. A strange inflection point should occur here where you're making so much that your savings rate goes up without changing your life at all.

The final big item to be aware of, housing. You can get away with roommates until around age 25 (stretching it) and after that it becomes difficult. Must get your own place. We're not sure how each individual will make their choice but they have two options: 1) smaller pad with more amenities, 2) much larger pad where you're expected to host parties. We have a preference for option number one as it allow you to travel more. But. We also know several people who hate the airport and prefer throwing house parties more consistently (avoids the grind of going out consistently).

Housing:

This is the largest expense change by a country mile. This is also why we left it *out* of the total disposable income piece. It's going to determine how much you need since you don't want to have an unaffordable mortgage. We were going to put our own view on how much you should spend but decided to leave it out. There are too many moving parts: 1) if you live in a nice condo does your apartment come with a gym/sauna etc, 2) are you living further away from nightlife and intend on having a house with a large yard, 3) are you willing to pay up for monthly cleaning services on a house even if it costs more than the apartment, 4) will you be traveling a lot requiring a place closer to an airport (30 minutes away) and 5) how much noise can you tolerate changing the apartment floor level needed. Too many items to cover (we didn't even touch taxes) that will swing this number a lot.

Dollars

Now that we've covered all the major items that will change in a decade we're going to write out the dollar amount and utility level. This is entirely subjective. It's fun though as you can see a rough change in the "slope" of the utility. At the end of the day, money does increase utility even past $15,000/month, it just tails off.

Mapping Out the Changes:

At this point you're simply getting by. We give this utility value a 2.0. It should not feel like a good life since you're essentially paying the bills and doing your basic routine to essentially survive. A typical budget essentially has: 1) uber, 2) phone, 3) gym, 4) rare going out experiences and 5) one basic low level vacation a year. Sure beats living paycheck to paycheck, but it feels like treading water which isn't exciting.

$3,000 a Month:

There is a pretty big inflection here and we'd raise this all the way up to a 5.0. It means you can now plan for an international vacation easily, your gym can be upgraded and you're not worried about the bill when you go to a decent restaurant here and there. You can't close your eyes and buy everything but the feeling of "treading" water has left and you feel like you're moving in a positive direction. Mentally a good place knowing you can spend this every month with little worries.

$5,500 a Month:

The inflection continues and we'd raise this to 9.0. You'd think that the increase in utility would be weaker but there is a psychological benefit to being able to spend this much with no worries. We emphasize that this spending assumes your savings rate has not taken a hit, in fact, each time you jump up in utility the savings rate should go up if you're operating appropriately. In this general ball park you have everything you need in terms of spending and you only scratch your head on the big items like first class flights and other one-time expenses that are large. Many people would be thrilled at this level and don't feel a need to spend a penny more.

$8,000 a Month:

There is utility to gain but it is no longer a big move, we'll give this 11.0 points. The main thing that fades away is "one-time" charge concerns. This means those first class tickets are bought. The upgrades are not even a concern and you likely have a material possession that fits your personality (watch or car etc.)

$12,000 a Month:

This is the last significant move in utility and it only goes up a full point or under 10%! Here you essentially have everything you need. The additional increases are for chasing unnecessary items like a net-jets account or a Lamborghini. The odd thing about this spending range is that the only items out of reach are serious material items. Suits, watches, premium cars are all easily attainable but the "excess" or "super" version of each are out of reach. We're not sure what the ultra rich would think about this level but we're here to say that the move from ~$8,000 to $15,000 a month certainly sees lower increases in utility (unless you've got a drug problem). Essentially the curve looks a bit like an S as seen below.

$15,000+ a Month:

Now with that out of the way, where does the decline in utility occur for you guys?

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality … You'll probably like . The Definitive Guide to Doing the Opposite

The Definitive Guide to Doing the Opposite

In our year end blog review we explained that the best move on New Years Eve is to stay in. New Years Eve celebrations consist of nothing but the Junior Varsity crowd getting sloppy drunk at overpriced venues for $300 a head. It is a waste of time. This has been a consistent theme on this blog "do the opposite" and we're going to go through a large number of examples below. From small to large.

Small Examples

If you're new in town and want to find a good date venue then you should try a few restaurants… Solo. Most people are too insecure to do this and will unlikely read past the sentence we just wrote. If you've passed that piece and are willing to do so… Everyone sits around waiting for the check to come to throw in their "double the tax" tip and don't even think about trying to have an "image" at the restaurant. Do the opposite. Throw down a 40% tip before you even start eating and joke with the waiter () that you are making sure he doesn't blow you up when you bring dates in next time. He won't know if you're joking about this or if you're using self-deprecating humor. You'll show up with a date next time of course.

Example 1 – Tipping at Restaurants: Here's the trick. Tip before service.*note: not waitress since she will think you are hitting on her*

If you know of a few popular venues that have the type of women you like, then it makes sense to develop an "image" at the club (notice a trend?). This will range from the bouncers to the bartenders to the actual club/bar owner. Everyone else tries to grease the bouncer $20 just to get into the door with 2-3 other “bros” and ruin the club environment inside. Do not do this. If you are new in town, show up solo and have a good time. Develop rapport with the door guy a couple times during the night on small breaks chatting with him and other girls in the area. When the night is winding down tell him it was great to meet him (use his name of course) and slip him some cash on your way into a cab/uber.

Example 2 – Greasing the Bouncer: Here’s the trick. Grease the bouncer when you leave.

This is an obvious one to the long-term readers of this blog. If you’re running around trying to pay for bar/dinner tabs with credit cards to earn 1-2% reward dollar points you’re losing out big time. When you pay with credit cards you’re doing just that… stopping the flow. There is nothing worse than running your and watching the bartender/waiter fiddle around for 10-15 minutes trying to find your card mixed in with the masses. Not to mention… You can’t even establish that you’re a solid tipper. Waiting in the queue for the next round of drinks is a foolish move.

Example 3 – Paying Cash: *The biggest error when it comes to nighttime fun is losing momentum.*newly improved game

Most guys think that it is not manly to evaluate your looks. These are the same people you’ll see wearing crew neck T-shirts and Air Jordans out in public. Their loss. You don’t have to dress to kill 24/7/365 since you may be bogged down with work and staying in for the night. But. If you’re going to try and meet people you need to dress to impress. In addition, it would be smart to learn some basics around photography. Take a look at the video below:

Example 4 – Maximizing Your Looks:

Now you don’t have to watch four hundred videos like this but do some basic searches on YouTube and find a set of 10-15 tips to improve your looks. This can include basic photography like the video above (simply search for headshot photos for men) or it can include style of dress (just search for colors for men by skin tone). When people see photos of you it’s nice to know that you’re looking slightly better due to 30 minutes of basic research. Besides, any girl you date is going to show your photo to her girlfriends and say “do you think he’s cute?”. If you don’t believe this then why is Tinder such a popular dating app? Enough said.

Under no circumstances should you set up a meeting and show up late. This includes dates, interviews and meet-ups with friends. It is common advice that you should “make people wait” for your amazing presence. This is complete non-sense. If you show up early to any venue you’re going to have the first crack at impressing anyone in sight. Besides, if you’re willing to show up late to meet person X, you should just cancel the meeting. You don’t think they are important anyway.

Example 5 – Showing Up Early:

Notice that all the “small examples of doing the opposite” pertain to basic social skills and dating/acquaintances. This is because the lowest item on the priority list is acquaintances and random women at the club. That said, it is also the easiest to fix. So, if you don’t believe anything on here, try the tricks above and you’ll see they work. 1) leave a nice tip before service and the waiter will remember you, 2) tip after you leave the club, the bouncer won’t forget you, 3) pay cash to make friends with the staff – notice all three of these will cost money 4) evaluate your looks every year and 5) show up early or find someone else of value.

Small Example Conclusions:*but create valuable contacts,*

Intermediate Examples

Most people try to please everyone. That is a recipe for disaster because most people are not worth impressing in the first place. Before you bother trying to build a relationship… do some basic background work and find out if they are worth the time. If they are worth the time, .

Example 1 – Impress Only Those Who Matter: *go all in*

Twitter is a great example of this because we have weirdos and losers who @ message us to explain they are “un-following” the advice from both the main blog and Twitter micro blog.

If you want a clearer example of losers, just look at the garbage people who got upset by .

*Who cares.*Mike’s “offensive tweets”

In fact, every single time this happens our Twitter and blog followers grow because we lose the bad readers and obtain the good ones. A good problem to have. It is great to polarize people.

Part of the annual process of elimination is deleting useless contacts from your phone. This is done to prevent unnecessary emotional attachment to old friends. Just because someone has been your friend for 5-10 years does not mean they get a free pass to suddenly complain all day and waste your time. Most people believe that history is a good reason to keep a toxic friend. They are dead wrong.

Example 2 – Consistently Cut Your Contacts Down:

As you get older and your friends go through ups and downs the ones that stand the test of time always ask the right questions to get back on their feet.

Average people are going to read the paragraphs above and think it means .

*“When your friend is down you leave him!”***No.**

When your friend is down you give him access to all the *tools* you have to get his ducks in a row. If he continues to spam you to “borrow money” (see give him money) then you need to re-evaluate the friendship. The long-term friends you have (15+ years) will end up going through bad years. Your job is to find ways to help them based on their unique skill-set. Finally, when you hit a rough spot (and you will) it is your job to communicate what your skills are so your friends can help you find down the line.

a solid career

Most people buy items to impress other people. This is another recipe for disaster. Everyone has interests (sports, cars, clothes, drinking, traveling etc.) however these interests should be yours and *yours only*. Go out and try hundreds of activities and find out which ones you actually enjoy. You'll be surprised.

Example 3 – Buy Items for Yourself Only:

The vast majority of people *say* they don't care about the opinions of other people. But. Look at what they *do*. If they have to consistently announce to the world that they do not care about the opinions of others… Then of course they care… A lot.

So do the opposite, do the opposite, do the opposite. If you are going to spend some money on a material item? Great, buy it for yourself only. If you are going to buy something for a friend? Great, don't buy it because you are trying to coax them into something. Just give it to them and move on because it is what you wanted to do in the first place.

As we've stated numerous times in the past, money is to be spent on 1) making more money or 2) making you happier long-term. That is all.

For the first time in this post we had to put stars around a word in bold because it is extremely important. What is the difference between a legitimate and illegitimate mentor? Easy. He is investing in you. What does this mean? He invests real time into your success.

Example 4 – Find *Legitimate* Mentors:

This does not mean he should be holding your hand through every single step of a process, instead it means that the mentor is actively engaged in your life.

Someone you listen to every single step of the way is not a mentor. . That only has value if you have no working knowledge of the topic. It does not have value long-term.

Not a Mentor Example:*That is you following the directions of someone in front of you*

A person that is constantly trying to improve will eventually hit a decision point. Instead of running with his instinct he calls up a few trusted mentors to gather ideas on what direction to go in. That is extremely different from someone simply saying "do X".

Mentor Example:

In short? They want the answers in a "step-by-step" form at all times. You will never succeed this way. While it is great to have a general map or blueprint, no one is going to actually execute the steps for you.

Everyone else wants a hand holding experience through everything in life.

As you can see from the previous examples above, the intermediate examples surround friends and contacts. Generally, this is what most people are trying to improve upon.

Example 5 – Learn in Your 20s Earn in Your 30s: in their 20s

There is just one problem.

Most people believe that partying and chasing girls until 3 in the morning four nights a week is how you "meet new people". They even go out and try to run "game" in packs of dudes on the weekend.. during the day! This is wrong. Think about the people you meet in these environments and you'll realize that you're clearly violating rule number 1 by not having a solid screening system. If they are not worth your time go to the tried and tested move to get rid of them:

Smile, Nod and agree. After this, delete them from your contacts.

Finally, this does not mean that you should become a , it means that you need to learn to have balance. In our view this is going out *twice* per week. Thursday and Saturday since Thursday will have younger more attractive women and Saturday is by far the easiest night to meet women. Again, no need to simply believe this model. Try it yourself and report back.

boring frugal monk

On that note, if you are still running around getting black out drunk then this one is for you…

As you can see from above, doing the opposite is going to save you a lot of hassle in life. You're not going to respond to ridiculous drunk messages from that "one really cool guy" at 2 in the morning every Saturday. You are going to be "true to yourself" – as cheesy as that sounds and find activities you personally enjoy. 1) Only impress solid people – winners in life, 2) cut down your contacts if you make a bad choice – you will make several, 3) buy material items that make you happy – not in anyway used to impress the masses, 4) find a couple of high quality people that are willing to invest time in you and 5) build skills in your twenties, not damaged livers and childish hookup stories. You will have enough sex and fun if you strike a balance.

Intermediate Example Conclusions:

Advanced Examples:

That is right. The masses believe that you have to do something in particular (see win the lottery) to get rich. This is pure nonsense. The best way to improve your net worth is to do the exact opposite of this and focus on

Example 1 – Who You Are Determines Your Net Worth: You Inc.

We have mentioned You Inc. in the past and what this really means is. This is the only game you will play. How can improve where are, how fit are, knowledge base and ability to succeed? Notice that comparing to other people never comes into this equation. It never should.

you're going to compare and build upon what you had last year*you youyouyouryour yourself*

To reiterate. Everyone else believes that While it is true, this equation will only frustrate you. Why? You will end up complaining that no one is interested in adding you to their "special network". Here is what you can do instead. Re-read the underlined segment and compare yourself to last year. If you have more information on topics X, Y and Z… Then naturally… you're going to move up the food chain. Similarly, if your contact list from year 1 is not the same as year 2… You did something

"network = net worth". **right.**

Notice. Your network will expand in proportion to how valuable you are as a person.

This is not a typo because again… Do the opposite! Everyone else believes that time is money. They misinterpret the phrase to mean the following: That misses the point entirely!

Example 2 – Money is Time: *"if you do activity X you could have been doing activity Y which would make you money."*

Money is Time.

It means that you should use money to buy people's time. This can mean 1) hire someone and pay them an hourly wage or annual salary – no ownership!, 2) it can mean advertising since you are paying to capture the attention of people and 3) it can mean paying thousands of dollars to obtain face to face interaction with someone you need to meet.

Use money to buy people's time. This will make you money if you sell a product/service that is legitimate. Who cares if you spend $60K/month in advertising fees if it returns $120K in profit? Not you.

Pretty funny. Everyone that saw this blog over two years ago believed that it would turn into some "resume review service" or something to compete with . First we do not trade time for money and if we were going to build out a business like that the last thing you would want to do is build a reputation up on an established platform and stab them in the back. That is about the worst business decision to make.

Example 3 – Build Rich Alliances: Wall Street Oasis.Absolutely not and never will

Instead you build up a long-standing relationship and eventually you will both find a way to profit. That is a much smarter long-term model. Are we going to do anything now? Probably not, we are strapped for time. But. The point is that you should build alliances by delivering value to people you want to link up with later.

Funny that everyone "knew" it was going to be a Wall Street competitor. Of course they were wrong.

Everyone else tries to short cut the path to real money. No, real money is not "$250K per year" (something you can make) or some such non-sense. Real money is $1+ million per year or *at least * a one-time payout of $1M+.

Example 4 – Go For Real Money: at the age of 25 as a hedge fund associate

Real money is made when you develop many many many contacts (adding value to the bottom line of these contacts) over a long long long period of time and pull the trigger on an *event*… or by creating a recurring subscription revenue stream. That is the reality because is hilarious at best.

"getting rich slowly"

We have talked about the difference between minimalism and frugality in broad strokes (will have an updated version shortly) but the point is that . Lets assume that you are financially successful and have a liquid net worth of ~$1M by the time you are thirty. (As you know, this is our cutoff for giving any sort of financial advice, otherwise the person is not successful himself).

Example 5 – Live Well Below Your Means: living below your means will allow you to take risks in the future

That $1M in liquid cash is going to give you cash flow of about $50K per year. If you are smart (see doing the opposite), you will now use all of your extra cash flow to invest aggressively in businesses and higher risk assets (private equity, venture capital and others). Everyone else would go on a ridiculous spending spree, buying things they don't need to impress people who don't matter. If you don't believe this, why are people who win the lottery always broke? Now you know.

venture debt,

To conclude, the biggest tipping point is as follows. The catch 22 of this whole process is that by the time you are able to cover your cash flow with your investments, your entire income stream comes from work you love doing! Another one of those odd nuances in life.

"cover your living expenses with investments as fast as possible"

Clear as day, advanced levels of doing the opposite focus on money. 1) become someone instead of trying to "know someone", 2) use money to buy people's time, 3) build alliances, don't try to back stab people for a few bucks, 4) go for real money if you're going to build something and 5) live below your means to create options in the future.

Advanced Example Conclusions:

Elite Tip to Do the Opposite

Lets say you have succeeded at all of the items above. You are going to be in shape, financially well off, sharp socially and you will have a rolodex of successful people at your finger tips (Ideally sexy women as well!).

So what is left? The last item left on the list is to continue developing new interests. Yes that is the cheesiest way to end this post but it is the reality. Seriously. Look around. You will see that they have odd social manners and become even more rigid as they age! Make sure that you combat this tendency by continuing to get outside of your comfort zone. If you didn't do something new today, this week or this month. Go do it now. Do it today.

Many rich and financially successful people are boring.
****

The Divide, Short Predictions and an Answer to The Inflation Question

The Divide, Short Predictions and an Answer to The Inflation Question

The divide is here. There is no real solution from a macro perspective since we're not politicians and we don't have much of a say on anything. One of the themes here is that you should focus on the "microeconomics" since big changes are unlikely to happen (waiting and hoping is not a sound strategy). While we recommend always taking the time to vote in favor of things you agree with, the reality is that the masses are going to decide the direction in the end. Instead of praying for a particular government official, boss or company to come save you… It's time to save yourself.

The divide between the people doing well and doing poorly is now on full display. We have no idea how this will be solved any time soon. What we do know is that the vast majority are going to suffer.

What is Happening:

Unless you work in an industry that is knowledge based, internet based or software based… You're in a lot of trouble. We cannot imagine having any business that is brick and mortar with no real revenue online. Nothing but carrying cost and expenses.

Thinking through this more, it is clear the the financial divide will widen even *within* industries like real estate and brick and mortar for a simple reason… survival rates. Take two examples: 1) a rent controlled building and 2) a restaurant that survives a massive 6-12 month drawdown. Realistically, the only people who can survive are the people with a lot of money.

If a person was running a building that had forced rent control, he's actually happy that people are leaving since they were going to stick around forever (money losing tenants). The restaurant on the other hand was already successful because it was able to survive 6 months of limited to no revenue.

While the obvious winners are there (internet, software, etc.) as people work from home, the less obvious one = the classic rich. The classic rich (through real estate or small businesses) will become extremely well off only if they were generating large margins. This is something that many people forget. You can run a small business of say 10 pizza shops, but if you were collecting 20-30% operating margins, your cash position is enormous and you survive… Only to take over the prime locations of your competitors. You're going to get bigger and better.

In a phrase: . If you were one of the "winners" in your arena, you just got bigger and better due to this pandemic. You didn't change your marketing, you didn't compete, you simply won through attrition.

consolidation of power

This is our new mantra. Every industry is going through consolidation as inventory risk is high. Maintain every single relationship you have, put on those $5 t-shirts… $25 jeans and continue working. Why? Even if you're flat you're getting *way* ahead. The reality is that attrition is going to accelerate across the board in every single industry. Do what you can to stay as close to flat as possible (up is of course better).

Thrive Through Twenty Five:

Do not take your foot off the gas. When you see banks trying to encourage personal loans, credit cards, refinancing etc at rapid rates… you know things are starting to get bad. This means your competitors are dying off.

Within your industry (if you're in a career), you'll see more cuts around Q3/Q4. So you just need to survive. Do not complain about being flat as you're actually gaining ground against everyone on a relative basis. From now until 2025, you need to push as hard as you can as economic downturns create the most wealth dispersion. If you're in a career, do not complain about pay unless you have a job offer in your hand. Period. Having zero income is not a wise decision in the current economy.

With the main concepts out of the way, it's time to focus on the most important person *you*. That's the reality. If you want to help your family, friends etc. You need to be in a position to do so. Using all of your time to produce is the fastest way to provide. Using your time to provide limits your abilities as you have no scale. If you can produce at or above what you were doing last year, you can leverage your earnings (therefore trading money for time, most people attempt to do the reverse).

Micro Personal Choices:

This is an extreme situation. Unless you're in a private setting you do not want to flash money. You will be targeted (burglary, robbery, etc.). This seems obvious but we'd even avoid wearing custom/high quality suits. There is no reason for it as meetings are now virtual. You can wear them for the zoom meetings but don't be foolish. You don't want to wear it in public. If you're looking for deals on flashy products (watches, high-end cars etc.) this is the time to shop. That said, we'd strongly recommend items that hold value. IE. better to get a deal on a Rolex vs. a 2020 Porsche. Why? Well, this economic unrest is not going to go away any time soon. Our posts on the virus (received laughs) and yet it is playing out as expected as we enter a second wave (a bit earlier than expected but that's noise as predicting exact months is next to impossible).

Avoid Flash:

People are "over it". This is the common phrase you'll hear. They are okay with getting sick and infecting other people at this point. The good news? If your friends are intelligent they won't yell at you for staying at home. Keep your contact points at or near zero as you don't want to infect anyone else. Save the first world problems for a different year. Men and Women have lost their kids in wars. Men and Women have suffered heart attacks. Men and women have battled with cancer. We're pretty sure everyone reading this can avoid bars/clubs and massive group settings for six months.

Limit Contact Points:

If you are bored in this environment you're probably just a boring person to begin with. You still have a lot of options… so here we go: 1) new instrument, 2) isolated sports like golf, 3) gardening/home repair items, 4) purchase a pet dog and 5) outdoor hiking in less popular areas to avoid crowds. For fun if you want a recommendation and you are 25-35 we will go with golf. Is it fast paced? No. Will it cause you to meet other rich people? Yes.

Add Individual Items:

If you were looking to learn a skill that you can leverage in the future, becoming a decent golfer will help. Lots of people never learn and this is a great excuse. Take all your fun/travel/partying expense and learn to enjoy a sport like golf that will stay with you until you're in your 70s. If you really cannot stand the game, go ahead and look at the other items we mentioned.

This has been an interesting one. Practically everyone is learning to cook their own food so you may as well follow the masses on this one. You don't need to go against the crowd in everything. Learning to cook is healthy and it's a skill that will also stay with you for 30-40 years. As a note, the more expensive items are actually on sale and the cheaper items are actually going up in price. That is how bad the economy is doing. Many families cannot afford expensive items like scallops and lobster, so you're seeing lower prices on high-end steak cuts and seafood. The price of pork and chicken appear to be going up (general comment).

Add Cooking:

Yes we are serious. We're not going to get into a battle over home security systems, guns etc. All of these topics are far too emotional. That said, the world is getting pretty chaotic so it would be wise to research a wide range of security features. We talked about safes/vaults in the past but we continued to go down the rabbit hole and are looking at every single security item from cameras to wall types (for homes) and more. You just don't want to leave a single stone unturned. This is one of the best times to get the research done.

Revisit Security:

For those with no income, we'd strongly recommend learning a trade that can earn a livable wage over the next 5-10 years. Our blog has grown quite a bit which creates a wider range of income distribution (previously only focused on high earning individuals with $250K+ as we focused on the big three money making careers). So. For those that are simply trying to get started, we would go into any trade (medical – you can learn to draw blood for testing; standard trades – plumber, auto mechanic; any heavy equipment installation – generators, HVAC systems etc.). If you can learn any of these basic items you'll buy your self at least 5-10 years as they are difficult to automate with a robot near-term (again, this is a temporary solution and something you can easily learn in a short period of time).

Learn a Trade:

If you had trouble making money in the 12 year bull market and are struggling to make money in a recession as well… the reality is that you probably haven't tried hard enough to succeed. This is not something people want to admit as they never take responsibility for their own actions. So…

Ads are Back:

Why? This is a rare opportunity where big players have paused/cancelled their ad spending. What does this mean? With major companies cutting their budgets for "political reasons" or "social reasons", the cost of ads has gone down (cost of bids is now artificially low). This is *THE* opportunity to figure it out. If you were close in 2019, you should be able to make it work right now (as we speak). Not sure if we can be clearer than that. You're unlikely going to get another opportunity like this where spending is down among major players… opening up lower bids for at least a quarter (ability to test every single ad idea you have).

The time to figure out the ad game is now.

<u>A Macro Question – Inflation</u>

On a separate note we noticed that a lot of people don't understand this topic: inflation. When people talk about inflation and the declining value of the dollar, at this time they are referring to *money printing*. So we need to be clear here. Most people think of inflation as "price of products going up". However, this shouldn't be confused with *inflation of the money supply*.

Keeping it in simple terms. Lets say there is $1T USD floating around (no this isn't even close, Google search M0 money supply, we're making an example so it is easy to understand). If you have $1T in physical cash floating around and suddenly print another $1T and spread this around evenly, you've now caused the money supply to double. This would be *inflation of the money supply*. Even if people do not buy goods (they sit at home on the money), the number of dollars floating around has factually doubled.

This should explain the issue clearly. Right now the government has to "guess" and fill the void of lost demand by printing money (at least that is their strategy). Since people cannot spend their money right now, it's difficult (if not impossible) to guess the exact amount of money needed to keep the dollar value flat. If they print too much and the economy opens up in full force, you might have massive price inflation of goods. Why? Well, if your net worth doubled you're willing to spend more than $100 for those Nike shoes and more than $100 for your favorite dinner spot.

Hopefully this clears it up, monetary inflation, price deflation and price inflation are three different items. So we can move onto the next step.

In an ideal situation they do not want deflation and would prefer to have *slight* inflation. Slight inflation is "okay" since we are a debt burdened country. Think about it like this. If your average citizen owns a $100K house ($20K downpayment, $80K debt) and makes $50K per year… If his income goes down to $40K and the price of the home declines to $80K, he's in big trouble. Why? Well he still *owes* $80K in debt (assumes 80% was purchased with debt) and the asset is only worth $80K. Meanwhile his income also got cut by 20% so he can't make payments. Not good. Leads to tons of defaults and a cascading disaster.

What Does the USA Want?

What does this mean for you? It means the government is going to try and veer on the side of inflation. This is all you (the reader) needs to understand at this point. If they are going to veer on the side of inflation it means they will more likely *over print* versus under print. If they over print a bit and the example above sees his income go to $55K and his property go to $110K, he's in a lot better shape compared to the $80K home and $40K income. While they are simply numbers on a screen, the debt part is significant as he has the option to sell his home at $110K (making a small profit). This is a *huge* deal as it allows him to downsize if his wife loses her job or he has sudden expenses to take care of. IE. optionality is there.

Now that the utopian answer is here: exact printing given to individuals who need it… we need to shift gears and focus on reality. The reality is that businesses are blowing up left and right and the money is not exactly going into the correct hands. Having the government buy bonds of individual companies (many of whom don't need government help) is not going to flow to the middle class. The only thing that helped a bit was a $1,200 check to the middle class.

Fast Forward to Now:

Since the money will not go out effectively we're looking at a dispersion of wealth (outlined above already in this post).

In summary, since we enjoy flow charts. this is what we should expect to see: 1) people sell assets to pay bills, 2) price of assets goes down, 3) value of dollar goes up since there is high demand for it, 4) government prints money to try and prop up asset prices since those assets are being sold for cash, 5) this happens yet again as people are forced to sell, 6) government print more to offset the selling pressure… repeat repeat repeat. So the "money printer go brrrr" meme is alive and well.

This is why we've continued to say the same thing: just buy gold, crypto and hold enough cash (different number for everyone). Why? Well the one thing in common is the *number of dollars being printed keeps going up*. Again. They will print to offset people selling assets for cash to pay bills. The common denominator is printing which means you want to own items with limited supply (gold is a good example). No need to get fancy.

For a better explanation of the driving forces we'd check out the video below.

In order of importance: 1) do not flash any money in public settings. Yes we're serious. This is an actual safety hazard at this point in major cities, 2) it will likely get worse, yes we think the pandemic will continue through year end. You want to keep yourself as safe as possible by maintaining social distancing measures, 3) this is the best time to learn a skill/trade. Does not matter what it is. Make sure it is usable over the next 5-10 years and worry about the details later. Delete the news and focus on learning something (anything) that can pay the bills in a worst case scenario, 4) Flat is the new up – don't complain unless you have job offers in hand. If you do, feel free to ramp up the pressure, politics will remain important so don't mess it up and 5) focus your efforts on scarce assets and cash. This will give you the opportunity to buy time while simultaneously avoiding a massive pile of cash earning 0% over the long-term.

Concluding with a Focus on You:

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life.

The Downside to Blogging

The Downside to Blogging

Blogging is great. Anyone who has succeeded in the life should start a blog as a simple way of paying information back (to those that will listen of course!), yet blogging does have its downsides. Lets take a look at them.

This has to be the most annoying one. For anyone with Wall Street experience, you know that asking the same question twice is the fastest way to guarantee you will be at the bottom of the ranking pool. You will be bottom bucket, 4th quartile, faster than Usain Bolt can run a 100 meter dash. Yet. It still occurs.

1) Repeat Questions:

The most common ones we get are listed here, and they generally revolve around the same topics:

If you're not a multi-millionaire the chances of you being smart enough to outdo professionals is pretty much zero percent. If you're a multi-millionaire, you likely started a business, therefore you know the actual products and industry inside out and *may* have an extremely slight edge. Everyone else trading for money is going to get emotional about meaningless 10% declines in the market.

*How to *beat the market*.*

and create . You will be significantly better off having 3-5 streams of income, than you will spending any time generating 5% extra returns on a meaningless 6 figure portfolio.

Dollar cost, work you a** offmultiple passive income streams

There is no blueprint and people who sell you on line for line, rhyme for rhyme words that will get you laid… The people who request these types of posts have not even tried to get laid.

Blueprint to Getting Girls: are wasting your time.

This is not mean at all. It is simply the truth.

If they were to go out and approach 100 women (less than a month of effort if someone cares to do so) then they would find their own specific sticking points. If you do your best to look sharp, be in a positive mood and approach… You'll likely get laid. In rare instances, people with severe social skill issues, you may go zero for 100.

But even then? You will have specific issues, see sticking points, where the pick up falls apart.

If a person asks you for a blueprint tell him to go approach women. If he comes back with specific parts in the interaction where he falls flat on his face… He actually tried and you can now help him. Until then, don't bother.

Once the rubber meets the road and your who wasted 4 years of their life chasing girls start to fall off the radar, you'll learn that they don't like to hear the truth. They would rather read feel good information about how they can "make it too" than recognize they made terrible decisions that will take at least a decade to overcome. Instead of learning harsh truths they would rather be entertained. Unfortunately this will continue to get worse as you age, maybe 1/10 of your buddies will turn it around, the rest will become jealous of you and expect you to give them a handout because you are their "friend".

2) People Don't Like the Truth: friends from college

What does this have to do with blogging? In short, if you tell people the truth via a blog, they will get angry at you because they see their own mistakes in the writing. If what you're writing was truthful, you should anticipate some serious venom.

As your blog grows you're going to receive a lot more email. First it starts with 1-5 emails a week and you're excited to see you have some fan mail. Then… It grows to 10-15 per week. Still manageable but you're getting lower quality emails from people demanding you help them… as if your time is free and grows on trees. Finally, you start to get into the 10 per day range and begin ignoring large amounts of emails – 1) you don't want to use your time to respond to them and 2) most of them offer no compelling reason to read them.

3) Emails:

but that's the name of the game if you have no serious intention of becoming a full time blogger.

The worst part of this email trend is you likely miss out on some good ones,

We have a solution for this but it's not going to be put into action until 2015.

Traffic flow is practically impossible to control. One day you can be at your regular X thousand views per day, then out of nowhere, it jumps 5-10 fold or more. This creates a problem since a casual blogger does not have time to respond to questions/comments/emails and again many of the items get dropped to the wayside.

4) Traffic Flows:

On the flip side, if you're a serious blogger, you should plan for ways to monetize a spike in traffic outside of simple ads that help you track page views. Think of how each post would help sell a specific product. This way, you avoid the hassle of missing lost revenue.

Even if you're having a good time helping people improve their lives, you have no way of helping everyone. You're going to get busy, you're not going to prioritize them and a potential success story will slip through the cracks. It's simply how it works.

5) You Can't Help Everyone:

The best way to combat this is to have an allocated number of people you will allow yourself to exchange emails with and work with privately. Our number is a It is a low number because 1) we would rather help someone to the fullest than give 50% effort and 2) the number of people that are significantly underperforming relative to their abilities is low.

maximum of ten people.

As soon as you start gaining traction, you're going to get emails/requests on the weekend. While you can avoid tweeting and posting on Facebook during the weekend, you certainly cannot do anything about people searching the internet for the truth.

6) It's a 7 Day Per Week Process:

In addition, if you blog is new and *different* then people are more likely going to read it at home versus at work. They are afraid of being caught reading obscure websites at work because… you know… Human Resources.

At the end of the day, you're going to primarily speak to 20% of your readers. Just like everything else in life, where all good things flow to a small subsection of people, your writing will only reach about 20% of the readerbase.

7) 80/20 Rule:

—-

With the bad out of the way, there are a lot of reasons we're continuing to blog.

We've made a few friends through blogging and have also helped connect people who would have a mutually beneficial relationship by meeting. Win win.

1) Friends:

To say that the writing in the past was poor is an understatement. Writing for a blog is nothing like writing professionally or at the collegiate level. Completely different skill sets.

2) Improved Writing:

We thought we were going to have our first miss but the candidate eventually came through. We have helped a select few people with Wall street advice and a total of zero people have failed. The number of success stories is getting close to 100. Not bad. More impressed by the 100% success ratio. (no we still won't do any sort of resume review service since we do not trade our time for money).

3) 100% Investment Banking Placement Rate:

This blog is still a hobby. If we wanted to increase the traffic it would likely take 2-3 months of actual effort instead of the 3 hours per week we put into the blog at this point. Oddly enough it's still growing!

4) A New Hobby:

As you know, If you can learn to teach/inform via a blog it's going to improve your salesmanship. Not in a material way, but it will certainly help.

5) Learning to Sell is Harder than Learning to Buy: everything is sales.

The grammar police will always be watching! In addition to the spelling police! Continue to free form write and you'll find that your spelling errors will naturally decrease. This will help your more important emails that are unrelated to your blogging hobby.

6) Improved Quick form Typing:

With that out of the way… Expect some Wall Street effort shortly…

****

The End of Centralization

The End of Centralization

It is going to take several years but the end of centralization or the top was likely 2020. We don't even follow politics as many know but you can see the slow and steady move to control: 1) you can start a competing app, 2) removing apps they don't agree with and now 3) coordinated de-platform and loss of servers.

While the same old idiotic logic will show up “it’s a company they can do what they want”, this always misses the point: it means the firms have more control than the government at this point. Why? Well if you can remove the current president from being relevant you are the actual king of the jungle. As usual, this is not important. All that matters is what you should do and how to prepare.

If you haven’t figured it out by now, we’re sorry to say you’re behind the times. Crypto is going to balloon at this point and we will see innovation unlike any other industry (including the internet). The reason is simple: people can now create privacy and payment forms over the internet in small digital packets. This is simply the end of centralization as we know it.

Crypto and Decentralization:

Again. Feel free to laugh. Doesn’t matter to us, if you are laughing or think it won’t work then the comment is simple: “Have Fun Staying Poor”.

Right now the average individual operates his/her life at a loss. This means when you make $100 and put it into a bank account or in your mattress, that $100 no longer buys $100 worth of goods in a year. It can only buy $98. In addition, if you wanted to pay for college, a home, or stocks it would only buy $90 worth of goods. This means the system is designed to inflate away your hard work. Those days are now over and you’ll be able to hold your purchasing power flat through the use of crypto currencies. The $100 you save will likely be worth $100 in 10, 20, 50, 100 years in the future. A real savings account.

Decentralization doesn’t just impact money, it impacts every single industry with a middle man. Since the middle man can control the flow of content: facebook, twitter, etc. They will now have to face competition from decentralized servers that run with censorship resistant platforms. This is admittedly several years away, but the changes we saw over the past week have accelerated the move in this direction by a minimum of five years.

Even if you don’t believe the above apply to you because you’re rich, the wealth taxes and UBI are coming. Some believe that the US and other governments can simply print money forever. That is not the case. You can look at history and find that to be true. People in general believe in “American exceptionalism” where the USA always “finds a way”. This is also unlikely at the current printing levels.

UBI and Wealth Tax:

Again. Even if you think the above is crazy conspiracy it doesn’t matter, you still have to hedge. So think through the consequences of massive printing. The answer is the same, you need a way to store your wealth so it cannot be confiscated and in addition to this, you do not want to be “illiquid rich”. Illiquid rich means large foot prints in expensive real estate or large sums of money in a single brokerage account. So on and so forth.

Our best guess is that a wealth tax (in some way shape or form) will come in the future as the rich have gotten insanely rich, while the middle class was thrown into poverty in less than 12 months. The only way to really fix that is by 1) taxing the rich aggressively based on income, 2) implementing a wealth tax or 3) implementing a bigger inheritance tax. Since we’ll get the question anyway, our best solution is likely an inheritance tax. To be clear, none of these solutions are great, but there is likely more room to fund deficits if you take a billionaire and say he can’t hand off more than $XM to his kids/family. Income tax changes kill off the potential for new entrepreneurs and a wealth tax ends up being a lot more complicated. Therefore? If you’re well off you do not want to have an obvious tax footprint. Make sure you appear to be “upper middle class” and hide in plain sight as these new rules come out in the future.

Which then leads us to UBI! Guess what, UBI is coming. Old boomers who are behind the times will say “this has been a theory for years”… unfortunately the same boomers just passed on insurmountable amounts of debt to the millennials and generation Z. UBI is one of the easiest ways to prevent people from slipping into poverty in droves. During this time frame, the decentralized internet will be built out and new economies will be built out in the virtual world (NFTs, Crypto assets, etc. see the book “Ready Player One” if you want a serious look at opportunities in the future even though it is meant to be fictional).

It has been over 12 months now of lock down. People have adjusted the way they live in a permanent manner. While some cities will boom (Miami for example), this is due to improved weather and tax treatment. It is unlikely that this trends slows down any time soon. The idea of sitting in a small apartment to go to an office is simply crazy. Front office workers will eventually go back to traveling but when you have “prestigious” companies such as Moelis going remote, you should be certain that this is structural (not temporary).

No Need for Concentrated Cities and Even Establishments:

Lack of concentration has a lot of other implications beyond real estate. It also impacts the way that public goods need to be built out. If you used to have huge chunks of the population in certain cities and they are suddenly spread out across the state, the deployment of public goods will be different as well. The best example here is likely schools. If the USA wants to compete on a global scale in the future we have to move to a virtual environment which allows for both the rich and the poor to learn from the smartest people in the world. As we remove this massive barrier to entry (rich kids who were given massive head starts due to their parents), it should unlock value for millions of people who could have succeeded with the right resources. There is no reason to send kids to prisons where the teachers are unsuccessful with limited life skills to pass along.

Of course the other big one is banking. As we’ve been saying for quite some time… if you’re going into finance only go into M&A. The long-term outlook is bleak to say the least. With interest rates going to zero and the growth of financial technology (Square, PayPal, etc.) the usefulness of the legacy banking system is in secular decline. Money is nothing more than digits on a screen and the future is the digitization of all payments. The payment rails will be built out by new technology and eventually the dollar and other currencies made by countries will be digitized (just look at the talking points from the IMF for more information on this)

The one benefit here is that a smart individual can now scale a business into the millions and even billions of dollars without a single hire. Think we’re kidding? We’re not. In the future with software scaling at the rate it is today, you’re going to watch as all processes become automated. This leaves the following for work: creativity/becoming a producer. If you cannot produce or create, the world is going to speed past you.

Acceleration of the Digital World:

Take an e-commerce business for example. All you really need in the future: 1) manufacturing and 2) distribution. That’s really it. Sales can be done by you (ads online), customer service can be outsourced and you are left with accounting which will of course be automated by software. What do you actually have to do? There is no need for a CFO anymore, there is no need for hoards of accountants, there is no need for massive teams or “headcount” which is a product of the industrial age where man power meant production. All of that is simply gone.

Long, Long, Long term, meaning 15 years or so, since digital items are now scarce the value will sky rocket. This is because people will be forced to earn all of their income online over the very long term. Sure there is is going to be some of the legacy stuff around (same reason why printers still exist despite DocuSign and PDFs) but the picture is the same… move to digitization. In the digital world you can then find scarce pieces of art/video that will likely go up in value, for a sports example (since this is what average joe understands), NBA Top Shot is a great example

https://www.nbatopshot.com/

For fun we’ll do a sci-fi example, feel free to laugh. You put on your VR headset and enter virtual reality. Since all economic activity is now done via VR since everyone is connected and you can build anything you like, there are rare assets such as NFTs (non-fungible tokens) such as digital art. You can go up to the piece of art and walk around it and see it but it is not yours. Just like a physical museum, in fact you likely pay to view the rare exhibit. You also own digital coins/tokens for payments and digital homes/vehicles. Meanwhile in the “real world” you’re sitting in a small area with a simple bathroom and kitchen (think studio sized living). This means your quality of life is significantly higher at the expense of being in a bit of a smaller area. But hey, unlike the year 2000-2040, you get to keep what you make. There is no barrier to entry in terms of competition. While Ready Player One and Ready Player Two are incredible books for entertainment, they should be read with a bit of seriousness as a lot of the things are possible when VR takes off (next to no chance it evolves exactly like the books).

We've been incredibly busy to start the year but we are seriously considering an explainer for decentralization. This is probably the only thing you need to understand to be rich in the future. If you don't get it by now you're at least 5 years behind the times now. People who believe it's going to zero are simply morons. As our long-term readers know we rarely go out of our way to make a statement like that on the blog (we do it often on twitter to troll), but we're saying it now. If you don't get how important decentralization is going to be in the future, you will miss out on the biggest opportunity in your lifetime.

Side Note:

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life.

The Five Rigged Games in Life

The Five Rigged Games in Life

There are several things you cannot control in life and most of them occur before you're even born: 1) who your parents are, 2) your nationality, 3) your genetics and 4) the education you start with. Naturally, all four of these things have a large starting impact on your life. Being born with a billionaire parent vs. under the poverty line, dramatically changes your life. There are always ways to get out of these situations but there is no denying the truth. Being born with the "right" items out of the gate makes life significantly easier. There is good news however. Life is a rigged game so if you play the cards correctly and "hack the system" you'll get out quite easily.

Since information is a commodity anyone can get rich even if they have bad results from the big "four". You can still get access to the internet, read for free and get rich without stepping into a classroom. In fact, we have a clear outline for and this is written in less than 10 pages. In the past, information was not equal and it was possible to lie about the truth (the truth about how making money is done) and that is largely left to the foolish. In 2018, anyone who falls for get rich quick schemes is well below the bottom quartile of the intelligence spectrum. Even if someone falls into the bottom quartile, the logic and reasoning is publicly available to be seen and proven over and over again. Maybe the hot stove is touched once… But it is unlikely to continue unless there really is a sucker born every second (based on our experience, this is still true. A sucker is born every second, likely faster!). Jokes aside, the same sucker can learn from his mistakes if he really takes the time to read.

$1 million dollars in 10 years

Money is the First Rigged Game

The first rigged game is certainly money and there is one big trap here. The trap? The personality destruction that comes with it. You'll find that "most" rich people are boring as rocks. They are and simply worked hard all day long slaving away to make money. They are so conservative they don't even think the 4% rule works and likely live at 35% of annual passive income "just in case". These are the same people that exhibit large amounts of passive aggressive behavior, live with quiet desperation and just don't see money as a tool (instead they view it as their actual worth).

extremely conservative

If you avoid this trap, you can win the "money game" by simply feeding these individuals what they want to hear "that they are right". If you have no talents at all, simply put yourself in a position to tell rich people they are smart. This will make you rich. If you do have talents, you can simply sell products that target insecurity. This is exactly why Ferrari's and name brands exist. Since money is the *identity* of your typical rich person (he has little beyond this) selling to that identity will make you even richer than the most basic strategy of "telling them what they want to hear". For those that are uninitiated: the typical answer for getting rich is to give people something they need. We just take it further. We already know the highest profitability lies with the rich and we also know they are insecure. So all you need to do is find a product that makes their life easier and make it seem prestigious. An obvious example would be Fiji Water. It is simply expensive water but is branded as prestigious. This is why you see them in all those high end hotels. Absolute non-sense, but a great business.

The difference between a want and a need is that the "need" part cannot be ignored. Frugal people have low "need" levels because they are laser focused on cutting costs. A rich person is the exact reverse. He doesn't to cut costs. This leaves you with only one option, which is targeting his or her *need* for approval. Rich people are just regular people on steroids. They believe they are better than everyone else (they believe this deeply) and simply hide the fact. There is no denying the truth though. They have an absolute *need* to be seen as better than other people. Sometimes it is materialism but for the most part it is attention.

have

Now that you know how the money game works we have given out the two most obvious ways to get rich: 1) You feed the need for attention or 2) you sell them a product that gives them more attention. That is really all there is to it. The second option takes a *LOT* more work and offers a *LOT* more financial gain. The first option is for people who really have minimal skills and just want to benefit off the hierarchy of life. Afterall, if the CEO of a multi-billion dollar company loves you, it is unlikely you'll be fired within his firm even if you're simply working in Human Resources handing out the paychecks.

Happiness is the Second Rigged Game

The second rigged game is being happy in general. From the first section you can see that there is a clear way to get rich without having any talents. Once you have this money, it does not guarantee you will be happy. Being happy is more inclusive: personal relationships, self-esteem etc. Fortunately, just like money there is a basic formula to being happy which is as follows: Don't bother comparing yourself to anyone else and put all your effort into each day. That is really all there is.

You'd think the formula would be more complex but it isn't. The problem is that most people can't do either one. Comparing yourself to others is encouraged by practically everyone. You'll get passive aggressive comments suggesting someone who is your age or younger is already more successful. You'll get passive aggressive comments about being less important or "inferior" to older people as well. It is interesting because people who exhibit this behavior are not happy otherwise they wouldn't waste their time with the comments in the first place! If someone is both happy and rich they don't even bother, they are more interested in having a good day.

The second one is more psychological. Once you're set financially, you may go through the classic drug and alcohol addiction cycle as becoming financially independent is the hardest hurdle to jump through in the game of life. After this you'll find a balance in the stress spectrum. At the lowest end, if you do nothing, you'll get bored. Flat out bored. On the other end, if you try to do too much, you'll be stressed out again and defeat the purpose of beating the "money game" in the first place. We'll leave it up to the reader on how to adjust when they get there, but we've found that working until "tired" and calling it a day is just enough. No more long nights, no more stress. The only time the far end of the stress spectrum is acceptable is when you know it is temporary in nature. Then you balance this out with an equal amount of time of relaxation. Remember, just because those digits go up doesn't really mean much. Sure you may upgrade from a three bedroom to a four bedroom… but it's definitely not going to compare to the original dopamine rush of being "done".

Relationships is the Third Rigged Game

Eventually, you learn human psychology. If the general framework is learned, you'll never have a problem with relationships. Well… Never is a strong word, but you can reduce the probability by a large amount (probably 90%). Relationships are no longer a topic of this blog, it hasn't been for a couple of years since it should be figured out by late 20s (at minimum). Continuing to talk about "strategies" to meet people becomes ridiculous since you'll end up attracting the people who like your personality if you move up the value chain enough. We haven't met a single rich and lonely person who didn't have some sort of personality disorder. Learning how to strategize is essentially a Bandaid on a gun shot wound. It will bleed out eventually so don't bother.

How to win this rigged game? Quite simple. Never enter into a single relationship that you don't think will last a lifetime. That is right. As soon as you see a single character flaw you have to leave. You're essentially front-running the inevitable (which would be a parting of ways). It may take one day to figure this out or it may take three years. It does not matter. Once you realize the relationship isn't going to work you should leave. We're using the word relationship broadly because you can apply it to anything: people you hire, people you date, people you are friends with etc. This makes your real relationships extremely clear cut and dry when compared to your "acquaintances".

How to manage acquaintances? Yet again change the expectations here. If you have an acquaintance for swimming, don't expect them to be interested in your businesses or other hobbies if they are completely unrelated to his field of work. Generally, an acquaintance is someone who you have a single item in common with. There is no reason to expect more out of someone who only have one overlapping interest. This also allows acquaintances to come and go throughout your life without doing any sort of damage to your personal life. Yes it is terrible when your golf buddy leaves and you're forced to find someone else but it's not the end of the world. Sure beats hiring the same guy to your company for a role he wouldn't succeed in and leaving on a negative note.

The last item: . No matter what, people are animals. If they are incentivized to do something and it increases over time… Don't be surprised when it happens. This means you should not be surprised to see your closest relationships (not acquaintances) turn sour if they are put into a situation where they are incentivized to act poorly. People are capable of accomplishing practically anything. That said, it would be wise to incentivize them to align with your interests. Before asking for something, make sure everything is aligned otherwise you'll be sorely disappointed long-term. This is naturally since everyone does favors here and there. The "tit-for-tat" is mentally noted no matter how close the person is.

believe in incentivesmore of an art than science

Momentum is the Fourth Rigged Game

Physics applies to everything: Objects in motion stay in motion. Once you've established yourself, the key is simply moving in the "right direction". We constantly laugh when people believe they will "officially retire". Anyone who makes it to a few million dollars early in life, is ideally smart enough to realize he will get bored doing nothing. The key is simply maintaining "momentum". This is a massively rigged game. If you have $5 million dollars, with just 4% return you're looking at $200,000. This means your "money momentum" only requires you to spend under $200,000. Many people assume this means you should spend $200,000… That couldn't be more wrong.

What this means is that your is what determines what you spend in a year. We've said this many times but it continues to get mis-interpreted. Cash flow is more important than net worth because it determines your long-term net worth. Your net worth is going to go up and down a ton every single day. Anyone who is actually rich knows this and does not worry about the fluctuating digits in the air. If you have $5M and the portfolio tanks 10%… There is practically no way to offset this since that is a $500,000 decline in a single day. Instead you should look at your quarterly cash flows and decide if it was net positive or net negative. That is all that matters. If your cash flow coming in is always well above your cash spend you're not going to go broke. Once this capital machine is up and running you'll realize why rich people don't "know" what they are worth. But they certainly know exactly how much cash flow came in last month or last quarter. … It still isn't a big deal. You simply hold onto those investments, spend under the total annual income for the year. No change. (Total annual income would be $100K + cash flow from your business). It bears repeating. Once the nest egg is made, the momentum game is yours to screw up! Practically impossible for any intelligent individual.

CASH FLOWIf the passive income drops to say $100,000 for a year

Importance is the Fifth Rigged Game

The final rigged game is this desire to be seen as important. Once we realize we're just a spec on the earth and no one cares if we stay or leave, the ego takes a big step back. Attention is natural as humans do want interactions. That said, keep this level as low as possible. Much better to let people believe they are smarter than you and better than you unless there is a clear reason to show your cards. We've seen nothing but negative ramifications from being an attention monkey. Attention is certainly a way to make money… that said you don't need the money anyway… so why bother? Just an ego stroke. Once basic way to avoid this pitfall is by avoiding brand names for as long as humanly possible. Since it is all but guaranteed you purchase a few fancy items in the future, limiting these items is key. There is a line between "doing this for me" and "doing this to impress others". The second item in quotes always ends in tears.

These are the five rigged games. We've been blogging for about 6 years and yet we still get mis-interpretations of all of them. This is likely because there is too much marketing out there. While this is a publicly available article… We're still going to invest heavily in brands (targeting insecurity), fast food (terrible for health) and insurances (related to fear, similar to those stock market going to zero articles). While we don't believe in them ourselves, it doesn't mean that they will fail. In fact, it means they will succeed since 99% won't get through the first step! This is all good news for anyone reading this, they know exactly how to play the game… They know that people won't change and therefore… they know how to take advantage of this rigged game.

Conclusion:

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like . The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). The Five Stages Of Earning Income

The Five Stages Of Earning Income

Many people get stuck in a specific stage in life and never seem to make it out. The problem is typically due to cash flow issues or major life mistakes. In rare cases, the situation is uncontrollable (we'd wager below 1% of the cases). Since the goal is to get rich we'll go ahead and walk through the stages of income. We'd also be interested to hear where most of the readership is in terms of the life stages. We have no doubt that several of you are already in stage five reaping the benefits of a long and fun journey to the top.

Stage 1: Time for Money Exchange

The first stage in earning income is trading your time for money. In this stage, people are searching for a way to maximize their hourly wage. Almost everyone will work an hourly wage job at some point in their lives, especially the smart ones who work minimum wage jobs in high school to learn the value of money. It is important to note that the value in working for an hourly wage is not in the income produced. The income is meaningless if you're only earning $10 an hour doing a repetitive task. The real value comes from the *light bulb* that goes off in your mind. You find yourself doing the math and realizing that even if you were to work for 20 years it would be extremely difficult to save anything: $20K a year * 20 years is just $400K (pre-tax assuming 2,000 hours of work per year).

Who works in these positions? It is typically one of three people: 1) people living paycheck-to-paycheck, 2) older individuals who got bored (don't want to retire) and 3) young men and women. Of these groups the worst group to be in is group number one. . We are placing people who live paycheck to paycheck in the same group as those who earn minimum wage. The reason? They are running on a treadmill going nowhere and it's a difficult downward spiral to get out of.

This group should immediately run to obtain niche skills to increase their income and avoid living paycheck to paycheck

The second and third group are in good shape (ideally). The second group realizes that retirement is a sham and no one enjoys doing absolutely nothing all day. The third group has the immense value of time. They can take the small amount of money they have put away by working a remedial job and invest it into themselves to exponentially improve their earnings. One group gets to keep their mental health and the second group gets to learn about the value of time for money exchanges at an early age. Both win.

Stage 2: Performance Based Income

The second stage of earning money comes in the form of performance based income. For the vast majority of people this means sales. For others it will be Wall Street and Silicon Valley where your performance is ruthlessly compared to those around you (if you perform poorly your income *will* drop). While the pressure is certainly higher you are obtaining leverage for the first time in your life. The ticking clock does not determine your income. Your own value, will, determination (enter any motivational mumbo jumbo word) is what determines your income and overall success rate.

In this stage, most are beginning to see a meaningful savings rate. Instead of investing it, most will throw it into a checking or savings account since they are too stressed out learning how to succeed with their performance based career. There is nothing wrong with this for the first year, since the stress of being "on" all of the time will be a large shift for most people. The good news is that the first year or two of income will be significantly more than they were making in the past and they see the "light at the end of the tunnel" to growing their net worth.

The second stage also offers another revelation, the Company is profiting handsomely off of your revenue generation. The rough math is that you'll get paid for approximately 10% of what you bring in (this is the Wall Street side and numbers may vary). Even if you were to get paid a higher commission rate, at the end of the day there is a large gap between what you see in income and what the Company sees in profit. If the Company did not make anything, then they would be out of business very soon.

The final realization while working for a performance based position is the value of the platform you are on. A company like Facebook is a great example of this. If someone were to turn on a single banner ad onto all WhatsApp messaging interactions, the revenue line would go up $100M+. Turning on the banner ad is not hard and the person who decides to do this should not be paid $10M for it. Instead the value is in owning the actual messaging platform with millions upon millions of users. This final realization prevents you from demanding pay hikes incessantly. You'll have to build your own walking business and create an *ownership* structure for yourself.

Stage 3: Income Streams Without Leverage

The performance stage lasts anywhere from 2-8 years on average (this is pure guesswork/estimation). After a couple of years of work you're likely investing in assets, those can range from stocks to bonds to CDs. The type of investment is not of importance, the new income stream is. When each income stream comes in, the mind begins to see how each income stream can cover a specific "cost". For example, if one were to put away $100,000 into an index fund with a 5% dividend, they would say the $5,000 a year covers a month of rent for the rest of their lives.

Generally speaking, the first investment is typically not a leveraged position. Instead it's a lower risk investment that gives off a small return. Within a year or two, they realize that returns of 4% are not going to help them get rich. Especially when they have another 30 years to , taking a risk-off position does not make a lot of sense. Instead of continuing down the boring path they look for positions of leverage.

[become a multi-millionaire]

All of this said, the vast majority of people get stuck in this third region. It is possible to become financially independent with no leverage and no change in career by cutting costs to the absolute bare bones. Knowing that they can cut down to practically nothing and avoid taking additional risk (burn out from constantly grinding to get to this point) they usually settle into a routine. This routine results in cost cutting (more cost cutting) and did we mention cost cutting? Since the majority of career employees take this path we now know why frugality is a popular topic at this time. While it's certainly great to go down this route for many people, if you view life as short then risk needs to come on since you have 30+ years to make it.

Stage 4: Three Common Income Streams With Leverage

After stage three a fork typically occurs: the three people who make it either: 1) go into leveraged positions (, 2) go into building another income stream by hand or 3) take more concentrated skill risk – think technology. These three paths have very different skill sets. People who take position number two will rarely interact with people in position 1 (except for of the comments section of this blog!). People in position 1 will also rarely interact with heavier risk exposed people in position three, think of technology positions interacting with home builders… rarely happens except when the technology person is buying an asset.

[mortgage/debt positions in real estate are a good example)]

As you're all well aware, we chose step two which is why we're massively biased. And… Many of you have already realized we obtain all the Wall Street information from prior contacts at this point. That said there is no "right way" we're just outlining three high probability avenues that have worked consistently.

This one is easy to understand, you're taking on leverage in the form of bank loans or other types of debt to purchase properties that generate an income stream for you. The key is actually keeping your leverage higher since that's where the returns are. If you're generating $24,000 a year on a $240,000 property your return is 10%… If that position is leveraged (it should be if this is your path) then your cash return is closer to 20-30% ($48K invested while the take home pay $9,600 a year after taxes, interest payments, etc.).

Real Estate Route:

This is probably a confusing route for those uninvolved with marketing or online product sales… and an obvious one for those in it! In this route, you're building an income stream based on paid traffic. This is separate from what we do here on this fun blog since it's all organic and yields a zero return (content is not a good business model). Positively, this is probably the route that most will take that read this website as they are likely reading this post from their work computers where they could be building online income streams from wherever they are sitting at this moment in time.

Spending Route:

This is where the biggest pot of money is today. There is a reason why technology pays so much and it is because a good employee in technology can outperform 10, 20, 50 or even 100 mediocre ones.

Concentrated Skill Risk:

FullSizeRender

Technology has reached a point where it is comparable to sports, the money can flow aggressively into a few hands ("the elite amongst the elite"). We have not gone down this route given that we're no where near that field. The value of creating high quality recurring software revenue is incredible at this time (90% margins!).

The main reason these three streams of income have leverage? The first one is clear with financial leverage being debt. The second one is clear with a machine that sends the *right* type of traffic at all times into the same sales funnel and you're continuing to do so until the target market is tapped out. The third option is unbelievable scale since it's a set and forget recurring income stream so long as the product produces results. Leverage is typically confused with *only* being financial .

instruments when it can be as wellapplied to time

Stage 5: Mastery of Spending or Scale

The ones who make it this far will now reach the last stage which is mastery of financial leverage, spending or scale (recurring income). Yes there are a few other ways to get rich, however these are the most common if interested in doing research on how millionaires made their money. The vast majority are 1) business owners, 2) real estate or 3) a scalable skill/position (heavy skew to business owners). Naturally, the last two typically translate to item number one over time.

It's tough to say when someone has mastered the skill of spending or scale. We'd say the skill has been mastered once you're excited to do your work and any "set back" is seen as fun. Lets say a project didn't work. Instead of getting emotionally rattled a new lesson is learned and you're *excited* about learning the new lesson. If you've made it to a high net worth already, this is a rare occurrence. It is a rare occurrence since most of the big mistakes were learned a long time ago. You'll take the lesson in stride and happily go onto the next project with slightly more skill than you had before.

It is no wonder that frugality is popular nowadays. There is a huge difference in pay scale in America. Many people are living paycheck to paycheck while those with skills have moved into Career type positions and are working hard to move into stages 4 and 5…. Or they're hanging out on frugality blogs in stage 3. Frugality has gained popularity as those with Careers likely interact quite a bit with those on the paycheck-to-paycheck system and they see the upside if they were able to correctly obtain the right skills.

Concluding Thoughts:

All of that said if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like our upcoming book Efficiency. The benefits include: 1) How to get into the top 10% physically with 1 hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career the *right* company: Wall Street, Technology or Sales; 5) How to start an online business (the basics); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). , subscribe to receive discounts or follow us on Twitter for the launch. The Five Ways to Evaluate a City

The Five Ways to Evaluate a City

This is going to be a bit of a mixed post. Essentially, when you choose a city to live in, it is going to depend entirely on where you are in life. If you're at the younger age of the spectrum (target audience here) you're likely going to focus much more on economic opportunities since you prefer access to cash flow. While it would be awesome to simply move to the Bahamas and live a relaxing life forever, it doesn't make a lot of sense economically. As you get older, your priorities change similar to this blog where we're significantly less interested in chasing a few bucks at the expense of valuable time. So lets begin.

For young people, this is the first thing to look. Take a look at the industries in the city, both where is it today and where will it be in about 3-5 years. For the most part, cities don't change much in a few short years and there is no point in evaluating a city for 10+ years. This is because you'll be able to move if things don't work out. The key is making sure you choose the city that'll generate the highest income. While we are near certain that every smart reader will end up generating online income as outlined in we have to be realistic. A lot of smart people begin by taking a career position.

#1 Economics: Efficiency,

After a decade … This should no longer be the top criteria. It likely falls to the bottom (or near bottom). In a decade you should be focused on improving your quality of life. As we've said many times, money is just a tool. If you're stuck in a city you dislike with friends you loathe and a dating life that is boring… that is not considered successful to us. In a decade or so you'll be financially set to take more geographic risk (living in cities with less robust economies) while offsetting this with quality of life and lower stress (high net worth).

generating passive income

Now we get into a more interesting territory "later life". This is where a big fork occurs. If you're interested in having kids then your cities will change for a third time. If you're uninterested in having kids, you'll remain in the second paragraph. At this point, economic activity becomes more important since economic growth is typically associated with higher IQ individuals. In any case, a city that is fun for a bachelor is not going to line up well with raising a family (Las Vegas comes to mind as an example).

Putting this together we'd say your evaluation of a city based on the economy should look something like this: 1) it should take up 80-90% of the value if you're worth under $1M, 2) it should take less than 20% of the value if you're a millionaire and 3) it should take up about 33% of the value if you're having a family.

A good rule of thumb is to avoid cities that have male dominated industries. This would be technology, finance and construction. While New York is a rare exception given that media, fashion and many other industries are prevalent there, this basic filter will help you. The downside? You're only going to be able to take advantage of this later in life if you're going to work in Technology/Finance/construction for your first position.

#2 Demographics:

For young people, when you decide on the demographics… Do not rely on people your own age. This doesn't add much value to you since your peer group will unlikely succeed. People can complain and say if they "change the way they think they'll make it!" But. It just isn't true. Talent is real and the reality is that the majority of people are not going to make it. Under 1% of the population under 35 is worth over $1,000,000 (numbers don't lie). Solution: go and find people in your field and find out what they suggest in terms of a starting place. Take their opinion seriously since cost of living adjustments will impact the city you choose in a dramatic way.

After a decade passes, demographics matter quite a bit. Figure out the type of people you want to be around and get ready to make a few trips. Being rich and forced to hang out with boring people is not on the" to-do-list". Demographics determine your future rolodex. When you have made it financially you'll have contacts in the major cities so continuing to build a book isn't as necessary as it was before (unless you have a bigger number to hit). As an example of demographics, you want to search for 1) average age, 2) male/female ratio, 3) race/ethnicity mix, 4) number of universities in the region , 4) percentage of city that is married and 6) political affiliation. All of these will paint a good picture of the type of people you'll meet. A good resource for information on the population is worldpopulationreview. This is not good enough but it gives you an idea for your beginning research. If the numbers are largely the same as a city you like it's probably worth a visit. If it is similar to cities you dislike… cross them off the research list.

Moving to the next decade, demographics will be more important than economic activity if you're having a family. Why? Well you're essentially choosing the peer group for your kids. If you're not going to go down this route, this is typically why successful people live in two cities! If you remain single, you can live in two cities that address two different demographics you enjoy. This could also be driven by weather and outdoor activities as outlined in the next section.

This is essentially worth nothing for the younger people. If you have no money, fun shouldn't be prioritized. Every major city has enough to do for a couple of days a week since you'll be working the rest of the time anyway! Weather won't be an important quality in the beginning. But. Fast forward and that changes quickly.

#3 Weather and Outdoor Activities:

A decade later… weather and outdoor activities will become the second most important item on the city living test. If the city has the demographics (people you want to be around) the only other big swing factor is the weather and activities. While it would be interesting to *visit* a city that is freezing all the time with beautiful people… it won't be enjoyable to stay there long-term. For fun our personal preference is a beach city and an active city. This is a preference as there are some people who enjoy skiing more than the beach and others who simply enjoy living in the country with vast amount of acres (we couldn't do this). A simple example of a dual city set up here would be Miami and New York. Alternatively it could be Los Angeles and Chicago. We are sure there are millions of other examples but this is a good way to think about a dual city living situation.

Moving again to the later years or next decade or so, the activities are actually quite important if you're going to have kids. Again, not for us but for many people. This will determine the number of "attempts" they get at finding a talent. If you're in a city with limited activities, you're going to be limited in your guesses as well. The ideal city in that situation would be any major city that has a driving culture. Why? Well in a driving culture city you likely have more space which typically means more quality facilities. There is a reason why Texas and Southern California product quality athletes across multiple sports while congested cities produce athletes in more indoor activities. Activities determine the number of talent tests. To cap it off, if you're going to remain single this is still important as it gives you more options for fun. But. It isn't a deal breaker because you can always hop on a plane.

Similar to weather and outdoor activities, taxes will unlikely be relevant. People will say that "the 8% saved makes a difference". But. This isn't really true. The goal for young people is to scale up responsibility as fast as possible since a $10-20K difference in year 1, 2 and 3 isn't going mean anything. It barely gets you a single Bitcoin these days anyway. Unless there is an equal amount of upward mobility (the Company is headquartered in a tax free state for example) this shouldn't be taken as a big part of your decision making.

#4 Taxes:

Once you reach the next stage, taxes become unbearably important. A change in tax rate makes a huge dent into investment income (bonds, REITs, Real Estate, boring savings accounts etc.). That said, the city you live in determines a lot of the tax consequences creating an opportunity for you. From our experience, this is a big factor for the first 5-6 years of "new living" where you value your time over making a few extra bucks. After that it fades and you may find yourself changing cities for a third time. A high quality signal that someone is well off? Their level of hatred for the amount of taxes they pay. Unquestionably the worst day of the year.

<u>Side note:</u>

As you move forward, taxes become less important in theory. If you're interested in maximizing *net worth* they matter. But. If you've played your cards right you have more than enough money. We realize this may sound like a contradiction to the side note, but it isn't. If you're just over financial independence, a 10% difference is a big change. If you're 3-5x over financial independence it is much less relevant (you'll hate paying them even more though!).

This is a big one for the younger generation. When you move to a new city, doing everything "right" offers a large return on a percentage basis. Look into: 1) rental laws, 2) public transportation and 3) the services of the city. Rental laws allow you to decide if there are ways to game the city, from rent control to elongating leases for lower monthly payments. Public transportation is self-explanatory as a major city should allow you to move without a car (won't be using uber black daily like you will in the future). Services determine nightlife and culture, with shorter nightlife you're looking at day time activities and with a *low-cost* services industry you're looking at a lower stress city.

#5 Infrastructure and Laws:

In the future, this changes from rental laws to property tax/rental laws in the eyes of the owner. Public transportation drops off the list as it won't make a change to your budget and you'll rarely use it (only to save time). Services become more important as you ramp up the quality of your life and you look to free up valuable time. After all, if services can save you 5-6 hours a week and you can't make more money to offset the cost… something isn't working properly (it implies you're making less than the cost of services!).

Capping it off, in the later years, your focus then shifts to public education and safety for your kids if you go down that route. If you're more likely to remain a bachelor you're sticking with the same items in the second paragraph with a heavy emphasis on services since you're looking to maximize your free time. Keeping a pulse on the demographics and laws are constant (every month or so try to see if there are any big changes).

Can't really have this post without recommendations. Remember, this is for people who enjoy cities (and want to remain single). Good cities for this type of person include: Miami, Las Vegas, Dallas/Austin Texas (although Austin is seeing a demographic shift), Los Angeles for those that want to live in California, New York City and Chicago. There is a relatively wide range here since we assume you'll be less money hungry after succeeding over the first decade. While money motivation used to be high, it dies quite a bit once you make it (assuming your personality is wired for freedom and not materialism). That said everyone has a different lifestyle and those cities offer a wide range. Miami is better for lower stress offset by lower economic opportunities. Vegas is essentially a city similar to LA without the weather (desert version of LA) and lower taxes. Chicago/NYC are good for economics and bad for taxes. To cap it off Texas is essentially Miami with much lower costs and no beach/worse weather.

Fun Recommendations (Assumes second stage):

Q&A announcement: the Next Q&A will take place Monday May 14 for 24 hours.

The Future is Bright – NFTs (and Q&A Announcement)

The Future is Bright – NFTs (and Q&A Announcement)

At this point, the ship has sailed. People commenting on our blog about how crypto won't work are simply behind the times. The networks are growing fast and it is practically impossible to keep up with each sub-segment of the market. If you look at coinmarketcap they have already been forced to talk about different ecosystems, NFTs, DeFi etc. Meanwhile the people who do not "get it" are busy still trying to understand if Bitcoin is going to zero (Hint it isn't). This post is not meant for the majority. Even intelligent people will unlikely understand the ramifications of what is in here (not because we are geniuses but because many simply haven't looked into these items yet). So with that we can take a serious look at the big picture.

A good way to sell a product is through fear. Fear instills great motivation, much more than love (for better or worse). The joke is as follows "would you rather jump off a burning coal pit of flames, or eat a free ice cream". Clearly, jumping off of a disaster of pain and suffering is more motivational. So for the majority of products/industries fear is the primary motivator. The beautiful part here is that both insecurity and fear will drive digital ownership adoption.

Fear, Love and Insecurity:

What, What, Why? Well if someone has missed the run-up in BTC they certainly feel a lot of "FOMO" (fear of missing out) and over time the people who own the most digital assets will be able to prove it. This is immensely powerful. If you look at the convergence of art and crypto you'll be forced to jump down a deep rabbit hole. Why do people buy expensive art? Why do people buy Lambos? Why do people buy Richard Mille watches? Why do people buy $10M homes? The answer is to prove and show off their value. No one buys a Lambo to drive to the super market, they buy it to be seen and feel powerful.

valuable

How this relates to digital ownership and art is beyond clear. It is so clear that there was a book/movie that should open the eyes of anyone who has doubts: Ready Player One. In this movie (summarized), a new virtual world is created through VR and you can own land, skins (different outfits), weapons etc. In the virtual world, since it is larger and more connective, the world network moves online. This is extremely clear.

So why are people buying digital art and other scarce assets online? In the long term, proof of ownership will go online. You cannot simply re-create the Mona Lisa with an AI robot and command the same price (even if it an exact replica). You cannot simply recreate a Richard Mille without proof of its authenticity. In fact, digital ownership is *better* than physical ownership. If you walk into a club with your Richard Mille, most will believe it is fake (yes many haters live life like this). In the digital realm, you've created verifiable undeniable proof of ownership. People can take screen caps of your NFTs, they can try to recreate your NBA moment (top shots) and they can try to make the exact same item. The problem? In a single click everyone will know that you don't really own it. You're a liar and a fake with zero ability to prove that it is the original. It is time stamped and engraved.

The hash won't match.

Note: for those interested in NFTs check out Gmoney on Twitter

What does this mean for you, what does this mean for your future? It means everything will become authenticated long-term using decentralized protocols. We're not going into the technical jargon for now as most people have not even bothered to read the Sovereign Individual or Ready Player One. Instead we'll jump straight to the conclusion which is that your real estate will no longer sit in a dusty cabinet full of other paper deeds, it will be a token on the decentralized web (which is why they call it Web 3.0).

Hit the Ole' Fast Forward:

Why would you do this? It is faster, cheaper and more secure. Last we checked, technology usually wins when it is faster and more secure. While the infrastructure right now is "expensive" this is the exact same meaningless argument made by early critics of the internet. The argument was that the internet could not scale and that didn't turn out to be correct at all. Similarly, while we can use ETH gas fees as an example, this will be solved long-term. Expensive transactions will slowly come down and become seamless. We didn't go from cable connectivity to 5G wifi in a week, so don't expect decentralized blockchains to scale within a week either. The message is that it will be solved and you will either participate in the future (very bright future) of decentralized protocols and blockchains… or you won't. (Which funny enough goes back to the same circular argument of this being a fear and insecurity based industry as individuals panic about missing the boat… even if the boat has already left the dock and is slowly but surely going further away).

Therefore if we click on fast forward we can imagine how disruptive this will be to the legacy banking system. You'll be forced to compete with decentralized systems that are faster and more secure without needing an intermediary to confirm transactions. An interesting/amazing set up for the future. Over time? Governments begin to compete for the best citizens and you've seen an extremely miniature version of this with Miami being the first really crypto forward city (outside the USA, Asia is certainly far ahead of the curve).

At current levels, we're now playing an institutional game. Bitcoin is valued at nearly a trillion dollars (more or less) and moving the needle will no longer come from a typical millionaire with $2-3M in total value. It will be moved by people with $1B+ in assets under management. Take Blackrock as a fun example. They manage in economic value. This is an absurd amount of money as 1% would represent $88B USD. The firm has already stated that they are "dabbling in Bitcoin" and if any major firm of this scale commits to crypto, the rest will be forced to follow (or lose clients that want at least a minuscule amount of exposure to the growing industry).

The Institutions Are Here: *$8.8 trillion*

Now we also have to look at fixed income. While people use gold as the most obvious example for a store of value, you really want to look at Fixed Income. There are trillions of dollars in yielding bonds. Meaning people are willing to hold large amounts of money somewhere in return for a slight cost. This is insanity. In no world would we ever put money into anything that locks in a loss long-term. However, this is the world we live in.

negative

So now you have to look at the bigger picture, as more and more institutions move in, this de-risks the asset class. If Elon Musk bought $1.5B in bitcoin and he's seen as a visionary will anyone bat an eye if an institution with $2T+ in AUM buys $10B? No one will care. It will be a drop in the bucket and be seen as yet another selling point for the asset being "institutional grade"

To wrap it up we can then look at corporate treasuries. While we don't think people will go down the MSTR move of being all in on BTC with a 0% coupon convert, it is fascinating to see that the exact same strategy was used back when gold was seen as the store of value. At a period of time, people/companies would borrow money to simply buy gold. That is exactly what he is doing. Instead, we would not be surprised to see more private companies adopt Bitcoin as its treasury reserve asset (for some amount of value) and would not be surprised to see ancillary companies like Twitter adopt it as a reserve asset (After all Jack is in charge of Twitter and Square … Square already owns it).

If none of the above made sense, the following will. As VR video games become mainstream, the individuals will need to earn rewards. Well what is a reward… perhaps digital currency (hint hint). You enter the VR world and instead of trading digital token value, you could be chasing real store of value tokens such as earning Satoshis for being the #1 player in the VR system. This has profound implications as you can not only earn real tangible value but the video game creators can also earn significantly more money (the games would cost more if they drive real economic value). If this sounds sci-fi to you, we'd recommend talking to developers of video games (high-end) and report back… You can guess what you'll hear…

A Real Life Example of Virtual Economy for Your Boomer Parents:

While short and sweet, the bright people who follow our blog will understand this post. That is fantastic as you'll be wealthy and part of the next generation of forward thinking individuals. While we expect the next Q&A to be terrible we're going to do it for fun and focus entirely on crypto (no we won't tell you what we own). The Q&A will take place on Thursday March 4.

Conclusion:

We've been insanely busy this month for clear and obvious reasons =). Best of luck and we look forward to the Q&A even if it ends up being a large number of deletes from people who don't understand the basics!

The Future of America: Two Economies and More

The Future of America: Two Economies and More

This is a long overdue post. It will tie in a lot of stuff from the rise of socialism to the impact of brands (got a ton of emotional responses). True to form we like to focus on smaller chunks of time, around 2-3 years since it's more impactful. We've already publicly stated we're not buying stocks anymore (just leaving what we've got there) and are building a bigger cash reserve. We've also stated that brands work… Many cannot see how these concepts are tied together but lets go ahead and get ready for this lengthy article (much longer than usual).

to that one

The Current State of America

This is focused on today, not yesterday or tomorrow. Essentially we saw the middle of America and the "working class" (notice we didn't say low class, but working class) elect a completely different type of president. Naturally, we don't care about politics and never really talked about it after making a . That said, .

good amount of money off of it*the message was clear… the middle class of the United States was not moving up and to the right*

Now lets look around. The discount companies are at all time highs in terms of stock price. Look no further than Ross stock (ROST) or McDonalds (MCD). Then look at the middle/upper middle layer, Macys (M) or Nordstrom (JWN) and compare that to the ultra high end Kering (Euonext: KER). For those unaware (totally fine) Kering owns the high end: Gucci, Yves Saint Laurent, Alexander McQueen… and more. What do you see? You see a massive change in stock price around 2016-2017. During the retail meltdown (people moving online) you see that the luxury market continued to ramp higher.

So it's time to tie it together. How is this possible? It is possible because the latest generation is being separated into two groups, the "new rich" and "the lower middle class". The new rich have different styles/looks and several companies within Kering have figured it out. Since people got so upset about the previous article here's a fun hint… around 5-10 people noticed we specifically mentioned the impact of Gucci ()

this was of course by design – feel free to look into why

Hopefully the last few paragraphs were at least a bit convincing as you can see it everyday in the numbers. The stock prices don't lie. If the middle market companies are suffering while the two companies targeting the lower end and higher end are flourishing… the picture is pretty clear. We're seeing an economic separation.

How did we get here? The answer is technology of course. Due to changes in technology many jobs and tasks are being done by little lines of code. People just call it "Artificial Intelligence" since it sounds cooler this way, but software has been slowly taking away high paying jobs for years. 30 years ago when you were in school you were taught that "you won't always have a calculator on you" or "hard math is the only thing of use"… here we are 30 years later and computers are taking over a lot of those hard math problems and you certainly have a calculator on you at all times. It's quite interesting since the creators of high quality technology essentially "took all the value" into the hands of a smaller number of people.

Overtime this has only accelerated and the rich continue to get richer while the people left behind remain stagnant. Looking around, life doesn't appear to be all that terrible for people in the lower middle of society, they still have access to tons of cheap entertainment, fast internet and many other amenities. That said. They are basically staying in the same general socioeconomic hierarchy year after year.

How This Plays Out Socially

No surprise that drug use and hook up culture is prevalent in the United States. If you see no real chance to move upward in society you're going to be drawn toward hedonistic activities. This results in lots of alcohol (blacking out), drug use and casual sex. In fact this thought process goes all the way up to around the "upper middle class". This is because the jobs/careers in that range are seeing the most pressure (people who make $200-350K a year are ripe for cost reductions, just like the middle management layer in any corporation). The people in the upper middle that didn't quite make it fall down a peg and say "screw it" and also participate in this new culture. The rich on the other hand continue to make more… and live better lives.

Looking at this, it's not officially a "black and white" divide between the rich and the "lower middle class" (we don't say poor since you can still live a good life with $60-80K a year in a lot of places in the USA). That said. It's moving in that general direction. Since we're still in an environment where you can "move into the ultra rich", this current environment is essentially the *platinum* age for making money. You have the VAST majority of the population from the people with little money all the way up to upper middle class doing the exact same thing… Giving up.

From a social perspective, what you'd expect to see if the above is true… is happening right in front of our eyes. If the prior paragraphs are true what you would see is 1) an increase in hatred towards people who have luxury items – from those that do not, 2) an increase in animosity for anyone who makes the next jump financially – from those that did not and 3) a decrease in overall happiness for your average person as they were unable to move up socioeconomically from where they started (notice, average in this case refers to where the person started on the socioeconomic ladder)

Beyond the hatred and animosity for people who make it, you'll see more and more animosity for *smaller* gains. If you go from making say $50K a year to $500K a year, you'd typically see a lot of people say you changed or are a "jerk" now. This holds true throughout human history. That said, we've noticed that if someone even makes a *small* gain they *still* get a ton of negative reactions. This is startling. To avoid making anyone mad, just look at the people building their own personal brands on Facebook, Twitter, etc. As soon as they start to succeed even a little bit, the venom starts to flow. Not a good sign. It means that small to medium improvements are insulting (the majority are having a hard time mustering that)

The Platinum Age

With the bad news out of the way… There is still a good amount of time to make it. We're certain that anyone who wants to can still get to and this would get them with a small amount of luck (assuming they start in their 20s). Since we've painted a picture of an economy that is currently separating, you definitely want to be on the right side of the equation. So best to make sure you attach yourself to the right people.

$1 million over 10 years*close* to $10M

Before deciding if you're going to spend your valuable time with someone, make a decision on the type of person they are. If they are "happy when others fail" this is a miserable person and should be avoided. If a person is happy when other people fail, he/she is extremely likely to be happy if you personally fail as well. Other good tells include: 1) avoiding people who dislike the rich, if someone dislikes rich people then they are setting a psychological barrier that will *guarantee* they never become rich.. 2) attach yourself to people who are improving and cheer them along the way. If someone passes you or you pass them, there should be no animosity. That's how life works. Ebbs and flows and the guys who make it to the next level are not going to "look down on you" if you are still trying to go somewhere. 3) avoid the people who appear to be doing the same thing for 2 years. This is enough time. If someone hasn't improved at all in 2 years they are essentially giving up. It doesn't need to be income it could be their interests for example. 4) don't give any of your time to the people who get upset as you change. There is just no way you improve your life and stay the same. It doesn't make any sense at all. They are also showing their cards: they disliked you deep down in the first place (or they are insecure, both are terrible).

Read Between the Lines: **If someone hates rich people, they would have to hate themselves to get rich**

: This has been beaten to death. And. Many people still don't get it. Working for someone else does not lead to wealth. The percentage of careers that lead to wealth are so slim that you're better off trying something small on your own. How many careers/jobs pay $1 million a year? Practically none. Also. The more you make the more the Company will try to automate/get rid of your high cost position. .

Create Ownership/Equity/ScaleHint Hint another reason why sales is recommended here as a "for now" career as human interaction is unlikely going to be automated over the next decade or so

Since this is arguably the , you've got to keep making adjustments. It doesn't matter which route you go down (the most basic and low chance of losing money route – personal brand/looks industry, or the higher risk higher reward route – product sales/affiliate marketing). Naturally, if you're making good money already just go the product route. Anyway. Keep making tweaks and eventually you'll break through financially to the "next level" if this is from $0 to $1,000 per month or $5,000 to $25,000… Who knows. The point is that you'll have a project (you don't need more than one) that is being worked on constantly to help you move into the "right side of the divide"

*Keep Making Tweaks:*easiest time in history to earn money online

The Transition Age

At some point we will begin to go through the transition. We'll reuse a similar photo we've used in the past below.

Just like the stock market, peaks and valleys in terms of opportunity also occur. Since the last decade or so has been nothing but amazing upside, sometime over the next couple decades will be a period of maximum pain. This will likely be driven by Artificial Intelligence as middle and upper middle class jobs/careers are eaten up. Before this happens you'll notice increased contempt for the rich and the rich will naturally have increasing contempt for people trying to steal their hard earned money.

During the transition age you need flexibility. Like any cycle, there is always a good place to be. As this tension rises put more and more effort into diversifying your investments and having assets accessible without a third party (we all saw what happened in Europe). During this painful transition to Artificial Intelligence, you'll have a large opportunity to become wealthier by simply investing into lower middle class goods (naturally if there is a wealth tax or a way to move money from the rich to the lower middle class, they will spend it).

Being honest here, it's tough to figure out what this looks like since we're still quite a way from seeing the real impact of Artificial Intelligence. That said, we're quite convinced on the splitting of the "haves and have nots" since we can see that every single day. There will be capital allocators (ideally you, yes you reading this text) and then there will be people who are generating basic income working with robots instead of owning said robots.

How to Prepare

With the broad picture out of the way we can get back to the more valuable stuff, what to do now and explaining why our culture is changing so much.

Humans are naturally competitive. Even guys with no results no talent will talk your ear off and give you advice on sports, dating and money if you let them. But. If you date beautiful girls, have a bunch of money, normal/good social skills and are in shape… You will be the target of many many haters. This is a good thing as people waste their time giving you more attention which can ideally be turned into more money. Now when you find the rare people who are happy for your success, we will bet a good amount of money that they can be trusted in general. Unsurprising that this is how it works. The conclusion here:

Growth and Human Nature:*andthe only people you should give any of your time to are the people who are supportive/happy for you.*

Previously, you would see a photo or a video online and believe that it was real. This is officially dead for anyone who is well off. The well off people know how easy it is to fake an image and even a video. This will push down to the rest of society. That we are convinced of. This is why we've stated that starting your own services/brand using your own name is perfectly fine to make a living. These people with their own name out there will see hyper growth as they have an actual fan base. If you're really out of options (no way to start a product company, no way to get into a high paying career) go down this path since you're going to see a lot of growth. The value of real time messaging is going to go up. Reporting on the past is dying out.

Hyper Growth in Authenticity:

This is also occurring as we speak. Value of posting photos of rented Ferraris and homes? On the decline. Posting a video sitting court-side at a Knicks game, on the incline. One is easy to fake the other is significantly harder to fake particularly if you do it consistently. The "new rich" will be able to tell the difference. Spelling it out. If you're smart, spend less money on "people" for all your ads/photos as you can have them rendered to look better for a fraction of the cost. Take all that money and spend it on real time items… as they say "Customer Acquisition Cost (CAC) is the new Rent"

Increased Value of Events:

Since nothing we see online is real anymore (software/AI eating into these arenas), your in person image value is going to go no where but up. Before going to any event ask yourself what type of impression you want to make. People can fight this as much as they want but that's the direction we're going. People are unhappy since they are not seeing much mobility so make sure you *don't* send this message (that you're not going anywhere as well) since it broadcasts the wrong message and is a self fulfilling cycle. Similar to avoiding overly negative/cynical people. Their beliefs are self fulfilling and these types are also (surprise) typically not well dressed.

In Person Image Value Going Up:

The rate of change we're seeing is only accelerating, around 10-11 years ago people still took Taxis and used Blackberry phones. This means the way you currently earn money is likely going to see significant pressure at some point over the next 5-10 years. In some cases it won't even be there. So. You have to learn a new skill to pay the bills ahead of time which allows you to "Double or Triple earn" accelerating your investment rate. Notice. Learning random skills is just not good enough anymore. Learn one skill that can earn you money before it is too late.

Learn Any Skill That Makes Money:

Concluding Remarks

After re-reading the post it just looks brutal. People are having a hard time moving up the socioeconomic ladder so they resort to a lot of hatred and resentment nowadays. The extremely good news is that everyone who reads this post has the highest percentage chance to jump the chasm in human history. This is the natural balance of life. If the old way doesn't work anymore it means the new ways work the best and see hyper/parabolic growth. You know what to do. Figure out the new way and don't look back.

the old way

While this was a different post than usual (more high level) it's fun and feels like a cathartic release writing it out. Who knows if all of this ends up being right, yet the visible data points we're seeing tend to suggest this. The ones who don't make it become clearer as they become more and more resentful and negative (some of them are even violent in public). The middle tier brands are falling off. The low end is seeing growth… the high end is seeing growth… And… people are losing trust in videos/images/the news etc. Quite a crazy time to be alive… No worries… Won't be doing a high level one in the near future!

****

The Future of Money and How to Use It

The Future of Money and How to Use It

Not sure what the name of this post should be, but when you really think about it, money is being printed at all times (across the globe) which is removing capitalism. In a normal capitalistic country, failed companies would go bankrupt. These failed companies would then be purchased (the assets) and run by someone else. Instead, we're printing money to keep zombie companies alive and giving them interest free loans so they can survive. We're not here to debate if this is a good or bad idea (you can guess what we think from the prior sentences). Instead we have to focus on "what to do" as the future holds all of the value.

Hopefully we can agree on one thing, money printing won't stop. If you have double digit unemployment and on top of that you have debt above revenue (Debt/GDP is around 3x) it means that you cannot turn off the printing press. If you do, all of the people with debt go under. This is a complete disaster for the current financial system so we should assume that every government wants to avoid mass default.

Money Printing:

Now if we can agree that the government wants to "inflate away" the debt if they can, it means you need to get your money out of cash and into anything else that is scarce. When you take a 25,000 foot view of the world, we know that the supply of money is going to increase dramatically. If we open the economy tomorrow or in 2021 (who knows), it's going to require a lot of money printing.

The second item here is that you have to ignore "near-term" potential in practically everything. Why? Near term changes don't matter if the money printer is on. It means that all companies should be looked at in terms of 2023-2025. Interest rates are going to be 0 for the next 3 years (as already announced) so the real value of money will show up in three years (putting us into 2023 and beyond). Therefore instead of worrying about "cash flows" for the next couple of years, we have to worry about "who is actually going to be around" in 2023-2025? This is a big change in thinking and also explains why ultra-high technology firms are seeing significant increases in valuations/multiples (we recommend following Chamath Palihapitiya for a further explanation of this).

For those that want the "gist" you want to take all your cash and buy anything that is scarce/useful and anything extremely high tech that will be used in 3-5 years. The only cash you should have is enough for emergencies at this point since we've gone full crazy with the money printing.

Recently, Microstrategy (a technology company) bought a substantial amount of bitcoin with its balance sheet. The interview with the CEO Michael Saylor was quite informative. Funny enough, we think the most important concepts don't even relate to bitcoin. Paraphrasing below:

Real Inflation Rates:

"If you were a lawyer and made $500K a year and saved $50K in 10-years you'd have $500K in cash. While you're still saving $50K a year, that would be an increase of just 10%. Meanwhile, the cost of education (for your kids) is going up 8% per year. So that $500K you have earns $0 in interest and now it buys 9 years of education instead of 10. In another couple of years it only buys 8 years of education instead of 10… and in another couple years… you get the point"

What he is saying here is that the cost of the things that are necessary to get ahead are growing way faster than the rate of printed inflation. So if you need a home? Well home prices in major cities (at the time) were increasing by much more than 1-2%. Education? Another item you want/need to get ahead is also increasing by more than 2% (closer to 6-9%).

We did some digging and came across an interesting website which makes intuitive sense to us. This is well known to most of you but in case you've never heard of it it's called the Chapwood index (). While we would argue that the numbers are aggressive and should be discounted a bit, the real inflation rate is unlikely 1-2% and is much higher (probably closer to 6%).

https://chapwoodindex.com/

It's relatively simple now, if we know that money printing is going to continue (it has to) and we know that the government wants to create inflation… it means "money" is going to represent valuable assets in the future. If you have $50 in your pocket or one share of coca-cola stock, you're better off being the guy with one share of coca-cola stock unless you absolutely need the physical cash for the purchase of basic needs (or you believe coca-cola is going out of business).

How to Think About Money Now?

After reading quite a bit about global monetary policy the simple way to phrase it is you should look at your physical cash and say "This is worthless". While it is an extreme view, the point is clear. Unless you're using it there is no point in having money in your pocket or under a mattress or in a bank earning 0% (no different than parked under a mattress at 0%). Being responsible is no longer encouraged.

to purchase productive assets

Here's a new way to think about it. Assume you have $1,000 in your hand. Instead of saying you have $1,000, ask yourself how many shares of XYZ company you can buy. We have already outlined where we believe the future of tech is going (in our book Triangle Investing). Outside of that, make your own decisions and say "how any shares of this company can I buy". Then go through all of your spending and start denominating everything in shares of companies.

Is your steak dinner with your girlfriend worth a full share of the S&P 500? Do you have 100 shares of S&P 500 in your checking account? 1,000 shares? 10,000 shares? Does this make sense if you know the amount of dollars printed is only going to go up? So on and so forth.

These are very big questions. Even if you want to be conservative, instead of saying "I need 2 years of cash in my hand" ask yourself "how many of my investments are already up 100%, 200% or even 300%?" Therefore, even if you needed to sell some of them for cash to pay for something, you'd unlikely lock in a loss. This will prevent you from being one of those strange people who have 5-10 years of cash earning 0% for long periods of time.

With the knowledge that money printing will occur no matter what, your new flow of money should look like this: 1) absolute bare minimum to survive ~12 months without income and 2) every single cent after this needs to go straight into productive assets. Doesn't matter what it is, anything that generates returns above 0% is good enough. Why? Well bonds are at nearly zero, interest on savings accounts are zero and more money is being printed! So this means if the money supply goes up by more than 1% or so, you're losing money on that bond "investment" (Ie. your purchasing power went down).

Flow of Money:

For fun we'll stick with the above being correct. All we need to agree on is that the government is going to be forced to print. If we can agree on that, it means that the next 4 years will see more inequality. The rich will get richer and the poor will get poorer either though inflation or through lack of asset ownership. Even if prices stay the same (for all goods) if the cost of assets (homes, education, etc.) all go up… the only winners are the rich.

Implications:

With the main point out of the way, we can then move to secondary effects… which is that people will not be happy about it. The average person is not going to be okay with a massively increasing divide between the rich and poor. There are two ways to transfer that wealth through 1) taxation or 2) through a wealth transfer. Since wealth transfers are rarely seen as successful, an increase in taxes is more likely. Our best guess at this point would be an increase in property taxes since it is the most difficult to avoid.

Other ideas include: 1) a change in tax on dividend income, 2) a change in tax on stock issuance and 3) a change in tax on income. Generally speaking, the issue going forward *won't* be an income issue. It will be an asset issue. This means that you have to find a way to tax people with a lot of wealth not people who are earning a lot of income.

By way of example the person who is worth $10M today and makes $100K a year as a junior college professor is the person you have to tax, not the person who is worth $250K and earns $300K a year. This is a much harder issue to solve so we're sticking with various forms of "wealthy people" tax as the solution.

PS if you've got an answer to a divide in rich and poor based on assets we'd love to hear it.

For now, it's best to focus on the main items up front. Keeping your "value" out of cash and in items that will be used 3-4 years from now. Be it high tech stocks or various scarce assets. After a few years, we should see an increase in the proverbial divide "haves and have nots". At that point it would be wise to find ways to hold valuable assets that are difficult to tax (a good example would be rare art).

Conclusion:

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life.

The Future of Wall Street

The Future of Wall Street

For those that are in the "know" Wall Street is currently going through a major restructuring. The new issuance market (IPOs) has cooled off substantially when we compare 2016 to 2015 results and there is no reason to believe there will be a material snap back any time soon.

We'll outline our thoughts on how the industry will evolve.

Overview

First, there will be a barbell approach to existing investment banks. This means that there will be two types of firms, first the type that provide primarily advisory services such as Moelis, Evercore, Qatalyst and Lazard and the second group that will have a mix of IPOs and advisory service. The catch? Everyone who is in the middle will be squeezed. Return on Equity metrics across the industry have declined materially and we have to look at how the banks will adjust to hit their return metrics. In an answer? Layoffs.

Barbell of Banks:

If we fast forward a decade or so we see two key changes. First the smaller banks will either die off or find some advisory niche. Second, the larger banks will down size to address core markets that have large revenue potential. With a cooling market, the clear answer is to cut the global equities business first.

No one is immune to the cuts. However, the areas that will be hit the hardest include Research and Sales & Trading. As more clients move to electronic trading, the need for a human to match buyers and sellers becomes irrelevant. In addition, if the equity market is cooling off, there is no reason to have multiple senior analysts covering sectors with minimal investment banking potential. Finally, on the investment banking side, the clear loser in this case would be Equity Capital Markets. The silver lining here? Sectors with good banking potential or good growth potential in general likely won't be hurt much. The non-core sectors will be consolidated with more "multi-sector" analysts to keep costs down and maintain full coverage of US equities (Marketing for investment banks).

Who Gets Cut:

Somewhere around 20% makes sense, perhaps up to 30-40% for some banks (think DB, Credit Suisse, Barclays) given the weaker environment and impacts of Brexit on European banks. We are still in the early innings of cuts, while some small reductions in force (RIFs) were made earlier in the year and over the last 2 months of this year… The Trend will continue. Anticipate seeing another set of cuts around the January time frame and don't be shocked when the hammer drops.

How Big Will the Cuts Be?

In addition to the cut in head count, expect bonuses to be down materially as well. We would wager another 15-20% decline in bonuses (we will announce the real numbers at the end of the year before normally available) but this rough math makes sense. If the cost structure is about 20% over staffed, you have to charge the restructuring costs of FY16 numbers so the layoffs don't really help the bonus pool at all.

The safest sector in our view is the advisory segment. If you're working for a top advisory firm and have buy-side relationships where you're "their banker", then you're in great shape. As long as you can offer good advice and help negotiate attractive deals, there is no reason for you to be displaced. Giving high quality advice is difficult work. This is a great dynamic for the industry as it is least prone to automation. Instead of simply reacting to rules like a trading algorithm, it is not easy to automate 1) multi-year relationships, 2) salesmanship and 3) a long track record of successful transactions.

The Safer Segments:

Secondly, beyond the advisory piece we find that "hot" sectors will unlikely be touched. Expect a wider gap between the haves and have nots. This means sectors such as Internet (AirBNB IPO, Snapchat IPO, Uber IPO etc.), medical technology (including biotechnology) and energy for example. While we wont go through a list of each sub-segment, simple high level views should give a clear answer… Is there investment banking business to be done (new issuance and growth) or not? For fun we'll provide one example, which is banks themselves. If banks are cutting and downsizing along with overall secular declines, this is not a good sector to be tied to.

The segment is also in secular decline, ETFs and significantly reduced management fees will be seen. While it will not occur abruptly, secular declines will be seen and the safest place to go is Private Equity or specific hedge funds.

How about the buy-side?

– private equity will always be around. If/when interest rates start to hike… then it will become even tougher. That said, there will always be poorly run companies that need to be bought and fixed for a profit

– hedge funds, any fund pegged to beat or be in-line with the S&P (beta 1) will see secular declines. This is no different when compared to a long-only. The two pieces that will likely still be around are market neutral hedge funds and merger arbitration funds.

In short, avoid all investment vehicles pegged to the market. Go to PE or a market neutral/merger web hedge fund.

This will be the largest structural change we'll see over the next decade. Timing the exact year is not easy, however, any rule based position is going to be dismantled by automation. Cars will have self driving capabilities (somewhere around 2021 it seems) and the need for taxi drivers will decline as well. For Wall Street, this is the trading segment. Matching buyers and sellers for a few pennies per share, will decline materially. An automatic, electronic trading mechanism will decrease total revenue associated with these transactions and this will cost fractions of pennies per share. The need for human involvement declines for most day to day activities.

Automation:

Automation will not impact relationships on a massive scale given that trust is a difficult quality to build over a multi-year time frame (let alone automatically).

We will now answer this with "it depends'. If you're going to end up at a major bank post the downsizing (you're likely ok) and if you end up at a top tier advisory firm, you should be thrilled with the opportunity. The upside to attaching yourself to a growing sector or a major advisory firm will remain unchanged. When you make a percent off a billion dollar transaction, there is enough money to be dolled out to everyone. The only problem is each individual should choose carefully. If the sector goes into secular decline, either you will be fired or you will get lucky and be a multi-industry expert as spaces consolidate.

Is Wall Street Still a Good Career:

Long-story short, there are really only two paths that make sense. A major bank within a good sector (either the bank is good at getting on deals or they are expanding) and secondly within advisory.

The silver lining here is that many sectors will need more bodies. Technology will not slow down any time soon and this means being an engineer is also a good career. You're still going to go into: . This advice hasn't changed, the only difference is that you have to be even more careful when choosing your niche. There will be an immense amount of growth in technology and overall innovation and the opportunities will be endless (for a select group of smart people)

Now what? Sales, Silicon Valley or Wall Street

Best Ways to Make Money

The common theme here is that . If you can build up your ability to sell and build trust at the same time, you're going to be fine. This does not require fancy degrees or thousands of dollars of college debt. This only requires hard work, persistence and an obsession to become successful. The days of being paid without eating what you kill are dying slowly but surely. The producers will continue to make grips of money and support roles that do not require sales (clerical work) will be eliminated.

Sales: everything is still sales

If you have the skills, going into technology is still a great sector. Facebook, Google and IBM will still be around in a decade and having a set of skills that are difficult to learn will help you land positions at major technology companies. Negatively, this segment will also be cut between the haves and have nots. Hardware engineering for example is simply not as useful as software engineering. So. Choose the sector carefully, got to a *top school* and find a way to avoid debt. This will give you a clear path to riches.

Technology:

As mentioned above we think advisory and "hot" sectors are best. That said? Go to a big league advisory firm if given the chance. If you're working for Frank Quattrone and are involved in many major transactions, your resume will stomp out all of the competition over night.

Wall Street:

This is the second leg of the puzzle. If you can land a solid career, within a short couple of years you'll have enough to begin your own venture. Once you do, the sky is the limit. It is very difficult to get rich working for someone else, they are never going to pay you what you are worth otherwise they would lose money! As always refer to our post on a

Starting Your Own Company: clear path to a million dollars.

Ramifications of Wall Street Adjustments

– The ability to obtain a position on the Street will decline. The competition will continue to be fierce and the number of slots will decline (structurally)

– The number of positions in Global Equities will decline materially. This will lead to a swath of people fighting for corporate finance roles within specific companies

– Crowd funding will prevent smaller scale IPOs. With ways to raise funds outside of debt offerings (mezzanine, bridge loans, etc.) before going public, the time frame will become elongated. In short, there will be longer sales cycles unless the economy is rocking and rolling

– Generating revenue will be tied to performance based bonuses. While there is always some wiggle room for the sales cycles, if the sector/group is not producing the bonus differential will magnify. Don't expect to get paid simply because you did all the right things (followed the rules). You have to generate revenue.

– Top tier students will likely flood technology. With financial packages that are more attractive when compared to investment banking the cream of the crop will turn to positions at Google, Facebook and other large and growing technology companies. The remaining that attempt to go into Wall Street will be difficult to compete with, however, they will no longer be the top of the top.

Conclusion

Wall Street will go through material changes over the next several quarters, however, there are still slots that will offer large compensation packages and upside over the next several years. The performance based structure of the industry will move to "eat what you kill" and it would be wise to choose a segment or sector that will be growing and not consolidating.

—

Side note on politics. Yes Donald Trump will win the presidency on November 8. We placed a financial wager on and it will pay off. Despite many concerns about his potential downfall we know with certainty the polls are skewed and yet he's still within spitting distance. As more negative news surrounding Clinton surface, the inevitable outcome will be seen. Brexit 2.0.

Mr. Trump last year

The Getting Rich Thought Process (Part 1), Weekend is Part 2

The Getting Rich Thought Process (Part 1), Weekend is Part 2

One of the realities of life is that moving up in life causes you to lose "touch" with prior problems. Anyone who has followed this blog can see the significant change over the last several years. We used to focus on things that people struggle with if they are still trying to make it (still stuck in the $150-200K/year range). This included optimizing your life for dating, finding short cuts for working while on the job and creating benchmarks to keep your eyes on the prize (getting rich with tons of a free time). Since this was the target audience in the first place, we're going back to that type of content with a slight twist, reviewing what we would have changed to make the process even easier. Mainly, adjustments we would make in 2019 and beyond since the opportunities continue to morph.

Even in 2019, there is no reason to change the timeline, you can get reasonably rich within 10 years and the process is still similar: get to two forms of income asap (ideally more) and invest into nothing but cash flow positive assets – never sell. The good news is that we would argue that it is easier than never to make a few bucks. The bad news is you probably want even more than just a couple of forms of income as the cash flow may not meet expectations. From what we've seen, the larger established cash flow companies continue to put the clamps on smaller sized businesses. This is due to margin compression and inability to compete with scale. The good news? It's easier than ever to create multiple small niches.

No Timeline Change:

Unless you plan on building a massive unprofitable technology company and take it public (Uber, WeWork etc.) there is just no reason to deal with the headaches associated with negative cash flows. Since you're starting from zero even an extra $5,000 a year is a solid 0.5% of the way to a million dollars ($10,000 is already 1% of the number and that's possible to do in a single day in the future if you're lucky & successful). We're going to veer a little bit away from Efficiency here and talk about potential "prerequisites" for efficiency since we realize many people are starting from Zero dollars.

Only Cash Flow Positive Side Incomes:

The first item is to always get a desk job. This is always our initial strategy. While it is true that there is money in starting a brick and mortar company, if you have $0 to your name a desk job is going to work out better for you. Why? Less of what we call "bad stress". Bad stress involves potentially going bankrupt, going into massive amounts of debt and being forced to worry about every single penny you have.

Notice we've lowered the bar a tad to any desk job. In efficiency we say you must start in a career, but this is a post tailored to people with quite literally nothing. Once you get a desk job you then look to optimize the hours at the desk job. You can do this by trading time for money. That's right, we're actually fine with time for money exchanges if you have $0. Everyone (including us) traded time for money at some time. Your time for money exchange has a small wrinkle in it. It must be done at your desk. This creates a lot more opportunities than you could actually imagine if you have interest in getting rich. You can do any service that is done on a computer (hint there are millions of services done from a computer including editing services and copywriting to graphics design). This is now optimizing your time.

Some quick math. Lets say your first desk job is just terrible, you get paid $50,000 a year and work 40 hours a week (around $25/hr). Here's the first lesson in compounding. Since we know that low paying desk jobs rare require 40 true hours of work per week (more like 20 hours), you can now compound this number with just one or two projects a week. While most will laugh at the thought of doing a project that generates $100 a week, if you can do this consistently your daily income goes from $200/day to $220/day (10% increase). You've given yourself a 10% raise.

Do the math on that 10% increase or $5,000 a year. On a meaningless $5,000 a year in extra income, if that represents all of your savings for your working life, you're a millionaire at age 61 (40 years out and assumes you're 21 when you start and a 7% return).

That now practically guarantees you're going to become a millionaire before you die if you live past age 62.

Now that you've given yourself a 10% inorganic raise, it's time to learn the lesson of "life time value of customers". It doesn't matter what you are doing, if you're getting a lot of a referrals it means the amount of money you are charging is just too low. This increases the amount of money you're making Now you'll scale this up until you simply can't take any more customers.

Learning the Value of Time: *without being forced to look for new customers*.

As we've learned in basic economics, price is a function of supply and demand. Since you can't physically work more than X projects per week you either have to raise prices or you have to train someone to do this same job for you. This is where a typical mistake is made. Most will simply keep raising prices until the referrals stop coming in as the value is roughly equal to the price. Big mistake and doesn't account for the value of time.

Humans by nature are incredibly lazy by design. They would much rather go somewhere and get something guaranteed than take the extra time and effort to start something themselves. So… the answer is simple…. if you were willing to do it for the amount you are charging you'll find someone else who is willing to do it for 90% of the value (the lower the better!). Congrats you've suddenly turned this miniature hobby into something that may turn into a business.

At this point, mathematically you've at minimum created an extra $10,000 a year income. This is absolutely nothing in the grand scheme of things but The exact number is 9 years based on the same return profile but the point is roughly the same. You're now a millionaire at age 52 instead of 61.

you've cut a decade out of the time it takes to become a millionaire.

Funny enough, you'd think that your regular desk job performance would go down the drain. This has not been our experience and has not been the experience of people we've seen succeed. The reality is that your desk job performance actually goes up. Why? You're excited to go on to your next project and want to find ways to do the job faster and more efficiently without any significant error rate change. This optimization is going to bleed into your project work as well. A virtuous cycle upward.

Optimize:

Now here is where the decision making gets harder. You've got some desk job and you've got some side income and have a chance to get promoted or scale up other projects. You know (personally) that you can't do both at the same time. While we'd love to tell you that you should always scale up projects the truth is that the answer is unclear. If you can get a substantial pay increase with a *temporary* increase in hours, you should probably stop taking new projects for a few months. Why? We the fact that you're forced to turn down some projects will actually increase your brand's value as you are seen as a scarce asset. Also.

Never disrespect the chance for guaranteed money (classic mistake).

On the other side of the coin, if the new position require you to give up all of your projects for the next several years, it probably doesn't make sense unless its an insanely large amount of money. This isn't a mathematical science and this is why we still hold monthly Q&A's for situations like this.

: Assuming you've got this game down now, you're spending your time optimizing the desk job white churning out new projects. Most people get emotionally attached to their projects at this point which is a bad thing. Eventually you have to give up control. When we say give up control we are 1,000,000% not talking about ownership of the actual small company you're building. We're referring to the number of tasks you're willing to do. For fun it typically goes like this: Virtual Assistant -> help with sales -> back-end. Virtual assistant saves time and costs next to nothing. Initial sales positions are the easiest to calculate when it comes to profitability and finally back-end makes the small company easier to sell as no one in their right mind enjoys fixing boring technical/communication issues.

Giving Up Control

At this point your mind is no longer going to work as it did in the past. You're going to have at least one item generating money for you while you quite literally sleep at night. The downside of this revelation? You will now realize you're without a doubt being paid much less than you are worth at your job/career. For some reason you have to be in a position where someone is quite literally making money for you to realize that you'll never be paid your true value. This makes it a lot harder to show up to that desk job you're using to pay the bills. Who would hire someone that loses them money? Absolutely no one.

The second big catch 22 here is that you're going to be significantly better at your desk/day job. Why? You just won't be able to pin point it. To make a sports analogy if you're extremely good at say tennis, do you think you'll have a easy or a hard time learning how to play racquetball? Now take it a step further, even if you had to take up Golf we would bet that you'd start off at a higher skill level than most people. Why? You've learned basic techniques (how to hold a racquet) and are in better shape than most people. While it won't be as transferable, we would wager good money that you'll learn something transferable that'll continue to push you ahead of everyone around you.

Anything that produces money is a transferable skill.

This is a new concept we'll be talking about more often. Being "forced in". Typically, the people who fail at making money over longer periods of time suffer from over confidence. They do all the processes above, they see the market expanding and they spend a large chunk of their earnings (say 15-20%). This then leads to a year-over-year decline in income the next year (life's wonderful way of reality checking people who think they have it all figured out). This causes a reset once again in the journey to becoming rich.

Get Forced In:

Instead, you should always expand the distance of "living below your earnings" and eventually you'll be "forced in". What this means is that you'll make tons of adjustments and continue to save/invest more money and get new customers. Then you're forced into spending for yet another money making opportunity…. More on this on the weekend…

****

The Getting Rich Thought Process (Part 2 of 2): Avoiding Traps

The Getting Rich Thought Process (Part 2 of 2): Avoiding Traps

, the reason why there are very few millionaires is actually quite simple: overconfidence, cash flow and of course lifestyle inflation. Those three items all relate to one another but are difficult to see since they creep in over time. In fact, we can wager every single person on this blog knows of "someone" who is roughly on the path outlined in the previous post. Yet. By the time everyone is 40… Almost none of them are actually financially well off! Why is that? Well you'll see why in this post.

Picking up where we left off

The tricky thing about those formulas that say "save 50% of your money and you'll retire in 17 years?"… it assumes your spending never moves. These percentage type numbers don't do a good job accounting for lifestyle inflation and other likely factors in your life. The vast majority will end up having kids. The vast majority will increase their spending from age 20 to age 40. The vast majority will not be able to save 50% on day one.

Over Confidence:

For fun we can work backward on this topic. If we assume that you want to spend $100,000 a year for life, it means that you would need to save $100,000 per year for 17 years straight. Since this number is not viable for the majority, we can go ahead and use $60,000 to prove the same point.

On a post Tax basis.

If your lifestyle would be amazing with $5,000 a month, it means you probably need to make $200K per year for 17 years straight. This is a rough estimate as the post tax earnings at $200K is actually only $135K (using New York to Keep it simple). It allows you to spend $6,250 per month. And. It gets more complicated than that. We assumed the following: 1) no job loss, 2) no income loss, 3) no lifestyle inflation and 4) no one time financial issues. The reality is that at least two of these things will go wrong, if you read the prior post our money is on the side hustle job loss versus the career job loss (since there is more volatility).

Now the final warning piece when it comes to overconfidence… Run the numbers. No matter what you absolutely must run the numbers. If you get a sudden windfall of $50,000 and decide to use it for something like a nice car, The cost of overconfidence should be measured in years of work, not dollars received (when you're officially rich you can avoid this calculation since it becomes irrelevant). To conclude this point we would also take the time to work backward. If you were earning say $100,000 and saved $30,000 per year. Then you have a banner year and make $250,000… If you save the difference ($150,000), you actually The measurement is based on the fact that you were only putting away $30,000 before and there is no guarantee that this insanely hot economy continues to run.

you better be sure that it's worth a full working year of your life.gained 5 years of working effort.

As stated in the prior post this was a big mistake we made and would reverse if we could. While we lucked out and the returns were fine, generally speaking you'll want to prefer cash flows once you get over your "net worth number" needed. If we think about this it explains why a lot of people who are on the right track suddenly fall off. Those fixed cost payments hurt immensely in downswings. A home is easily the best example of this.

Cash Flow Issues:

While your average person says "you're losing money to rent"… You still have to live somewhere. So the real goal (until rich) is to keep your "living cost" as low as possible. Once you're officially rich you can go all out and buy anything you like. But. Until then, view the buy/rent debate as a cash flow issue. Even if you miss out on some property appreciation, you also missed out on all of the risk associated with owning the home in the first place. The only time it'll make sense for you, is if you can put down 25% or so and the post tax money (after deductions etc.) is equal to your current rent. This is a classic way to game the system from a financial leverage perspective. You're spending the same amount of money each month but now you're actually making small amounts of gains as the equity ticks up over time.

The second cash flow issue is the volatility in your earnings. If you have never been fired or laid off in your entire life, that trend is eventually going to reverse. Run the math quickly. The typical person who appears to be living right is actually increasing their expenses and likely saves around 20-25% a year. If you lose income for just 6 months, you've gone into a -20-25% situation. A job/career transition of just 6 months . Please read that again. A single 6 month transition period sets you back a full two years as you lose one full year of savings and on top of that you didn't make any progress in that specific year.

sets you back a full two years

Now the classic rebuttal is that the person could always "cut" their spending to make this temporary transition less painful… But… We'd argue that it is likely that you'll be forced to take a position that pays less. Think about it like this. Even good performers can get laid off/fired and if that person is toward the higher end of the pay scale due to performance, they are going to have to accept a position that "restarts" their standing at a new firm. For those that have worked for several years, they know it is naive to believe that "high performance" guarantees job/career security. It doesn't.

One of the key messages from this blog is that staying in shape and learning how to dress are incredibly important. Why? Well it actually relates to lifestyle inflation. If you're in great shape and know how to dress well, the expectations for your earnings are actually lower. This is why you see a lot of extremely fit guys with decent looking girlfriends but a lighter bank account. It is also why the "lifestyle inflation bug" hits unattractive men the most (they have to spend more to compensate for being less attractive). Also. An unfortunate fact of life is that momentum carries itself so if someone is forced to overcompensate, it usually requires longer hours of work (making it difficult to reverse this spiral).

Classic Lifestyle Inflation:

Now that we know how this impacts a lot of people, where does it surface? It surfaces in the following areas: private school tuition for people who have families, expensive cars that decline in value, over levering on a home, expensive watches/clothing and of course, more expensive dates. To be clear, we're fine with spending on every single thing in the prior sentence. If you're rich, go ahead and buy a huge house, a yacht and that private jet. Until you're officially rich, decreasing the percentage invested causes you to work backward in time and increases the risk of sudden losses (lose your business or career and you're going negative in a hurry). This trap is exactly why the number of millionaires is so small and yet a lot of people do earn top 1% income for a small period of time.

The problem only arises when your savings rate suddenly declines significantly.

Becoming over confident in earnings for a couple of years which allows you to save more dollars but does not actually improve your savings rate. For example if you continue to increase earnings by $50,000 but then spend $50,000 you're actually worse off since your fixed costs have increased opening you up for financial downside (if you lose your income). The second issue is not doing correct cash flow calculations on your fixed costs to encapsulate the true value of each income stream. The reality is that larger income streams () are also the ones most susceptible to going away quickly. Finally, if you've been smart, you'll avoid lifestyle inflation until making it since your physical fitness and general personality/style should already offset the need to spend large amounts of money. Don't tell the tech nerds about this though.

Summary of the Big Three Mistakes: *especially when employed*

Assuming you've gotten this far you're now learning the game relatively quickly. You're now making decisions regarding . Back in our first post we explained that many individuals do not like to give up control so they end up raising prices on the products/services they offer as their secondary income. If you're sharp you'll eventually find someone to do these tasks at a smaller rate (be it 50%-90%, we don't know your market) which then frees up even more time. You know what to do. As your time frees up in exchange for a slight decrease in cash flow, you should find another stream of income that *increases* your opportunity cost.

Now Back to the Money Part: *time and opportunity cost*

Since we're going back to the basics we'll use a simple example. You work as an accountant making $75,000 per year. A solid income, it's stable and the job comes easily to you. In addition, you learned a skill (lets go with graphic design), that leads to $40,000 a year of extra income. This unfortunately is the most you're able to do given time constraints and you want to work on yet another project (say website design as well). Instead of killing this $40,000 stream, you find ways to optimize it by outsourcing part of the process (for example going back and forth on the basic design concept). This cuts your workload in half but only costs say $15,000. Now you're making "less" at $100,000 a year instead of $115,000… But… you have now regained your time. This results in a new website design income. You use your graphics design references to help drum up interest in your new P&L item and unsurprisingly you make $40,000 more through this new venture… It's obvious but we'll spell it out… Now you can find ways to 1) train someone to work for you and scale, 2) find ways to outsource and free up time, 3) create templates that automate a large portion of the process – and 4) ramp up marketing to increase the sales/lead funnel.

hint this one is done by every single major company for a reason

At this point you're now playing a game of optimization. Don't take it too seriously, you already did all of the serious hard work. You've created multiple cash flows, lived well below your means to show money the respect it deserves and didn't fall into the three biggest wealth destroying traps. At this point when you look back at your original calculations you're probably tracking to "financial independence" at around the late thirties. At that point you realize… if you just turn those side businesses into something organizable to be sold in the future… Once that last item kicks in you'll get a taste of real freedom which forces other people to adapt to your schedule (its a fun change!).

Optimization: *You'd be done 5 years faster.*

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like . The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality.

Efficiency, Get Rich Without Giving Up Your Life

****

The Good and Bad of Anonymous Blogging

Below is a quick outline on blogging anonymously thus far:

Five Themes:

This is not surprising. The only people who are able to tell that this blog is legitimately run by Wall Street professionals are people who either a) work on Wall Street, b) have legitimate knowledge of Wall Street or c) have a high IQ and spent the time reading about the profession.

1) Intelligent Readership:

One of our contributors stumbled upon a personal finance website called and in just 2 weeks we noticed he dropped in and left a comment on our post: Sam over at Financial Samurai has a legitimate financial background so he's one of the rare people we read with regard to personal finance advice. He didn't inherit his money so he has a right to speak on the topic. Even though we may disagree (IE: we don't like homes as long term investments while he loves them) at least he has walked the walk.

*Example:*Financial SamuraiWorking with a Psycho Managing Director.**You can't fake experience because the content would reflect the lie.**

Again, this is a bit Wall Street specific, however anyone who has actually spent more than a few years on Wall Street knows that the job can become painfully mind numbing and boring. By verifying legitimate Wall Street professionals (emails, linked-in etc.) it becomes very easy for someone to write a blog post when they have had very minimal exposure to creativity. It becomes a fun hobby and the content by default becomes much more interesting.

2) Easy to Recruit:

We had a chance to speak with a few high end individuals in Private Equity. While they have no interest at all in becoming long-term bloggers they jumped at the chance to put in their few cents on what life is like on the Street and what their days look like. Negatively, since Wall Street is an extremely close knit group no one wants to have their name plastered over the internet so we can use hypervisors/logmein accounts and different servers to easily erase their linkage. Now you can see why

*Example:*choosing friends is important.

This is probably the largest benefit of having an anonymous blog. You develop a private network where you can help other contributors meet one another to exchange ideas and build their own mini-private network. This way you are adding value through multiple avenues 1) posts and content and 2) peer to peer networking.

3) Private Network:

Back in September of 2013, we had an out of work investment banking analyst contact us asking for advice on landing a job. The catch? Well we already knew of a slot that had opened in his city and the other contributing blogger was the person in charge of the hiring. You can guess what happened. Slotted into an interview at minimum which resulted in a job. As mentioned several times on this blog, this does not mean you can simply ask for a job or help, No one in their right mind would have a problem referring someone with legitimate job experience for a first round interview.

Example: **you need to be qualified.**

Naturally, if you don't want to put your name out there (no idea why anyone on Wall Street would ever do this) you're going to experience slower growth. The slower growth eventually turns into sporadic growth and ideally hyper growth in the future. After about a year we received ~5-10 emails per month saying that the information was "fake". Now that we have hundreds of posts and have answered the only people who could believe that the information is fake don't know anything about Wall Street or are simply haters. We get one of these once every 4 months or so and just chalk it up to someone being illiterate.

4) Slower Growth: hundreds of questions

Before we got around to throwing up our we had to prove our information was legitimate. So what did we do? We threw up an which is 100% accurate for anyone who has ever interviewed for Investment Banking. After a few highly detailed Wall Street specific posts we saw a massive increase in our stick rate (returning visitors). With the backdrop out of the way we believe an anonymous blog will take at least a year to gain any meaningful traffic since you have to build trust like any other business.

Example: resume adviceInvestment Banking Q&A

Since we have no interest in really making a lot of money from this blog, we can simply write at our leisure and work on a product on the side as well. For one reason or another we've come up with some good ideas for posts over the past 3 months so we've increased the post count dramatically during February and March.

5) Hobby Atmosphere:

The posts slow down in the Summer/December. This is the only time Wall Street employees take vacations. Generally it's the "August slow down" and the normal holiday season shut down (week of Christmas/New Years). This year we'll try to keep a few posts pre-loaded to help with the flow, but there is no chance we're going to be typing up posts while we're kicking it on an .

*Example:*international vacation

In short, if you intend to make a blog that obtains a high amount of revenue and net income, you need to show your face. If you look around at the high end blogs that make money, all of them have a person to attach to (IE: people don't have control of their emotions and need a human connection). On the flip side, if you're looking to meet a set of high quality people, anonymous blogging is great. You're able to quickly filter out the noise and meet like minded individuals. Once every 1-2 months you'll come across someone who understands your views and you may have a new friend out in Chicago or Miami in no time.

Overall Suggestions on Blogging:

We are assuming that many of the readers here also run blogs or have an interest in starting one, if you have additional questions/comments feel free to leave them below.

****

The Greatest Time in History to Be Alive

The Greatest Time in History to Be Alive

Lets look back a mere 40 years. In 1977, we didn't even have the internet. We didn't have electric cars. We didn't have "low cost airlines". We didn't have cell phones. We didn't even have a CD player! There are so many things that we did not have that it could take a full day just to list them into a single post. That said we'll highlight every reason to believe this is the greatest time to be alive. We cannot come up with a single solid reason to go back in time to "live in the past" because every single day gets better and better.

Information

This is the #1 reason to us. Information can be obtained in less than five seconds. If you have a smartphone or access to a computer (even at a *free* library) you can learn about any topic in the world. You can learn about sports, stocks, automobiles, fitness, technology, dieting, etc. All the information is already on the web and it requires $0 to obtain since you can access this information by walking into a public library.

Since we've started with getting things you need, we can see that obtaining information is quite easy. There are websites and blogs today run by people with decades of experience. In addition, they don't even receive a high number of page views. If a regular person wants to feel good for a moment he can simply search for "motivational speech/website" and get pumped up for nothing. If a smart person wants to learn how to sell, that is also available in a simple search as well.

Obtaining Information: There is no barrier to obtaining information today.

Sending information is now free as well. If you wanted to tell your closest friends about a new investment? You had to either use a telephone or send physical mail. Now? You can simply go into the internet and click send from an email address. Free. Sending large documents was once costly, and is now completely free as well. If you wanted to send a 2,000 page report to someone… You would be forced to use standard mail. Now? You simply send it as an attachment.

Sending Information: There are zero barriers to sending information today.

For those that worked in investment banking… Can you imagine going to a physical Data room versus a secure internet based data room? Well… That is exactly how it was done in the past. To obtain SEC filings they had to be sent in the mail. Documents were stored in storage containers. It is simply unbelievable to see how much has changed.

Storing Information: physical There are zero barriers to storing sensitive information.

Even for the cynics out there, we don't see any barrier to securing information as well. If someone absolutely needed to write a document and secure it forever, that can be done with a basic computer. Never connect the device to the internet, write the document, place it on a USB stick and delete the document (destroying the computer as well). No one needs to go to this level of extremity, however it can be done.

Securing Information: There are zero barriers to securing information.

With a little bit of intelligence, you can be certain that the information you are obtaining is also accurate. Why? Only go for information that can be tested and proven. . This is an incredible advantage. 95% of people want to be entertained so they will spend their time getting information related to pop culture and "feelings"… They will consume millions of stories about making money that give no practice advice. You on the other hand? With a few clicks you can build baseline skills for practically anything… for free.

Accurate Information: While going for nothing but *proven* information,you'll never get a *material* edge on the competition, you can build a fundamental baseline of skillsThere are zero barriers to obtaining accurate information.

For free. We cannot stress this enough. You can obtain, send, store and secure information. In addition, with a little bit of intelligence you can see if the information is accurate or mumbo jumbo used to attract the masses. This section alone makes today the greatest time in history to be alive. All of these things used to cost money. But it gets better.

Conclusion: For Free. real

Making Money

Anyone can make money if they simply want to try. If someone cannot make money today, they are saying quite literally: Even if someone is located on a mountain in a remote part of the United States… All they need is an internet connection. After obtaining an Internet connection they can offer services to people in wealthy parts of the United States. These basic services can include cooking, cleaning and fitness training. They don't even need to be there before they obtain their new line of work. How much does it cost to travel across the entire country? While this is an example of the extreme low-end… lets look at more logical examples.

*"I have no skills and am unwilling to acquire any".***About $200 by train.**

It can cost $100,000 to start a brick and mortar (commercial real estate can get expensive). With that $100,000… You could buy millions of entrants to your website! Depending on the cost per click (what region you're targeting) you could get well over Lets think about that scale for a second. How long would it take to get 1 million visitors into a single brick and mortar? A Year? A decade?! We don't even want to know because we'll never get into that business. Ever.

Internet Customers: .1 million visitors in a day for the same price

How much does it cost to sell someone else's product? . That is right. With a few clicks on a computer screen you can start selling someone else's product today. You don't even need to own the product or be on their staff! All it takes is a few clicks and typing information into a computer screen. This means you can have two income streams with lightning quickness. Not only that (unnecessary, but for those uninterested in fame/publicity it can be done).

No Barriers: $0but if you're smart, you can buy a few accounts and make sure none of the sales are linked physically to you

We've moved on from two industries in less than 5-6 years. Lets think about that for a second. In just 5-6 years there have been *two* business shifts. You can start with a career on Wall Street, shift into online sales and shift into selling your own product within less than 5-6 years. Can you imagine trying to do this in 1977? Back then people would laugh at you. Today? Not so much because you could begin this process *while* you're still fixing cars to keep the lights on and the bills paid.

Shift in Business: *"Hi, I'm going to sell Jewelry to women after 5 years of being an automobile mechanic"…*

There are two ways to make good money: 1) go where the money is or 2) go where the money will be in the future. If you go where the honey pot is today, it may not be there in a 10 years. But. You can absolutely put some money away to get your neck well above water. Once your neck is above water you can then spend all your time focusing on where the money will go. Finally, if you're brilliant, you'll know where the money is going to go. We all know what that means. Use what is making money *now* to fund new projects… where the money will go. Back in 1977? Information was consolidated into special groups and it was difficult to get up to speed.

Honey Pots:

Put a dollar in and get a dollar back within a year… The rest will be profit. If you told someone this back in 1977, someone like Warren Buffet would buy it with millions of dollars before anyone had the chance. The funny thing? This is happening right now. You can buy e-commerce companies that are poorly run for 1-2 times earnings and get your money back within a year (the remaining pure profit). You don't need a , you don't even need $100,000. What do you need? Information… Which is free!

Acquisition Prices are Low: million bucks

Lets take the final item, the "low-end". If someone doesn't want to do anything listed above. They don't want to work in a career. They don't want to start a business. They don't want to make a lot of money, they just want to get by. The answer? Move to where rich people live. Rich people do not want to feel an ounce of "discomfort" in any way. Offer a service. This can be babysitting, cooking, fitness help, etc. By targeting the wealthy, you'll earn a median wage with relative ease.

Services Through the Roof:

We now have access to *practically* any type of investment project we like. If you're interested in private real estate deals? . If you want to invest in the entire S&P 500… that can be done now. If you want to buy options? That can be done with a few clicks. So on and so forth. Oh and one last thing… it can be done for a few dollars with thin spreads (Anyone else remember when stock prices were listed in newspapers with numbers such as 1/8? We do.)

Investing: That is available to you right now with no need to be an institutional investor

Everything that is needed to make money can be acquired for significantly smaller prices. You can obtain the information for free. Start the company for a fraction of the cost. Acquire customers for nickels and dimes. Run multiple businesses at the same time. Start a new one without dropping the ball on your current project and worst case scenario? Offer a service to keep the lights on.

Conclusion:

Health

Time and health are the most valuable items in our lives. Better health gets you more time and time is the only thing that you can never get back (money comes and goes but you can always get it back). All that said, it is third in this list because it was possible to live a healthy life 40 years ago as well.

With advances in technology we are living longer. Since we can use a computer to make money, our bodies last longer. In addition, healthcare technology continues to get better. Surgeries are more accurate and the medicines being created today continue to be more and more potent solving more and more issues. Overall? Technology has helped improve our healthcare system.

Technology:

With more information on longevity, we can now come up with our own conclusions on how to live longer. We have information on the life expectancy by country (take a look below)

Data and Analytics:

Untitled

This means we can go ahead and make some broad conclusions. As you travel the world (undoubtedly you will or already have), take some mental notes on the life styles of the people in each country. Use this to create a basic "mosaic" of the keys to a long life. Are the people happy? What do they typically eat? How do they exercise? How much rest do they get? Are they physically bigger, smaller, taller or shorter. So on and so forth. Can you imagine trying to get this information 40 years ago…. We don't even know where we would begin.

Obtaining a gym membership can cost you a grand total of ~$1 a day. While it can certainly cost more, if you simply need access to all the equipment necessary to train without buying it all (thousands of dollars) you can do so for about a dollar a day. By the time you're done, using all of the equipment for a few short years (lets say you spent $1,000), your body will see a parabolic improvement. If we wanted to do this 40 years ago, exercise equipment was difficult to access.

Access to Equipment:

Personal Life

It does not matter what your interests are. You could be interested in cats and dogs. You could be interested in making money. And. You could be interested in fiction books. With the internet you can easily connect to someone with the same interests as you.

While everyone assumes that the "other person" writing comments, blog posts, forum posts etc. "must be a loser" this is simply not the case. If you provide high quality information on a topic, people in the *know* will immediately reach out to you. It is simply not possible to have 3.2 billion people connected to the internet and have 99% of them be "losers". In fact, several readers of this blog have already figured out what industries we left (we have left two so far in just five years!). Why? They simply read the blog posts.

The Other Side of the Screen:

What does this mean from a social perspective? It means that there is no real barrier to meeting new people. You can find someone who lives in Chicago even if you live in Rome. The person in Chicago can then click on Skype and call you to discuss a topic you're both interested in. Naturally, no one *needs* to do this, however it is possible with the internet. As you can imagine, we don't recommend socializing on the Internet, but… it can be done.

There is no need for a relay of information. Those days are long gone. A news report seen “Tonight at 6pm” is typically old news. You can now receive information as it happens with a simple click of a button. Why would you take information from someone who spent 2-4 hours to decide how it should be displayed when you can see it live right now? It doesn’t make much sense.

Live Information: *from the source*

From a personal life/social perspective, you can now obtain accurate information real-time and dissect the meaning yourself. No need for an intermediary anymore.

This post was written in less than an hour. We’re not saying it was done intelligently, but we are saying there are too many reasons to list. We could probably write for 5 hours and not even scratch the surface! If there are more reasons to add please leave them in the comments.

Concluding Remarks:
****

The Growing Economic Divide

The Growing Economic Divide

At this point, every single country is trying to print trillions of dollars to solve the economic crisis caused by COVID-19. If we look at the solution from a “fix it now” perspective, it works. If we look at the situation from a long-term impact perspective, it does not. Paying off debt with new debt is exactly what happens when a company is entering bankruptcy/insolvency. If you give a person debt who cannot pay his own bills, this means his future bills just went up. He’s better off shuttering and moving on.

Since our readers have various backgrounds, a restaurant is a simple example to follow. If we take a middle of the road restaurant, call it “Italian Restaurant”, this location will cost ~$40 per person for a dinner. This is a reasonable price range for middle class people. Unfortunately when you sell to the middle class, margins are usually lower relative to someone operating an ultra high-end restaurant. How low are profit margins for regular restaurants? They run at around 5%. If you don’t believe this feel free to look around online and you’ll get to a range o 0-12% or so with most hitting 5%.

Example – a Restaurant:

Now that we understand slim profit margins, we have to look at only two variables. Rent & Food/Drink Costs. Why? These businesses are being forced to run at 25% capacity at max. To keep it simple, we will even give them a boost to 30% of normal capacity. Remember, social distancing and other rules cause these numbers to be generically correct. Therefore we have to ask… How much is rent?

Well, rent/lease cost is usually 5-8% of total sales (this is during Food and drink costs (cost of goods sold line) is around around 28-32%. This gets us to a minimum cost range of 33% with a high-end of 40%.

normal times).

Put it all together. If a Restaurant made $1M in a year, around $333,333 was spent on lease + supplies and you’re left with 60% “Other” expenses like insurance, employees etc. Even if we assume that there are no other costs, you have to pay out $333,333.

Jump to the conclusion at this point. If the revenue line is stuck at $300,000 because of the pandemic, and you must pay out $333,333 it means you’re losing $33,333. Also. This assumes you have no debt at all (running the business as 100% cash). This is incredibly unlikely as most restaurants are levered up just like a home (you borrow to buy).

How does this end? It ends with the person losing everything. Even if you give the person a free loan for $100,000+ with no interest rate attached to it, he’s still losing money every single month. This means you’re creating a payment for him that just gets bigger and bigger and bigger as he borrows more and more during a time when the business cannot operate. Pretty insane when you think about it. His business was shut down beyond his control and the person paying the price is the business owner? It’s quite a mess to watch. He’s better off closing the business instead of running at 25-30% capacity over the long-run.

The above should make intuitive sense to anyone. No need for a specialized degree in Economics or a degree in anything else they told you would help obtain a “good job”. If we look at the other side of the equation, competition is imply ramping up in two ways. You have two other options to eat: 1) you can cook by yourself and 2) you can have food delivered for you by Amazon.

Go to the Next Step – The Competition:

Now you’re probably asking, why won’t people go back and live a normal life once we open up the flood gates? The answer is that a large chunk of the population is unemployed so you cannot simply flip a switch and force companies to hire everyone. In fact, many of these major companies learned that a huge number of their employees were not useful at all. They were simply collecting checks and going home without any productivity. The firms that said “we won’t fire anyone this year due to the pandemic” will be cutting heads by next year. The firms that did not make this offering? They have already started the cuts.

So now you have a “retail apocalypse”. The major retail areas have less foot traffic (even if everything opens up), the competition allows people to save money (cooking for themselves) and the longer term solution (delivery) is run by Amazon who’s interested in making costs go down long-term. It is safe to say that a structural shift has occurred and you’ll have a larger remote work force (continued pressure on foot traffic).

Put this together and the below chart is a good set up for what is to come.

The second step is where degrees in economics and "Phillips Curve" discussions get thrown out the window. We've lived in a world where inflation has been part of our lives and we believe that this is going to continue with no rational explanation for why. There is a great book on this topic called "The Price of Tomorrow" by Jeff Booth.

Another Structural Shift:

In summary for those who haven't taken economics, the Phillips Curve is simply the statement that "economic growth comes with inflation so inflation should line up with job growth". That is great, until you look at the national debt and realize all the "growth" wasn't economic growth. It was really just debt piling upon debt which was causing the "inflation".

Take a step back (as the recommended book does) and ask yourself, in what future will we see job growth? Job growth in the physical realm is highly unlikely. All the products we are consuming are competing against robots. Factories are run by robots in many areas (hint think Alibaba and China), the number of jobs being replaced by lines of code is accelerating and on top of that, levered up companies that are facing potential bankruptcy are looking for ways to cut jobs that are unproductive. Job growth will not occur until we're able to create a new virtual economy discussed in a prior post. Until then… job growth is going to go down.

This creates an extremely difficult set up. If you print a ton of money and cause asset prices to go up, you're putting the clamps down on 90% of society. If you don't allow assets to go up, large numbers of people/companies go bankrupt. The solution is to re-do the entire monetary system and that requires far too much coordination (if you obsess over this stuff like we do, you know the IMF is already dropping hints of a new Bretton Woods agreement).

It is quite interesting to watch. The best solution is to issue checks to everyone and tax it back based on their income this year. And. That's not going to happen as the government had a chance to do this and went with mass printing instead (hence asset prices went way up while people who do not own assets got significantly poorer). Focusing on asset prices prevented any sort of market reduction and now we're living in a twilight age where big companies believe they will always be bailed out even if they lever up to the gills.

The answer is quite simple, you must produce something (anything) immediately. There is just no way around it. Unless your net worth is increasing by 20-25% a year, you're going to be falling behind. Why do we think the number is this high? Look at the prices of tech stocks. Since we know that tech is going to drive all the value going forward (or at least the vast majority) it's the new standard for relativity. Buying something like the Qs (NASDAQ) is a lot more reasonable with a 10-year time frame than a diversified basket of stocks in dying industries ()

Solution for You: *as usual, not to be deemed as legal or financial advice of any kind, just an opinion*

If you don't have money, we would go ahead and trade your time for money and work those 60-80 hour weeks. There is just no other way to gain ground. If you have $50,000 to your name, producing even $5,000 of extra income is a 10% move for you. This gives you a shot (at least). Go ahead and start fixing iPhones, repairing watches, doing yard work for money etc. Anything and everything is on the table since the value of assets are going up rapidly.

Meanwhile, For those that have followed our recommendations over the years, we've historically talked about times to sell and times to avoid selling your company. At the current rate, unless your business is going down and you're certain, you do not want to sell it. The number of ways to generate *income* from an asset is declining. Tech stocks are great for investing (healthcare as well), but, the majority of them don't have big dividend payments. So you need that cash flow to invest into the future which is heavily technology centric.

do not sell any internet producing assets.

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life.

The Human Condition – Learning the Truth About People

The Human Condition – Learning the Truth About People

Feel free to ignore this post at your own risk. We won't argue with you. You'll see why in the post. If you've lived long enough to see hundreds of irrational and illogical decisions made by people, you'll build a new framework for how they tick. If you want the summary, everything you learned about economics can be tossed if the phrase starts with "assuming humans are rational…". They are not. So we'll jump straight into some long-term expectations as it relates to people.

If someone dislikes you, they won't believe you regardless of factual evidence. Even in extreme situations where it is blatant. If you're able to successfully dunk a basketball and you are 6 feet tall while the other person is also 6 feet tall, he'll think you cheated somehow. Or that if he trained harder he could be just like you. No we are not kidding. Also. If you played XYZ sport at a high intensity college, where it can easily be looked up online, they will rationalize and say "it's probably his twin brother". No, again, we are not kidding.

Do They Dislike You?

If someone really doesn't like you, they will go to great lengths to try and believe you are not good at anything. Even if the facts can easily be found, they will claim that you're a liar. This is just how it is. In public settings they may tone it down a bit and try to claim they are better than you at something "more important". If you understand this concept, you'll easily flush out who dislikes you and likes you based on what they say about your verifiable accomplishments (to your face or behind your back).

This one is extremely intense if you go up the income/net worth ladder. While the vast majority of rich people are first generation millionaires (something around 80%), there are still some people who got rich by luck or inheritance. Again. Vast majority are *not* like this. That said they do exist.

You're Always the "Dumb One":

So if you ever meet someone who went to a top school like Harvard, people will assume they are smart. They might be dumb because they simply went to the best private schools their whole life and mom/dad made a generous donation. So on and so forth.

The important concept here is that you're always the dumb one. So if you ever try to explain something you better be that even an idiot can get it. If an idiot cannot understand it then you shouldn't talk about the topic. Why? When you try to explain it in basic terms and they don't understand, they will assume that . We are not kidding. So you better be *sure* that you're explaining things in obvious/simple terms. (Hint: now you know why our writing is non-nonsense straight to the point, it reduces confusion for everyone – smart or not smart).

sure *you're the stupid one*

If you end up getting into a heated argument with someone, that relationship is officially over. Just give up on it. While there are rare exceptions to the rule, you're never going to change someone's opinion on highly emotional topics for example. So you're better off just deleting their contact information. Have you ever gotten into an argument with someone and they say "yeah you're totally right, i am totally wrong". Neither have we.

Arguments Are a Waste:

The other problem with arguments is that other people may be watching. And. To them you just look like two idiots yelling at each other. So you've not only wasted your time with someone who thinks they are right but you've also diluted your own worth in front of anyone who saw the interaction. There is a zero percent shot that you'll remove all argument from your life, but, it doesn't mean you shouldn't try.

This is another human condition that is common amongst 99% of people. This is NOT common among the 1%. The 1% are the 1% because they do have self awareness despite the average person thinking they have big egos. Big ego people are unable to see what they are good at, what they are not as good at *relative scale* and what they need to improve upon.

Lack of Self Awareness:

Take sports for example, if you can jump 40 inches in the air and your one mile time is a horrific 5:00 in high school, you probably shouldn't be a long distance runner and you probably shouldn't waste your time trying to play soccer. Instead you should probably play volley ball, basketball or compete in the high jump/long-jump. So on and so forth. We're not saying you *can't* get better at running a mile, we're saying that you're a fool for spending your time there. Just because you can get better at something doesn't mean it should be a focus point. This is an extremely common mistake. Just because you like something doesn't mean you're good at it (no matter what mom and dad say).

"You changed man"… "Of course, I didn't work this hard to be the same". This is another reality of humans. While your close friends will actually be happy to see you succeed the vast majority will not be happy about it. Think about the average person, does he enjoy seeing someone the same age as him vastly surpass him in terms of life success? No. Why? See point #2 where they always think you're the dumb one and they are better than you despite all of the verifiable data points.

If Successful You Will Lose Friends:

You shouldn't let this deter you. As you become more successful, you find out who your real friends are. You'll be surprised at which ones stick around and which ones drop off entirely. Some of your contacts end up being around for 10, 20 or 30 years and you would have never guessed that they would still be around.

While many internet intellectuals will argue that women rationalize more than men. Our experience suggests that both of them rationalize. We are not kidding. For example, if a guy shorts a stock like , he will seriously believe he was right "but the timing is off". Well if you lose everything there is no way you were right because you have no time to recoup the money.

Rationalization: Tesla and it goes from $40 to ~$1,800 today

This happens a lot. Look at CEOs who claim they made the right decisions despite running their companies into the ground. Or guys who leave from Company A to Company B only to see Company A thrive and Company B go bankrupt "It was the right risk reward decision" is a common saying. The real answer, the mature one, is to simply say "got this one wrong". At least have some self reflection.

While you can *remember* what people say, try to focus on the tangible part of "what they do". If someone says they want to improve at something but don't show any results and don't show any resolve to go out of their way to fix the issue… It means they don't actually want to get better. They can continue to tell you but what they are really saying is they "wish they could get better without any effort". For those that have been involved with affiliate marketing, you know why diet pills are so attractive. A quick fix with no real effort beyond popping a couple of pills. This is only accelerating in our society where everyone wants to know exactly what is going on in just 2-3 sentences and they get upset if you can't explain it to them in fractions of seconds.

Ignore What People Say: "I want/am going to get better at XYZ"*Focus on actions not words.*

Unless you are related (family member) or perhaps a friend for 10-30+ years… Assume that you have to align incentives. If you put two people in a room who are "friends" but then incentivize them to compete and fight one another, they will fight eventually. This isn't a bad part of the human condition, it is actually quite natural. Assuming that people are going to do the "right thing" all of the time when you're constantly tempting them to do the wrong thing is going to net a lot of bad results/outcomes. For your regular life and your work life, try to align incentives so everyone wins. This is not easy but the headache will be worth it. Friendly reminder: your co-workers are never your friends. Don't be a fool.

Incentives Rule:

One final one we'd leave with is your average person is entitled. If you've run a product business you know that even if you tell the customer something is delayed they will ask that you give it to them for free (seriously). This isn't something you should do unless there was an issue with the product of course.

Instead recognize that everyone expects a free hand out. On your side, never expect more from someone. If you sell something for $8 and it generates $800 for them, don't expect them to come back and give you a $20 tip. Hell. People don't even tip properly at high-end restaurants since they view the servers as "lower than them".

Set and Forget:

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life.

The Last Round of Bullets – Prepare for the Worst Hope for the Best

The Last Round of Bullets – Prepare for the Worst Hope for the Best

In short, we're screwed. While we can fight off the virus and potentially stave off mass casualties, the economic damage is the real issue. Back in 2008-2009 there was a *centralized* issue. The issue was that many mortgages were collapsing. So the solution was drastic and simple, lower rates and inject cash to the major banks to avoid a cascade of defaults. In this situation we have a distributed attack on the system. How do you bail out restaurants, airlines, hotels, malls, casinos, cruises and real estate all at once? The second issue is that the distributed default is not easy to contain, if someone runs a small business with $1M in revenue and $100K in profit, it means his monthly expenses are $75,000! This is a big issue. Even if it's a single month at 0% interest… It would take the person 9 months to recover. Now scale this up and spread it across the united states. That is the current situation today.

The more sophisticated readers can skip this part. In simple terms many companies operate with leverage. This means they have more debt than cash. So imagine you have $1M in debt and $200K in the bank to run your small business. Well.. if the business makes $1M per year, you're probably okay. If the business has slim margins (restaurants, airlines, casinos, etc all have slim margins), then you're in trouble if your annual income was low.

Explanation:

What happens? We can use a simple real estate example. Forget the "regular upper middle class consumer household" they are actually okay if they have a single mortgage. Go to the bigger picture. You have a 1,000 unit apartment complex in a major city like Las Vegas Nevada. Suddenly the entire casino industry shuts down for 2 months. This means people cannot pay rent. If they cannot pay rent that entire apartment complex now defaults. So you're not looking at a regular mortgage default, you're looking at a corporate debt default (even bigger).

What happens to "fund managers": This gets even uglier. This week major hedge funds have fired Portfolio Managers. If you think all hedge funds are "hedged"… Well many are simply wrong. Even Citadel and Millennium have fired PMs this week and those are some of the better performing funds in a market neutral book (market neutral for newbies means they have to be long $100 of Stock A and short $100 of Stock B). In theory, by being long and short the same amount, you should be "flat" if the market goes down. As you can imagine with huge volatility this doesn't work. Why? Well the books are levered up 5x!

Lets review in basic terms. If you want to own say Google, you have to be short something else in internet say Amazon (again this is not correct exactly but explains it well to regular readers). So you have $1M to invest. Well in order to generate returns you lever up the book. You have $5M to invest into this position. So lets say you short Amazon and go Long Google. $2.5M is short Amazon and $2.5M is long Google. Great. Assuming no wild swings, you will outperform if internet stocks go up and google does better than amazon. If internet stocks go down and Amazon goes down more than google, you're set!

Seems fool proof. Until? 20% swings. Look at stocks in the S&P 500 and you will unlikely ever see this ever again (we hope) over the next 20 years. It could get worse as we don't think we're anywhere near the bottom. That said, a 20% move would force you to LIQUIDATE that google position. That is absolutely crazy. Since you're 5x leveraged if you don't have money to support the margin call, they force cell the asset… You'd think it ends there? No. It gets worse.

Now imagine while this is happening, you have had 5 years of record performance (Citadel and a few other funds are up substantially the last 5 years using this long=short construct). Now you get people calling "i need to pull out $5M since my business is getting crushed" from wealthy clients. So not only do you have to deal with the margin calls, you now have to begin selling assets to cover the $5M redemption (redemption is finance speak for customer asking for money back).

Welcome to what we're seeing today. We won't even go through the Oil fiasco as that's too painful to even write. Texas is going to suffer if numbers stay as low as they are (oil prices) and we'll leave it at that.

Since interest rates have been low for so long, the interest payments were easy to hit. If you take $1M loan at 2%… That's only $20K a year! Incredibly easy to find a way to generate profits of just 2% on $1M of capital (so everyone said…). Then you have a strange event like this, a complete out of the blue viral severe pneumonia. Suddenly those business that were making profits due to cheap debt, borrow at 2% and get 4% returns… are borrowing at 2% and seeing – 50% "returns". Leverage cuts both ways.

Fed Policy Out of Bullets:

If you believe -50% is not feasible we suggest you look at real estate or casinos as good examples. You have a sudden revenue drop to zero for at least a quarter (we doubt it's that short), and you're looking at $0 revenues and hundreds of millions in losses. Unless you fire people of course… which is why layoffs are occurring immediately. Remember the small business example set above, if you have zero revenue, you have to borrow to cover that month of expenses. Now imagine that monthly payment is $50-100M not $50K… Now you see how hard it is to "get that money back" with future earnings.

Since we live in unprecedented times, the Fed is attempting to help create "liquidity". This means all of those margin calls are being funded with 0% interest rate money. Also. The government intends on giving individuals money straight to their bank accounts (sending them checks!). While this is fine for now, it doesn't solve the long term problem. If trillions of dollars of revenue goes to zero… expenses were paid with 0% debt… How long does it take to repay the debt? We don't know. But. We'll say it is likely a very very very long time. If you want us to guess, unless there is a miracle, you could see 3-5 years before real growth and pay down is seen. This is simply a guess based on the environment continuing through Q3. If the virus does come back in Q4… all bets are off as thousands of business depend entirely on holiday season earnings (not to mention skiing in the winter).

The Fed had two choices: 1) take rates to zero – Check and 2) start printing money – check. This is a bandaid but we're now building a massive debt burden even if it as 0% interest. Also. It assumes that everyone returns to "normal" when we get through this mess (doubtful, again an opinion). So you have a cascading debt load, consumers can't pay bills, those companies are levered up, they can't pay the debt, they get 0% debt, they have to pay all that debt back with future cash flows. You can see the issue.

"Just print money"? This definitely will help. We'll actually go on a limb and say that's better than the debt idea for now. We know the crypto community will hate that comment but it sure beats seeing people unable to pay for food. You're better off with the second option which leads to? Hyperinflation or even Stagflation. If you print too much money, prices keep going up and people are still unemployed creating a massive issue – stagflation.

So there you have it. Two choices: 1) push out the pain again with 0% debt and pray the business environment goes back to normal quickly or 2) give people money to prevent default and risk asset price inflation. By the way, we mean "give people money" literally. As in sending checks in the mail.

First of all, thank you for all the emails the past two weeks from the people who actually took our advice. We're thrilled you're financially better off and mean that seriously as we don't even care about being right anymore, better to see people avoid a massive blow up (having a month of food is huge in a lockdown). What you should do is much of the same. We're in markets that are likely going lower (opinion) and if we're wrong and there is massive printing leading to inflation, you still hold some stocks from way back in 2012-2016 so the cost basis is 50-60% lower. So you're good to go.

What Do You Do:

Instead any more you get you have to keep it simple. 1) retain 12 months of cash on the books at all times, 2) all income you get you want to buy "store of value" this is gold, crypto etc. While people believe the store of value narrative is gone.. it isn't. Re-read the section on margin. If people had billions of dollars levered up 10x or more, it means a 10% price drop would liquidate all crypto investors immediately. That is what you saw. Same with gold. While gold investors are less levered up. Any time leverage continues and margin calls ramp up… this means everything goes down temporarily and volatility spikes.

Investors have to sell gold to fund their losing positions.

Since we have to give a recommendation now, the easiest one is the same as a month ago. Keep cash balance up to 12 months of your expenses. Just focus on that and take your costs to zero (impossible but you get the picture). If you are already there and have 12 months or more, go ahead and buy store of asset products like crypto and gold.

In terms of your work there isn't much you can do. If you're in the Ad space, the vast majority of you should probably take spending to zero. Yes zero. Unless you're in an industry where benefits are being seen today, just take your spending to zero if you're already losing money. On the Career side of things, this is not the time to be "lazy" catch up on the news when you're done and spend your time being helpful to your employer. Thank your lucky stars you're still employed at this point.

We *hope* for the best but prepare for the worst. Our "standard case" not worst case or best case is that this virus lasts for over 3 months. In addition, we think it comes back stronger in Nov-Feb time frame. We're not being pessimistic, we're simply looking at facts from prior corona virus cases. The last 6 of them never resulted in a vaccine so we don't know why this one will suddenly be solved. The answer? We recommend you personally stay safe and if you've been acting paranoid keep that up for another 9 months or so. You will be laughed at today and it's worth it. Better to be laughed at and take the risks to near zero.

Predictions of the Future:

In terms of industries we have some bad news: large gatherings (casinos, concerts, cruises etc.) are going to see long-term issues for at least a year after resolution. Why? There is just no mathematical way this is solved in a couple of weeks. To the low IQ people who said "this is just the flu", "store of value is done for crypto and gold" and "will be back to normal quickly" it's best to go ahead and delete all of those comments. They are incredibly uninformed. Even if the numbers get "better" in two weeks, you don't want to have people come back together because it will just spread… AGAIN. This virus is asymptomatic which means you can catch it and have no symptoms. We lost control of where the virus is and by quickly going back to crowds you're just going to spread it again.

It was fascinating to see how people understand "big risks". Tail risks and things like that sound fancier but we prefer simple english. a "Big risk" is a systematic uncontrollable risk. In plain english: 1) you die or 2) you lose everything. This is why we went full paranoid with this virus, one of those two risks were clearly present. If there is a chance of losing everything you have or dying, you just don't take the risk. We don't care how strong, healthy or intelligent a person is. They do not have the capability to avoid a airborne microbe that can infect you with a debilitating lung infection.

Think Through Risks:

On the positive side of the ledger, this is also why things like crypto and gold exist. In a world of absolute chaos, what can be used as money besides "paper". If we enter hyper inflation like Germany in the early 1900s… those dollars are going to be worth nothing. To be clear. We really really doubt it gets to that but the point is the same. Always have a 5-10% hedge (if you can afford it) or a 1-2% hedge (everyone can afford this) against a catastrophe. If it's asymmetric to the upside you *must* own the asset. If it is to the downside, you must AVOID it at all costs. COVID-19 is the downside.

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending.

The Most Common Excuse

The Most Common Excuse

This is becoming the go to excuse these days. If you're a millionaire with a serious franchise, constantly flying to meetings and juggling a possible family this is viable. If you're under the age of thirty this is just nonsense for most people.

"I don't have time".

The truth is this… When people tell you they don't have time the truth is,

they are wasting time.

They don't have time for job searches and updating their resume but they have time for talking about getting new jobs

They don't have time to work out or invest but they have time to watch people work out playing various sports and memorize their statistics

They don't have time to go out and spit game to improve their sex life but they have time to watch people have sex through the security of the internet

They don't have time to update a blog on a weekly basis but they have time to edit photos on Instagram and load up frequent posts on their Facebook profile which makes them $0

They don't have the money to fix their diet but they do have the money to eat a $10 lunch everyday when this is substantially more expensive than a homemade juice and a meal

Instead of reverting to "I don't have the time" how about you ask "Am I wasting time?" If a single worthwhile proposition comes into your life, you should make time. Since this site is about getting laid and getting paid lets look at some common examples.

Getting Laid:

If you maybe you are also on Wall Street and have to rely on nightlife to provide the vast majority of your sex life. Or maybe you are new to going out and attempting to pull new girls and simply need the alcohol induced environment to get the juices flowing. How can you spend that time efficiently? Before you even bother entering a bar/lounge/club ask yourself if it is even worth attending. Go through the checklist.

work insane hours

1) Is there free seating? If not you're damaging your chances

2) Are the drinks strong? If it's a pretentious watered down venue you're likely SOL

3) Is there a dance floor? If not it will be tougher to deal with any conversational lull

4) Is it close by? If you can't take a quick taxi there, it's a bad fit

5) What is the competition like? Stack odds against yourself once you have a harem

Lets look at a couple of real life examples:

Lounge/Bar

Notice in the diagram, "where is the flow in the lounge", if you're spinning your wheels fiddling around the center of the bar in the high traffic area or posting up next to the seating and next to the dance floor you are wasting time. Be honest with yourself. You're not going out to bars and clubs to have a few drinks you're going out to pull so your actions better match your intentions. If you wanted to simply have a few drinks you can do that in your apartment or at a house party with friends. Slide into the heavy flow of traffic but face towards the crowd holding your drink to your side, open with innocuous questions to people who pass your way and you'll yield significantly higher results.

Bar

Clubs

Now take a look at the club environment, for people who go out a lot you can already tell where the worst spot is: the small dance floor or “VIP”. If you’re a “Very Important Person” and you’re youngish, no one thinks you’re an important person. Unless you came with a group of people and are running social group dynamics (or you are in Vegas and need seating) this is “No Man’s land”, no man is going into the VIP and pulling out one of the girls without encountering severe obstacles. More likely than not someone within the social circle is going to block you and even worse, you’re much too visible in the smaller floor relative to the large dance floor, all else equal she’ll be much more hesitant with her “friends” judging her.

Unlike a lounge, you’re unlikely going to be sitting up and chatting people as they walk by, however if you’re going to get drinks and or walk around you want to choose the high flow areas, follow the green lines. Finally, the last reason why the spot closer to the exit works is you can always make up an excuse to “chat outside for a second because the music is too loud” this is an abused line for the club scene and works extremely well.

Club

Getting Paid

Are you correctly playing your political cards to work the least amount of time for the most pay, if not you're wasting time. Maybe you really like two of your colleagues but unfortunately these guys do not determine work flow, your bonus or your workload. Play the game. Get the layer of staffing and direct correlation to your bonus to love your positive demeanor and error free work. Become genuinely interested in their lives make the connection and solidify yourself as this persons "ideal hire". Continue to chat with your regular colleagues that you enjoy but remember to always remain as slightly more "intense" about work so they don't believe you're getting less work than them. Don't worry you will be receiving less work.

Politics:

Are you engaging in costly activities that don't help you improve your life? Watching TV? Browsing Internet forums where the vast majority of people are undoubtedly broke, liars or worse both? It might feel good to watch a 2 hour comedy but this is no where near as useful as improving your humor with live practice on people.

Entertainment: A successful man does everything in life with a purpose.

What does saving money on entertainment have to do with getting paid? Well now you have 2-3 hours a day or more to chase girls or money. It sounds "extreme" to cut these activities out but the problem is they really add nothing to your future. Until you're successful it is simply a waste of your time.

Are you spending money in lump sums on vast extravagant experiences? Practically everyone makes this mistake at some time in their life and you should pull the trigger on quitting the cycle as soon as possible. If you have time to memorize sports stats you sure have time to memorize yields, spreads and other financial metrics to at least understand the bare-bones of investing. Unlike your friends, you'll .

Investing: If you have time for vacations you have time to invest.understand a three statement model

All of this should snowball for you and snowball quickly. You need to start early. Not "want" to start, this is an emergency. Wasting time is that you absolutely cannot afford to do.

Conclusion: one of the four things
****

The Next Big Market and the Underlying Truth About… The Brain.

The Next Big Market and the Underlying Truth About… The Brain.

We get a lot of questions about where people will spend money. We gave a ton away in our book, , but we'll give another one out for free. We're giving it out for free because it's a rapidly growing market, we have no interest in building a business around it it has every single emotional item needed to sell well. This is essetnially everything you would want wrapped into one market… The market? The brain pill market should see rapid growth so lets jump right in.

Efficiencyand *"Brain Pills"*.

The Brain Pill "Sell"

With AI taking over a ton of the news articles nowadays, this brings up an interesting problem for your average guy. The average guy now thinks the "robots are out to get his job" so now he feels insecure about his own capabilities. He won't admit this publicly but he's worried to his core that his white collar job that requires data entry into an excel sheet may be automated. This doesn't sit well, so he's going to look for a solution.

Artificial Intelligence: As always he'll expect a magic product to solve his problems.

The vast majority of people believe that intelligence is genetic. You're either born smart or you're born to be normal. If there is a way to somehow take a product and become "smart" they will jump all over it. You see this today with a lot of people jumping on things like ModAlert and other grey market products. We're going to see more and more people research this market. If you look closely, you're already seeing these products infiltrate a lot of main stream websites (the advertisements are becoming quite common).

Belief in Genetic Intelligence:

This is the third major reason we see a large increase in demand for "Brain Pills". With more and more people becoming aware of athletic drug use, they are going to immediately believe that people are "cheating" with their brains as well. We're not saying it should be illegal, that's essentially irrelevant, the real point here is that people "believe" there is a one stop solution. As an example, a lot of average people believe that a single steroid can make you a world class athlete. This defies all logic. But. This is how people think. Knowing that this is the trend-line people will be ready and willing to shell out tons of money for a "trick"…. If you can take advantage of all three of these things, you'll be a in practically no-time.

The Belief Others Are Cheating: multi-millionaire

The Brain Pill "Product"

As usual, the product has to work. If it doesn't work temporarily you won't be able to sell them consistently. So lets go ahead and look at what products actually work for brain functioning.

This is a natural product that helps your brain function (assuming you take a liquid product). Many of you are already aware, but the premise is quite basic. The human brain requires long chain polyunsaturated fats and fish oil essentially provides this. The most common term you'll hear is "omega 3- fatty acids". In short, by including "omega 3-fatty acids" into your product it will be easier to sell since your average person knows of it.

Fish Oil:

Doing some quick research you'll find that blueberries are tied to brain functioning as well and they throw around the phrase "anti-oxidants". In fact, we got bored and googled this phrase and found an article with the following: "According to James Joseph, PhD, lead scientist in the Laboratory of Neuroscience at the USDA Human Nutrition Research Center on Aging at Tufts University. 'Call the blueberry the brain berry', says Dr. Joseph." In short, by including anti-oxidants with a blueberry angle will help and make the product easier to sell.

Blueberries:

We're going into greyer areas now, by including caffeine in the product you're essentially using a temporary high to improve performance. Instead of saying "coffee" or "caffeine" pills you'll want to keep the dose lighter. This means you're going to use some sort of low dose caffeine that seems healthy. Clear answers include: Matcha Green Tea and Yerba Mate. Does it matter that caffeine is always going to be the same chemical formula: CHNOAbsolutely not! The key here is you want something that works, appears to be healthier and

Caffeine: $_{81042}$**?** can be sold at a premium.

Now we're into the real grey market area. It will come as no surprise to anyone reading this, but we don't take either of them and don't recommend it. That said both of them sell extremely well and have been shown to improve brain functioning. Adderall is significantly harder (worse) on your body and consists of dextroamphetamine saccharate, amphetamine aspartate, dextroamphetamine sulfate and amphetamine sulfate tablets. Provigil (Modafinil) on the other hand is another stimulant considered to be weaker but "safer" than Adderall (specific chemical name: 2-[(diphenylmethyl)sulfinyl]acetamide).

Adderall/Provigil (Modafinil): For this reason it is a controlled substance.

This is the last item that comes up consistently as a "brain enhancer". LSD is borderline mainstream at this point, in fact, if you google search LSD and Silicon Valley you'll find it on "Ted Talks". When something hits "Ted Talks" level, you've reached the masses since that is the target market for Ted Talks in the first place (something that seems kind of edgy, but old news to people on the forefront). This is no longer “grey area” and we’re now solidly in the black. The primary ingredient is unsurprisingly… lysergic acid, acquired from fungus.

LSD Usage:

How To Compete

Ah yes, we’ll even give this away. If you’ve read the section above you now have enough ideas on how to create a solid “brain pill product”. The question is going to become “how will you compete”. You can compete on the product side, the marketing side or the process side. If you want to compete here, you’re going to have to really think about a competitive edge. You buy all of the main brain products (one bottle each) and then think critically about how you can create more “power” out of each item. If you’re reading between the lines here, you essentially need to find a way to legally sell items that are approaching the grey market slowly but surely. If you’re interested in competing on the marketing side because you’re a fantastic salesman… you already know what to do. You buy a brain pill product that is currently working, take the ingredients off the back, make a few adjustments… rebrand and market like crazy. Since you’re commoditizing the product, the secret sauce will be the sales section. Since this is a newer market, there is a chance (a *good* chance) that the process of selling and distributing isn’t being done correctly. The type of item being sold, quantities and supply chain likely need improvement. Unlikely but a potential hole is here.

Product Side:Marketing Side: Process:

Now before we sign off we’ll answer the question you’re already thinking. “If it’s a good market why don’t you do it”. The answer to be honest is . If we look at the three ways to compete “Product, Market, Process” the way to compete is by having the best product and hiding all the ingredients/secret sauce to the best of your abilities. We tried to figure this out and failed. We then looked at the marketing side and realized (at this point in our lives) it makes sense to simply buy other companies in the markets that we are currently involved in (we don’t have to re-learn the marketing side). In short, we couldn’t figure out a clear competitive product edge to become a small monopoly in a niche market.

we couldn’t figure out the product side***ideal**same***

The Reality and the Truth

As always the truth doesn’t sell. We are always willing to try a new product (even a brain pill product) but it has to offer something different. We know the majority of the items in all the major brain pill products today and you won’t be surprised to find out… . We take one look at the ingredients and know it’s essentially a concoction of different “tag phrases” that don’t add any real value.

they don’t work long-term

For fun, if you’re looking at real ways to improve your brain power they are actually quite simple. 1) you want to drink/eat foods that increase blood flow such as pomegranates, beets and ginger (with cayenne if drinking it), 2) you’ll also drink fish oil daily – you won’t take tablets, 3) you’ll juice or eat blueberries and 4) you’ll use caffeine on occasions when you really need to focus, just remember it’s a temporary boost. That’s the reality right there and in that order. Once you consume blood flow items in the morning, move to brain functioning items and use caffeine as a boost you essentially have the right formula down pat. If you’re going to venture into the grey/black areas that’s your call and we don’t really have an interest in it anymore.

How to Improve Your Brain Naturally:

For the newer readers… if you’re interested in learning more about making money, staying in shape and doing so without choking off your personality… You’ll probably like . The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality

Efficiency, Get Rich Without Giving Up Your Life
****

The Only Four Things That Matter

This article may sting for many people but needs to be written as many people have asked for a blueprint of sorts.

When you really break down life for a man the only four things he is trying to maximize in life are free time, money and sex. That’s it. Unfortunately, most people will fail terribly at this maximization process so they’ll hit their late 30’s when it’s actually time to live off the hard work and dedication they put in the past 35+ years and do not have any source of income. Compounding the issue, without marketable skills or knowledge you’ll be playing the catch up game when the game is already over. Sure there are a lucky few who turn everything around but at the end of the day it’s best to have an organized plan of attack.

health,

This site is actually a great example. 30+ year olds tend to ask how to make money, while 20 year olds are asking how to get girls. This is entirely mixed up. When you’re young you should be throwing away health and girls for money as it buys long-term time. When you get into your late 30’s you can’t work incredibly long hours without doing serious damage to your body making the cash flow you have set up for yourself a significant safe haven.

This will always come first. The issue is that people use their “health life span” in the wrong fashion. Once you realize that the phase “YOLO” is really just a way for you to rationalize your flat-lined bank account, you’ll be in much better long-term shape. In your twenties your body can take immense amounts of pain and suffering, unfortunately most people simply quit, watch TV and take a $50K a year desk job. If your skillset is low, go work two or three jobs. If your skillset is high, get a inhumane job that pays the most amount of cold hard cash. At roughly 27-29 years old your overall stress levels tend to decline and this is really your last shot to make good money, at 30 you’re perceived as a man, kill yourself those last couple of years to get that managerial level promote and laugh your way to the bank. If you can’t quite get the jump, kick the insane hours before you hit 35 because your body will slow down dramatically causing serious long-term damage.

Health: The best years of your life are not in your 20’s, you are not a high school cheerleader/prom queen, you should not spend this time partying 24/7.

This is where you can create a rock solid exit point. Always shoot higher than this but anyone can reach this level even with zero marketable skills. If the two braincells that we have left were destroyed and we’re under 35, the plan of attack would be to take up two jobs with no excuses. Even two average jobs, call them a desk job at $50K and a low end bartending job at $30K you’re going to be closing in near $100K fast, saving $33K a year, You’ll likely and quickly exceed the mark. Naysayers are going to tell you half a million isn’t enough, these guys don’t know anything so just ignore them. You’re going to be working past 35 but you’ll take a job purely for status which leads to maximizing point 3.

Money: Half a million dollars liquid by age 35. clipping 7% rates on bonds.

If you are a virgin and have terrible relationship skills, then you'll likely take a year to deter from the above money plan and fix this part of your life. Once you have the basics down, put it all on the back-burner and get back to work on creating a 40+ year stress free lifestyle when you hit 35 and your body simply can't take it anymore. The easiest path to sex is quite simple, fame. Fame is just an extreme version of being "publicly noted " or "of power" and the easiest ways to be of miniature public note is to take up bartending, teaching or setting up a small business catered to the crowd of girls you would like to attract. Just kidding – half heartedly.

Sex: Coke anyone?

Before moving onto time, the money and sex importance debate is one that will live on forever. It simply pins up two extremes where one group argues for sex and are generally broke while the argue in favor of their vibrating leather seats but could survive on their bank accounts for the next 10 years. As usual, both of these extremes are insane. We recommend chasing cash early because no one can argue that game cannot be learned in 3 years, now ask people around you to wager on them becoming a millionaire in 3 years and zero hands will go up.

rich guys who can't get laid

Free time is the last piece that men worry constantly about. Am I maximizing this time frame or that, long-term health, current fitness to pull girls etc. At the end of the day just remember that the four categories work together. There are ways to shorten your lifespan, taking up drugs for example, that usually lead to more sex and less money, while there are many other ways to combine – a bartender (money + sex). It really is that simple. If your age group is spending the vast majority of their free time trashed, you should be building a business, if they are getting hitched you should be single, if they are worried about money you shouldn't be and if they are going through a divorce you should be focused on maximizing your single sex life.

Time: In this regard simply compare what the general public is doing and avoid them.

With that in mind, since this article is really meant for someone getting an early start in the game of life, tread carefully as you observe the world around you. The future is bright, brighter than you could ever imagine, since life comes down to decision making and effort. Never raw processing power.

Conclusion:

As a final note, remember that there is no such thing "hardwork" it should be renamed "correctly applied heavy effort", if you know you'll get results that exceed the effort put in you should not care if it is, in fact "hardwork".

****

The Power of 1% and Why You Don't Blog for Money

The Power of 1% and Why You Don't Blog for Money

The photo is a HUGE lie, the title a small lie. It *should* say the power of 2% but the headline title is better as is. Three things 1) how you can utilize the power of 1%, 2) why you don't blog for money and 3) takeaways after ~3 years of blogging . They seem a bit unrelated but they are not. The power of 1%, or 2% in our case, refers to the total time commitment here. 3 hours per week maximum or 2% of a week (3hrs/168hrs in a week). In addition, the related point is why we don't blog *for* money (will likely launch a product later at a ROI) and why you shouldn't either.

terrible

How to Utilize the Power of 1%

You can become competent at practically anything if you commit 1.6 hours a week to the task. This is the truth. If you decide to take up drawing. Take up a new sport. Or even take up a new language… 30 minutes a day three days a week will result in massive change. You will not become an expert (not even close) but you'll have a baseline competency that exceeds the first standard deviation of the bell curve. Now you're probably wondering… How can I possibly utilize the power of 1%?! Well…You know that is not our style… Lets go ahead and get started.

You haven't given me anything actionable!!

Our goal is for you to , so lets brain storm some quick ideas (we mentioned a couple above). 1) Learn a language, 2) learn a dance, 3) learn an art, 4) learn how to sing, 5) learn 6) learn how to play a sport, 7) learn how to 8) learn how to ride a motorcycle, so on and so forth.

Step 1 – Choose a Topic: live a balanced lifehow to give a speech,make a good first impression,

Once you have determined which item you're going to learn you need to categorize the item. We *strongly* suggest you have two hobbies brewing at the same time (at all times). One that is inside and one that is outside. What is the difference? Simple…

Step 2 – Inside or Outside:

This is something that *requires* you to be at a specific place to improve. You have to literally block out time in your schedule to do this because you cannot practice at home. This includes: team sports, learning how to ride a motorcycle, learning how to meet new women during the day/night, learning how to dance etc.

Outside (extrovert):

: This is something that you can do at work, at the airport or at home. You don't need to be out and about to improve on your hobby. Simple examples include: this blog, drawing, learning a language, improving your tone of voice – recordings.

Inside (introvert)

While some will argue that many of the outside activities can be brought inside… That misses the point. You want at least one hobby where you are forced to go outside and interact. You need to learn how to perform even if you're an introvert. So, you should maintain both one introvert activity and one extrovert activity

Remember the world is a stage.

Set an alert on the weekend. You need to set a specific time where you will improve. Hold yourself accountable. Generally 45 minutes of time is ideal (2x per week, this usually means at least 1 day will be a weekend as noted in the first sentence). If you are able to do this, you will no longer be allowed to do any other activity until the extrovert activity is complete. Again hold yourself accountable.

Step 3: If possible make it in the morning.

PDF and install. This means you need copies of the introvert activity in your hand at all times. If it is a language you are learning, you have lessons/recordings on your phone 24/7. Unlike other places, we love the introduction of smartphones because it allows you to be *significantly* more productive.

Step 4:

Now what do you do? Force yourself to take action. Every day when you're done working (spend a minimum of ~60 hours a week on real work, IE: or a) you then turn to your introvert hobby *first*.

[a careerreal business]

*Side Note: As a fun fact, literally 90% of the posts here and even edits to the blog were made on a smartphone or tablet. That is not an exaggeration. We write and send to our main guy who hits publish (TeamViewer is an amazing and *free* resource)*

Focus. Lets repeat. When you are working on your hobby you do not do anything else. You do not watch TV in the background (throw it out if you have one). You do not listen to music. You do not connect to the internet to browse. You do not allow yourself to have access to anything. This step is excruciatingly important. You *must* focus 100% on the activity otherwise you will gain nothing. It is only 1.6 hours a week so it is not hard to do.

Step 5: *FOCUS*.

Do this for a full year. That will result in ~83 hours of attention. Lets go ahead and round up to 100 hours to be safe. That is nothing! Now go ahead and take your activity and use it. Go to Brasil if you taught yourself basic Portuguese. If you learned how to dance? Go take a girl out dancing (please do not take her to an actual dance lesson though, you'll get slaughtered by the real pros).

Step 6: 100 hours is *only* 60% of one week!

In short, after the year is up, you're going to be a much more interesting person. In just five years you're going to have *ten* different skills where you will be above average! That is a huge accomplishment and we have no doubt that it will work for you as well. Why? Unlike regular people you're reading a blog for the elite. That means you don't need a push and you'll be thrilled at the results by 2016.

The power of 1% is underrated. If you follow our step by step process: 1) choose a topic, 2) have an introvert and extrovert item, 3) set alerts, 4) send yourself the training materials, and . You will be *significantly* more interesting. You'll add at least one friend (we practically guarantee it) and your confidence will soar as you learn a new skill you never thought you would be any good at.

Concluding Remarks: 5) focus intensely <– most important piece 6) do this for a full year <– second most important piece

Moving on…

We're going to give you an example of the power of 1% (or 2%) since you're staring right at it.

2) Why You Should Never Blog for Money

As usual… What is everyone else doing? Do the opposite. Everyone and their mom is apparently ready to become a professional blogger and leave the "declining west" ().

whatever that means

The problem is really two fold 1) are you trying to make money? and 2) are you ~25 or younger?

If you answered yes to either of those… Stop. Don't even bother getting started. We will explain exactly why it won't work and what you should do instead. Finally, to avoid appearing pessimistic (that is not the intention) we will also give solid reasons *for* blogging and how we completely f***** up a lot of the basics.

This one is the easiest since we have experience in making some money.

Why You Don't Start a Blog for Money:

You are old enough to give advice (or successful enough). You then decide to start a blog.

Here is how a blog works:

Here is how the business model operates: 1) start posting, 2) gain audience, 3) continue to add large amounts of value for free, 4) gain more and more followers, 5) deal with haters and idiots who try to scam you for money or raid your comments with dumb questions, 6) repeat steps 3, 4 and 5… 7) after adding tremendous value and gaining from your audience over a period of years… You sell a product that is even than your free and valuable content. "Profit". (profit in quotes…)

over and over and over again! ***trust**better***

Based on our research, a solid blog makes about $5-15K a month. Nothing to laugh at but definitely

not a good use of time if you're trying to make money.

Here is how a business works: You spend many months/years studying a multitude of industries. You find a product hole/gap. It is small but enough for you to make a nice profit… Here is how the business model operates: 1) check to make sure there is demand, 2) create a product that is of high value and has a decent margin profile, 3) create the full and *professional* look for the site, 4) buy tons of traffic from that specific niche, 5) make money for as long as you can, 6) wait for competitors to come in and start invading your space and 7) compete aggressively with them. Once step 7 in the process is in full force, you will either become the market leader, sell your company or get priced out of the market (someone did it better than you) and simply let it die.

What is the real takeaway here? A blog builds an audience first then sells a product. A solid business niche, one thatThat is an enormous difference. That needs to be repeated. That is an

A blog is a reverse business model. solves a legitimate pain point, just needs to be marketed. enormous difference.

If you are trying to make money, building an audience is going to take a lot more than buying the audience correct? Correct. So if you want to make money then your risk reward is heavily skewed towards solving a market/demand issue. You just buy the audience if you know where the demand for your product is. There is a reason why major companies have huge sales teams correct? Again… Correct.

time

No matter how many times you try to replicate the work of someone else… It will NEVER work. It is sad. We have even found blogs that are trying to replicate our content and we don't even make money (insert laughter). Why does it matter? Our blog is only growing because the content here is Why? It is impossible to reflect the realities of Wall Street without working on Wall Street!

Do You Have Enough Experience? The audience can tell if you are legitimate. impossible to fake.

That is enough of that. While the above looks like a diatribe, that is not the intent. The point is this. If you do not have relevant and valuable experience to share no one will read your blog.

That is our point and it should be repeated.

If you do not have any interesting views or opinions and you are just out there trying to make a few thousand bucks a month,

you're going to miss by a country mile.

Reality check. If you start a blog without enough life experience You are going to waste a lot of time writing and writing and no one is going to come back to your blog because they will know that you have nothing interesting to say. You can rip, regurgitate and repeat consensus information… No one is going to come back. That is the reality.

you are doing immense harm to you and your future.

We do not care if you ignore this advice.

Why? Time is the most valuable resource in the world and you are wasting your own time by blogging without anything interesting to say.

If you want to make money, your risk reward is significantly better if you start an actual business. A blog is essentially a reverse business where you build an audience then sell. A business sells a product and then buys the audience through advertising/marketing/sales team. If you do not have a unique voice, opinion or viewpoint, you're not going to build a meaningful audience and worst of all you will hurt yourself by losing valuable time.

Concluding Remarks:

With the ugly part of the post done with, we'll end on a positive note. As our readers know, being positive and happy is a necessity to success (section two appears quite dreary!) so lets explain why you *should* start a blog if you want to…

<u>The Main Things We have Learned After ~3 Years of Blogging</u>

Lets say you pass part two of the test. You don't want to make money, you simply want to spread the truth and you have a unique opinion. You are likely a good candidate for a blog. As cheesy as it sounds, your "heart needs to be in the right place". Your audience can tell if you care about them or not within your first 5-10 posts.

This is one of the things we did well from the get go. You buy a legitimate domain with a website name that is 1) catchy, 2) conveys the point of the blog and 3) hints at fun/excitement and solving a problem (Most Wall Street Guys are type A nerds who don't have enough fun, we're trying to fix that!).

Branding:

Once you have the website name… Go buy the domain, not "wordpress". It should just be [insert name] .com. We actually do not know what provider we have since it is all outsourced under one guy who doesn't contribute to the blog… Which brings us to point 2.

Steps to Take:

That is one of the differentiating features here. We'll unlikely ever go public (fame is awful – opinion). Going public or becoming famous is simply not worth it. Harassment from regular people at a sticker price of $200K a year or whatever… Hellz to the no.

If You Want to Be Anonymous:

If you're serious about anonymous blogging, do it right. This is the second thing we did correctly. 1) Buy the persons accounts – facebook, google, Paypal, etc, 2) have him/her set up a server and just reimburse the costs of hosting – meaningless $100 a year, 3) go download TeamViewer and set it up in one location so you can maintain the same IP address at all times – set team viewer so the code never changes. If you don't have anyone who is willing to sell or give you their accounts… You're not connected enough to blog so you've already failed the second section of the process.

Steps to Take:

Complete whiff here. Our previous design was terrible at best so now we're on to the good stuff… where we f***** it all up! Our previous structure was a free piece of junk that didn't have the minimum requirements. What are the minimum requirements?…

Website Design:

You need the following 1) pictures for each post, there is a reason why Instagram is so popular (SnapChat on mobile), 2) responsive website, it needs to auto adjust to mobile phones, tablets, desktops etc, 3) Matching colors – we went with the banker blue for those hard coded cells!, 4) clearly differentiated forms for mobile and desktop views and 5) new colors when the admin leaves a comment. This is the bare minimum. The most popular form is called "Genesis", there are many genesis themes and they cost about $100 a pop. Just pick out the one that is best fit for your blog.

Steps to Take:

This is a disaster. When we first started blogging no one believed the information was legitimate. Then… more Wall Street people came and word spread. Then… The retards show up! The retards will try to promote their blog in every single comment (the comment is never useful). Then… they try to give you "advice". Even though you don't even know who they are… about how your blog "used to be good"… (just another hater). If there was an auto spam alert for idiots and retards we would pay $5K for that <– (business idea, sort of).

Comments:

In our opinion, you need a harsh auto filter. Once every week you should check your spam filter to make sure that no good comments got chucked into spam (many do for one reason or another). If you lose out on a few good comments … oh well. Charge it to the game. Better to lose out on 1/100 good comments in order to prevent regular people from commenting. On the internet… there are a LOT of regular people. Finally, do your best to contact the good commenters to let them know it was a harmless error. If they are upset about the delay then they don't have control of their emotions anyway. Finally, try your best to respond to everyone you can (it is not possible). We had to completely shut down email communication.

Steps to Take:

Another miss here. Our previous logo and banner was terrible as it did not match the content/colors or anything else on the blog. It was just text and a simple icon. We suggest you create a solid logo and banner. Who made our banner? He did a great job and we watched his work over the past year. We also promised he would eventually redesign our logo and banner. Of course both happened.

Banner and Logos: A guy over at unlucky devil.

"Stop being a broke ass and get your 1% on" – Unlucky Devil (got a good laugh from us)

With your theme picked out, colors and all of that good jazz, go ahead and grab a logo and banner. Make sure the logo and banner can be used on all of your social media. We use Twitter, Facebook and… that's about it at this time. Make sure that you can create a banner and logo that is consistent across all of your social media platforms. We don't have the time to expand to other platforms (again 3 hour maximum for this hobby) and would recommend you think in advance as well.

Steps to Take:

Finally? Given how the logo looks and how efficient everything was… we suggest you have Unlucky Devil do the design for you. If you can do it all yourself? Go for it, but that is not our expertise.

The real beauty of this blog is that most of it is "ever green" (note any product you make should be ever green). Some of our original posts written by much younger gentlemen… Need to be redone… But… A lot of it can be redone and made into an "ever green" post. A great example is our interview guide (will add more) and information on careers (doesn't need to change). Wall Street has a structured recruiting process and a lot of our overviews will stand for decades as well (multiples of course will change as we go through recessions and bull markets)

Create Content that Solves a Problem:

Try and create posts that will last a long time (we know, this is obvious!). This will not work all of the time. You may suffer from writers block but it definitely helps if someone can read one post, get something and everyone who tries to copy it will simply do a worse job of it. Not all of our posts are like this, but in an ideal world every post will be "ever green". As you can imagine… Our actual product will be ever green. We just won't bother releasing it until the numbers/page views/users are there. Maybe in 2 more years, who knows and we don't care either.

Steps to Take:

We are experts in this field and likely never will be (no one gets good off of 3 hours a week). But we do know that the items listed above are true: 1) address a problem 2) brand, 3) TeamViewer, 4) responsive website 5) colors, logos, banners and 6) long-term content.

Concluding Remarks: no where near

We have no doubt that anyone with a serious blog will laugh at this advice but we got a lot of questions and there is our minimal contribution. In addition, if you have items to add, let us know and we'll put it on the "to do" list.

Finally… Notice that point 6 highlights that a blog is significantly less effective than a product. The main rule of starting a business is that you want to create an "ever green" product. With a "real" blog… Every single item should be "ever green". Much more headache than it is worth (opinion).

—–

More positivity.

Assuming that you still want to start a blog, but don't have the required experience, we suggest you leverage a blog as a learning experience (from pain). Do not spend your life on the blog. We have already debunked this myth since the upside is severely limited unless you sell to "regular people" (in which case you may as well create a business that sells to regular people)

Every time you come across a harsh reality… The pain will come through in your writing and people will realize that you are living a real life (in real life you will suffer a lot and recover if you are a man).

then you write.

A great example is

30DaystoX.

Why? He's a young guy who is simply learning how life/business/money making actually operates. He is honest and the best writing from him comes when he is reminded of pain (ie: the latest when he got swindled out of $1,500)

While we do not read all of his posts (he won't be offended by that) we are most interested to see if he starts a company. IE: builds a product and pays for the audience.

We hope he does and we hope he hits his first $1M before 30.

****

The Real Guide to Our College Education System

The Real Guide to Our College Education System

A few of our readers are still in college as can be seen by the hundreds of questions on investment banking analyst recruiting. The world is changing rapidly, however we believe the blueprint to college remains the same, just more competitive. So with that lets go ahead and take a look at our view on how to manage your college experience and why it is instrumental that you do not follow the crowd.

If college was legitimately the best time of your life, that means you did it wrong. That is not to say that you will have no fun, instead it means your life did not improve after graduation. The reason why college should not be the best time of your life is as follows:

"Best Time of Your Life":

1) You should attend the highest quality university possible while minimizing debt (more on this later)

2) You should major in a subject with legitimate and the development of niche knowledge (these go hand and hand together)

career prospects

3) You should spend 90%+ of your time chasing girls, the only ones who get away with this are those with good family business connections or people who simply get lucky

not

4) You should learn how to outwork all of your peers, college is a time where you're on your own so you will be forced to develop these skills solo

5) You should obtain internships/work experience in your field because the student with a 4.0 and no internships will not beat you for the top careers

If you follow the above five items you're going to do extremely well in college. You will 1) exit with a better job than 99% of your peers, 2) develop personal work ethic/motivation, 3) obtain some niche knowledge in a field with good career prospects, 4) maintain a reasonable social life and 5) have a rolodex of other future successful people.

With the highlights out of the way lets go through a step by step process on how you're going to set yourself up from the beginning.

Lets go ahead and cut to the chase. There is no point in attending a no-name university because the cost of education has skyrocketed and the job prospects are weak (low income) unless you attend a solid university. With that said the best way to break down the process is as follows:

The Application Process:

If you have solid grades in high school and a solid SAT score to back it up, apply directly to four year universities. In addition, if you are on the fence, apply to colleges that are slightly out of your league.

Top Student?

If you have sub-par grades and know that a meaningful university is out of the question, attend a community college with a high transfer rate to top schools. No point in incurring debt for a school that won't increase your income correct? Correct.

Mediocre Student?

We are highlighting the word apply because you're not going to apply to your major of choice. Go through the possible majors at each university and apply to the easiest major. As an example, if you want to get into the liberal arts section of the school do not apply to the difficult majors such as "undeclared" or "Economics" or "Psychology" which will be saturated with applications. Instead such as Ethnic Studies or an obscure foreign language major. You are doing this to simply , once inside the university the vast majority allow you to by your sophomore year. Make sure to check the switching rules. Most do allow this.

*What Major to to?***Applyapply to a major no one cares aboutgain admissionswitch majors**

If possible always side with a minority group. Again not something people are going to tell you but Naturally this will only work if you are mixed, as an example if you are Hispanic and White or Asian and African American… Choose to apply as Hispanic/African American. It is the name of the game.

What Race to Check off? **both the major you chooseand the minority group you associate withis going to drastically impact your admissions rate.**

This is where a divorce will actually help you. Similar to major and race, colleges will consider economic background as well. If your mother and father are divorced, only claim one person (the lower earner) as your primary care taker. Do not combine the two and use an inflated income number.

What Income Box to Check off?

In a phrase "I want to help save the world and rid it of evil". Okay not that drastic. The point is to avoid any sort of right leaning views and instead to have a philanthropy twist to your entire application. There are a few reasons for this 1) universities will call you for donations once you graduate, at least this gives a hint that you may be the type to donate later, 2) colleges are left leaning (heavily) and you're better off assuming the reader is a bleeding heart liberal and 3) what type of person becomes an admissions counsellor? Enough said. As a side note, this is exactly why community service type activities are smiled upon by the admission staff.

What Type of Essay to Write?

As you can see, once you clear out a lot of the fluff there are only a few driving factors that are going to improve or act as a detriment to your applications. To summarize you are going to get the highest academic scores possible, write a left leaning essay, apply as a minority (if possible), apply to a major no one is interested in and understate family income if possible.

We are relatively strict here so we would call this a Top 40 University or better (USA comment). This is not always the best answer and we can also include an income calculation method. If your net income from year one post graduation is equal to your debt load then it is likely a positive. This means your degree must add $X and that amount cannot exceed your total debt upon graduation of $Y.

What is a Good College? *additional*

Additional income from education in year one = Total Debt (ideally better)

Roughly speaking, if you're able to pay every penny off by the end of year two, you will be in good shape. We are strict with this calculation. It is a good guideline as you will be out of debt by ~23-24 years of age.

With the income and debt side of the equation out of the way we can go ahead and narrow down the income estimation. This is key to building out your career/future income prospects.

Start at a high level, go to your career center and track down every single major and find out which ones have the highest placement rates into the top companies/industries. Make no mistakes. This is the biggest part of your decision making process. If your college is unable to provide a laundry list of successful examples you shouldn't attend that school. This step is so important that we would go ahead and triple check your work by doing the following:

Career Niche Knowledge Development:

1) Find the average starting salary for your major

2) Go on linked-in and find at least 10 alumni from the college for the last 2-3 years

3) Find at least 2-3 contacts where their grades are displayed, if their GPA is poor (below 3.5) chances are their family got them the job not the school. Make sure this is not the case for the majority of the successful alumni

Does this sound like a lot of work? Yes and no. It does take time but we can go ahead and cut through a lot of the fluff right here. If they obtained a high paying job and majored in Political Science, Ethnic Studies, any humanities major etc., they received the position through connections. . Many years ago your major did not matter and you could simply obtain a 4.0 and find decent job prospects, but employers are wiser at this point in time. To weed through the insanity unless you went to a truly elite institution (Harvard-Yale-Princeton) assume that the only viable majors are 1) engineering based, 2) business based and 3) in some cases arithmetic based.

They did not receive it from merit

Generally, everything else can be crossed off the list.

When you first enter college you are told that you will be tasked to think for yourself and work extremely hard for high grades. This is probably the biggest lie told and we've heard a lot of lies in the past, here is the truth:

What College Learning is and What it is Not: This is a complete lie.

*"College does not teach you to think for yourself it teaches you to think "***LIKE someone else**

This is a major difference.

When you attend your first course you need to take note of how your professor thinks because it will determine your entire grade in the classroom. No one actually cares about your opinion on the topic at hand, particularly for the humanities/social science/general education piece of the curriculum. If your professor is a bleeding heart liberal, you better write like one. If your professor has an obsession with George W. Bush, you better take that side of the coin. If your professor loves trading options in his free time guess what questions will happen to show up on your mid-term? If your professor is an ex-bond trader, you can bet your last cent there will be a skew towards bond questions.

The real skill you develop is the ability to tell what topics interest a person.

The second piece we need to touch on here is work ethic. Your average college student is lazy, eats unhealthy food all day, is incredibly out of shape and cannot . Take all of these traits and do the opposite. This is a great problem to have because you can gain tremendous ground on your peers by outworking them. and jotting down everything you need to do. A good idea for a workday is outlined below:

get motivated by himself**College actually teaches you to be lazy so** you must learn to do the opposite.Keep yourself honest by keeping a journal

1) Attend all private teaching sessions (skip lectures if you are in a jam)

3-4 hours

2) Work your unpaid internships (freshman/sophomore) or your paid internship (junior/senior)

3-4 hours

3) Workout for at least .

1 hour

4) Study

1 hour

5) Join a group related to your major such as the finance club

1 hour

6) Intramural sports, socialize etc. for

1-2 hours

7) Write down your schedule and items accomplished for the day

15 minutes

8) as you fall sleep,

Read for a book**30 minutes**

This should represent a typical day, ~12 hours of actual activity and we assume ~1-2 hours of transit time. You will obtain at least 6-8 hours of sleep as well. If you can maintain this run rate of 12-14+ hours a day of actual work, you're going to graduate in the top 5% from a job opportunity basis. We practically guarantee it. Finally, you're going to learn a lot about multiple subjects which can lead to business ideas later.

With the backdrop out of the way, lets go ahead and give some guidelines on what to focus on each year so you can efficiently use your time to get ahead.

Working Through the Years:

There are two key things to focus on for your freshman year 1) obtaining high grades (shoot for a 4.0) and 2) meeting like minded individuals. Do your best to sort out the future winners from the future losers. It won't be hard as the future winners will be seen sporadically (ie: coming out when they are free to have fun) and will be focused on grades for the time being. During the summer you can try to either get ahead on your general education course work or obtain a simple internship (even unpaid) in your field of work.

Freshman:

By now you have a good grasp for how much work it will take to maintain a ~3.7 GPA average. Maintain this work ethic and begin searching for internships, school groups and opportunities related to your future work. You will also have a bit more time to socialize as you have obtained an even better understanding of the requirements to succeed.

Sophomore:

This is the game changing year. Everyone assumes it is the Senior year but it is not. Your junior year is where you put the clamps down on work experience and obtain the important paid summer internship. During your first semester you focus 75% on grades and 25% on interview preparation. Then you focus entirely on work experience/job preparation. Take a lighter course load in the back half of your junior year so you have as much time as possible to hit the ground hard.

Junior:

At this point you should be on cruise control. Your GPA will unlikely waver much and you should have a job offer in hand. Focus on interviewing for more prestigious positions and make schoolwork come second. If you have a 3.7GPA+ into the recruiting season, seeing this drop to 3.5 or so by graduation time will not matter. Once you're all set with your job by December of your Senior year, go ahead and relax. Find time to party and socialize, do some basic prep work for your job and most importantly make friends with every single person who landed a high paying position as well. Now you have time to have fun (you earned it) and you can quickly build out the rolodex from the future alumni.

Senior:

Efficiency Key Points:

1) Use all online resources that show grade distributions/difficulty such as ratemyprofessors.com. There is no point in making a course harder when your transcript will only show a grade and the course taken. Don't be fooled, the vast majority of what you learn will not be used in the workforce.

2) Focus heavily on classes you are certain will be used on the job. For Wall Street this is beginning/intermediate accounting and corporate finance. The complex items are unnecessary for the .

vast majority of Wall Street

3) Take advantage of early morning classes, most are too lazy to wake up and if there is an easier professor teaching early, jump on it

4) Frats/Groups all of these are fine, simply ask yourself if it is going to be a net drag or benefit to you later. Many frats have strong alumni support and many groups will be looked at positively by employers. The reverse statement is also true so be sure to do your due diligence

5) Remember that studying can be made up on weekends while internships rarely occur on weekends, use this as a guideline when you look at your schedule

There are a lot of misconceptions about College but generally the idea is as follows: 1) give yourself the best shot at the best schools/majors, 2) use an 80/20 rule for work/play until you've secured a solid future, 3) focus and learn in the courses that matter, 4) teach yourself discipline, 5) learn how to think like the other side of the table as they have no interest in your actual views and 6) there is no reason to make the experience harder than it needs to be.

Conclusion:

Assuming you can execute efficiently here, the college experience should be fun but not the best time of your life. Your grades will be solid, your friends will be successful and you will have a lot of fun memories from partying on Spring Break to watching your grades take a cliff drop in your last quarter/semester. Execute on this plan and every year after college should be up and to the right.

****

The Secret for Success in Life: Being Wrong Early

The Secret for Success in Life: Being Wrong Early

If you've already made it in life we will wager that you've made a ton of mistakes *and* you made all of those mistakes early. Most people spend hours upon hours looking for a magic potion to cure all of their problems. They will look for the easiest way to make the most money "per hour". They want to know a specific "routine" to get all the girls they want. then they wonder why it always fails. With that said we'll start out with a ton of items we got wrong.

They want to know that the decisions they are making are 100% correct before they even try…

Laundry List of Things We've Gotten Wrong

Couldn't have been more wrong on this one. You can only give people the basic structure (framework) and after that it is up to the individual to think for themselves. Who in the world would help someone for free if all it did was increase the competition level within their industry. No one that is who. Any time something can be summarized in a step-by-step fashion from $0 to hundreds of thousands of dollars, the margins within the industry are going to die shortly thereafter.

There is a Step by Step Process to Success:

Got this one dead wrong. While there is no step by step process (point 1) if you do a ton of research and send a single email with one concise question to an expert in the field… you'll likely get a response within 5 tries. The key part is knowing EXACTLY what you need to ask. After you ask your extremely specific question within a few sentences (3 maximum) they will respond and then ignore you. . The ego is an extremely powerful tool. Most people send outrageous emails that are 2 pages long about their "situation". In reality, there should only be one precise question which can be summarized in a couple of sentences. If you don't have a specific concise question it means you're likely wasting their time and they'll ignore you in the future. Remember people won't give away their business model ("step by step process to success") but if you have one specific question people are very likely to help you.

People Won't Help You: If you then take their advice and show/prove that it worked, they will happily help you again

Never do this. Unless you really don't care about the product/business, never work with a partner. It will fail once the money comes in and people begin to bicker about who is adding the most "value". Under no circumstances do you work in a partnership with anyone. The best way to learn is by becoming your own business and eventually carving out a niche. Once you have a niche skill, you can then work in a team (not partnership) because there is a clear delineation in roles. Oh and never work with friends for money. Never ends well. The best structure is to outsource and temporarily hire people if it's not in your field of expertise (pay cash for the best people). No equity should be given.

Working in a Partnership is "Good":

After going from broke to rich, we can happily say this is a huge lie used to make the masses feel better about themselves. There is no such thing as "hedonic adaptation". The only time it begins to plateau is when you no longer have to work for a living. If you're happy living off of $5K, $10K, $20K a month (the number does not matter) then the additional money you earn is not going to make a big dent in your happiness. The studies that show people are "just as happy" with and without money do not account for people who are in control of their emotions. The people who are rich and unhappy/miserable are those that spend their time comparing themselves to the "Joneses". Hedonic treadmills only exist for the masses.

Hedonic Adaptation is "Real":

Here is a fun one. We thought this was going to be a terrible business when it first came out. Who in the world would pay a premium to have tap water in a plastic bottle? Seems like a logical counter argument… That is exactly why it was wrong. People are extremely lazy and after positioning bottled water as "somewhat healthier" because it *feels* cleaner … The masses took to it immediately. There are even "luxury" bottles of water such as Fiji. The bottled water industry generates ~$14-15 billion dollars per year in total revenue. That is $14-15 Billion (with a B) dollars per year. A huge lesson was learned… . For the record we simply drink filtered water since a large portion of bottled water is indistinguishable from tap water.

Bottled Water is a "Bad Business Idea": never underestimate the value of 1) marketing and 2) laziness of the average person

For those you'll notice that we don't engage the trolls. There is no value in engaging people who don't like you. If they don't like you, just move on. They may spend some time hating on you in the background but it really doesn't matter. Once they realize you're not going to interact with them they will leave you alone. Also, if you waste your time trying to change their opinion you're losing 2-3 other customers/friends/contacts. It is never worth the trade off. Just accept the fact that at least 50% of people will dislike you (the President has a similar approval rating). In short, by ignoring people who hate you… You're also helping their lives. They won't burn valuable time interacting with you and will find something better to do.

You Can Change a Person's Opinion: that follow us on Twitter

Wrong again! We have no problems creating Efficiency because most people won't listen anyway. Maybe 1% will and they deserve all the credit for their future success. You can hand them the exact way to work out correctly (they'll spend thousands on other products looking for a trick that works slightly faster such as "Cross Fit"), you can tell them exactly how to look for the right company to work for (they won't listen and will join the Company that "feels better") so on and so forth. People want immediate results (right this instant) so they'll always choose the path that works better *temporarily*.

People Will Take Action:

This is just impossible. At first it makes sense because if "everyone loves it then it must be good". This sounds like good logic until you realize that . If everyone likes it… that means it speaks the best to the average person. If it is a good book according to average people… well you can fill in the rest. The only way you're going to get an edge is by reading new and interesting information from intelligent people that are *not* popular with the mainstream. If it is mainstream… It's officially dead. Besides, has sold over 100 million copies, you can do the math from there. Even if every single millionaire in the USA read the book that would lead to a 10% success rate (vast majority failed, so the money was made by selling to the masses).

Reading Popular Books Gives You an Edge: most people fail*"Think and Grow Rich"*

How to Get Things Wrong Early

Not knowing where to start is the most ridiculous excuse of all time (and it is the most common!). This just means "unwilling to fail", which means the person will fail by default. If someone is not willing to do five google searches, they will be eaten alive when it comes time to earn money so maybe it is better that way. All that said… here is the best way to be wrong early.

The best way to make mistakes quickly is to make them yourself and make them early. This does not mean you make big mistakes (choosing to major in humanities for example) it means you make mistakes when learning your craft. If you've decided to go down the sales route, read 2-3 basic copy writing/sales books and get cracking. You'll make more mistakes in the first year and .

Go Alone: learn more by doing than you ever will by having a teacher

Without experience it is foolish to make a leveraged decision. Going into a large amount of debt without knowing with certainty that the debt will result in success is a recipe for disaster. Instead, make a ton of smaller financial mistakes when scaling any decision. This can include buying small amounts of traffic, buying small websites or buying a bit too much inventory to avoid losing sales. Either way, by making a handful of small scale mistakes you'll learn a lesson or two when it comes to scaling your ideas in the future.

Make a Bunch of Small Mistakes:

Unless it's a life changing decision, go ahead and listen to well researched information. As a quick check point, if you got the information from a main stream outlet you've failed at doing appropriate research in the first place. Once you've found a solution to your problem from a non-mainstream solution provider, run with it and see it works. If it does, the value is not in the success.

Take Information and Run With It: The value is in knowing that you can find good information if you search hard enough.

Take a full week and work until failure. This means you'll be working somewhere around 18 hours per day. You're not doing this consistently. You're purposely proving to yourself that you've been feeding yourself lies. Anyone can work 18 hours straight if there is a reason to do so. This way, when the time comes (an event requires a lot out of you) you'll be well prepared.

Work Until You Fail:

Everyone will tell you it doesn't make sense so try it anyway. It will feel like you're doing everything wrong but just wait until you see the results ("These Guys Tried to do the Opposite of the Masses and You Will Be SHOCKED At the Results"). By going alone and making a bunch of decisions that go counter to the mainstream advice you'll get an eye opening experience and likely take on more risk due to the results you see.

Do the Opposite of the Masses:

A short post highlighting multiple things we got entirely wrong several years ago. We left out other things we got entirely wrong such as date venues, beliefs about athletic and others. The real point is that by making a bunch of mistakes early and being willing to fail, you'll catapult yourself ahead of everyone else. The masses want a step by step magic potion to success (it doesn't exist). Instead of trying and finding the right resources they continue to buy product after product for when the solution could be found in five or ten minutes.

Concluding Remarks: , , ~~$49.99$39.99$29.99~~$19.99 (ONLY THREE LEFT – NO SALES EVER IN THE FUTURE)

Overall, there is enough free information on the Internet to prevent you from spinning wheels so it's best to get started today. In addition, if you don't want to look for the information, will tell you 1) how to work out, 2) how to eat correctly, 3) how to choose the right college and major – unnecessary but we cover it anyway 4) how to choose the right career, 5) how to choose the right company, 6) how to start a online product business, 7) how to go into affiliate marketing and 8) how to do all seven while maintaining a fun social life. That alone guarantees that there is enough information out there for you to live a successful life. All that said, with the basics for each of the items listed above! That alone is why life is so awesome. There is no competition!

Efficiencyaloneentirely covered people will *still* look for magic potions
****

The Seven Sins and An Ad Hoc Post

This will be shorter than usual (we're in a good mood so creating an ad hoc post). Taking a break from the usual money making advice, we'll take look at enjoying vices/the seven deadly sins. It is certainly possible to participate without ruining your life. In fact, we think it is almost necessary. No one wants to be stressed out all of the time thinking about every move they make. Just think about the extreme dieters who look old despite eating healthy:

hint stress is the worst thing you can add to your body over long periods of time.

The Seven Deadly Sins

This is also known as "self-overestimation". Essentially pride is only bad when you cannot follow through on your skills/abilities. Naturally, we think pride is actually useful for making money and living a good life. If you get to the point where you are actually in the top 1% (or better) in your field, you *should* be boisterous and louder than usual. Being humble does not work in most situations because it is not marketable. Just think of Elon Musk or pro-athletes, attention is a good thing as it builds your personal brand. So the first one is easy, you should have a lot of pride only to the point that you can back it up.

#1 Pride:

As a word of caution, your average person doesn't have much to be proud of so it is better to keep building up skills. Also, it only pays to be loud when you are competing against someone close to your level. If you're attempting to be proud/boisterous in front of regular people, you're coming off as too competitive. In these situation, simply smile and nod to their comments and move on. Many people make the mistake of always being loud. This doesn't work well because you're essentially giving off negative energy.

This is the second deadly sin. Despite the name of this blog we're not that interested in greed in the real sense. Greed means you really focus on making money just to have more money. We beat this one to death and people who simply read the name of the blog won't even read this paragraph. Greed is probably the worst of all the sins because people who suffer from it really ruin their lives. They date women we wouldn't talk to. They are out of shape. They have no friends. They live shorter lives. They are passive aggressive (weak). They have no outside interests. So on and so forth.

#2 Greed:

Unsurprisingly for the long-time readers, we actually despise greed. Greed along with gluttony are the only two we would avoid. The key is remember when you've crossed the line. Easy answer though. You've crossed the line when you will no longer use the money. If your number is $10M, $100M or a billion it does not matter. Once you realize your life wouldn't change when you add a few points to it… Time to stop. You only get one chance at life and if you're interested in making a bank account go up a few digits, that's just as bad as a video game player sitting in an arcade to beat his own high score on a game he beat 20 years ago.

This is a common vice for rich people (typically in the form of sugar babies). We have no problem going down this route to be honest. As long as you're not breaking the law and putting yourself in jail, you're good to go in our eyes. What we never understood is why people go with the same woman over and over again. If you really want to participate in transactional relationships, it's a lot smarter to have them occur once. This prevents the person from trapping your in a situation you don't want to be in. It also prevents you from developing a traceable relationships with this person. We'd actually recommend people to go down the one-night only path.

#3 Lust:

Think about it in terms of your reputation. If you do this once and a while, no one is going to figure it out. Also. People won't care. Once you start doing this with the same person, it could leak into your actual life. If a person had a family we don't even want to know how they would talk themselves out of it. You can draw a parallel to President Trump. Sure maybe he had a one time fling with a porn star, but does anyone really care? No. If he spent his time with her for years while acting as president, then people would likely care a lot more.

We actually don't suffer from this vice. If someone has what we want it is much more likely a friend. Being envious just reduces your chance of obtaining something. Similar to money. People who distain rich people rarely get rich since it is a psychological barrier. Besides. When you think of Envy in terms of a person's whole life… it gets much much much harder to be envious. Sure you may want Warren Buffet's money, but we wouldn't want to be him or live his life (he is old and we wouldn't be interested in his lifestyle at all).

#4 Envy:

Unacceptable. We despise people who are unable to make care of their own bodies. They got a chance at life and decide to trash their only body. We take it further and would happily vote for higher taxation and higher insurance costs on people who do this. They end up costing more money as well (IE. being in shape costs less money than being out of shape due to future health costs). Under no circumstances is it "okay" to let your body go down the drain. If you gain a few pounds due to stress that's acceptable (still trying to make it), taking it to the point where you're officially overweight = time to slam the brakes.

#5 Gluttony:

This is a tough one. When it comes to wrath you should only strike if needed and make sure there is no chance for a come back. There are times where you will be forced into a situation where you must fight and you should fight as hard as possible. Our only comment is to make sure the person does not get a chance to fight a second time. It is best to choose your fights when they are one time in nature. Notice this is similar to the Lust section! Any time you must go through an immense fight and take someone out (competitor, getting someone out of your way), makes sure you won't be in the same situation later. We think these one time events are rare, but a common one would be employment for people who are still working in a career (fight for your life to keep your employment if needed during layoffs, don't pull any punches there).

#6 Wrath:

Good old downtime. Ideally you have a lot of sloth in your life! That's right, sloth is an okay vice/sin to have assuming you've earned it. Most people reward themselves far too much. But. There are times when you should be rewarded with a day off. Anyone who ends up succeeding will earn a period of sloth. Also. These same people won't stay in the same state forever. They bet bored, get back to working on a project and then go back to a sloth state once they achieved something new. Since we're only interested in successful people, sloth is not a major sin to worry about. For regular people it is probably the biggest sin as they spend time relaxing when nothing has been accomplished yet.

#7 Sloth:

Participating in the Seven Sins

With the sins out of the way we'll recap: we're perfectly fine with – Lust, Pride, Wrath and Sloth depending on the situation. Greed is only okay until you have made it and we're not interested at all in participating in Gluttony/Envy. Funny enough if you're successful by a truly inclusive definition of success, you won't be overweight or envious of people.

At the end of the day, most hedonism surrounds lust. Men don't talk about traveling to destinations with unattractive women. They spend a lot more time searching for beautiful people to spend their time with. Since we know this is reality, we have nothing negative to say about lust activities that don't damage your life/reputation. If you're going to go to strip clubs in vegas, sign up for seeking arrangements or go to other paid for lust activities, we really don't see a problem with it. The one caveat here is you should be "good to go" on the social side. If someone is desperately trying to figure out how to get girls (something solved by mid 20s unless a failure at life), they have no right to involve themselves in these activities. They are damaging their social skills. Therefore insert any activity dealing with lust and we're going to say go for it. Just remember. If it ends up on social media or impacts your family you've really messed up and have a problem.

Most Hedonism is Around Lust:

Again we're fine with all of them. Except maybe heroine and things of that nature. If you're going to use hard drugs once and a while we really doubt it'll mess up your life. In fact, you can do them and be successful. And. You can avoid drugs your whole life and also be successful. We've tried a wide array of them over the years and have moved on (don't use any anymore). Maybe once and a while you'll fly out to California (since it's legal) light up a joint and have a relaxing day at the beach. This isn't going to hurt your life in anyway. Similar to lust activities, as long as you don't damage your health seriously (like Avicii), you can do as much as you like. Our guess is you'll get bored of them and only use them to give out at parties to other people.

Drugs/Alcohol:

Trolling is essentially a form of showing superiority on a topic. We are naturally positive on trolls. Just focus your trolling on people who will lift your perceived value. Trolling a regular person is a waste of time because their life has already ended. No need to troll a regular person since it would be similar to telling a 50 year old who made the wrong decisions that he/she is a failure. No point. You just look bad and nothing is gained since you're interacting with a regular joe in the first place. If you see an opportunity to troll someone who is going to elevate your perceived value you should be going ALL IN. Pick your battles wisely.

Pride is Really Trolling:

A common invitation you'll get is to parties with a lot of "friends for hire" at the event. We'd say you'll be shocked but that's a lie. Once you succeed you'll realize that a lot of wealthy people do this and won't be shocked when you're invited to such events. Feel free to go just don't have your photo taken (a good general rule for life anyway). Many rich people realize the same thing. They want to have a good time with good looking people… They just don't want their personal lives to be involved at all. So. A common one will be a one or two week vacation where nothing is done and you're simply hanging out with a few friends and several paid for friends for the week. As a side note, we don't recommend bottle service if you're going to throw one of these types of parties. It always ends up being significantly more expensive than it is worth. If you're going to do it, go to a location and set it up outside of clubs/bar scenes.

Combining the Sins:

In just a few paragraphs, we've already covered the major sins and despite what people believe there is only so much you can participate in. Even if you were to go down the lust route on a weekly basis and use drugs on a weekly basis, you'll eventually get bored of it or see your health take a hit. So another common move is to go on a a week or so trip to do almost nothing. This means your food is all made for you, you order up several massages and you spend your day on the beach chilling in the sun. Generally, this type of week is what women dream of and call 'being pampered" a phrase you'll hear over and over and over again if you decide to date a gold digger for a few months (yes gold diggers are better to date than regular people since a real gold digger should be extremely attractive – otherwise we wouldn't consider them gold diggers, they would be imposters).

A Week of Nothing:

We're not sure why but many rich people get their rocks off by having tons of watches or cars. As you know we're not really big into either. Cars guarantee you're going to have a run in with the cops and cost tens of thousands of dollars a year. Watches are simply boring to us and we'd prefer buying an expensive suit and shoes versus a watch. The one item we will note is that either will give you a lot more access to temporarily date gold diggers. From what we've seen a watch is a bit better since you can use it more frequently and a Patek is only going to be noticed by a true gold digger while something like a rolex is going to be noticed by the masses.

Status Items:

Answering Some of the Questions We Ignored

Since we're basically admitting to being ok with drugs, lust an any hedonic activity that doesn't hurt your life long-term we're going to answer some of the redundant questions we continue to get. (yes, another amazing weekend so we're addressing items we already answered!)

A mentor is just some guy wasting his time helping someone. So a real mentor is someone you actually want to become that you don't bother much. Meaning 30 minutes for maybe 1 time every 4-6 months. Anyone who thinks there are people who "grab someone and take them under their wings" are delusional. This is only the case if the guy is earning an ROI by doing it. If he was successful he wouldn't waste large amounts of time on something that doesn't add value to his life.

A "Mentor":*Hint: if you want to see if someone will succeed, see if he asks for a partner. These guys never make it.*

As usual only buy if you're going to stay in the city for at least 10 years. If under 30 you shouldn't know where you're going to be in 10 years so you shouldn't own.

Home Ownership:

Not sure how this came up but trophies aren't really interesting, if you wanted to succeed at something the medal/trophy doesn't mean much and usually means more to your parents so give it to them so they are proud (this applies to diplomas as well).

Trophies???

We've already covered it here, using hardcore drugs a few times in your life won't do much. Performance enhancing drugs we're also fine with assuming you've hired a private doctor. If you're going to inject items into your body without a pro… you're probably not going to do your body any favors and we disagree with the decision.

Performance and Hardcore drugs:

We've answered this hundreds of times. AI is already here and things like digital advertising jobs will go away. Yes we mean a Zero. In fact if you're not using AI for ads these days you're probably very far behind and need to catch up. In the future it'll replace the vast majority of job that are paid by the hour. Why? If people can pay by the hour they can easily see how much value it adds. Since it's a commodity it can be automated.

Artificial Intelligence:

We're not sure and will have to think about it. Unless you do something ridiculously irresponsible it is almost impossible to lose a "lot of money". If you're down 50% on one asset class, you should have accounted for this when putting on the position. If everything goes down by 40-50% then that's great. Everyone else is in the same boat. So on a relative basis you're essentially the same.

Losing a Lot of Money:

Again. We are the worst people on earth to ask about this stuff. If someone needs a step by step to improve their life, they should go to a Tony Robbins seminar or some sort of pick me up seminar. There they will find other losers to hang out with and talk about their problems. If someone wants to fix their life, all the answers to major questions are available for free on the internet. So we don't bother addressing this topic. A bad habit is just misplaced priorities. Which we can't change for anyone.

Removing Bad Habits:

Generally, our view is that people want to feel important. This is why they want attention, status items, to feel better than other people etc. Naturally ,the solution is to do the opposite. Since most humans are unhappy it is likely because they think they are important/deserve attention. One you realize that practically no one is remembered (even CEOs of billion dollar companies), you'll come to the conclusion that being alive is the best gift you could get. Avoid people who want attention (anyone who wants fame would immediately be blacklisted in our own phones) and move on. Enjoy your life because you only get to live this rollercoaster of fun once.

Our View on Humans:

Most people don't succeed so they seek motivation. Motivation is therefore the biggest market and we don't address it. If someone has succeeded they will go through a period of time where they are looking for the next task. Our answer is simple, wait. Keep reading and learning about things you are interested in and within 12 months or so you'll get a new idea or project to work on. Asking for inspiration or seeking it out doesn't work. Never has, never will.

Finding Another "Inspiration":

Hope you enjoyed this adhoc post and had a wonderful weekend! Another day has passed and another day closer to death, hopefully you enjoyed the day!

As usual no questions, only for purchasers in formal Q&As.
****

The Status Disease

The Status Disease

After the massive bull run in crypto there are many millionaires walking around who have never experienced wealth. If you made money in a different way, this post is still for you. Status is a disease (the need for attention). While we've recommended targeting three areas: health, wealth and insecurity (in terms of starting a business)… This post focuses solely on status. This is the best time to do this. Many previously anonymous people are going public with their real faces and real names. Why? To get into more exclusive clubs/deals and make more money (even though none of them need it, they are already rich). Perhaps they are doing it for a different reason. And. Incentives typically lead to the correct answer. Therefore it's best to explain the psychology here.

Humans are generally acceptance seeking creatures. From the beginning of time we lived in particular tribes which led to echo chambers. In short, it is to look for acceptance and attention. We're suggesting you avoid this.

Attention Seeking Creatures: *"natural"*

In the new world, you do not need the approval of large numbers of people. You only need a few close friends/family members and they don't need to know your net worth. No one does. In fact, there is always going to be a person in the world so you're effectively playing a losing game.

"richer"

Take a step back and ask yourself . If you ask this enough you will come to the no-BS conclusion, which is that you're insecure. You want people to know you are rich as wealth is one of the only ways to "show" the world you're better than average. Other ways to show you're better than average include an extremely attractive partner and extreme athleticism or good looks. Again. We will focus on money here as many of you made millions according to our email thank you letters.

"Why do I want people to know I am rich?"

> — WallStPlayboys.eth (@WallStPlayboys)

The need for attention and fame is a disease. A disease of insecurity.You are good enough as it is, you don't need validation from anyone (not even your heroes). When you get rich, come back to this tweet before you buy that green Ferrari.

March 14, 2021

Contradiction? Not really. Everyone goes through the insanity/mania phase. Perhaps you get the black lambo. Perhaps you buy that $100,000 watch. Perhaps you buy a home that is obscenely large. Perhaps you fill in the ____.

You Will Buy That Green Ferrari:

Everyone does it and we're not here to shame the status/mania phase. We're referring to long-term attention/fame. This is a different game. And. A game you should take incredibly seriously. Once you open the bigger flood gates, you cannot "go back". If you decided to buy a super car, you can always sell it and go back to your normal life. is always a good way to claim you lost it all. Leverage is a common wealth losing mechanism. Fame? Fame is forever.

"I lost it all with a heavily levered position"

If you're a public figure, you also inherit the following: death threats to your family. Death threats to you. Potential for serious violence particularly after the COVID-19 global recession. Potential for additional security attacks (people will find all your personal information and go straight into attack mode). So on and so forth.

Downside of Fame:

The easiest way to see that this is true? Look at the paparazzi that celebrities have to deal with. They can't even go to the beach and lounge around for half an hour. They can't go grocery shopping without security. They can't even talk to someone new without a photo being taken of the event . For more information on this youtube is a perfect research hub, watch it on video.

"oh my god he/she is talking to so and so"

The most important part? The inability to reverse course. The only real way to lose fame is by losing all influence (such as a one hit wonder or a pro athlete who gets injured and is quickly forgotten). Otherwise? You're stuck with it forever. This has implications for not just you but everyone associated with you. Your best friend? He's now at risk. Your pet animals? Psychos will quite literally try to kill them or steal them. Kids, Family so on and so forth… all at risk for as long as you are in the spotlight.

Well if you agree with the general premise the good news is you can still play status games online while remaining anon. Unless you have not been paying attention, avatars of punks, masks and other objects are popping up all over the place. If your goal is to show you're rich while remaining anon, this is a true and real strategy. Go and buy a crypto punk (), expensive hash mask (), an expensive beeple () or Fewocious… etc.

NFTs are Great Timing! https://larvalabs.com/https://www.thehashmasks.com/https://opensea.io/

Once you've done that you can prove you own it and flex online to the other "plebs" while maintaining your entire anonymity. Besides. If you're dropping $200K on a JPEG, you certainly don't need to become even richer. You're already set for life. In addition? Your goal of getting in on the best deals will come naturally. Once someone realizes you own a 10 BTC photo, they will slide into your DMs with those crypto projects you've been dying to invest into. Problem solved! No need to become a public figure.

Hopefully this post has spoken to you in some way. If not save the tweet and this blog post for the future as you'll likely become ultra rich. If you've been following us for the past ~5 years you're probably already a millionaire anyway.

Time to End on an Ultra Positive Note:

On that note, if we look at where the world is heading, Digital is eating Physical. It's happening to , music, financial services and more. The digital future is here ().

art*the art post link here is probably one of our best of all time*

It's best to fade into the background in terms of what you actually own (unless entirely anon then you can go ahead and flex). Think about the big picture. If crypto takes over as the world's reserve currency. Check out

The Wolf of Wall Street – Review

The Wolf of Wall Street – Review

Rarely ever step foot into a movie theater but with all the fuss and questions it was time to go ahead and see "The Wolf of Wall Street". For those that have not seen the movie, there will be some spoilers in this post so ignore the post if you want to see it first.

Jumping straight to the chase the movie is a 7/10 due to entertainment value however, Wall Street does not operate at all like the movie depicts. There is no chop. Brokers don't make squat anymore. There is definitely no way you're going to personally own 85% of a company you take public and the office environment is certainly not a college frat party. With that said are still common (people use anything from testosterone to modalert to cocaine etc etc.), pay for play does occur (definitely not in the office but strip clubs and other drunken celebrations do occur) and you can still make some on Wall Street if you've got the work ethic (survive to your mid 30's and you did something terribly terribly wrong if you're not at least a multi-millionaire).

Summary:drugsdecent money

With that said lets get the myths out of the way and jump into the good stuff after.

Myths:

Back in the day, stock prices were flashed in 1/8ths of a dollar terms, 1/4 and so forth. So you could make a "spread" on the transaction. In simple terms, you find a sucker who buys the stock for $15 when you're on the phone with a willing seller at $14.75… You just made 25 cents per share. This is why one of the brokers suggests he simply "makes a lot of trades". This was true back in the day, if you could get a large chop on several hundred thousand shares, you're good to go. Today? Good luck making more than a few pennies on a transaction.

1) The Chop:

: If you look at our , we don't even include brokers anymore. They are basically dead. You make peanuts. Just check out this listing where someone withThat's not even worth a look. In addition, while we're at it, they claim that the series 7 examination is some sort of "serious" test. It is not. The joke on Wall Street is you should shoot for exactly 70% on the test, if you get 90%+ you're a weirdo who had to study to pass the exam and if you score below 70% you're just an idiot. Fun fact, during training some people pool together and say "whoever scores closest to 70% wins $X", the test is that easy.

2) Stock Brokers Don't Make Money Wall Street map 3 years of experience can make… $50K.

The glorification of IPOs in the media is beyond overblown and the movie basically makes it worse. If you ever meet a guy who says he wants to "Work on IPOs" just shake your head and move on since he is saying he wants to work in Equity Capital Markets… one of the lowest rungs within the investment banking umbrella (still better than back office of course!). There is no skill involved in an IPO, if you're a Big Swinging Dick (BSD) with massive connects and can leverage a balance sheet for a billion dollar IPO, you're the man! If not try to avoid starting your career in ECM unless you have the rolodex. Finally, illegally owning 85% of the stock would simply not happen today, that is a whole different level of pump and dump.

3) IPOs:

Good luck getting a job on Wall Street with no credentials today. If you're at a get ready to grind more than you've ever grinded before in your life to get your foot in the door. better shine like a diamond too. Easy ways to move up on Wall Street simply don't exist anymore, unless your dad is the head of the investment banking division or your uncle is the CEO of a Fortune 500, the only way for average man to break into the Street is with 1) great work experience, 2) a great school/education and 3) an extremely positive attitude.

4) Education:non-target school, That resume

The closest you'll get to a frat like environment depicted in the movie is if you Here you can hear all the cussing, screaming and annoyance but definitely not to the level in the movie. Funny though, you can actually hear some traders calling up hooks from time to time but that's another story. In reality, the environment today is "quietly intense". If you're using your mouse to operate on your computer and if you're unable to respond to questions/tasks/clients within a few seconds… consider yourself a terrible employee and soon to be fired (yes this comment is broad and IB/PE/S&T/Research/Hedge funds all have different priorities but quietly intense is the best description for the whole industry).

5) Frat Life:become a trader.

The Fun Stuff:

Yep. Of course this is always going to come first. No matter how you slice it there are simply not many jobs that pay $100K+ your first year out of college. They don't exist. If you are not motivated by money who knows why you're reading this site and who knows why you're alive in the first place. Money buys everything from the best health care to a custom suit to a brand new apartment dead center in SoHo. Money is referred to as a drug in the movie. This is actually true. We half-jokingly tweeted that every zero in your bank account is a point on your long term looks scale. Put a million bucks in the bank and you're a "7" for life. You can't fake that kind of confidence. If you follow the money/life advice on here (even outside of the Street) you should be able to gather up 6 figures relatively quickly, 7 figures is definitely not out of the range and you'll see for yourself that money changes you. You don't get stressed out, you don't care about some chick turning you down, you don't care about the price tag on the new iPad. Anyone who says money isn't important, ain't never had any to begin with.

1) Money:

If you can sell you can do anything in life. This was probably the highlight of the movie, "Sell me this pen, now.". The biggest takeaway for anyone who watches it should be this "sales will always lead to success". If you can sell a million pens, a million diapers a million burgers… you'll be a millionaire. Fast. The Street generally recruits people who have good academic skills, above average math grades etc. But at the end of the day sales will set you apart. Can you work the room? Can you walk into the office and get the "right guy" to like you? Can you sell your higher ups on more responsibility? A promotion? Will XYZ important client like you? Can you convince your PM to take a position in XYZ stock? Can you raise funds? Can you convince that 8.5/10 Russian girl to spend the night with you? Sell sell sell sell sell. Always Be Closing (ABC).

2) Sell Me This Pen: If you've found the cure for cancer it doesn't mean squat if you can't sell it!

There is a major change in the movie when Bedford decides to go after the whales. He becomes rich! Not surprising! If you're going to make a sale, if you're going to sell anything always get the deepest pockets possible. The other clear point is this: get near wealth and you will be wealthier. If your phone is filled with CEOs and CFOs there is next to no chance that you are poor. If your phone is filled with a bunch of haters, complainers and average dudes… Chances are you are or will become a complaining, hating average dude. Don't put yourself in the poorest environment in the world, try to put yourself in the richest environment in the world.

3) Go to the Rich:

Never been to anything quite as extreme as the movie, but wealthy people definitely know how to party. If you make friends with the right people you can find yourself in some interesting venues. You don't need to own a private jet, you just need to know someone who does. The best parties in the world are always thrown by wealthy people.

4) Partying:

Can't decide if this is a good or a bad thing but the truth is, unless you have monk like capabilities, you're going to use some sort of drugs at some point in your career. Many guys get addicted and lose their jobs, don't be that guy, but you're going to go through some horrible horrible crap during your career. The best example is the "banker twitch", this usually occurs when you cram through 48+ hours straight and you lose control of your eyes. Your left eye looks left and your right eye scans to the right. You're on empty. Thank god those days are over. Drugs have an extremely bad reputation in the public eye, the scenes in the movie didn't help, but the truth is that drugs are used for high end professions. It does not stop at Wall Street, just go to a Law School and tell us those guys/girls are not loaded up on addy.

5) Drugs:

Conclusion:

The movie was much more entertaining than expected, was a bit long at 3 hours since the end got dragged out, but it was certainly funny. One day Hollywood will come out with a more accurate depiction of Wall Street today, but we won't hold our breaths.

****

The Worst Question In The World

No hate. Mistakes were made. We've all made this major one. Here is the worst question in the World.

"What if?"

What if I want to switch schools? What if I don't get into a bulge bracket? What if I get rejected?

[What if I lose my job?]

Here's the answer.

What if you do nothing at all? You may as well be dead.

Life is a game. Take action. If you spend your time in a state rumination, you remain on the bench. No one wants to be on the sidelines in a game you only play once.

Your friends, your family, your boss, your wife and anyone near you is going to protect your near term emotions. They will play what if with your future and the answer is always the "safest" solution. Why are you going to let someone else

[make a decision for you in the moment in exchange for what you desire the most?]

We get a lot of emails about college debt, getting into a target school, making the right decision. But only one email has come in asking the right question, The is you probably have not. You're already accepting failure and you're limiting your own potential.

have I maximized my potential?[harsh truth]

If everyone else can only muster a 4.0 GPA at a community college why can't you do the same… And get a job relevant to your passions… And stay healthy… And wake up every day with a positive mental state of mind… And step out of your comfort zone every day… And ignore all the haters… And ignore the limits you have unnecessarily placed in your own mind.

Escape the prison.

When you escape you will wreck the belief system of everyone who was trying to help you make the safest choice all the time. You just gave all of your relatives the biggest gift of all, a new positive mindset.

Help them escape prison as well.

Of the people who read this post maybe one person will follow through.

The sad part is everyone deserves more. They just aren't willing to earn it.

****

Things to Know for Your Thirties

Things to Know for Your Thirties

We have gotten a lot of requests for a post on "rules for your thirties". Unfortunately? There is no value in a post like that. Anyone who has succeeded is not going to be interested in a post on rules since they already have their life together. Generally, this question is posed by people who are in their mid 20s and are looking for guidelines for the future. With that in mind, this post is going to cover general beliefs and steer away from rules. By the time you're in your 30s you shouldn't be worried about money, girls or friends. But. We'll go ahead and add on to these themes.

Financial

Maybe you had to take a few salary jobs earlier in life (20-23) to break into (usually engineers fall in this bucket). That is fine. But. By the time you are in your thirties under zero circumstances should you ever work for an hourly wage ever again. You will work for performance (sales/revenue generation), ownership (equity) or you won't work at all. Period. You're going to leverage *other* people's time and never take on any sort of hourly consulting role. It just doesn't give a good ROI. Finally, if you're working in a career, yes part of your compensation will be a salary. But. It will not be more than ~50% of your total income anymore. Otherwise? You're going ot be fired anyway.

Never Trading Time for Money: a real career

We have a clear path to . Since this is a post on your 30s there is literally no exception to *not* being a millionaire and in your mid 30s. You would have to make terrible decisions in life over and over again to miss this financial hurdle. Even if you didn't move up the totem pole quickly, if you're making ~$150-200K a year it is quite easy to get to $1M. The reality? Most people reading this blog (Wall Street focused people) will clear $1M in net worth by the time they are 30.

Millionaire or Something Went Wrong: a million dollars laid out

Most people who reach 7 figures in net worth have closer to 5 solid sources of income. You should have at least 3 sources of income. If one of your legs gets taken out (business goes south, career goes south or investments go south) you should be perfectly fine. With three forms of income, if the economy collapses you won't sweat it. You will simply lose one, maybe two, forms of income and get back on your feet to focus on what matters (getting new forms of income again). More importantly? Your total income should easily be north of $250K (more likely $400K+ at least).

Three Forms of Income:

You should have several friends who do good work. Lawyers, accountants, online marketers etc. You should receive a referral fee if you find someone who will benefit from their services. If you are going to recommend something you may as well take the fee as well (no point in giving your time away for free). A better example is a recent referral for a top tier accountant. Once your friends start making $300K+ off of their businesses, they are going to focus on limiting tax liabilities. A good accountant can save $4-5K easily on a $300K income stream. Once you refer your friend, the accountant will happily pay you for the referral. Your friend is happy you're making money off of the referral and your accountant is going to keep you as a customer for a long time (he probably won't even charge you if you refer 5+ low maintenance customers). In short? Don't do anything for free. There is no point in wasting your valuable time.

Easy Referral Money:

We get a lot of questions about managing finances. Unfortunately? We will never under any circumstances work with retail investors. It is not worth the time, money or hassle. If you do not know your own risk tolerance, the last place you should go to for information is the Internet. Go and talk to a professional (for free!). It took us a long time to find a useful source and we're glad we no longer have to field personal finance questions anymore!

Risk Tolerance:

Social Life

Maybe you didn't have fantastic social skills as a younger guy. So you spent some of your time going out of your way to be social. Blocking out time to meet girls at clubs/bars or even trying your hand at meeting girls in SoHo. Fantastic. By the time you are 30? This should end. Your time should be extremely valuable. You simply meet girls on your way to work, meetings or even at the airport. Maybe you enjoy nightlife and go out with your friends. But. Under no circumstances do you block out time to "do approaches" since this is an enormous time suck. If your "opportunity cost" is $500 an hour. That 4 hour hangover the next day simply isn't worth it. Finally, if you're one of of those rare people who can go out 5 nights a week and see no impact… Well then it doesn't matter. The main point? Don't let your social life impact more important things: Health, Money, current friendships. No strange girl on the street or at the club is worth it. No exceptions.

No Longer Go Out of Your Way:

On television they teach you that successful people have hundreds of thousands of elite friends who they hang out with all of the time. This couldn't be further from the truth. Successful people have a lot of soft touch friendships. By the time you're in your 30s you will have ~10-15 solid contacts who probably live in different cities. You have maybe 2-3 solid friends in your city that you see 1x a month and another 12 friends who live in other major cities. The rest? They are all acquaintances. Acquaintances are fantastic for grabbing a drink and "hanging out". But. Under no circumstances do you ever tell them how much money you really make (or have) or any real details about your personal life. They will try to tear you down.

Tougher to Meet Friends:

Similar to never going out of your way to meet new people, you've already developed a niche. It does not matter what the niche is. Maybe you have a few high end lounges you enjoy going to (everyone knows your name) or maybe you have a social circle involving museums and art. Neither is right or wrong. The real point? You've combined an actual interest of yours with a way to meet new people (new social circles) or girls to date.

A Solid Niche:

As soon as you hit 30, the "marathon of life" works in your favor. The competition starts to drop like flies. Men are getting married left right and center and you'll get tons of invitations to another lame "international wedding destination". Attrition is really weeding out the competition. Perhaps, 5-10 years ago you could make the case that men didn't "know better" when it comes to marriage. In 2015? This is simply a terrible BS excuse. The only downside? You'll lose a lot of friends and acquaintances during this time period.

You Shouldn't Be Married:

At this point you should have contacts abroad. At least 5 of them. You should be able to land in a few countries, call/text a friend and have no problem meeting sometime during the week. This will make your life a lot more interesting. Since the pendulum swings both ways, you can show them the ins and outs of the United States of America (best place on the planet). Eventually, you'll notice key mannerisms of specific countries (the colors they wear to the brand names they like), which will make it even easier for you to spot foreigners out in NYC.

International Friends:

Obtaining Information

If someone disagrees with this, they are likely unsuccessful. Why? The only way to gain an edge is to have a strategy that no one else is doing. If it is well documented, researched and public… Then everyone else is doing it as well. How in the world is that going to give you an edge? It won't. In fact, new age dating advice cannot be proven (yet) and anyone who has gone out more than 100+ times can easily tell you it works.

Anecdotal Evidence is the Best Evidence:

The best way to obtain more anecdotal evidence? Cross check your beliefs with other people living a similar aggressive lifestyle. If you know that Person A, B and C all have the same goals as you and they are all taking action… Have a quick conversation to exchange notes on what seems to work and what doesn't. This applies to everything from lifting weights to to meeting new people.

making money

While you should certainly read every single day (maybe 30 minutes to an hour) you should understand that *action* will result in much more progress than information. You can read a million books on how to shoot a jump shot. But… the chances you shoot anywhere near close to Stephen Curry is zero percent if you don't actually shoot a basketball. A guy with less than perfect form who shoots 1 million shots will beat a guy who shoots 100 shots but studied basketball for 20 hours a day.

Action Over Books:

Action applies to making money and generating revenue as well. You're much better off trying to buy traffic. You're much better off picking up the phone and trying to sell. You're much better off cold emailing. The key is to spend <10% of your time doing research (preventing bone headed mistakes) and using 90%+ of your time taking action where you'll make minor fixable errors.

We had to put as the best information because life experience always wins. That said, in order to find good information you should have a strong filter before even considering the content, here is ours: 1) is this person better than you at the task? If not… don't bother reading or building a relationship anymore, 2) is this going to provide information or emotion… the latter is useless but feels like good content to average people, 3) is the information based on studies or years of mistakes? Choose the person who has made many mistakes, 4) is the book worth reading after the first 50 pages? If not… Throw it in the garbage and 5) can you apply the new information within the next 3 months? If not… select a new book.

Selective Information: **action over books**

The real trick here? You're only going to find ~10 books a year that are worth reading by the time you're in your 30s. Assuming you're successful, there are very few resources that are going to improve your life and unless you're reading for fun (fiction, not action) you're not going to read all that much. In fact? You're probably better off learning a new language or picking up a new hobby instead of reading books that aren't going to help you anymore.

Time Management

By the time you're a millionaire and don't work on an hourly basis, you should be able to make your own schedule. Naturally, you're going to get bored easily since you put in the hard work (60+ hours a week for ~6-10 years) so you'll probably work 45-50 hours a week anyway. That said, you should have a team working with you so you can skip days when there is no need to work hard. If you recently closed a transaction that exceeds your quota for the year… there is no reason to show up to work on Fridays for the next 3 weeks anyway. Have everyone else send the basic updates for you.

30-55 hours a Week:

This was an easy lead in from paragraph one. If you are not trading your time for money? You should become more efficient by delegating tasks to other people. Any task that is not going to lead to more income but *needs to be done* should be delegated. This means updating documents, making tweaks to sales pages, dealing with technology updates, answering unimportant requests to show you're "always available". All of these tasks are not worth your valuable time. Hire someone to do them for you and pay them slightly above market rates so they have no reason to complain.

Learn to Delegate:

Unless you enjoy doing chores for fun (cooking as an example)… there is no reason to do them anymore. Make a list of items that take away from your time on a weekly basis. Remove at least three of them so you don't have to bother anymore. This won't cost you much. Maybe $300-500 a month and will allow you to focus on more important things: 1) your health, 2) thinking of ways to generate more income and 3) how to diversify your income streams. A quick list of things you shouldn't waste time with: 1) dry cleaning, 2) shopping, 3) responding to emails from low-end clients, 4) team building activities – ask someone on your team to attend and be the cheerleader, 5) cooking and 6) booking flights/hotels/etc.

No More Chores:

****

Think Like You're in the 1% – Focus Energy on Important Questions

Think Like You're in the 1% – Focus Energy on Important Questions

One of the benefits of our Q&As is that is creates an opportunity for us to come up with new post ideas. After we realized we were complaining about repetitive questions, we decided we'd go ahead and make a post that gets rid of them. In essence, most questions don't really matter. What we mean by this is there are really 1) only a handful of decisions that really matter, 2) questions with direct answers that are useful and impactful immediately and 3) a whole host of questions surrounding "fear and worry" that don't even need to be addressed. Think like you're in the 1% is certainly a rude title and that's the point, much like the content and audience we intend to focus on. The good news is that most questions will typically fall into category 2 which makes the Q&As a lot easier as there is an immediate and definitive answer.

Common Questions That Won't Help Change Your Life

Think about it like this. If you take a job making $100K or a higher risk job making $70K with $40K in illiquid private stock… this really isn't a question. Why? Well both of these mean that you're going to be worth about the same in 1-5 years. Unless the stock somehow goes up 10x (unlikely) you will be in the exact same position as the guy who takes cash up front and simply buys some higher risk stocks. It's interesting because people ask these questions all the time and yet the choice between the two rarely makes a difference. $10,000 differences for 5 years is $50K… That's not going to change your actual lifestyle.

: "Jobs and Careers"

Why are we starting with this example? Sure you "could" work a lot harder and make an extra 10% in one of those positions but is 10% really going to change the *value of your time*? No. This is why we always respond with the following which has come up at least 30-40 times in Q&As. This only sticks with people who will eventually get rich. If people don't understand this sentence we'll bet against them 97% of the time. The entire point of this blog is to get rich while you still have time to enjoy it. If you're happy with being a millionaire at 55 years of age (in today's dollars to keep it simple), it's best to leave. It's best to leave because this is just not how rich people think. Rich people don't care about 401Ks, an extra 3-4% increase in net worth or earning hourly wages. The only time they care about these massively long time-horizon investment vehicles is when their accountant rings them up and tells them there is a more tax efficient way to set his money up for 1) inheritance in the future and 2) lowering his total taxes being paid.

It's because .rich people think about time. "Always choose the option that gives you more free time"

This should now shine a light on why we don't really put much effort into responses that don't deal with anything life changing. It's because we know it doesn't really matter. Also. It is very likely that the person asking the question already knows what he or she is going to do and just wants affirmation. So we type out the same old answer "Sure go with A or B. Make sure you don't lose time". The only time it gets difficult is if someone is already close to becoming rich… then you can make small tweaks to make sure the person gets over the finish line safely. But. If they are already close to the finish line they would always choose the risk off option… which then… by definition… means they are looking for affirmation.They already know the right answer.

This brings us to the final point on this subsection which is that rich people have clear thoughts because they don't waste their brain power on questions that don't make a big deal. You don't see rich people wondering if they should buy a coffee, upgrade to business class or buy a new laptop. These aren't meaningful changes since they don't generate any equity (fancy name for ownership). Unless there is an opportunity to make large amounts of money, they are not spending their time worrying about the bread crumbs. This sounds terrible as we realize that a laptop purchase could ruin a normal person's budget. But. That's the way it is. When you're killing yourself trying to get a product to sell, getting clients and holding down a job (if you need to keep the lights on)… None of these questions ever come up. That's right. What we're saying is if a question is about two different jobs we know the person hasn't bothered even trying with a business… otherwise they wouldn't have asked the question. They would know the answer and wouldn't bother jumping in the Q&A. Anyway. Most people waste their time talking about prestige, a new opportunity for 10-15% and other such nonsense which is good for the people who actually want to get rich (lowers the competition!).

If you're not rich yet, the rich people who end up making it don't have time to even think about buying a laptop.

The funny thing about personal finance is that the vast majority of the "big disaster" decisions can be avoided as follows: 1) don't get legally married – minimum pre-nup if you absolutely must, 2) never have 100% allocation into a single asset class, 3) don't take stock tips from anyone and 4) don't follow the markets. Funny how these four points are exactly what the masses try to do. A large number of smart people get divorced and are forced to start over. People try to go "all in" to somehow make it in one shot… doesn't work. They try to follow someone else for investment advice instead of thinking for themselves. They try to follow day to day price moves on everything.

: Most "Personal Finance"

Pausing for a second. Yes hedge fund managers and other investment professionals do track markets and all of these things like hawks. But. They underperform the market. Every. Single. Year. So it's really just a testament to how useless it really is. Even blind squirrels find nuts and some random guy is always getting rich off of some lucky break. We've been blogging and tweeting for years and not once can you find a tweet or post "complaining" about price movements. Feel free to look them all up and even the archived ones of our older lower quality deleted tweets. This is because it just won't make a difference yet again. Long-term, assets go up in value and anyone who wants to create the ultra doomsday case of "deflation long-term" can go ahead and put on a tin-foil hat. If that really occurred, you're still going to be rich because you're one of the only producers in the world while everyone else is begging to "work for someone else" to pay their bills.

So what kind of personal finance questions are legitimate? Not many. The only ones that are legitimate are related to 1) leverage, 2) asset allocation relative to long-term plans, 3) structural trends and 4) tax structures, inheritance, and other huge one time tax items. In fact, if someone is really rich, they usually ask about item #4. It's funny we're laughing about it as we type it out because we think about all the rich people we're close with and it's never about "buying the dip" or "interest rates", it's always about .When you realize that Uncle Sam receives more money for your work than you spend in a year… that's when the light bulb really goes off that it's a disaster out there.

*"how do i lower the biggest *lifetime* expense i have called Uncle Sam"*

For those that are interested, people who are successful millionaires rarely ask about a specific stock or a specific investment. Instead they focus intensely on trends, i.e. where is the money going to go. Is it going to go into this sector or that sector… so on and so forth. This is more important because you just want to be on the right side of the trend. If people don't believe us, check out all the major presentations made by ultra rich people. Rarely does it talk about a single item to buy and it's typically a presentation about "here is where we are today, here is what the world is going to look like tomorrow".

So there you have it. We have no problems answering personal finance questions in Q&As. That said, always ask yourself "does it really matter" and you're going to be surprised at how many of the questions really don't matter… At all. Personal finance questions become "real" once a person is rich. If the person isn't rich then the focus is on same old same old… getting a biz up and running and working a high paying career until that's possible.

We really stopped talking about this topic a long time ago (seems like 2-3 years or so). It honestly feels like a different planet. This is because we no longer relate to "dating improvements". The days of trying to maximize dating are long gone and aren't even on the list of priorities. The reasons why? Well here we go: 1) most people won't listen and will end up getting married with no prenup and roll the dice, 2) only 0.1% of people in the world have personalities that are so horrendous they cannot get dates once they make good money and are in shape and 3) it's just boring.

Dating:

We used to actually respond to questions related to dating but now it's not even something we can help with. What we've noticed is that the entire "getting girls" community is essentially faking being rich. Rich people travel a lot to international destinations, they don't care if a girl responds to their messages or not and they don't have any sort of anxiety because they legitimately don't care if the girl converts or not. Oddly enough once you stop caring about the entire dating scene it actually gets easier. . When you look back at how the "dating advice" industry evolved… all it did was slowly mirror what rich people do. First was act aloof (rich people actually don't care), second was joke with them (rich people do this by nature because they are bored), third live close to the night life (nice areas usually require a more expensive apartment), fourth travel the world (rich people are usually the ones with the luxury of time and money to travel) and finally fifth, become a "figure head" (when you're ultra rich people know who you are).

Much like everything else in life

With this backdrop, one fun thing about dating we did learn is the ability to tell the fake guys who are "running game" from the rich guys who actually don't care. The difference? This is the official giveaway of a poser. If a guy cares why the girl likes him he's officially a tadpole/scrub, insert any low totem pole phrase in there. Rich guys don't care. They really don't. Any smart rich guy is just going to make sure he doesn't make any major mistakes: 1) accidental kid and 2) massive loss of assets through divorce. This is the last thread that will always separate the real winners from the fake winners. It's also why the pick up community will always defend this to death. They know they don't actually "have it" so it's best to assume every attractive girl is a . It makes sense this way since a person who's willing to fake their status to this level needs to protect their ego in some way. This is the way to do it. Also. As a final big "ah ha" moment, the guys who end up getting the girl who doesn't want money typically ends up getting a divorce. Why? Well financial troubles are the 2nd most common reason for divorce. Funny how that works… sort of. Sad actually.

"Aren't you worried she wants you for your money". gold digger

Anyway, this is a long winded update on our philosophy surrounding "dating". You simply walk up to anyone you find attractive and start talking to them. If it works it works. If it doesn't oh well. No need to analyze each interaction since you're going to be living close, making good money and living an awesome life anyway. Instead of dating questions the only real question is if you believe the person will be a good mother. If you don't plan on having kids or getting married, then the entire topic isn't really relevant (hence why it isn't relevant for us).

Unless you're considering having kids, there shouldn't be any dating questions.

So take a look at the big three categories: Jobs, Investing, Dating. This is quite literally the three most common items you'll hear people gossip about at the work place. They talk about politics and so and so. "what the next hot stock is" and of course… Who is dating who. Since we know those three topics are the most common for people who end up going nowhere in life, we can conclude that those three topics don't really make a difference long-term. Pause. Now to make things crystal clear we'll still talk about these topics for fun (except dating because that's officially too easy and boring to even talk about anymore). But. If you're not rich yet, you shouldn't use any brain cells worried about any of the things listed above. That job offer you got for 10% extra? Just decide within 15 minutes. That Christmas bonus you just got? Toss it into stocks/bonds/RE/crypto and forget about it (after biz expense of course!). If you start doing these things, making faster decisions on things that don't matter… you're going to be forced to think like a rich person. That's always the ideal situation isn't it!

Conclusion: *What we're hoping to do is eliminate wasted thoughts.*

While we don't expect a change in the Q&As as most questions are rarely life changing we do want to point out that if someone has life changing questions we actually respond outside of Q&As (these people know who they are). The goal of this post was to attempt to delete "clutter" and remove "jugglers" (people who run too many ideas at once). Having less thoughts is a good thing in many situations (less items to worry about).

Important Note:

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality … You'll probably like . The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). This Blog Apparently Has Female Readers

This Blog Apparently Has Female Readers

We've been working on a post related to the corona virus, but had to pause as we noticed that more emails were coming from women… That's not a typo and we were surprised. The interesting part about it? It suggests that following the non-dating part of the blog works for practically everyone. We're glad we stopped writing about that since it takes less than 12 months to master and writing about difficult items is a lot more fun.

Below is an email we recently received and we're going to highlight a few parts in bold (our emphasis).

*"mid thirties (redacted) woman who has worked in alts for the past decade and a half after collecting degrees in finance from two private universities in New England. Followed your advice, "made it" outside of the day job in seven years, continue to stay full time on the street as a D&I unicorn on a bench full of white to keep collecting carry points on successor vehicles. Will tap out at some point, but no rush as I have seniority and can pull rank pretty much 24/7.***Unusual reader here: dudes**

Wanted to say thank you for the amazing content, AGAIN. Huge fan since before Efficiency who is curious to see where you head next with WSPs.

*And had to say that this product is downright .***eerie**

*How is it your product addressed all of the things I've been looking at recently? Looking at upgrading to a massive and completely unnecessary house in the 'burbs to entertain, scoping out private doctors for the past six months, daily routines to increase flexibility, reading up on performance enhancement options, spending on family to help them bridge to stepping up in life/pay for medical treatments badly needed, learning to ski for networking since I am NYC based and so many of my contacts are regularly in Stowe/Whistler/Vail during the season, upgrading my mattress to one that seemed ludicrous , but actually has had a huge impact on rest quality the past 12 months, working to jump a decade, outsourcing all low level uses of my time, figuring out where to donate to minimize tax burden by being based in one of the highest tax jurisdictions in the country, realizing just how out of touch I am to most in my age bracket in terms of lifestyle/focus/emotional balance/maturity/spending ability, looking at those $10K-$50k watches and just not being convinced that , creating once in a lifetime experiences for those dear to me, , seeing what a pain in the ass it is to flip sites after seeing so many scams on bizbuysell, etc.***at first blushlemon is worth the squeezepiling up cash/crypto**

.**EERIE**

Cruising on autopilot, piling up cash for the next downturn. "Never work for the same money twice" indeed"

If you look at the above writing, the average guy is going to assume it's a troll. Luckily, there are several clues that give us confidence it is a woman and she's actually from a finance background. Why? Even in a quick email, a lot of tells are given. The use of "dudes", "at first blush" and "lemons". Your average reader would say this doesn't mean anything but it does.

Initial Screen:

For fun if you want to do this yourself when proof reading an email to see if the woman worked in finance other tells would be the use of the phrase or . Both of those phrases are incredibly common in New York as well and anyone in the industry now or in the past is laughing a bit at their screen since they know it is true. So for now it appears this isn't a troll.

"Will do""buddy"

The last item is that she repeats a word that practically no guy would ever use "eerie". Just isn't common word choice for men. Perhaps if the word creepy was used it would make it more likely but that is usually reserved for people women don't like. So replaced with eerie lines up.

She's going through the exact same decision trees: 1) bigger house, 2) thinking about a watch, 3) flexibility training, 4) performance enhancing and 5) donations. Not to mention the most obvious sign of all which is being out of touch with regular people in the same age band. To close it out, being interested in crypto was also out of left field as the vast majority of crypto advocates are male (exceptions of course include Elizabeth Stark etc.)

Some Interesting Notes:

We're going to add an addendum to the book here. May as well given that the product wasn't written for them. These are simply opinions since we aren't women but we'd add it if you're female.

Some Notes for Women:

All of the health items still actually apply. While we wouldn't recommend increasing male based hormones we're referring to a private doctor and all other health advice. In fact, women can probably benefit a lot as most women simply try to "eat less" and refuse to exercise more. Generally speaking, men prefer to work out and eat garbage, while women prefer to eat less and don't like going to the gym. So everything still applies and if you're willing to get a private doctor you're going to be way ahead. To wrap it up, we're positive on any cosmetic surgery as long as you don't go overboard with it and look like a mess later on. "Men" who claim plastic surgery is bad are just poor. No real debate there. If someone has a few changes made, not sure why it would be a big deal. Looking like Michael Jackson would be a mess.

1) Health:

Luckily, smart women realize that successful men don't really care much for a wealthy partner. While we would have probably changed the wording a bit in the book if we knew a large number of women would read it… Too late. It's much more important to find someone who is easy going with a warm heart (at least to a successful man). Why? Well if you're a rich female reader you already know why… The extra digits don't do anything. You end up in the same spot if you make it within a certain range of outcomes. And. On that note, remembering that rich people don't have to deal with annoying people explains why they prefer warm hearted people over a rich person with sky high standards. Just another "problem" to solve. We'd bet that rich women feel the same way as well.

2)Unfortunate Truth:

Unsurprisingly, the women who get entertainment value and enjoy the blog are already rich and are making good amounts of money. The ones that hate us probably all live in or Seattle (anywhere where purple hair and needles are acceptable). If a female is reading this she shouldn't be surprised to find out that most "guys" are just talkers with no real results. This is a great opportunity for women. Since you know that they will be busy getting drunk at the bars you can simply follow the plan in efficiency and move onto bigger fish in the sea.

3) Most Guys Are Lazy: San Francisco

:If we wrote a blog similar to this related to women, we'd probably emphasis the decisions made between ages 20 and 25. Versus 30-35 for men. At age 20-25 you should ideally find a high quality partner particularly if you want kids. For men these life decisions don't occur until their 30s. It just isn't realistic to think it's "easier" to find a high quality mate at age 30 vs. age 21. Sure you're giving up all the fake excitement your friends talk about, but you win over the next 20-30 years. From the reader above it looks like she somehow made that decision correctly while starting a side business and working in finance. So for all the naysayers out there… It is not only possible but incredibly realistic.

4) Smart Early Decisions

: For what it is worth, most rich women end up going down the endless pit of materialism. While buying a nice car and watch is fine, we're talking about constant wardrobe upgrades and status symbols that never really end. The wealthy women we know that appear to be happy have at least two things that they enjoy doing from a social perspective. Vast majority choose kids as priority number one and the second one usually ends up being some sort of community work. The rich women who don't fall down the materialism trap usually do interesting volunteer work. They might run an animal shelter, they might be the head of the local golf/tennis competition, they might do fund raising events for some sort of cause for their home city. The main theme here is they find something to do that helps their general community. Why? We've noticed most women settle down by age 35-40 or so (if rich) and become attached to that particular city.

5) Find Something Non-Material

As usual… All of the above is general and there are always exceptions to the rule. That said it highlights some of the main things we've seen from happy wealthy women. For our next Q&A we might even see some new interesting questions!

Our Next Q&A will be on February 9.

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending.

Thoughts After Recruiting Season

With the MBA Associates and Analyst Class recruiting season wrapping up we're going to highlight some of the most common shortfalls we saw in 2013. Overall the some big things that stood out are 1) more people are catching onto the idea that work experience trumps educational prestige and 2) this was a sizable up year for the Street and bonuses should be up ~10% unless you're stuck at a bank with legal problems such as Barclays. With that said, we've broken down the main errors in terms of resume edits and interview skills below.

Resume

Many people continue to make one of the common errors we have mentioned in the past a poorly formatted 1-page resume and unprofessional/unrelated interests. No matter how many times you read a resume always have a 3 or 4 set of eyes on them and always PDF the resume

1) The Same Errors: rdth

This is becoming much more common nowadays, the most common nuance is "Financial Analyst" followed by bullets that are unrelated to Wall Street. Even if you hold a back office job such as Treasury – Financial Analyst, it is better to disclose your exact position for recruiting purposes. Simply spin the bullets to address Wall Street needs.

2) Ambiguous Job Titles:

The people you will interview with have unlikely looked at your resume before you walk in the door so make sure the first bullet on your resume is the most pertinent. If you've working as an Investment Banking Analyst highlight the biggest accomplishments. In rank order: received a return offer, closed deals, live deal work, financial modeling, simple valuation analysis such as precedent comps and trading comps, pitchbooks, company profiles and other maintenance work. The best way to organize your bullets is to think like a Managing Director, they are working to make money so anything you contribute that leads to revenue generation will always outshine an excel piece. Similarly, if a pitchbook lead to an engaged deal that went live before you left the internship, that also outweighs financial modeling.

3) Unorganized Bullets:

We will assume a slight exaggeration factor on your resume however with many people starting up small internet businesses the phrases "founder", "CEO", "CFO" and "CTO" have started to show up on resumes. While it may be true that you're in charge of running the website, if it is only generating a few dollars a month in revenue it is better to lean towards a humble approach and simply use a phrase such as "website designer". This way when you're questioned about the task any income generation will appear to be a positive where a title such as CEO/Founder will raise expectations of your interviewer.

4) Exaggeration:

This one was much more common for MBA level candidates, generally speaking include your month and years of employment when applying for jobs. If you have spent 5+ years on Wall Street, having a gap on your resume given all the changes in the economy would not be frowned upon. Stating you worked from 2009 to 2010 when the dates were December 2009 to February 2010 will bring your entire resume under a microscope.

5) Removing the Month of Employment: It is okay to have gaps on your resume.

The Interview

Generally it is not difficult to have a bland story for wanting to enter Wall Street, however many responses become unrelated to the job function. If you're more interested in investing in stocks versus helping close deals your story should change.

1) Having a Bad Story:

As an example: stating you invest personally as part of your story will pay higher dividends for a slot at a hedge fund, long-only, equity research or sales and trading than it would for a position in investment banking or private equity

As a secondary example: if you have sold houses in the past as a real estate agent this would tie in much more with investment banking.

Highlighting your interests within your story should always tie to the job you are looking to obtain.

If information is readily available on the internet regarding the office you hope to join avoid asking questions regarding the product groups and industry groups.

2) Not Knowing the Bank/Group:

As an example if the firm you are interviewing is strictly working the M&A or you should never mention an interest in raising funds through IPOs, follow-on offerings, PIPEs etc.

As a secondary example: if you are interviewing for the ECM or DCM group you should not state an interest in fairness opinions or merger models.

Unless you're interviewing for a position and you're from Harvard with a Wharton MBA and Goldman Sachs/KKR as your credentials chances are you've got some weaknesses. In that case when people ask you questions such as give me three reasons to hire you and three reasons not to hire you, be sure to spin the answer as best as possible. If you have a 3.5 GPA you know that there are other candidates with a 4.0. In that case highlight your previous work experience, explain that you're hard working (through examples versus outright statements) and imply that you know other candidates have a higher GPA than you. It will let the interviewer know you're not overly confident and you are willing to make up for your flaws.

3) Unable to Spin a Weakness:

At the end of every interview you should have a set of questions ready bucketed into two groups the first being non-revenue generating and the second for revenue generating personnel. Broken down simply, questions regarding life at the firm should be asked towards the lower level employees while career trajectory and high level business questions should be directed towards the revenue generators. This does two things, it allows you to make a better connection with both groups, lower level interviewees are more interested in how you will interact with them on the job while revenue generators only care about expanding their business and doing so in a risk free manner. If you begin ask lifestyle questions to a higher up he will assume you are lazy while an entry level employee will assume you're asking about the culture. Be prepared to spin all of the generic questions to the product/industry group you are interviewing within the investment bank.

4) Unprepared Questions:

Thisis less of a blow to your interview, however if you are questioned about interests always attempt to tie them into the job. If you've completed 3 iron mans, or played college sports than can be spun as a read through to your work ethic. If you've built websites for a school group and know how to code, it can easily be spun to imply that you think logically/intelligently.

5) Highlighting the Wrong Interests:

Finally, in general it is a good idea to avoid commentary on volunteer experience (unless substantial). To quote an old Managing Director:

*"I don't do this job for Charity. If I did I would join the F***ing peace corps and not shower for two years"*

For the too long, didn't read type a lot of the same themes apply, 1) no errors on your resume, 2) no lies on your resume and 3) always weave your experience into relatable job tasks. The competition continues to rise, so get ready to start networking for the calendar year end hiring jump in December – February.

Three Concepts to Get Rich: Recurring Income, Time of Day vs. Income and the Fixed Cost Game

Three Concepts to Get Rich: Recurring Income, Time of Day vs. Income and the Fixed Cost Game

For one reason or another frugal people focus on the last item on this list. They would become significantly wealthier by focusing more on the first part but just don't have any interest in putting in the time. Perhaps this is because they believe being rich at 30 versus 40 isn't a big difference (could be one explanation). We disagree since life is the most active between 30 and 50 so we wouldn't give up our 30s to live frugally (essentially living like you're starting from scratch). With that we'll jump in.

Recurring Income

This is by far the most important item to understand. Recurring income allows you to invest more aggressively. It allows you ability to since you can wait out a downturn in one of your riskier investments. It also allows you to save consistently on a monthly basis without praying for your year-end bonus to make it up (we're looking at the Bankers on that one). Essentially recurring income building is the most important item to get rich since it offers the most stability. This is exactly why millionaires have multiple streams of income (they generally have 7 or so).

buy time

Pretty simple hurdle for us, we think a stream of income is anything that represents 15% of your annual spending. This is a moving target and is an important concept since we assume the other streams of income don't require a lot of time. Assuming you spend $100K a year after tax you'd need to generate $15,000 after tax in order for it to be considered a stream of income. The second hurdle? It needs to generate this amount of money for at least 5 years.

What is a Stream of Income?

Breaking down the math we'll see how this makes you rich in short order. Assume you already save about half of your high paying career/business income that runs at $200K a year. Well you'd essentially save $100K a year, meaning . Assuming you had zero other forms of income it would take you a long time to be well off (you'd be set in about 15-19 years depending on investment returns). Here's the catch… Assume you had just four of them. Four tiny streams of income that only contributed ~$1,250 a month each (practically nothing). Now you'd be financially set in just 10-12 years. You have essentially accelerated your way to being rich by a factor of ~40-50%. Since we know that your 30s and 40s can be an amazing time (still fit, no age related issues, still mobile), buying 10 years of "life" is an enormous change.

<u>1 full year of living expenses</u>

Standard thinking says you have one stream of income (career/job) and then you invest to slowly build out the second stream. And. This is "good enough". Naturally, this makes no sense. If you're with a large company for a longer period of time you become a bigger target for being cut and people typically spend a little bit more as they get older. This creates two problems: 1) your expense line is growing making you run on a treadmill and 2) the cash flow you rely on becomes more and more risky as you age. Think about it. If you were the Company would you focus on cutting a few guys who make $40K a year or the one middle management guy who makes $300K a year. You cut the middle management guy and give the lower level people slight pay raises to make up the gap.

Standard Thinking:

Put the shoe on the other foot. There is a reason why managers and business owners make a lot of money: someone else is doing the work for them. Sounds harsh but it is true. Ask someone how many people he manages and you'll get a good snapshot for how well off they are. We've never met a single person who manages a large P&L with 100+ employees that is poor. This will almost always be the case. Why? Well you wouldn't hire someone unless they made you money… right? Right.

<u>The faster you can hire people the faster you'll be rich.</u>

No this isn't motivation, this means you never quit something that is cash flow positive! Another common mistake is selling an asset because it isn't growing anymore. The bigger question is "does it need to grow?" If you have an asset that generate $5K a month online (as an example) and it remains there for two years in a row… Instead you should ask By focusing on , you'll naturally move on from businesses in the future. Why anyone would sell their website for 4x earnings when they know it'll be around for a decade is beyond us. The person better be 100% certain that their new idea will be better. The final answer is that the income stream requires too much time and cannot be automated (we highly doubt it!).

Never Quit: <u>You probably shouldn't sell it.</u>*"how do I reduce my time on this project"*.efficiency

If calculating percentages isn't your thing we have an easier rule of thumb which is the "five house" rule. Essentially, your spending will equal ~3-4x your housing expenses in a single month. If you spend $2,000 a month on housing, you're typically spending $6,000-8,000 a month for all of your expenses.

Putting This into Simple Math:

Knowing this, the ideal set up is to have "five houses" worth of income streams. Once you know how much you pay in rent, your next hurdle is to create one cash flow that pays for your mortgage/rental payment. Once you have five of these you're essentially set. Real estate is a good example since it gives you a good benchmark for the amount of money you need. In simple terms, it also controls for 1) area you wish to live and 2) amount of time you have to spend on recurring income projects.

Time of Day Vs. Income

This is probably the easiest way to break down mental hurdles. Generating income is easy once you know how to do one of them. But. Most people don't want to put in the work. Similar to any activity in life, once you learn how to do something once, the second time is typically easier.

Surprisingly, we actually encourage thinking small for your first internet income stream. Why? Most people believe it is impossible to make $100 a month let alone $10s of thousands a month online. Making $100 in a month online typically leads to an "ah ha" moment where they realize it is possible. This is particularly true for people who are working as affiliates: they realize that the money they received was just a sales commission and doesn't represent the full margin of the sale.

This is a big part of getting through the breakthrough. $100 is nothing. But. Most people have the "ah ha" moment because the money is made while they are sleeping. That's right. People who buy stuff on the internet do so 24/7/365. While they do buy a ton of stuff while they are at work (after all no white collar worker does 8 hours of work per day, likely closer to 3-4 hours), the website is up 24/7. This means you now have an opportunity to make money when there was no way to do so before (you were asleep!).

When was the Money "Made":

Once we figure out that the money is being made with no physical time being contributed to it, you can see the value of internet income. We'd rather have three mediocre internet income streams, than any income stream that required 10+ hours of work per week. Why? Well at this point, we could probably take any internet business down to 1-2 hours of work per week maximum. If you're selling something online all you're dealing with is returns and basic customer service. Something that can be outsourced with a basic flow chart of how to respond and deal with the issue.

You'd think that would be the only benefit. It isn't. The biggest benefit of all is ! Assuming you have a serious career that demands your time from 8am to 6pm… you don't have much free time to do the other project… Or do you? Well once you learn the ropes and realize you only need a couple of hours to do the work, you just made your lunch break a lot more profitable. You can now take those few hours a week and put them into time slots where you are typically doing nothing. Ideas include: 1) airports, 2) transit, 3) lunch break, 4) at conferences and 5) large company presentations where you're supposed to simply "listen and take notes". Don't even get us started. While making money in your sleep sounds like the "coolest" part. The really cool part is knowing that you can do the work any time you like.

Time of Day: when you are personally working on the project

This is less relevant to us but sounds good for millennials. The last benefit of having something recurring online is that you can do it anywhere in the world. This isn't relevant for older people. Why? Well if you're rich, you already live in a city you enjoy and likely want to travel less (we've grown to despise airports with the exception of a couple trips for fun). Location is also important for people who go down the "five home path" since you want to build that empire in a city you will live in.

Location:

Now that we have convinced the readers that income is more important than being frugal, the next question is "what type of time do I want to expend". Many people ignore this question and just go for anything that makes money. This creates headaches as you may be forced to work extremely hard at all times without being able to maximize your time. This also creates cash flow issues as you're forced to choose between two different tasks that must be done during an explicit time frame. (Hint Hint as to why we avoid brick and mortar businesses).

Asking the Big Questions:

Fixed Expense Game

With the most important topics out of the way we can now create a ladder for anyone to follow if they want to see the value of recurring income. As usual we recommend thinking big. But. If someone really thinks it's difficult then they can start small. A buyer of our products recently stated the following:

https://twitter.com/nerdow/status/996094231440748544?s=21

Naturally we agree with this statement since it is possible to make at least a few hundred dollars online in just a few months. With that in mind we thought of a good game to play if you're trying to build up to financial independence without even realizing it. Play the fixed cost ladder:

Generally costs ~$100 a month or so. More or less, and take all your income from online and pay this bill every month.

Cell Phone Bill:

Once you clear out the cell phone bill, move onto the gym and utilities.

Gym and Utilities:

Now instead of trying to pay the small bills, you then move onto trying to pay off your rent only.

Rent:

Now you hit a point where you're paying all of your fixed costs at once.

Rent + Utilities + Phone + Gym:

After this you're essentially on your own. If you can't see the value in having no fixed costs anymore all from selling basic products on the internet we don't know what else to say. Naturally, the hardest jump is typically from #2 to #3 since it requires quite a bit of income. And. If you can make this jump, the sky is the limit because you've likely succeeded in some form of paid traffic.

Notice, we don't recommend spending your first revenue stream on food or variable costs. Why? Well psychologically you're going to think "I am making more so I can spend more", while this is fine in the future we assume the person isn't financially set yet. By targeting the fixed costs it makes it quite difficult to overspend. All you do is live the exact same life and simply pay of all of the fixed costs on a monthly basis. This creates forced saving mechanism for you and also teaches you to focus on leverage in your own P&L.

Psychological Note:

Conclusion: Rules for Getting Rich Remain Unchanged

Luckily math doesn't lie, so the rules for getting rich remain the same. you have to focus on earning money since your costs will always be at a specific level. You have to eat, sleep and pay for internet so there is no way to reduce those costs to zero. valuing streams cash flows over a raise at work will help you immensely since it reduces your risk, increases your ability to take risk and improves your long-term investment returns (ability to weather downturns). to stay optimistic think of cash flows in terms of annual spending. If you're able to create a small cash flow that covers 10-15% of your annual spend that's a large boost if you look at it over a five year frame. time allows you to get rich based on compounding. And. You want to get rich before it is too late. So you want to focus on income streams that allow you to be flexible so you earn money when you would have nothing to do. once you learn how to earn money in one way, the more likely you are to automate it. Automating it will reduce the amount of time you're spending on it making the return profile in terms of time go up.

First: Second: Third: Fourth: Fifth:

For those that missed it this post is essentially inspired by the best question we got yesterday which is pasted below:

"For cash flowing assets outside of a business what yield do you look for before worrying about capital preservation?" – Synth

"Probably the best question on here.

Here's the thing, we . If you can do nothing at all the yield can be lower and we'd be fine with it. Say you buy an internet asset and only work on it for 2 hours a day, well how much money did that make? If it made you $100 a month it was terrible. If it makes you $10,000 a month that's fantastic. That is $1,250/hour or the equivalent of a $2.5M annual income! That's worth it.<u>don't think about yield as much as we think about time</u>

Then if it requires no time at all (say stocks/bonds etc) and you're setting and forgetting. We would just use a standard barbell approach and put a weight on stocks and a weight on bonds that hits your yield based on your age.

After that for capital preservation, we suggest basic living expense calculators. If you're young you only need a few months of living expenses, when you get to age 40 or so you need a few years sitting basically in risk free assets. Here's the natural catch though… if you got to age 40 and are likely rich, then you don't really need more than 3 years (a recession will only last a couple years and at worst 3 years or so), this creates a natural way for you to take on more risk.

Hope that helps may need a post on this one specifically. But. Think about it in terms of how much energy you're using. This is why we think online is the way to go, people underestimate the ability to automate an online business. If you're working 40 hours a week online to make $100K a year that is just awful. Essentially created a new job. We would rather have one asset making $25K a year but have that asset only require 1-2 hours a week. At least that one has potential and doesn't take up valuable time"

Importantly, for those that are serious about developing multiple streams of income and a high net worth, we can recommend The Company offers *free* software tools with the following four key features: 1) ability to by tracking all fees associated with an investment product allowing you to choose the best possible fund for your future, 2) portfolio analysis where your risk profile is stacked up against your current age and retirement goals, 3) in addition to these free tools, you can also track your net worth and path to becoming a millionaire and 4) when you hit $100K in networth you'll receive a free one time consultation with an investment professional at Personal Capital. After linking up all of your accounts you'll be able to sit back and watch as your net worth goes up and your fees remain minimal over the next several years. We strongly believe that Personal Capital is the premier personal finance software tool when compared to its competitors such as Mint. If you're looking to avoid personal financial collapse, it makes sense to track everything in one place for *free*.

. Personal Capitalavoid losing money

Three Downsides of Success: Scaling, Becoming Desensitized and Higher Expectations

Three Downsides of Success: Scaling, Becoming Desensitized and Higher Expectations

We haven't done a life related post in quite some time so here goes nothing. After hitting the exit button (we'll have a follow up to this post later), your net-worth typically goes up vertically (step function) assuming you never included the value in your calculations. This means you are now tied more and more to versus concentrated equity in a single company. As your net-worth goes up, it gets harder and harder to move the needle. While we realize this is a "1% problem" we have no doubt that many of you will run into the same issue. We can even see this issue at a *relatively* low scale.

on a Companystocks, crypto and Real Estate

At this level if you're still working in a Career (), the paychecks and annual income derived from it become less relevant. Keeping the example basic, even if you only generated 7% in after tax returns, this would result in $210K in annual income. In order to make the same amount of money on a post tax basis you'd need to clear ~$335,000 in pre-tax income (assuming you live in New York). This makes the list of opportunities smaller and smaller for you to pursue. Is it worth your time to slog long hours working hard when you can generate the exact same amount of money by doing nothing? No. And. This is exactly why rich people rarely work for anyone else.

#1 Scaling… A $3 Million Example: highly unlikely

This does not mean we should feel bad for rich people (not a single tear should be shed for the rich). Instead, we're highlighting an issue you'll face later in life: Scale or Don't scale. One of the biggest problems with generating more money is you'll be forced to decide between adding resources (headache) and boredom. If you're a multi-millionaire, dedicating significant time to a new idea needs to be lucrative, while boredom can be solved with a multitude of hobbies from blogging to sports to traveling (all of which cannot be done 24/7 or else you get tired of them).

What is the Point?

The solution to this issue? How much can you generate with the least amount of human resources. When we use the phrase human resources we are using the phrase in its literal form (not the people who protect major corporations). The best solution we have found (so far) is to look for businesses that require the least amount of interaction with new people. The leaner the team, the better the results. You're not forced to interview new people who unlikely deliver on their promises.

Examples of this include: 1) Internet businesses vs. Brick and Mortar, 2) limited number of products vs. a broad set for reselling, 3) outsourcing ads based on conversions vs. in-house team, 4) re-bill business model vs. one time sales and 5) outsourced property management vs. managing them yourself. In all of these examples, you're deleting a large chunk of your time from the equation. If you were to choose the latter in any of the examples, you'd lose an exorbitant amount of time with limited scalability. In short, avoid all of those five items unless there is absolute "must have" reason.

Another 1% problem. As you move up in the game of life, less and less things become exciting. The first $100 you make is not as exciting as the last $100 you make, especially if ($100 is just 0.01% of net worth for a millionaire). This continues as you succeed in any field. If you don't suffer from extreme amounts of insecurity, you also won't be interested in telling people how much you're investing or how much you make either (only the insecure give this information out). So you're left with a feeling of stability. Most people believe you end up popping Aces at the club all of the time but if you made it in life… you already "did this part" many times in the past. Instead you end up living an up and down life where you sporadically live life very hard before going back into rest and recovery mode (similar to a predator animal).

#2 Becoming Desensitized: you're already a millionaire

Fortunately, there are two good solutions to this problem (without the standard drug/alcohol abuse most rich people go through). This is very easy for an American and if you avoid the resorts you can visit lower tier countries and revitalize your appreciation for life. The average American doesn't know of a world without smartphones, 24/7 food/services and a stable government. By taking a quick trip to a country with worse economics you can immediately snap out of the "desensitized" funk. 99.9999% of problems in a first world country are not problems at all, they are simply fake scenarios that will never occur. This is probably the best solution out of everything in this post. If you start a completely new business in something you've never tried before, not only will it be exciting but it could also become a grand failure as well. This will result in either a new form of income or a large lesson in humility. Since you're already rich, both results are a long-term positive. It also gives you a chance to become intense and focused again (in a different way).

1) Go Into a Poorer Country:2) Fail (or don't) with a New Business:

This is probably the most annoying. Paraphrasing a common quote . This means that people will only see the end result and expect that you'll somehow provide them with some sort of magical potion that gets them to the exact same stage in life. A frequent commenter and friend of ours () calls this a "life tax" where successful people pay a "life tax" early to get paid later… if someone hasn't paid the tax then they don't receive anything in the future. Unfortunately, this logic doesn't fit with 99.9% of people because they think they deserve to be rich… by giving up nothing.

#3 Higher Expectations: *"I was an overnight success after 10 years of planning"RE Guy*

The second downside to constant attention is the need to keep people "up to date". For some reason people will constantly check up on you to see what you're "working on" to try and peek around the corner for a new idea. This doesn't even include the constant stream of emails and text messages from people you're no longer interested in. So when you hit your numbers we're giving you a heads up that many, many people will come out of the wood work to "catch up" (also known as waste your time).

As you can see from the tone of the last two paragraphs, we despise these types of people. The good news is that there is a very basic and simple solution. Only meet people who can add value to your life with 100% certainty. That sounds harsh but it makes a lot of sense. If they are not a close friend of yours (10 year relationship or longer), they are more likely an acquaintance than a friend. This cleans out your phone and you're now left with people related to work. If someone values your advice but offers nothing… You know what that means… They are going to waste your time.

There are a lot of significant consequences to the three items we listed above. For this reason we'll outline them in bullet form: 1) making money gets less exciting unless it is going to change your life and . If you want a fun life where you travel once a month to a new country… That does not require an enormous amount of capital at all. 2) when you scale you have to come up with a completely new plan or become more "visible". Marketing is just a fancy phrase for gaining attention and the double edged sword now appears. If you become more visible you're opening yourself up to more and more annoying noise from people who waste a ton of your time. 3) luckily, life is long and the number of things a person can learn is limited to his/her imagination. This makes the desensitization problem less relevant assuming the person isn't boring. 4) your friends are going to change rapidly as you move through life. Ideally, you'll keep a handful over the course of 10-20 years and they will remain within your "success band" preventing a fall out. Don't regret leaving the bad ones behind and 5) the most mind-boggling one we have noticed due to these three clear issues is the amount of insecurity rich people have. They need to have their ego stroked 24/7/365 for no good reason. We still don't understand it. Then again the vast majority of well-to-do people grew up in upper middle class households so they never had to work hard in the first place (hence the need to constantly be told how cool/good they are). If anyone has an answer to #5 please let us know since a guy worth $40M and a guy worth $60M live similar lives while the $60M dollar man needs to have his ego stroked 50% more.

Interesting Conclusions to the Three Downsides: changing your life is relative to how high your desires are

With that said, It has been a fun start to 2018 and we'll be back with a new post shortly to make up for the delayed book launch and a couple missed weeks of posting.

Happy New Year!

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like . The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). Time for a Quick Crypto Update

Time for a Quick Crypto Update

Since people only care when prices are up (like now) we'll go ahead and change everything we said in the past. Just kidding. Nothing has really changed from Triangle Investing. We've already mentioned we *stopped adding* to our stock portfolio at the end of 2018 and for 2019 we're investing in the other two legs of the "triangle". Unfortunately, since most people don't have much money they assume when you "don't invest" that you somehow sold (which isn't true). Rich people can diversify by simply investing more into other vehicles while pausing investments in one or two vehicles. All of that aside, lets jump in.

We're using the same strategy we used for stocks since 2012. Every month, . This means you end up buying highs sometimes and you end up buying the lows as well. If you've done this correctly you're buying "forever". This means you're investing an amount that is meaningless to you for your day to day living. Meaningless to you could be $500, $5,000 or $20,000+. The dollar amount isn't relevant. What is relevant is the strategy of consistent buying without selling. Keep it Simple Stupid! Or as we say Keep it Stupid, which means the strategy needs to be dumb enough to work for low IQ people as well.

Dollar Cost Average: buy the exact same amount and never sell

While we have an S&P example in the prior link above, we'll do another one for Bitcoin as well. Since your average person doesn't know how math works, they assume people lost money and all bought at the top (this is mathematically impossible with dollar cost averaging). So lets say you decided to buy $5,000 worth of Bitcoin per month. Also. We will start at the end of 2017 at near peak prices. This would lead to the following:

Dollar Cost Bitcoin Example:

$13,791 = 0.36BTC; $10,058 = 0.49BTC, 8: $10,486 = 0.48BTC; $6,963 = 0.72BTC; $9,213 = 0.54BTC; $7,550= 0.66BTC; $6,377 = 0.78BTC; $8,139 = 0.61BTC, $6,995 = 0.71BTC; $6,598 = 0.76BTC; $6,325 = 0.79BTC; $4,013 = 1.25BTC; $3,892 = 1.28BTC; $3,468 = 1.44BTC; $3,867 = 1.29BTC; $4,110 = 1.22BTC; $5,308 = 0.94BTC; $8,747 = 0.57BTC.

Dec-17:Jan-18:Feb-1Mar-18: Apr-18:May-18: Jun-18:Jul-18:Aug-18: Sept-18:Oct-18:Nov-18:Dec-18:Jan-19: Feb-19:Mar-19: Apr-19:May-19:

There you have it, after starting at practically the top you spent a total of $90,000 and accumulated 14.89BTC. While the price might fluctuate incredibly, at the time of this writing it sits at $10,700. This means you spent $90,000 and .

now have $159,323 or a 77% return

We can't emphasize enough. This is assuming you only invested $5,000 a month and it also assumes you started at one of the worst possible times (end of 2017). So. You can quickly see that the people who lost money investing in this space were essentially speculators. Attempting to time the market with no knowledge and didn't bother buying when everyone was selling. Buying when people are calling the industry dead is usually the smart move. As a fun note, we sold a product at the peak of the hype by "coincidence" =). Sell picks and shovels in manias.

For fun we'll give away the update for free. Why? Well nothing has changed at all. Still looking at the exact same ones. Sure some are down, some are up but the strategy should work over the long-term and on balance (as mentioned in the book) only a few will survive. That said. The ones that survive will be worth a ton. If we end up investing in other ones we'll provide an update in the section mentioned in the book. To put a bow on this, zCash and Blockstack are two we are currently looking into.

Updated Coins:

We never really gave the regular blog a good explanation so this is a good time for it. We've been involved for quite some time, with older readers remembering more aggressiveness back in 2015. Now here is the main reason why we think everyone should own some of it.

Basic Summary of Why We are Involved:

You're entirely free to transact. This means there is absolutely no way to stop decentralized crypto currencies from completing a transaction. If you want to send $100 worth of Bitcoin for example to your friend, no one can say "no". You could do it as long as the internet is up and running. Pretty simple. There is no other asset that offers this property.

Limited Supply. Unlike Gold where more gold is pulled out of the ground from the prior year, there is a factual limit to many of the currencies (not all of them) with trackable inflation rates for the other ones. No other currency is like this since we have no idea how many dollars are in the world.

Privacy. If you don't give away your address to anyone, then it is not possible to know who you are. This is even more so with privacy based crypto currencies. Privacy coins make all transactions private (unsurprising given the definition). There is nothing like this in the world. The best we have is physical transactions but even then the person has to see you face to face. All electronic money transfers outside of crypto go through a third party and can be tracked.

Speed. For anyone following the space, making transactions is becoming incredibly fast. In fact if you're involved you know that you can send tens of thousands of dollars within seconds at next to no costs. This is incredibly valuable. Just imagine paying someone's dinner bill while you're in another country. All you need is their QR code to pay the bill and you can hook them up from New York while they are eating in Moscow.

Cheap. While it used to cost a lot to send a transaction, this issue has largely been solved. If you have the latest and greatest technology on your computer and phone it costs pennies to send tens of thousands of dollars. There is just no way to do this so seamlessly. In fact, if you move more than $10,000 with any normal bank this is going to be flagged and the transaction might be stopped while you are grilled about the movement of the money in the first place.

Unsurprisingly, we've avoided the scam coins. Many of them have gone to zero as expected with the natural wash out (similar to the original internet bubble). We think the scam tokens and ICOs will begin again at some time but we won't be involved. Unless we get a chance to really figure it out, we're happy to wait until its in the top 50 or so before bothering with the research. No need to play hero and try to get the exact starting point of every single coin.

Avoiding Scams:

Sometimes the stupid easy strategy is the hardest to execute. It isn't mentally easy to hold through down turns and keep buying. Also. It isn't easy to keep your emotions in check when the prices suddenly go up. This is great news for anyone involved in the space. It means you're going to do perfectly fine by buying every month and having an auto-pilot investment strategy. To cap it off, we already stated we think it could go down a bit near-term since it moved up so much. But. We won't change our strategy at all.

No change:

That's it from us and we'll have the normal post go up later this week.

****

Time to Look Past the Outbreak

Time to Look Past the Outbreak

While everyone is still quarantined, it's a good time to go ahead and look into the future. This is not an exciting time as many readers will likely know a victim of the corona virus and will be personally impacted by it. That aside, we have to remain forward looking as it relates to this website as it's not the best time to sit around hoping that someone else will "come to the rescue". As usual, no one is going to come to the rescue and your future is entirely in your hands. There will be a lot of new opportunities: software, physical security, real estate on fire sales and niche products will continue to thrive. Online sales will be more important as millions (yes millions) of Americans learn how to operate and order things online. While this website targets young people, there is a large number of americans who really do not bother with learning new technology (this virus has changed that).

We're currently gathering information on recent online sales trends and you'll find that there is a new group of people to sell to. Who? Primarily people in the age 50-70 band. People in their 40s are generally online aware but the late 40s all the way up to 70s is opening up. While it will sound crazy to a millennial, many of these people did not need to use Amazon, Netflix and other internet based solutions for delivery of goods/services/entertainment. While many will return to their old ways, a lot will stick as they realize it can save them time and even energy if they don't need to leave the house for the delivery of essential items.

New Demographic Opportuntiy:

Broadly, what you're seeing is young people move back home (temporarily and perhaps permanently due to unemployment) and they help the older generation ramp up the use of new technology. In addition, the older generation is being forced to learn how to utilize VMware, VPNs, Citrix etc. Otherwise… they cannot "work from home". Everyone is getting a crash course on connectivity technology and Zoom is the current poster child for this movement. Video conferencing, conference calls and eventually virtual reality will become more valuable as a result.

What does this mean for you? It means there are a lot of opportunities here. You could offer crash courses on how to use new technology, in fact there are not any good education resources where someone can go sign up and say "i now know how to use 10-20 different items effectively". Most of them tailor to one specific niche such as a type of coding or even excel classes. It also means that these individuals are going to realize how much more effective high-tech is. Everything has shifted ahead. Instead of being forced to wait another decade for people in the 50 year old band to understand high-tech, everyone in this band is forced to understand it. Think through the ramifications here and there will also be product niches that target this niche group (previously ignored as their addressable market was small).

Stock markets don't reflect the economy at all. If the market recovers with unemployment at 20% or so, this is not a good thing for anyone except the ultra rich (and people who grew up upper middle class and never had to worry about normal living). It takes 120 days for a home to go into foreclosure so you won't see much for at least three months or so. The payment will be "deferred" in many cases, but it just results in a larger balloon payment (fancy word for being forced to pay all of it in a single payment later on). These payments will be missed as well since it's unlikely that employment snaps back for large sections of the economy. If you believe that the current situation will be a "blip" with a sudden return to normal… We don't know what to say except we're happy to bet against you. Businesses cannot simply bring everyone back immediately as there is a lot of cash flow risk associated with that (you'd have to assume demand is exactly as it was prior to the virus).

Big Move in Real Estate:

Where will the opportunities show up? As usual, it depends. In real estate, the market is determined by a lot of factors. Nevada and Texas are hurting even more than other states since the casinos are shut down on the strip and low oil prices make large companies in Texas unprofitable. While it is true that people will go back to major events in Vegas… Oil likely gets resolved at some point… the result is still the same. Unemployment goes up. The economies do not suddenly go back to normal as citizens need to see how their finances look before booking that next fun trip to Vegas.

Funny enough, this sets up almost perfectly with our recent book "Spending for Maximum Return". In there you'll see a recommendation for your average reader in terms of what to do. The only problem is that you need to be sure. What this means is that the market you enter needs to be a 10-year commitment. If you're going to buy something and not use it or ditch it in a few years, it's tough to wait for the recovery. It will likely take 6-12 months for an official bottom in real estate (since defaults have not started) and by then anyone taking RE seriously will have a decision on if they are buying in XYZ location.

From January 1 of 2017 to present, the average price of Bitcoin has been in the $6,000-$7,000 band. Even if you want to look at different exchanges and want to adjust for leveraged blow ups (sudden pumps and dumps)… the point remains the same. You have 1,800 coins sold every day for 365 days out of the year. This is approximately $350M a month. After the halving occurs around May 13 or so, the amount of coins sold every month will drop to $175M (notice we didn't even bother getting the exact average since it defeats the primary message).

Dead Horse Crypto:

First… it does *not* mean the price will immediately go up on the halving. This is because some speculators may pump up the price into the event and it may mean some people are looking to sell right after the halving event. Any "day to day" trading answer is never going to work (never has and never will for retail investors – yes we're sure there are a few guys who made it but 99.999% of the population will fail and go broke). This is called "technical analysis" and there are hundreds of hilarious videos of TA traders simply changing the lines on the chart when they are wrong and say ridiculous things like "new support or new resistance is here".

What does it mean? Conceptually, it means you believe that the amount of demand for Bitcoin will remain as high as it has been over the last three years. If that statement is true the price would need to double to $12,000-$14,000 on average. So it's a pretty good risk reward in our opinion (not to be deemed as legal investment advice). If you don't think that it will have the same amount of demand then the amount of demand has to decrease. This can be caused by 1) long-term holders selling or 2) sudden consistent drop in regular demand.

We've already covered this for a couple of years, and fortunately it has been right. If you've followed the advice here you're actually up from January 1, 2019 to present while everyone else is getting slammed (down 20% or more in many cases). For fun we were even correct in having a fair market value at around 2,190 which surprisingly represented the market bottom and are back to saying its a bit over bought (unless inflation kicks in like Venezuela).

Since the above sounded a bit too arrogant, we can recommend an extremely easy way to make money. Learn copywriting right now. You're in quarantine. You might even be unemployed (which is not a fun feeling). The only thing you can do that will certainly be needed? Learn sales. When we go back to normal we'll find out who the good sales people are. If you were simply getting the sale since the economy is good, you'll find out quickly. If you were getting the sale because you were amazing, you're going to have job offers like there is no tomorrow.

Long Live Copy Writing:

Hopefully, we can all agree that *some* demand will permanently move online. If we can agree on that one piece while other parts go back to normal, it means that demand for copywriting will go up by definition. As ad spend takes a breather, we get to see which ads were run by geniuses and which ones were really just a by product of a burning hot economy.

To end on a little bit of tough love, we already recommended many sales books in Efficiency. If someone doesn't want to read it (that is also fine), they can go ahead and google the best copy writing books on google and get to reading (10 books is not difficult in 10 days if you're out of work). The reality is that someone who is unwilling to google and find good resources won't be a good copywriter anyway. Copywriting requires meticulous tracking of ads and learning what works (what doesn't) and keeping up with new trends like any other living breathing industry. The good news? Practically every book on copywriting will teach you something. It just isn't possible to make money in sales and not have anything useful to say. Otherwise you wouldn't have been making sales!

Interest rates are at zero percent. Not a typo it really happened. We're printing money like crazy. The world is simply going mad. What does this mean? It means that standard financial services will be under pressure. Layoffs will eventually happen especially as many banks realize a lot of their employees were just dead weight. The politics will hopefully die down a bit as performance becomes more important in a more virtual environment. That said? Of the big three career options: Finance, Tech and Enterprise sales. Tech wins by a long shot and enterprise sales is now significantly better than finance. While M&A will still be around and is still the best segment within high finance, we can't recommend anyone choose that direction with a clear conscience. Tech and enterprise sales are now the better routes as they offer more stability, a closer skill fit to online sales and have a much healthier long-term outlook.

Tech Tech Tech:

This is an area that is extremely interesting. Many restaurants will go bankrupt. This will leave a lot of open space for you to either start one yourself or reinvent the restaurant concept. It's one we're mulling on now (as a hobby) and one we will monitor. It's unclear if the entire experience will change or not. In fact it is something hotly debated on twitter as well. Will people simply go back to hook up culture and cram into small places like nothing happened or will change take place?

Restaurants:

The good news? You don't even need to know the answer. Since a lot of businesses will go under, you can wait and decide if you want to enter the market sometime in 2021. Behaviors will reveal themselves and you can start up the popular trend in your area. Our guess is that the changes will depend on the city. For now we doubt that things go back to normal for quite some time as Americas will slowly know someone who died from the disease. Until it hits home, most won't change their patterns. By the end of this thing it will have hit home for a large number of people.

To put it together, some of the key items are: 1) monitor demographic changes now, for those that contacted us privately this is exactly why the back end and tracking needed to be optimized! There are new customers coming online every single second, 2) think about solutions you can sell immediately after the pandemic is done – particularly if it is software/educational in nature, 3) find new ways to sell to the growing niche markets, 4) take a look at real estate in exactly 120 days, this is where a lot of the blood will show up, 5) same old necessary education on crypto for the younger generation – no need to go nuts as we've mentioned even $20-40K is enough for a millionaire unless well versed/educated, 6) learn sales learn sales learn sales… 7) Tech and enterprise sales now clearly way ahead of financial services and 8) track the brick and mortars, we're primarily looking at restaurants and bars to see if they change much from the past.

In Summary:

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending.

****

Time to Manage Your Own Book?

Time to Manage Your Own Book?

We've been proponents of for over 5-years (long-time followers of the blog will know this) and now we're going to switch gears and suggest it is better to manage your own book. We've seen too many companies get bid up due to participation in specific ETFs/funds etc. that don't deserve a propped up multiple. If we look across investment funds we also see two more alarming trends: 1) small time retail investors are now blind purchasing passive funds and 2) the increase to passive now has projections for making up 51% of the market by 2021-2024. When the masses start to flood into a specific type of investment and more than half of the companies are seeing bids due to blind purchases… we all know how that will end.

Dollar cost averagingBefore we begin, we note that none of this information should be considered as legal or professional financial advice.

Before You Manage Your Own Book…

While we've long recommended simply purchasing the S&P 500 index (you would have made a good amount of money by the way!) the first rule is to trust no one's opinion but your own. Taking advice from a single person/entity forces you into a position of reliance… What happens if that person/entity no longer exists? You get burned. Do not give someone that type of power. All decisions will be made by yourself and you will do extensive research before investing a cent into any project/stock/bond etc.

Trust No One:

If you decide to manage your own book, when you make the transition it is critical to purchase a small amount of comparable indexes. Wait… We said you shouldn't buy indexes right? Well, the point is to keep your performance honest. If you can't beat the index you're bench-marked to… then you're simply wasting your valuable time. As an example, owning nothing but micro-cap stocks and comparing yourself to the S&P 500 is not a fair comparison. In a more positive example, if you own a large number of mid-cap stocks and consistently beat the mid-cap S&P index, you're outperforming. By purchasing a small amount of comparable indexes when you begin to manage your own money, you'll see the actual results.

Keep Yourself Honest:

The last thing you'll have to do is ask yourself how much time it will take to manage your own money. If your net worth is under $1M… It does not make sense to manage your own money. You're better off owning a basket of products across multiple asset classes: Real estate, stocks, bonds, etc. If you're north of $1M and have some specific knowledge you can apply? Then you're going to be a *candidate* for money management. As a basic example take a person with $2M to invest. If he can return an additional 5% that's $100K. Take the $100K (above market return) and divide by the amount of time spent managing the book. If it's less than how much you could make in your own business then run with it. If not… Go back to square one and do basic broad stoke investments across asset classes.

Ask If IT Is Worth the Time:

Managing Your Money and Asset Classes

There are millions of ways to break down asset classes. Most people will simply say "stocks" is an asset class (we stated this above as well). But. The reality is each stock has a different profile. There are micro-caps, small-caps, mid-caps, large-caps, dividend paying stocks, REITs…. And much much more. So we'll start with the most important step first (as usual) financial independence cash flow.

If you can wake up every single day knowing you'll never have to worry about food, drinks, shelter and healthcare… You're a solid candidate for managing your own money now or in the future. Your asset classes here will typically consist of 1) dividend paying stocks, 2) real estate, 3) bonds and 4) some small amount of boring CDs. If you've gotten to this point in under 10 years or so, then your goal is simple *don't lose the money*. This chunk should not be managed, it's just there to give you peace of mind. Even if you do a poor job with money management… You're still never forced to work for a living.

Step 1) : Cash flow to Cover Costs

We have always found humor in Entrepreneurs stating that managing your own money is not a good idea. Entrepreneurs quite literally went all in on one "stock" (their own company) but some of them believe that good companies/investments cannot be found? It doesn't add up. That said, you're going to need a specific strategy to build up your portfolio in the future. If you're going to go down this route you'll need a specific comparable index. Since we don't know your strategy we'll go ahead and provide some examples:

Step 2) Decide on Your Strategy:

Real estate is one of the most common ways to get rich. If you live in a specific city, say Chicago, then you'll have to compare your returns to the Chicago housing market. If the market continues to go up at ~6-8% a year and your returns are closer to 15%… You're in the right business and have the necessary skills. We also have a theory on real estate…. It is a common way to get rich because you're essentially combining a regular scalable business with investing. You're essentially a niche portfolio manager since you're dealing with both investment returns and an active side if you build an actual RE business.

Real Estate Example:

Another way to try and create excess returns is through a sector focus. If you have this type of knowledge in say retail products, then you're going to compare yourself to a retail focused index fund. If you were to focus on oil and gas, then you'd have to compare yourself to the overall O&G basket of stocks. Beating a dead horse, but as you can see, just because a "stock is up" doesn't mean it was a good investment relative to the comparable group. Our guess is most people will fall into this category. They successfully started a business in category A,B or C and can then identify business structure changes that will impact the Companies in the space.

Sector Fund:

This is largely a macroeconomic strategy. Business cycles are not only sector specific but "cap and risk" specific. Largely speaking you'll see small caps get hit harder in recessions and outpace mid-caps and large-caps during expansions (as we have seen thus far). The best part about this strategy (if you believe you have an edge) is the S&P is likely the best comparable metric for you. Since the S&P is a good general benchmark for the "market" (US specific) you'll need to outperform this benchmark by weighting your exposure to small, mid and large caps over a multi-year time frame.

Caps and Risk:

Under no circumstances should you under-perform the benchmark. If you have a real edge you should be outperforming the benchmark every single year. If you want to be more flexible with this then you should outperform the market 8/10 years and (of course) the total returns need to more than offset your "bad years". Our annual outperformance benchmark is certainly hard to accomplish, however, unless you have more than $100M, you're not going to run into "size issues" where purchasing any stock will actually move the value. If you have $10M or less and manage your own investments, a single move into any security, bond, etc. should be liquid at all times.

Step 3) Annual Benchmark:

In addition to all the ideas listed above you'll need liquid cash in your investing account at all times. If you know a certain sector well or you believe a certain cap will outperform, you need the flexibility to buy when no one else will. We realize this is typically a large hurdle given that you'll have a separate portfolio that will always cover your living expenses (never touched) you'll need cash on top of this for "one time events" where there is a large opportunity that can't be missed. (In the past we've stated it takes about ~$50K to start a new consumer product and we think that same number is fair for a cash balance in case there is a nice investment opportunity).

Step 4) Always Have Cash: And

As usual, if you're already set for life you can ignore this last paragraph. That said, it always feels great to see your net worth go up every single year. Therefore, if you're going to actively manage your money in the future, we would recommend taking at least 20-30% of your future earned income (likely a business or career) and investing it into a wide variety of assets (stocks, bonds, real estate, etc.). This is a hedge against a one year blow up and all but guarantees you'll see an increase in your net-worth every single year.

Step 5) Do Not Actively Manage Everything:

Instead of doing a conclusion for the five steps we'll use an example instead with an affiliate marketer. Assuming the affiliate marketer gets to ~$1M we'd put this cash aside and invest in a variety of items to generate about $5K a month in income. This will cover all of his living expenses in the future and all the money he makes in the future can now be invested without any concerns. Since he's good at what he does, we'll say he makes $500K a year to keep it simple. This leads to about $400K net income since he'll live in a state tax free location and will always have business deductions.

An Example:

Now year one, we'd take $100K and put that into an index he's going to benchmark. Let's say he wants to trade internet stocks and media (he's an affiliate marketer and better know the space very well), then that's the set of stocks he'll compare himself to. After that he'll take $100K and throw it into various investments (similar to the $1M portfolio) and the remaining $200K is his to start actively managing. While year 1 only has $200K in actively managed money, year two should have $300K+ every single year (assuming his business is stable or up) since the original $100K into the indexes is simply for bench marking purposes.

In year one… He'll have $1.1M in diversified funds, $200K in actively managed and $100K in the correct benchmark. In Year two…. He'll have $1.2M in diversified funds, $500K in actively managed funds and $100K in the correct bench mark… Then in Year three he should have $1.3M in diversified funds, $800K in actively managed and $100K in the correct benchmark. As you can see, by year 4 or so, if you're outperforming the market your actively managed money should be well north of your diversified funds you'll have proof of your market outperformance (keeping yourself rational at all times).

Year Logs:**This does not include investment gains.**and

For some reason people believe that risk is bad. The reality (as you all know) is that risk can also lead to large scale rewards. We never understood the point of slowly building up a larger amount of money once you're rich. If you don't have to work for a living and have ~$10K in all but guaranteed money coming in per month… Is an extra $5K per month really going to move the needle? Of course not. At the same time we have also seen our fair share of "disasters" where someone accumulates $5M into a single stock and then loses it all (should have sold off ~$2M to avoid working and let the rest of the $3M ride if he was truly convinced that the Company would succeed). That said, here are some ideas for the risk loving readers we have.

Risk On….

You all knew this part was coming eventually, since we do accept BTC as a form of payment for … This is a perfect example of a high risk investment. From what we've seen the crypto currency "universe" has a wide range of investors from small scale retail to very big investors (VCs, billionaires and more). The one thing you'll find in common? The rich guys don't spend a lot of time talking about the prices. They simply focus on following the changes and evolution of the technology. They don't trade, they build a position and talk about the technology. They also accept it as currency, no questions asked, since it's not a big deal. (this should be a good hint at how you should think about it as well)

Crypto Currencies:Efficiency

Levering up excess money can spike your net-worth pretty quickly. In the affiliate marketer example, if he had conviction that a trend was taking place in 2017, he'd lever up the $200K and buy into the stocks that he believes would benefit. This would then give him a 2x return (assuming a doubling of buying power to keep it simple) and severely outperform the market over the full year. While the most common example of leverage is used in Real Estate (), this can also be done with securities.

Leverage:which has been covered in the past

If you've read our entire book, you'll see a clear hint at another way to generate large returns (with a different type of risk) being small scale buyouts. Scour the internet for poorly run websites/businesses and see if they will bite on a bid. Follow the rules listed in the book in terms of "what to look for" to see if a website is being run appropriately or not. Now you'll be able to enter a new purchase at say 3x net income and exit that purchase at 4x net income with a much higher net income number… As usual we'll drop a hint…

Mini Private Equity:What if someone did this with a low interest rate loan with cash acquired by using another asset class as collateral?

To cap this all off let's look at what the "index king" is saying about passive investing. Jack Bogle the founder of Vanguard stated at the Berkshire Hathaway annual meeting Now remember what we said above, by 2021-2024 there is a good chance that passive will make up over 51% of the market (Bogle believes 75% passive is safe – we disagree). We have also stated numerous times . We're looking forward to a future where people continue to blindly invest in index funds. It'll just mean more money and opportunity for the smart people in the room.

Parting Thoughts: "If everybody indexed the only word you could use is, catastrophe". **chaos***"Chaos is just another word Opportunity"*

——

Speaking of "Books", this fact will SHOCK YOU. Apparently, the first month after a book is launched is the most important time to promote it. So that is what this concluding paragraph is for. If you're interested in 1) getting in shape, 2) getting rich and 3) doing both without giving up your health personality/social life…

orEfficiency is for you.
****

Top 8 Losers You Will Meet In Real Life

If you want to succeed in life you need to choose a good group of people to be part of your circle of friends). Sometimes it is useful to know what kind of characters you should be avoiding so here are the most common you'll meet.

(not friendzszslosers

Generally, you should take advice from people who had it harder than you growing up. Don't worry this loser always had it harder than everyone else growing up in the dangerous suburb of the Hamptons. No matter what there is something everyone else has that explains why he is so unsuccessful. Women? If only he was 5'10" instead of 5'9" tall. Money? If his mom would just sleep with the admissions officer at Harvard instead of Yale he'd be set. So remember to feel sorry for him, he still doesn't realize .

1) Poor Me:no one cares about him*"Poor me. Poor me."*

Remember in elementary school when you were made fun of for trying to out other people? No worries this guy is going to try and do this in real life as well. He'll be watching over you like a hawk and will throw you under the bus if you slip up even once. If you do be sure he'll be raising that up the flag pole in seconds.

2) TattleTale: *"TattleTale! TattleTale!"*

This guy is somehow the master of probabilities. He knows that there is a 91.7% chance, rounding of course, that what you're trying to accomplish will not work. Be sure to disregard the fact that the payoff if he's wrong is $10M because everything worthwhile has a low probability outcome. Nah he's not pessimistic at all.

3) I'm a Realist: *"What can I say I'm a realist. I'm a realist"*

While it is true that becoming socially intelligent is a bit harder for those with oversized , this guy seems to believe he "too" smart. Ignore the fact that he's broke and terrible with women, they are just too stupid. If they are so dumb and you're so smart why are you broke and going through piles of Kleenex?

4) People Are Stupid: logical brains*"I don't know man people are stupid. People are Stupid."*

This is the of them all, they just don't have time. If you say you have a packed schedule all the sheep will nod in agreement because they also can't seem to lose weight or get a job because they are so jammed up with drinking on weekends, reading gossip magazines and catching up on the Kardashians.

5) I'm Too Busy: coolest excuse*"Why don't you lift weights? I'm too busy man. I'm too busy"*

Another good one is the guy who's looking for that one trick to fix his life. Six minute abs, twenty minute cardio, a trading program guaranteeing profits… Instead of putting in the time by consistently , he is looking for instant results like a drug addict.

6) Immediate Results: improving his life through repetition*"If you work hard you can improve. But what can I do for immediate results. I want immediate results now."*

Don't you worry young man, eventually . You'll walk up to a girl and she'll just take off her clothes when you spit some game at her with body odor, a fat gut and no money in the bank. You can get that good.

7) I Never Lose: you'll be like this guy*"I never lose man. I have never failed in my life"*

Generally, whatever someone believes they are if you treat them like the reverse you're likely correct. If someone touts on and on about how they are such a "good person" be certain they are far from a good person. Run. They can lie, cheat, steal and back stab you with a machete, but they are "good people".

8) Not Selfish: *"I'm not selfish. I love people, I'm not selfish at all"*

Hope you didn't make this list. Did you?

Top Ten Reasons You Are Broke

Ideally you can get through the vast majority of this list, if not get ready to change how you operate on a day to day basis.

Don't get us wrong it is not easy in America anymore but if you are cynical you will continue to fail. If you believe everyone is out there "to get something" from you that means this is what you yourself truly believe is the "true nature" of humans. If you are negative about the helpfulness of others it more often than not means you are unwilling to help people yourself. Break this negative belief system. It is significantly harder to bring someone up than it is to attempt to drag someone down.

1) You are Cynical: Your Mind is stuck in a negative feedback loop.

If you cannot work up the courage to cold email, cold phone call, walk up to a girl and say hello you don't deserve anything. If you're not failing you are losing. You need to fail, no failure no growth, no growth no improvement, no improvement no happiness, no happiness and you're on a downward spiral.

2) You Are Not Actionable: The harder you work the luckier you get.

No one cares about you. Repeat after me, no one cares about you. The only way someone will care about you is if you help them or you add value to their life in some way. The truth is in order to become important you must at that point you can give back to people who will undoubtedly help you in the future as well.

3) You Believe You Are Important: become of value

If you are 18 years old and you believe spending the $5K you have saved up in muni-bonds you don't deserve to be rich. If you are young the most important business you must invest in is yourself. Build equity in your brain. A few extra thousand dollars investing in yourself to learn how to code, learn a language, read books will outweigh the $350 a year you earn by doing nothing. If you want to become rich with no risk, please leave this website because the truth is hard work and risk are the only ways to make money, if you believe in guaranteed success with no hard work or risk we know who you are.

4) You Don't Take Risks:

This is usually similar to cynicism but is even more apparent. Be honest with yourself if one of your close friends was asked in confidence under oath if you are optimistic or pessimistic what are they going to say? If you know in your heart the answer is pessimistic you need to change your life today. Do you know anyone or look up to anyone who is a captain complainer… All signs point to no.

5) You Complain:

The vast majority of rich men and women have created a business to offer a product or service that helps people. To say they did not earn it or inherited a trust fund is to quickly rationalize your own failures in life. Yes they do exist but to say that this is the "only way to get rich" is a complete and bold faced lie. Go and look up the latest millionaires and billionaires. If a 17 year old can build an iPhone application and sell it for $30M (looking at you Nick Aloisio) you're simply making excuses if you think you can't earn a measly $100K a year working hard.

6) You Vilify the Rich:

While everyone else is working toward a bigger and brighter future by working 60+ hours a week, hitting the gym, eating healthy and talking to girls non-stop you're ruminating about that one time back in high school where your team won the "league championships" and you got laid. See rule number 3, no one cares. If you're trying to relive memories, we hope you are 80 and those memories are packed with stories of success.

7) You Are Stuck in the Past:

The difference between frugality and minimalism is this, minimalism means you don't need to be frugal if you don't want to be. If you are worth $10M and you enjoy shopping at Walmart no one can say anything to you because you have the cash to buy other items. If you're not saving any money and don't have any money in the bank the joke is on you for buying that new iPhone when you receive less than 1,000 emails a day that need responses.

8) You Overspend:

We only talk about finance and girls on this site and may do a small stint on lifting but that will be it. We are not going to give advice on cardiac surgeries, big law, consulting or running a Chinese food chain restaurant. If you attempt to comment on everything you will eventually have nothing. Find a niche market to become an expert in, do not attempt to be a scholar if you can barely send a simple and short email to deliver a point.

9) You Know it All:

Assuming that you do not meet any criteria in the above and you have had strong mentors in the past the last step is to make it on your own. You are likely already incredibly successful as you've developed unbreakable confidence The last step is a culmination of a successful past. You are now ready to make the final leap of faith down your own road to success. If you choose not to, you will regret it for the rest of your life. Pain today or regret tomorrow.

10) You Don't Pave Your Own Path:

If you are at the tail end of this list that is good news. Most need to live through all 9 steps before making the last leap of faith. At that point you don't care if you fail because you know with certainty you will recover.

You know there are only two choices in life recover or quit.

****

Total Cash Flow or Total Net Worth? How to Maximize Them.

Total Cash Flow or Total Net Worth? How to Maximize Them.

If you forced us to decide we would choose the highest cash flow at this point in our lives. Trying to maximize net worth is becoming less and less important since the money doesn't go with you when you die. That said, everyone has different opinions on what is most important to them. Maybe they have families (where the future requires setting up trusts and declaring "bankruptcy" to hand over assets) and maybe making money is just a game to them where they're pushing the number up .

to change their lives as fast as possible

Cash Flow Maximization

We're starting with cash flow because we're biased. Once you're financially independent… what is the point in growing your net worth aggressively if you can't even use it? There is practically no point at all. While you don't want to go negative we would strongly prefer to have tens of thousands of dollars coming in per month than have $5-10M locked away in an investment that can't be pulled out for 5-10 years.

The first step is creating a cash flow machine that allows you to sleep at night. This is a framework that you can use when deciding how to allocate money to your streams of semi-passive and fully passive income. You'll have flowing into your P&L and more importantly, you're likely still working since no one really quits. We set it up with the same assumptions as a prior post ($5K a month) to keep the math simple. (Click to Enlarge)

Untouched Cash Flow Setup: at least 8 different streams of income

In this example, you have everything you need. It isn't perfect but it's pretty solid asset allocation to protect against many different types of "risk". The first three items are at risk to inflation. Why? If inflation suddenly goes to 5% and you're earning 1-4% in CDs/bonds… that value is being diluted over time. This is why you're going to have assets that have the potential to go up if inflation increases. These assets typically include rental properties, dividends and preferred distribution assets (preferred dividend instruments). Finally, you've got a set of static Internet properties that generate good monthly income off of sales (not content based income). These internet properties are more important than any of the above items because you can always build more of these boring small sites if you need more income without material updates in the future.

Application for Various Assets: since that eats up valuable time

In the top right corner is an important point. The primary reason this is "good cash flow"? There is minimal difference between your minimum cash flow and your maximum cash flow on a month to month basis. The spread is $1,200. Since you have $60,000 in a checking account for either 1) or 2) cash flow issues for your living expenses… you'll never have to worry about eating into the principal.

Variance in Cash Flow: starting another Internet based business

In your worst case scenario, you pull out $50,000 and you have to do so in April when your cash flow is lowest. This gets you down to $8,500 in cash balance that will be replenished pretty rapidly. In addition, this incentivizes you to pursue cash flow rich businesses in the future (fast payback on your $50,000 investment).

The last thing we recommend is placing all of the cash flows from these items into one bank account. All of your future ventures will be funded from a different bank account(s). This is a way to prevent you from eating into the principal. Lets say you took out $50,000 to fund a new venture… well all of that money must replenish your "safe account". Then, take a chunk of profits and throw it into a new cash flowing item. After a year or so your new account will look something like this (Click to Enlarge).

Psychological Bank Accounts:

The other accounts you open should be for your active income. By the time you're a millionaire, you're likely working for yourself so the cash flows will not be stable. The entire point of creating a "passive income" bank account is to prevent you from ever going overboard on debt load and risky ventures. If you're levering up a *single* business that goes bust, you can always recover. Levering up all of your assets once you're above the age of 30 is probably not worth it (as you know we anticipate most of you will be millionaires within 10 years).

What are the Other Bank Accounts for?

Total Cash Flow Maximization

With the basics out of the way lets move on to the good stuff: Maximizing cash flow. This way you can spend *more* every single year without worrying about going broke. Given the nature of financial investments it will be difficult to maximize both net worth and cash flows so here are three simple strategies to maximize cash flow:

Take your income and split it up into two different types of instruments. Say, Junk bonds and CDs. Your income will now be split between an aggressive high yield bond portfolio (90% of excess income generated from active earnings) and 10% into boring dull instruments like CDs and money market accounts.

Bar-Bell Cash Flows:

Take all of the leverage you possibly can out on one business and buy income producing assets (keep the spread). If you're willing to lose that business then the "get cash or die trying model" can absolutely work. You can

Lever Up: make millions with other people's money.

We've been messing with this idea lately. You lever up and buy assets you can fix on a small scale (not classic private equity, but a mini private equity). You can do this with homes, internet properties, small businesses etc. Since a lot of our readers are interested in internet businesses you can use Flippa which sells tons of websites ("we may or may not" have done several of these with other people paying them to set everything up including the bank accounts). You'll do one of the three: 1) buy it straight and fix it knowing there is an issue with the site or 2) you can see a new business model and apply it to a different niche you know well or 3) you can rebrand it.

Mini Leveraged Buyout:

As always success is up to you. No matter what. Anyone who finds this website/article will be the master of their own future and they deserve all the credit in the world for their successful ventures. That aside, we can say option #1 is for risk averse people, #2 is slightly riskier and #3 is the riskiest. The barbell strategy is straight forward. You just want to spend more money next year because you're trying to upgrade your life a bit. Maybe you just want to pay for golf 1x a month for the rest of your life. the lever up model is usually used in real estate and is more stable/predictable relative to most leverage models and it is tough to get leverage to buy a random internet business so rates are higher, in addition there is usually an "inflection" point in most sites where the demand is tapped out. So you have to be certain of your venture and you also want to sell right around the green area (year 5 in this example). Why? The buyer will think there is more growth potential even though it begins to flat-line at 5% a year versus the 15% it was growing at previously "blue sky" still appears to be on the table if you sell in year 5.

Which to Choose? Option 1) Option 2) Option 3) *Note: Yes all of this is rudimentary math, there are deductions, depreciation, appreciation potential, valuation of websites and other items that are not included. Time frames can also be moved in if you do good work (returns in less than a year or two). (Click to*

Enlarge)

Net Worth Maximization

This is a different way to prioritize your future. Many people who intend to have families (or those that already have families) want to build a large net worth so it can be passed on to their children. In addition, there are many people who don't care too much about spending more and prefer accumulating assets as a game (making money is just a fun game after all). If you're in this camp you're likely going to focus more on higher risk/growth type assets that will be locked up for longer periods of time.

This is one of the ways to lock up your assets with a high return profile. We laugh nowadays with people saying "it's all about fees and you should never pay a PE firm even 2%". These individuals don't understand risk and returns. There is a trend to simply throw your money into index funds forever and that will outperform "every" private equity firm and VCs etc. (Wall Street knowledgeable readers will not believe this but it is true, most don't understand private equity). If this type of thinking were true… all of those firms would have a difficult time staying in business (last time we checked KKR isn't a small company). We digress. If you're looking to optimize for net worth Private Equity can be used as a vehicle to accelerate investment returns you're willing to leave it untouched for several years. In addition, do not go in blind and simply hand over money to any firm, you must research and be 100% comfortable with the investment vehicle you choose.

Private Equity: assuming

You can also get aggressive during downturns with small cap indexes assuming you've built a cash portfolio. This means you're unwilling to lock your money away and This is the most critical part of buying baskets of small caps. You have to buy them when everyone is selling. We don't mean you "time the market" on a yearly basis, instead you're going to buy as soon as we're officially in a recession (build massive cash position and acquire small caps like no other). Once the economy is *factually* in a recession and the market in general has puked you unload all of your excess cash into small cap investments. Aggressive? Yes. Is that the point? Yes.

Small Cap Overweight: you believe you have extreme emotional control.

Below is a clear example of this strategy. We used three simple tickers to show it (SPY which is the S&P 500, DIA which is a Dow Jones Tracker and IJR which is a S&P 600 small cap tracker). We entered into a recession in the 2008-2009 time frame (roughly), if you started buying when things started to go negative (grey bars) you'd make a ton of money. To emphasize this, if you bought small caps you'd make *more* money. Since small caps take a bigger beating during recessions that's the group you buy. In short, the small cap index went up about 357% vs. the S&P at 228% vs. the Dow Jones at 202%. Those are big differences. (Click to Enlarge)

This is yet another high risk strategy. You're going to invest in early stage companies after they have tapped out every single source of funds they could find using their personal networks (you should be an accredited investors). Some people attempt an aggressive "bar bell" strategy here where they are taking their excess income and putting 10% into CDs and then 90% into high risk Angel/VC type project where a few outsized returns make them rich. This is not for the faint of heart and requires quite a bit of knowledge.

Angel/VC Type Investing:

The one thing to takeaway is that we did not mention a "dual process" approach. This means we would recommend choosing *one* path. You're going to either maximize your cash flow in the future or you're going to try and maximize your net worth. Many will disagree and that is fine. From what we've seen most people decide on one path (either cash flow or net worth) and develop extreme expertise in a few of the ideas listed above. There are very few people doing heavily levered real estate transactions while angel investing and buying small cap stocks. The reason? Specialized knowledge. If you can crack any of the above strategies you'll see strong out-sized returns relative to what everyone else is doing.

Concluding Remarks: All that said… If you have a great strategy that doesn't give it all away feel free to leave it in the comments.

Investing

Triangle Investing: Stocks, Real Estate and Crypto Currencies

With the world changing rapidly we think these three asset classes will result in the best wealth accumulation. To organize all of our thoughts we have the following sections:

In this section we provide a broad overview of how much we think an intelligent individual can be worth by age. This is more of a fun introduction and gives the reader an idea of what we believe is doable without giving up any part of your personal life (still have time to party, have fun and live a free life). We offer three high level strategies: Risk on, Risk Neutral and Risk Averse. By giving away three different ideas, we don't have to do any sort of specific consulting. Simply decide on your own risk tolerance and you'll invest in the various asset classes. As usual, we bias towards the positive side. So if you can do better than the numbers we provide, we agree! There are many people who make their first billion dollars before they even turn thirty. Anything is possible. We simply provide a framework for the "ambitious" individual.

Financial Benchmarks and Overview:

The basic dollar cost averaging strategy still works. And. We give away what we own in our actual portfolio (beyond ETFs). We give 1) a basic explanation of why ETFs can cause a large downturn and 2) what we own in our actively managed accounts. The actively managed portfolio is a long-term holding and talks about "where the world is moving". Some of them have specific stocks we own other parts talk more broadly. This section is essentially tailored for someone in their late 20s or older. If you're thinking about managing your own money, we assume that you already have a business up and running and a high paying career. Otherwise you should continue with the dollar cost averaging strategy.

Overview of Stocks:

To avoid any confusion, unless you're financially independent, it does not make sense to do anything else beyond ETFs. Why? Well if you are not financially independent, this means you're not generating enough income. You can scrimp and save and try to generate 5-10% in additional returns but it will not move the needle when compared to creating your own business or growing your career. We focus on the big money first then you can move onto the smaller "fun items" like trying to outperform the market long-term.

: This is the most actionable section. Unlike crypto currencies and stocks, real estate has a blue print so to speak. We give ours away and realize that there are millions of ways to get rich in real estate. In fact, we know people who would laugh at our strategy because it is not aggressive enough. That said, it works if you're running a couple of online businesses combined with a busy career. If you're following the strategy in Efficiency (online sales), this strategy is for you since it is scalable and profitable. At the end of the day, people will need a place to live so real estate will not be going away any time in the near-future.

Overview of Real Estate

Our strategy is not for people who intend on doing Real Estate full time. The good news is we do explain how real estate investors make a living in the sector as a full time profession. The well known "BRRRR" strategy still works: Buy, Rehab, Rent, Refinance and Repeat. Our product is not meant for someone in this situation and is meant for people who want to diversify their income without taking on substantial risk. The key word there is "substantial" since all investment vehicles have risk.

No one will agree with this section. The one thing we can all agree on (at least those that have done their research!) is that it will change the world in ways we cannot imagine. Whether it is called Bitcoin or something else, crypto currencies are here to stay and we should do serious research into the space before the technology is truly understood. We provide our opinions and strategy for investing in the space. We also give out business ideas and ways to participate in the upside without owning a single coin.

Overview of Crypto Currencies:

We are happy to share the investments we have, while we won't give away the dollar amount, you'll find the percent allocated into this sector along with the coins that we currently own. Since this is more of a venture investment (lots of volatility and many moving pieces) we have created a special way to keep up with the space. We don't think it is right to re-charge every year for the same book so we will have a surprise for those that purchase the product and actually read it! This makes the page count "constantly increase". You'll see when you read it! Note: there is no way we can cover everything (it changes too much and there are too many coins). And. On a positive note. We can give you a good way to start while avoiding a lot of the noise. We will also have more Q&As in 2018.

Basic stuff here. Since our blog is tailored to younger people trying to become deca-millionaires, we don't cover it as much. If someone is over the age of 40-50 they already have a different risk tolerance and have a personal view on the amount that should be allocated towards bonds. This is the shortest section since interest rates are low and protecting principal is simply not that interesting.

Overview of Bonds/CDs:

Here is yet another controversial section, we will outline our own personal investment strategy at this time. Meaning, if we were starting all over again, where would we put our money? We would remind everyone that this is more of a risk on blog. If someone already doesn't have to work for a living (financially independent and wouldn't need to work even if there was a 50% market correction), then what is the point of saving money in "CDs". We just don't understand that logic and take a different approach.

Portfolio Overview by Age:

This product will not be a "fun read". Similar to Efficiency we cut straight to the chase and to the point. We don't like wasting time and don't like filler words like 99% of all of the products out there. Having a summary section is helpful to make sure all of the items are understood and can be recalled with a few simple pages (similar to how we structured Efficiency).

Conclusion and Putting it All Together:

We include the posts that covered stocks in the past so you have it all in one place. Same exact structure as Efficiency.

Appendix:

The book is 138 pages. Unlike other products, it is written in standard 12 point font (Garamond) on a standard 8.5″ x 11″ page with no filler photos to take up space. Exact same way as Efficiency, majority is new and the Appendix is from the blog. (If you read it, you'll understand!).

Length: Key note: we have a surprise that makes the length of the product *much longer* over the next year or so.

Click Below to Buy the for $8.49 E-Book (PDF)

Buy Now

Notes: 1) please save down to your drive 2) we also take Crypto if there are payment issues, email Admin@wallstreetplayboys.com and 3) keep your email and receipt as we'll hold Q&A's for buyers only… You'll see why we set it up this way by the time you're at the second half of the book.

Email us for the address to send to (BTC, LTC, XMR, ETH are accepted).

To help prevent constant stealing, we're only going to host Q&A's in the future for people who have purchased the product (either one). If the product was not purchased 1) we're being forced to answer repetitive questions and 2) we don't want to burn time on people who didn't have a few bucks to invest into their future. We will likely update the book periodically (every year or two) and anyone who purchases the product will get the newer versions for free. We realize we can't prevent all theft, however, there is a ton of value in Q&As when specific questions come up in the future. By cutting this off, the thieves will be forced to struggle on their own.

Keep Your Receipt: Keep your receipt as you'll need it for future *free* benefits and future products/services etc.

The writing style is practically identical to the blog. We write to the point and with some incorrect grammar (for dramatic impact of course). It should hurt to read in a sitting since all of the information is actionable. There is too much information and a missed sentence/line could result in valuable information being lost. That said, it is organized in a smooth fashion and should give you a lot to chew on.

Writing Style:

Two Separate Topics – Wasted Talent and 2021

Two Separate Topics – Wasted Talent and 2021

Due to the pandemic, everyone is being forced to connect with people they did not talk to frequently. The reality is that as you get older you unlikely talk to your parents every day or your uncle every day. We could go on and on with examples but the point is the same. You probably know your neighbor better than you did 1 year ago due to the forced quarantine. All of this forced us to take a step back and realize how much potential is wasted here in the USA. In addition, the good news, is that many of the naturally gifted people simply give up and fall of the radar with stories about "how they were this or that". The second item are some clear patterns we're seeing (looking at ads) and how to avoid blowing up next year with the wrong plans. Some things are certainly going to happen.

We really do not care where you're from. You could be from an upper middle class area where people were naturally raised in a more strict environment. You may have been raised middle class where there is a lot of petty crime and low end drug dealing. You could also be in lower middle class (more drugs and maybe some gangs) or even from the absolute bottom with rampant drugs, gangs and poverty housing environments. No matter what, every single one of these neighborhoods in the USA has at least one person (probably closer to 10) that "could have been someone". Yet, when you go back in 10 years of those 10… Maybe one makes it. This is due to a lot of issues that we've covered here in the past that need to be reiterated.

Part 1 – Wasted Talent:

A lot of middle class areas do not have "bad people". Bad people are usually in the lower to lower middle range (we're referring to legitimate criminals and drug dealers, hard to argue these are good people). The majority of the middle class? We'd describe this as nice people with no real direction. You see a lot of them talking about eventually making six figures one day, consumption of tons of boxed foods – "a calorie is a calorie" and a focus on "moderation" since they don't want to be pushed too hard and break something. The big issue here is that this type of thinking is passed onto every generation. The only way to break out of it is to find someone who came from the same area that made it. Talk to them and you'll learn (FAST) that they didn't do things the same way. They worked much longer. If they played sports they trained far and beyond what they were told to do and they took their food/diet seriously.

No Results – Time to Ignore:

The other way to look at the results is by figuring out where they are now. If they made it to a four year college (an accomplishment from most areas outside of the upper middle or better) you should then ask what they are doing now. Did they make the right decisions in college to set themselves up? So on and so forth.

The theme here is that the majority is stuck in the middle, going along with mediocre results. There is no reason to be upset (with the people giving you advice). And. There is no reason to listen to them either. As we've said many times in the past Therefore, adopt a "smile, nod and agree" policy. If you are getting advice from someone who is simply a "good person and trying to help", say thank you smile, nod and agree. You don't need to battle their egos and get into a fight. Simply act amicable and move onto the correct tasks. (Hint it never involves "chilling or relaxing" if you're not where you want to be yet).

"You don't owe anyone anything. If you want to help people, the best way to do that is by becoming successful yourself".

If you're being called extreme you're definitely on the right track. How else do you change your momentum into the right direction? What billionaire isn't extreme? What professional athlete isn't extreme? What successful company isn't extremely competitive? Being extreme is a complement. You don't want to be an extreme drinker or drug addict but you get the point. If you want to take whatever talent you have and maximize it, you have to push that talent to the extreme or live with guilt for the rest of your life. And. Sit around telling people how you "were" this/that in the past.

Extreme Results:

Remember. You have to drive to extreme results in something you are actually talented in. Just because you're passionate about something doesn't mean you're going to be good at it. A 6'6" guy with a 40" vertical should be playing a jumping related sport like volleyball not training to be a horse jockey because he loves horses. Someone with incredible software skills shouldn't be majoring in english/languages because he enjoys writing. He should be writing code instead. Take the talents you have (majority will be gifted in at least 1-2 things) and take them to the extreme. Eventually those two skills collide and you're unique in your craft.

The final item that seems to be lacking (when talent is wasted) is the misunderstanding of value. Just because you're good at learning new languages doesn't mean you can make money from it. In advanced hospitals they already have devices that can translate what they are saying into a separate native language. Lets use a random sport like water polo. We're sure it is difficult. That said a pro water polo player is lucky to make $100K per year (we don't know the sport well and googled it but maybe it goes up to say $200K). The point is clear. If you can get a full ride scholarship and be the #1 player at say Harvard due to your skills in Water Polo… What is the answer? The answer is that your free education is the "peak" of the return if you can get a free degree from Harvard. It is possible to make $150K+ once you graduate and you get to spend 4-years competing in a sport you are talented in. Notice, you don't have to love it. You have to have a winners mentality and enjoy winning. Going in every day knowing that you've won a free education for playing a fun sport. You need to have at least one hobby that keeps you in shape anyway so you're winning in two different ways at the same time. Stay positive.

Follow the Value:

We've really simplified it here but these three items alone should help filter out your contacts right now. Take a look at where you want to be and figure out if the person has it. If the answer is no then you need to find someone else. One person could be for money, one could be for fitness and one could be for any other skill/topic you want to master. No one is a jack of all trades (exceptional people are typically incredibly good at 3-5 things, which makes them unique and irreplaceable). For those that want the "answer", the typical one that works for anyone is good sales skills, avid writer (not reading as that's a crutch for stealing the ideas of other people) and some sort of talent that is in high demand today (coding, design, manufacturing, copywriting – just a combination of the prior two and relationship management). Finally, the ones that stand out like sore thumbs are usually in great shape due to some other hobby/skill (tennis, lifting, swimming, soccer etc.).

1) don't listen to people who haven't made it as you can find someone who did. While it is true the person who didn't make it may be right, it's always better to just find someone who made it as they are likely to know the next steps and be "ahead of the curve", 2) take things to the extreme since you'll never regret giving everything you've got and you'll always regret 50% effort days, 3) follow the value chain to figure out how far the specific talent can take you, sometimes you only need one talent – seriously – if you're the best golf player in the world or best salesman in the world you're set for life money wise and just have to worry about health and 4) you don't need to make people feel bad about themselves. You simply smile, nod and agree. This allows you to maintain a healthy relationship at a distance. They won't be with you 24/7 and won't realize how you made it out in the first place.

Summary to Avoid Wasted Talent:

Part 2 – 2021 "and Beyond!"

There is a hilarious meme going around talking about QE Infinity "and Beyond!" with the sounds from Toy Story. While funny in nature, we have to think about what the market is telling us today and what people are doing differently. We got a back and forth on Twitter and there are really people who believe there will be no impact to retail. This is beyond delusional and these people should not follow our account anymore as they are hopeless. While retail will see a snap back due to a boost in temporary demand, the long-term trend has been the same for 20 years and will continue. ANYTHING that is a commodity is going to go online since the cost of doing business with only warehouses is significantly smaller than retail shops. We do agree that clothing will still be around as people need to try things on… But believing commodities won't continue to move online is just nonsense. Sorry, there is no way we'll be wrong on this one as it continues to happen, higher margins online = ability to lower price = more competition = consumers over the long-term choose the lower price since the quality is exactly the same (a professional baseball is still a professional baseball). After that annoying rant we can look at 2021 (and beyond!)

You can track some of the start up layoffs here () and you'll see that the numbers don't look great. We're going to go ahead and say that there is a limited chance we get near 4% unemployment again by the end of 2021. Lots of companies will realize that they had bloated cost structures, a lot of the work was not value additive and that headcount could be reduced without a loss of revenue. So in 2021 you should be prepared to operate at a lower cost structure (for your business) or operate at a lower operating expense line for yourself (personally). This will give you additional wiggle room for the next 12 months as restructuring across every industry is likely. No one is irreplaceable and since many of our readers likely work in a career, operate as if you may get cut in the next 12 months. If you make it through 2021, 2022 should be perfectly fine. A good motto should be "Survive twenty twenty one and done".

Unemployment: https://layoffs.fyi/tracker/

Guess what you lucky reader you… If you listened to the advice from this blog over the past 8 years you're going to be in great shape! You will likely see a drop when the quarantine is lifted as people reorganize. But. You'll find that your baseline sales are going to be higher than before. If you were doing say $25K in net profits a month before the pandemic, saw that jump to $35K it will likely drop but normalize closer to $28K. We're making estimates of course but the picture is clear. More and more users now know how to purchase things online. Your total addressable market (TAM), just got bigger forever. Some people will not come back but the number of people who will be comfortable with online purchases just went up forever.

Online Boost!

The ides of living in NYC just got significantly less appetizing for most. This will likely lead to a decrease in major city density. If unemployment is generally higher, once the 6 months of extra money dries up, people will likely move to lower cost regions close to the hubs. Think 30 minutes away from the major city, draw a circle 15-20mins away from the major city you're next to. That's where people will push out to.

Decrease in Density:

Longer term it's hard to see if this sticks but it will make logical sense for the next year or two. While Americans pride themselves on being tough, especially in NYC, lots of people won't be able to afford it so you should see a bit of a rebalance. Slight rise in pricing further out and a drop in the city center.

: China hasn't been a good partner to the USA for a long time. Stealing intellectual property, sending fentanyl and now the virus. While it is a growing country based on GDP, its hard to see the US being positive on China. The average american doesn't know anything about Asia so you should assume that anyone who looks Asian will be considered "Chinese". For those that are well traveled and educated, this sounds absolutely crazy. If you've lived anywhere near middle class you know that it's also true. The average person doesn't know the difference at all.

Anti-Asian Sentiment in 2021

What this means for you? Try to avoid using ads that feature asian men/women. Don't associate your brand with anything Asia related. You're going to be better off. Also as an individual, since you're smart, you should look out for discrimination. Why? You can find talented people who were wrongfully fired. It sounds terrible and cynical but it's also true as we're only referring to business/making money. Racism is always going to be around in some pockets of the USA and this pandemic will highlight the people who are outwardly racist against this demographic. You have to hold these ideas separately which most won't be able to do: 1) anti asian sentiment will increase even if not Chinese, 2) it's a good idea to move away from China and 3) you should look out for wrongfully fired talented individuals. It is crazy, but there are videos of asians being beaten up on trains and they are not even Chinese and likely were Asian Americans. To end on a positive note, this won't last too long, similar to what happened after the 2001 terrorist attack (negativity towards middle eastern people).

Due to the lock-down anticipate more divorces and more kids! This is also a reality that is starting to play out. We talked about other demographics opening up (mostly older via online sales) but you could see a big spike in children. This would be a good opportunity to create an online business catered more towards families. If you're a real genius you can find one that works with newborns and with people who are still living at home with their parents (a likely trend as hiring slows for at least a year). Anything that addresses those two trends in 2021 should be winners. This can't be a better example of the whole "Yin and Yang" concept. While divorces go up, birth of kids also goes up while older people are being impacted by this terrible virus. Nature has a strange way of keeping us all in check.

Kids and Divorces:

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending.

Two Ways to View the Path to Millions

Two Ways to View the Path to Millions

You can spin any story. This is what makes a good interviewer separate from a bad interviewer. He can spin his resume to sound like all of the decisions were intelligent, rationale and value additive to an employer. Similarly, he can also spin his background as a positive when going out on dates. In essence, the way you view the problem will determine how "difficult" or "easy" a specific task will be. As you already know, we view the path to a million as relatively easy. But. For fun we'll paint both sides of the story to see how convincing things can become. This is our view of the Robert Frost Poem "Two roads diverged in a wood, and I—…. I took the one less traveled by, And that has made all the difference"

Millionaire A Difficult Path

If you're born in the United States you have a small chance of making it big. It fact your odds are around 3%. This means of the ~335M people in the United States, there are only ~10-11M millionaires. Not an easy task. It gets worse from here. You don't want to be rich when you're old do you? No you don't. You want to be rich when it is enjoyable. Lets use 40 years of age as a hard cut off. At 40 years of age your body slows down a bit and everything becomes more difficult.

So how many people get to a million before 40? Not a lot. In fact the number of millionaires under 40 is well under 15%. That is right. So we went from 3% and cut that down to just 0.4% or so. For every 100,000 people you meet just 400 of them will be worth a million dollars and under the age of 40. Oh it also gets worse from here!

Since we're already talking about 0.4% we didn't include some other important items. Do you care about your health? Do you value your free time? Do you want to have enjoyable life experiences? Guess what… All of that changes the probabilities. Approximately half of people are over weight. Your chances have gone to just 0.2%. For fun we'll say that only 25% of wealthy people are overweight so we'll take it 0.3% to be generous here. Next step. Business owners do make up the majority of under 40 millionaires, around 75% or so, taking this number down to 0.225%. To put a bow on it, we're going to be extremely generous and say that half of wealthy people under 40 are exciting and fun people (no odd personality disorders) creating a number of just 0.1125%. Since we were generous with the prior sentence we'll round it all out to make it easier to remember at 0.11%.

Scary isn't it? Just one tenth of a percent of people will hit this hurdle. Of the 335 million people in the USA (one of the most opportunistic countries in the world) just ~370,000 people will make it. Unicorn chasing by those raw numbers. Still want to roll the dice eh? Lets see how ugly this gets. By asking a quick question… Is a million dollars a lot of money?

A Million Bucks You Say?

Well all of the above math that brought down the field to just 370,000 people? It was based on a 1 million dollar hurdle. A million dollars gets you to around $40,000 to $70,000 a year in annual passive income (assuming a 4-7% annual return on your investments). The bigger question? Does this include owning your own home? It probably does which makes the math worse. If your home is worth $1 million and is paid off, well you are technically a millionaire. Just on paper.

The natural follow up is where we can say you're comfortable. Push it to $2 million. This becomes a lot harder to argue against. With a $500,000 property paid off limiting your overhead and $1.5 million generating money, this leads you to $60,000-$105,000 in income *without* any overhead. This is pretty smooth for any individual. The rub? Well. If you want to raise the bar by a million dollars you have cut the field in half.

Cutting the field in half now leads us to ~185,000 people in the entire United States. That includes everything: Hawaii, Alaska, California, Florida and New York. Every last one of those states. Want to take a guess on where these millionaires live? That is right, most likely in the higher cost of living areas: New York, the San Francisco Area, Los Angeles, Miami etc. You guys know the drill already. If the city is expensive, the wages are likely higher which means the ability to stretch a dollar is much more difficult. It gets worse.

Hello Uncle Sam

Well you know how we said that $1.5 million dollars would get you $60,000-105,000 a year? That was before taxes. If you generated 4% returns you're likely doing that with a lower tax bracket of around 15% since dividends (3% yield) are only taxed at that rate. If you're making closer to 7% it is much more likely that you have higher tax rate. Two reasons why. First ,to get higher returns you usually end up taking on more risk which usually leads to higher taxes (unless you hold for over a year). Second (and most important). The tax rate depends on your income as well, if you have non-qualified dividends these are taxed by the normal income standards. A person making $60,000 a year has an effective tax rate of around 25%, while $105,000 would lead to around 29%. So. Lets go ahead and cut those numbers to $45,000 in spending and $75,000 in spending per year.

Is this headache worth it? You've now broken into the top 0.1-0.2% in the United States and all you have to show for it is $4-6K in monthly income.

A Millionaire – Smooth Sailing

Welcome to the United States. First of all you've already won the lottery. There are only 335M of you within a population of something around 7 billion. No need to take it so seriously, its a rough estimate. Maybe 5% of people are born here. Sure. Maybe there are a couple of other specific locations where you have a better chance to getting to a million but that is for whiners and complainers. At the end of the day, the government wastes so much money that you can get access to books written by anyone on the planet for free. At the library. Oh and we also have fast internet.

Now of those 335 million people about half of them are stuck (financially speaking), now we have 167.5M. We are against student loan debt in the 6 figures and have always said it is a disaster. With that sentence out of the way, the reality is that they are no longer competition for you. That is right. While a few of them will figure it out, the ones that are in massive amounts of debt just won't be able to climb themselves out of the hole they are currently in. To be more conservative, we'll say that people with consumer debt (people who work and without student debt) are the lowest form of competition. This number is still startling at around 50%. That is right. About half of your "competition" lives paycheck to paycheck because they would rather consume all of their earnings.

The College Branch Hurdle

Get ready for a huge drop off! We haven't even started cutting off the competition. A fun fact to be aware of is that ~30% of people graduate with a four year degree. Now lets pause here. That takes the number down from 167.5M to just 50.0M.

We've been pretty vocal about starting a company. This means you do not need to go to college. And. This is a HUGE pause… those guys who skip college could have attended top universities. Let that sink in. The guys who could have gone to Harvard (insert any top university), simply dropped out or they created something (didn't even need to attend).

This brings up another fun point. The fact that you're reading a ex-Wall Street blog implies that you already know what Wall Street is! Most people still believe Wall Street is about making "money" off penny trades (that died years ago). Why are we highlighting this? It implies that top universities are what we should really use as the filter. This makes sense due to the competitive atmosphere. If you enter into a school with a 90% admissions rate, the chances are that the school does not have high quality competition or resources.

We re-read the last 3 paragraphs. It reads terribly and is jumbled but we're leaving it as is. Why? Too much excitement caused those paragraphs to be written since it implies that anyone reading this is already going to pass our hurdles! Keep reading below to see how tiny the competitive pool is!

What a difference this filter makes. There are approximately 2,500 universities in the USA that give out 4 year degrees (private and public combined). Once we realize that the vast majority of millionaires will come out of this group we then adjust for the fact that they will come out of the top 10% of these universities. Being more realistic we should only look at the top 5% or so… this means 125 universities. To prove this out, does anyone know what university is "number 100" in the USA? We don't know. (okay just looked it up apparently it is "Loyola University of Chicago"… never heard of it before). Take those 50M people you're competing against and now you're at 2.5 million.

Oh. We didn't even control for relevancy. Of those 2.5M you're now competing with, about half of them are dead on arrival. They have decided to follow their dreams and "learn" about things that won't make any money in the future. History, sociology, ethnic studies… the list goes on and on. The important thing to catch here is that we're going to take a blanket cut of 50%. This means some of those bad major guys will actually show up later down the line (good for them they fixed their situation). The more important news is that you're left with just 1.25 million people.

At the end of the day, we know that doctors are not in the competitive sphere either. Why? Well even if they make $350,000 a year they are not able to make this type of money until they are around 30 years of age to begin with. So it is unlikely that many of these guys will clear a million in net worth by the time they are 40. Besides. If you studied and worked like a dog to make $350,000 a year, you're not going to live with a bunch of guys to save on cost and drink cheap beers.

Side Note:

The Business Starting Hurdle

Instead of cutting the medical students out of the race, lets just cut out the "business talkers". These guys are the most common in the 1.25M you will compete against. Roughly speaking, there are only 4 million businesses in the USA. Of them many (emphasis on many) are run by the same person. of the 1% who try to start a business a small fraction are "new risk takers". We cannot do precise math here since it would be incorrect. But. What we can do is the rough math on "new businesses started by new people". This number goes down to 50% or so.

Of the 1.25M people you're competing against we are down to 625,000. If you simply try to start a business in the first place, you're creating an enormous chasm between you and your peers. This cannot be emphasized enough. "Most businesses fail" does not account for 1) shell companies used as tax shelters, 2) profit losing companies for tax purposes and 3) other fake businesses used to simply save a few dollars on cost. No big deal here. The point is that trying alone gives you a 50% edge. Since 75-80% of millionaires are business owners anyway.

After all this cutting, we now see you've got around a 50/50 shot at being a millionaire and a 25% shot at being a multi-millionaire before you're 40. Not bad at all! All you had to do was make sharp risk adjusted decisions and you've got yourself a seat at the roulette table placing a bet on red or black (yes we know it's slightly less than 50% just making a visual).

50/50 or 25% insanely good chances!!!

Unlimited Upside

Pay no attention to the guys who cry about taxes, inflation and returns of 4-7%, you got better things to worry about. You made your first million dollars by around 30 anyway which means you were able to put away $100,000 after tax per year. That is $100,000. Only about 10% of the entire population is able to earn this in a full year (pre-tax!)! You're putting a large amount of distance between yourself and your old peers at this point. Also. Do you think you were making more money when you were 21 or 31? The answer is obvious.

Since the answer is obvious it means you can now save six figures a year while increasing your spending by the investment income each year! That is some serious leverage. Forget about spending $75K a year, you're able to spend $75K + your regular spending each year. You're not going to quit working at age 31 anyway. You're having too much fun playing this video game on easy mode.

So there you have it. You have a 50/50 shot of getting rich or just 0.1-0.2%… all depends on how you look at it. Besides. What have you go to lose? Beer pong Saturday's with dirty balls that have been stepped on by shoes entering the public restroom? The latest episode on the food network where the "grand prize" is $10,000? That bachelor party in Vegas where the guys try and hook up with the Stripper addicted to pain killers? It's a tough call isn't it.

Q&A Announcement: *The next Q&A will be held on Monday the 13th. To participate please keep your purchase of either Efficiency or Triangle Investing.*

Uncovering the Truth

Uncovering the Truth

This post will hit on a lot of hard truths. has been destroyed with emotional comments from regular people so we are doing an elongated version to flush out the smart from… well… the not so smart. The truth is rarely pleasant and takes a significant amount of emotional stability to accept. This is why 1/100 people are good people to know.

Our most popular post

Outline:

1) Why the Truth Hurts

2) Why the Truth Will Lead to Happiness

3) Reflect and Change Your Activities… Now

Why The Truth Hurts

We do not like cliche phrases. That said, there are two that stand out. "The truth hurts" and "The truth will set you free". The truth hurts refers to *internal* realizations while the truth will set you free refers to acceptance of your *external* world. The difference between the masses and excellence is the acceptance of the truth *regardless* of emotion. Reiteration. This is the only way to remain balanced with your decision making. Lets get started:

In order to accept the truth you must apply logic to emotional topics.

While we have a humorous version of our take on , it is still the truth. Marriage is just a way to siphon money from you, by taking advantage of your emotions. Here's the rub: 1) Purchase an asset that serves no function (wedding ring), 2) go sign away half of your future earnings if anything goes south (divorce), 3) transfer all power to a woman who will still take your money away even if she's the one cheating on you. Where in the world is the upside?

1) Marriage is a Sham: marriage in the form of a pitchbook

Simply put, all upside for her and all downside for you. Game recognized. You lost control of your emotions. In addition? You're going to pay higher taxes to the good old government if you're in the higher income tax bracket!

Unfortunately, if you say these comments publicly, you'll be ridiculed as a "monster". While it's fun to get a rise out of people once and a while, you're probably best off with (WSPs trademark approach to retards). Finally, if you really met "the woman of your dreams" she should not care about getting the government involved with a ridiculous marriage license. The reality is that most women just want the ceremony so she can obtain attention and jealousy from her friends.

*the smile and nod approach*In short: Do not get married… Ever.

If you have ever started a company or at least moved up to a managerial position… You learn this fact quickly. While an average girl may be boring, slightly unattractive and annoying… At least she is not angling to ruin your life. Average guys are the worst.

2) Average Guys are Worse Than Average Women:

Average guys get jealous extremely easily and are hyper competitive with nothing to show for it. They will consistently compare themselves to others and believe that they are better than you based on their zero success in life. It is atrocious. The worst part? They even have the audacity to give life advice when they have accomplished nothing at all. Leading more and more people down a path of mediocrity.

In Short: Avoid average men and never return their phone calls.

We covered this in the post listed above and it is true. Your family only matters if they are helping you with positive reinforcement. If they are trying to tie up your time with crazy requests and phone calls, you have to stop picking up the phone and stop attending the family "meet ups".

3) Family Doesn't Matter:

Standards should be applied equally across the board. You wouldn't let a friend try to bring you down so why does your family get a free pass? They don't. You won't let them if you're smart.

Funny enough, the previous post railed at this truth the hardest. It does not make sense. If your family *is* helping you… then absolutely keep in touch with them! A good family member is probably equal to two friends you've known for a decade or longer. If your family member is a crack smoking degenerate, it is not your responsibility to fix his life for him. As you get older, you realize that the only time you should give advice is when you're asked for it (particularly with friends and family). Otherwise keep focusing on building yourself up.

In Short: Just like friends, if a family member isn't helping you improve… Move on.

No matter what, you are going to waste * of time. By 25 years old you're going to look back and realize you wasted thousands of hours on horrible activities: 1) getting too drunk, 2) participating on message boards, 3) sleeping in, 4) dating toxic girls, 5) networking with the wrong people, 6) eating the wrong foods, 7) building the wrong type of company… We could go on and on and on.

4) You Will Waste Time: a lot*

Why does this blog exist? To help people avoid big mistakes. Big mistakes being marriage, becoming a boring type A person, trying to start an internet business that only clears $200K a year instead of a Simply put, even if a guy isn't very bright but is willing to put in the work, he's going to break into the top 5% or so by simply avoiding the big mistakes.

working a job instead of a career, scalable product based business, etc.

In Short: You're going to lose thousands of hours… when you realize the mistake you'll be in pain. Embrace it.

That's correct. That comment includes the authors of this blog. Everyone at one time has been conned into believing something that is not true. Our favorite quote of all time (that no one likes!) is the following:

5) You've Been Conned:

"It is not what you don't know that gets you in trouble. It's what you know… that really isn't so"

It takes a bright person to realize the intensity of this quote and how true it is. To make it even clearer.

The longer you go down the wrong path the more painful righting the ship becomes.

Lets say you've been married for 10 years thinking she has been a good housewife for the past decade… Then you find out she has been cheating on you for the past 4 years. That pain is going to be than breaking up 10 years ago! You *believed* something was true when it wasn't. That is real pain.

significantly greater

Closer to home for us… Lets say you believe business person X is trustworthy and you place a large order with them. Unfortunately "something comes up" and the person does not deliver. This costs you many tens of thousands of dollars. While you think it was a mistake that was unavoidable… You do your due diligence and realized he screwed you on purpose to throw a wrench in your business since he was playing on the other side of the fence! That is going to hurt. You have to develop a new relationship over the course of a few years to displace this single dishonest person. You trusted the wrong person. Pain.

In Short: If you're trying to succeed in life, you're going to get conned. Remain stable and remember that ignorance is rarely going to cause you meaningful pain… Incorrect certainty will cause you the most pain.

While we do not like hero worshipers, you should have one *mentor* or ideal person you're striving to become (similar). You're not special because many people have lived insane lives over the past 5+ centuries and what you want is going to be *similar* to someone in the past. Find that person, befriend that person and make your own path with the guiding comments in the background.

6) You are Not Special:

Two years ago, life was great. Going out drinking, having fun, and the money was finally coming in. Flew out to see the "mentor" for a game of tennis and a few truth bombs were dropped that forced change immediately. Without butchering the actual advice, here is the crux of it:

traveling

1) "If your life is so great, why do you have to go out of your way to meet new girls?"

2) "Why are you building someone else's dreams? Only do this if it will help you obtain yours."

3) "Before you decide to retire, take a week off. Do not do anything related to your career or company… Report back"

These three truths will quickly put a 180 on how you think. They are all true.

First, if you are not coming across people you want to meet on a day to day basis (replace women with new connections as well) your life is not where it should be. You need a consistent stream of new contacts so you can improve in every environment. Going out to be entertained is ridiculous when you can go out for entertainment and improvement. Be honest with what you're doing. If it is pure entertainment, great, a few hours a week will do. Otherwise… Better start combining.

both

Second, building a company or your career is great… Just make sure its part of *your* dream. Is that the direction you want to go in? Are you just burning time out of boredom? Working on a project that is not part of your dream is expensive. You will never get the time back.

Third, retirement is a complete and utter joke. Once you hit your financial independence marker you're immediately thinking of all the cool stuff you can do now. Travel to a new country, lay up on the beach for several months, take up new hobbies etc. The problem? The type of person who obtains financial independence is an actual winner. Meaning, he/she enjoys improving. <– regular people will NEVER understand that sentence. Once you realize that hard work is the best part of your day, selling that company is not going to make much sense anymore.

It's boring.Working hard is the *fun* part of life.

In Short: You're not that unique. Someone out there has a life you're trying to at least emulate. Befriend them and be open to hearing harsh truths. Oh… and before you sell that company… take a week off first and realize retirement is non-sense.

If you learn anything from it is that people are driven entirely by emotion. Sales is nothing but the transference of a feeling. As soon as you can control your own emotions and feelings, you're going to realize they do nothing but create bad decisions for you!

7) Your Emotions Are Meaningless: practicing sales

The above paragraph sounds like it is written by a bitter person and that couldn't be further from the truth. Once you're in control of your emotions you get to *choose* how you feel on a day to day basis! This is the of regular people. Regular people are easily influenced and swayed by how they feel. This is exactly why they listen to all day long. They just want to feel good. Temporarily. They don't actually want to take control of their lives and their emotions. That is far too much work.

complete oppositemotivational nonsense

In Short: Emotions need to be controlled. As long as you are ruled by how you feel, you'll never gain any momentum.

We get a lot of these and they need to end. Now. You should not ask "scenario" type questions unless you are actually in the scenario. You are wasting your time.

8)You Shouldn't Ask Many Questions About the Future:

Lots of young people do this and we used to do this as well. "What if this happens, then what?"… Who cares. Unless it is actually happening it's a waste of your time. Go do something that will benefit you *today*. Asking questions about gold diggers when you're not even making $500K a year is equivalent to asking about movie contracts when you haven't even acted in a play before. Here's the fun part. If you're smart enough to make $500K+ and you found this blog… You're going to be smart enough to avoid being skinned by "gold diggers".

In Short: Unless you are in situation X, don't worry about situation X. It is simply mental masturbation.

The self improvement community, or whatever you want to call it, focuses a lot on reading. The problem? For every 2 hours you spend reading you could have learned the same material in 15 minutes by doing. That is the legitimate ratio… 15 minutes of doing gives you as much information as 2 hours of reading.

9)Doing is Learning: Reading is nothing compared to doing.

While smart people read, those same smart people spend atBeing well read is like watching videos of Michael Jordan shooting a basketball. You can replay the shooting form in your head 1,000x times but if you've never picked up a basketball you're never going to be any good at it. The guy who spent 8 hours a day playing, without watching anything, will beat you every single time.

minimum 8x more time doing.

Being well read is a good excuse made by intellectuals to avoid actual work. They will read and read and give you a lot of Snapple facts. But. They cannot connect the dots so they always seem socially "off".

In Short: Spend more of your time doing than reading. Reading is great when you have a problem to solve, it is horrible for building a talent base.

That's correct. There are many things that you cannot control. You cannot control the actions of others (IE: your expectations are insane if you believe this). You need to accept this fact.

10) You Are Not In Control:

If someone does something bad to you or something bad happens to you… Ask yourself… Could I actually control this event? 99% of the time the answer is no. If you cannot control it do not worry about it. Many many many people worry, whine and complain about things they cannot control. This is exactly why we do not talk about ridiculous things such as culture, feminism, politics, religion or otherwise. People are going to believe what they are going to believe and you can only control how you interact with the *environment*. People who complain about these things are not able to understand that they cannot control the actions of other people. It is best to move on.

In Short: Stop worrying and complaining about things you cannot control. The world does not revolve around anyone.

That was a lengthy section. We're going to give you the bullets in more concise and actionable steps below:

Concluding Remarks:

– Never, under any circumstances, do you get married

– Average guys are much more likely to cause you harm than an average woman who you can ignore

– If your family is bringing you down, it is not your job to fix their lives for them

– You are going to waste a lot of time. Accept this as a part of learning and life

– You will go through painful truth realization phases. Accept this. You will get burned at least once.

– You're not special. Someone has obtained what you're hoping to obtain.

– Emotional decisions don't work. Take control of them and live a happier life.

– Stop asking about the future, ask about improving your current situation. "Scenario Analysis" is primarily done by people who never get into said scenarios.

– Doing is learning. You read to solve a problem after *doing* something fails.

– You are not in control of the lives of others. Don't expect anyone to listen to you. If they want your opinion they will ask for it.

Bonus: For fun. Find what someone complains about and you'll find what they were never any good at. This is exactly why poor people complain about the rich. They never did the necessary work to make it. Use this to avoid bad advice.

Why the Truth Will Lead to Happiness

The section above primarily covered "the truth hurts". This section will explain the external version of the truth. That it will set you free. If you are free spiritually, financially and emotionally then you will be fast tracked to extreme levels of happiness (barring good health of course which is always #1).

To become happy externally (without faking it) you need to be happy with who you are at this point in time. This is exactly why most people in their and "rage against the machine". Who they want to become seems to be on a different planet compared to who they are today.

1) External Happiness:[20s are unhappy]

Where is the fun in that you ask? Well if you've been paying attention you'll see that The sooner you accept this as fact… the happier you will become. Think about it. When you're young and restless and working like a dog 80 hours a week… you are going to be making incredible (non-linear of course) gains. The faster you realize that working hard is the most exciting part of life you'll realize that your twenties are a great time to be alive.

***work is fun*.**

Most people won't comprehend the previous paragraph. Most won't even comprehend it by the time they are 40! (they will make terrible decisions). We suggest you get onto this band wagon as fast as you can. Find something you are good at that is scalable… Get to work.

In Short: Once you realize work is fun… Your twenties become an amazing time to be alive. You will work harder in your 20s than any other point in your life… Which is the most fun part of being alive.

The easiest example for a young person is a break up. You're dating a girl and she either dumps you, cheats on you or leaves you for one reason or another. The day that you accept that you couldn't do anything to prevent this is the day you've finally gained control of your emotions from a relationship standpoint. If you're still pining away, complaining and trying to "make sense of all of it" crying into your pillow at night… You're still a teenager mentally.

2) Acceptance of the Uncontrollable:

Once this event happens you need to do two things immediately: 1) spend one day writing down any potential game mistakes you made and 2) drop contact forever. If you cannot do these two things within the first 48 hours you are still ruled entirely by your feelings. This is a womanly trait.

Assuming that you've accomplished both tasks, no one should even realize you've ended a serious relationship. Your internal self has already processed the information (you cannot control the uncontrollable) and your external self will reflect this and return to a state of happiness within a 24 hour period.

Congratulations. This was a blessing for you. The acceptance of the harsh internal truth has set you free *emotionally* to maintain your state of happiness.

In Short: Knowing that you cannot control the actions of others… will make your happiness *independent* of the actions of others.

Now we're getting to the good stuff. If you accept reality for *what it is* and not *what it should be* you are going to live for you. You are not going to live for the acceptance of other people (external). Instead of living for the aspirations of *others* you are going to live for your own aspirations.

3) Your Life Your Rules:

This is going to be different for everyone. For our readership, this means $1M by 30 or so is nothing spectacular. We hope that everyone reading is *at least* aiming for 5-10x that amount. That said… If you're happy with significantly less then you're going to stop reading this blog quickly! You're going to go and find someone who is living a life that you want and take guidance there. We have no problem with either group we just don't cater to the latter one.

In Short: You will create your own rules for life in terms of a balance of what will make you happiest. Since it is your life, you won't have rules that are predicated on aspirations laid out by anyone other than… You.

You're going to lose interest in mainstream topics. You won't be interested in the latest movie or reality TV show. You may have one mainstream interest (say Tennis or Golf) but the vast majority of the things you see on TV are going to come across as cheesy and ridiculous.

4) Loss of Media Interest:

This will do wonders for your external happiness and freedom. If mainstream media cannot even hold your attention, they are not going to have a shot at dipping into your mind or wallet either.

You won't be able to pay attention to mainstream media!

In Short: You will no longer be swayed by any main stream media ideas. You won't have the attention span to watch it.

The last piece, after accepting the truth, is that you will feel true independence. You can lose your career. Your business can go bankrupt. Your girl can ditch you. Your friend can screw you over.

5) True Independence: You won't change.

Independence is a popular topic, particularly in the USA. But. How independent are you if your happiness is derived from the actions of others?! The answer is you're not independent at all. The day you accept all of the truths laid out above and map out your own path is the day that you begin to feel true independence. Your emotions are separate from the noise of your life.

In Short: Your life will be a separate island. You allow people on the island, some decide to stay and sometimes you may have to send them away. But. The island is always yours and stable.

This section is literally one half as long as the internal section… For good reason. Your external being will be a reflection of how you feel internally which is why you must build the inside first. Fixing the big items first (internal painful truths) followed by its positive impact on your external life.

Concluding Remarks:

Reflect and Change Your Activities… Now

We are at the tail end of the post. What are you doing incorrectly? What belief are you holding onto that is creating unhappiness for you? Where are you spending your time? Why are you spending your time on those activities?

Ask yourself uncomfortable questions to uncover the truth.

We do not know what you are doing for 168 hours per week but we can guarantee that there are time wasting activities in your day to day life:

– Are you wasting time on message boards creating content for someone else when you've already obtained the crux of the information?

– Are you reading all day without actually doing anything?

– Are you emotionally unstable? Being rattled by meaningless events like your girlfriend cheating on you?

– Are you asking about scenarios in the future that haven't even occurred. IE: speculating on things that may not even happen… wasting the time of everyone involved?

– Is your life in the slow lane because your family members want to spend time with you… Which consists of them hitting you up for money and begging for a job?

– Are you watching motivational videos because you don't actually want to commit to improvement?

What is it that you are *actually* doing. Why are you doing it. Is it going to get you to where you need to be in a year? 5 years? A decade?

We don't know. But we do know that if you don't build your own pyramid, you're building someone else's.

****

Unlock Your Mind. Unlock Your Potential.

We hope this does not fall on deaf ears. It is certainly a divergence from that will be going up soon.

a few of the posts

Rewire Your Brain to Frame in Your Life as a Positive. Everything

Complete synchronization of your life. Lets take a look at some examples:

Back five years ago when lifting at the gym, angry aggressive and downright mean songs would blast from my earphones. Now? Weightlifting is done while listening to incredibly upbeat and happy music. Why? Weightlifting with angry music blasting is good, but imagine lifting with positive vibes flowing the entire time. Now your mind and your body are associating weightlifting with a positive connotation. There are a lot of fit guys at the gym who listen to heavy music, it works, but what if it could be better? This change alone allows you to be in a positive mind frame both before you enter the gym and after you enter the gym.

Weight Lifting: Rewire Your Brain.

No doubt we all get reamed out at work. "I expected better from you" or "XYZ error was in XYZ document" or so and so over at XYZ branch said this and that about you which makes us look bad. Negative feedback. How do you If they were not giving you criticism they would not care about your improvement. That's an improved frame of mind. The sure tell sign that you are about to be fired is when people no longer care about anything you are producing. When people quit on you, their ready to let you go.

Getting Reamed at Work: Rewire Your Brain?

When you try to chat up a girl during your , or at if you get rejected how do you react? Do you allow your body to take a negative body language posture by shoving them into your pockets or do you laugh it off? Instead when a girl gives you the classic head turn or something worse, repeat to yourself "Practice makes perfect i'm closer to the goal". As always the difference between a winner and a loser is a failed attempt is viewed as practice where a loser will view it as a defeat. How are you going to get any better without failures? You won't.

Girls: lunch breakat the club, the dance venue**Rewire Your Brain.**

This one is nearing intermediate level where you stop comparing yourself to other people. It's much easier to compare yourself to Joe Millionaire and be jealous or see a guy with a 9.5 and be jealous of his catch. Stop it. The success of someone else does not deter your own improvement. If this guy can make money or get a girl that is a 9.5 why can't you? You know the answer, positive practice and repetition,

Jealousy: Rewire Your Brain. you need to believe in yourself.

This is certainly at intermediate level. Maybe you lost a family member, maybe you lost a large deal and your job, maybe you got into a car accident and will be in recovery mode. An enormous myth in the media is that most well off people didn't work to get to where they are today. Nonsense and defeatist quitting mentality. Negative, real setbacks separate the heavy hitters from the wannabes. Within the group of successful friends that should surround you, undoubtedly most of them have a terrible setback in their life before they made their big breakthroughs. Otherwise you're a trust fund baby and have no need for this website. One saying that should stick in your mind is this

Real Setbacks: Rewire Your Brain. Every single setback is an opportunity to recover, a man is defined by how much he can come back from. *"You become a man when you overcome a negative life changing event"*

This is something we should all strive for, no one writing on this blog is here yet but this is the end goal. While there is the saying of "yin and yang" this is another level above the good and bad dichotomy. Instead every life event is positive. A "negative" life changing event is now a positive you can say you came back from "xyz", a "positive" life changing event such as a new career or business is just that, a positive event that you should continue to improve upon.

Tranquil:You have Rewired Your Brain to believe that everything is positive.

This last part may be a bit confusing but the idea is the following, what in your brain needs to be rewired? Do you believe you can't gain weight? Eat until you puke. Do you believe you can't meet girls dead sober? Get a short-term harem and go do it over and over again until you succeed. Below is the feedback loop you want to create in your mind. Forever.

The Takeaway: Unlock your reptilian brain.

Complete Event 1 -> New Level of Confidence -> What else within my system is limiting my potential? -> Complete Event 2 -> New Level of Confidence ->

mind'sbelief**What else do I believe in that really isn't so.**

Your mind has an unlimited number of beliefs, therefore your potential is also unlimited.
****

Update on Trends in America and Surprisingly Some Dating Observations

Update on Trends in America and Surprisingly Some Dating Observations

Over the last few years the general trend in the USA has stayed the same (so it seems), more separation between the "haves" and the "have nots". Also a large delta between people's interests which only cause the separation to widen over time. We took a look at our contacts and none of them sit around vaping marijuana, playing video games and doing hard drugs on a consistent basis. It has been interesting to watch and while we try to avoid dating/culture type posts it's a good update once a while and this feels like a good day to do so.

We continue to keep the same belief. There are really three items that need work for a male: fitness, social skills and money. If you have all three it is rare to see an unhappy person. The explanation is quite simple, if you only have two… something is always "bothering you". For rich guys it is typically the dating market as they are either out of shape or socially awkward. For the in shape guys on the beach, it is typically their wallets. Lots of people are able to get two of them down and only a select few get all three. We can't prove this last part, but, we think it is extremely tiring to get good at all three. So once a person gets two down, they try to make them "offset" their weakness in the third. Unfortunately it doesn't work that way.

General Framework:

As a source of "motivation", you don't need to be amazing at all three as you should view your life as a mosaic. It's better to be worth a couple million, be in shape with great social skills vs. being worth $10M+ but no real social skills or physical fitness. The reason why is that you never know what a person values so if your "product offering" is a mix of all three, your selection group expands. Also. Realizing that you're not doing well in one of those categories requires self-reflection and awareness, another positive quality. Don't listen to people who claim that one of them can be ignored, make sure you're willing to take a step back from what comes easy to you (be it fitness or money or socializing) to focus on fixing the areas where you're weak.

We see the same trend occurring, lots of young men/women are graduating with few opportunities. This results in panic attacks, a loss of purpose and a shift to questioning the "life path" everyone was told to go down. Even if you avoid going into debt to get degrees, the *shock* becomes much more apparent as you see Companies constantly looking for ways to cut costs and automate their work flow. This is combined with easy access to drugs and alcohol and constant complaining from adults who were not able to keep up with the times It still amazes us to this day that three trigger points really tell you a lot about a person's future: their college (if they went to a top university or were somehow able to avoid it due to intelligence/skills), their first career/job/business they start and of course the city they live in. If you gave us the answer to the three items listed you'd be able to predict with ~90% accuracy the next 5-10 years (financially). If they choose well in all three, it usually leads to a high quality financial life.

Current Cultural Issue: *"back in my day everyone was on their own by your age!"*

Either way, this leads to the same old issue we've seen over the last 5-10 years. The number of people with high paying jobs is small… the pool of people with little debt is even smaller… and the number of people being forced to live with their parents goes up. We don't see this trend reversing any time soon and the separation between the haves and have nots will likely widen. In short, nothing has changed in terms of the "trends".

As usual this is an actionable based blog and we're going to make some adjustments right now. The following are trends we've noticed from the younger generation (well the successful ones since those are the only ones we're interested in monitoring). They do the following: 1) they tend to view making money as a game, most complain about it being "hard" but the younger ones view it as a game to improve at versus work, 2) they actually don't drink much. The only ones who seem to drink are born to rich families and also landed a pretty high paying job. These individuals do spend a lot of time at concerts/raves etc. The ones who don't have that to fall back on are not really partying a lot, we see them doing a lot more physical activities, 3) on that note, they are in shape since they are not out drinking and partying as much, 4) they already have two sources of income, we know some people who are only 23 with up to five sources of income… It sounds impossible but you'd be surprised at the range of businesses being spun up, 5) almost *all* of them admit to earning extra money while on the job – they are not delusional and realize no one is going to watch over their shoulder 24/7/365 and 6) their social skills are a tad weaker than their peers but you see them improve over the course of year. This one is a trend we picked up over 5 years, as they start out with little confidence and little time to improve. But. In 3 years or so they've gotten to standard skills and it seems to be the last item on the priority list – but still takes up the #3 slot in terms of time preference (money and health being the top 2). Simplistically, each person is following a with different angles: some with the exact idea from our book, others with the real estate hook, some going full start-up and others working even harder than we could imagine to maximize their consulting/services revenue. All of these ideas work, none of them are "right" as long as the end-game worked out

What to Do: similar path to Efficiency

On the opposite side of the spectrum you can see the downward spiral lead to an impossible hole to climb out of: 1) believing that "hard work" can be avoided because they are smart and only need to put in a few hours to succeed. Not realizing that even billionaires worked insane hours in the beginning since it's the "life tax" associated with success, 2) getting involved in a lot of drug/alcohol binges. Reduces the ability to operate the next day, make its hard to meet the right people and on top of all this if they don't have the will power to work long hours, they definitely can't stay off the drugs, 3) not taking advantage of down time, spending this instead on consumption/entertainment, 4) thinking the weekends are always "off days because they deserve them"… when in reality if you put the work in early every day (even weekdays) can become off days when you don't feel like killing yourself and 5) constantly valuing the comfort zone of old friends. This one is probably a common sign, if their friends are all the same people they knew from college – something has gone terribly wrong (2-3 years after entering work force)

What Not to Do:

Updated Changes in The Overall Culture

The high level changes haven't really moved much, what has changed is the way it is reflected in the dating market, social market and preferences. In a rare case we'll talk about dating since it has been fascinating to watch.

Applications are still being used by guys who have their money straight. Naturally this forces them to bat below their "class" since they are a crutch for people with weak social skills. We have no doubt that the comment section will be filled with "it's the same!" but we haven't seen it and have yet to find someone who uses apps that dates "up". The old saying is still true, you never trust a guy who cannot date up as it's a sign for lacking at least one (if not two) of the three items you need to live a fulfilling life.

Dating:

The other fun thing we've noticed is that *some* women have actually caught on to this whole cultural trend. For all the complaining we've seen about women on the internet, a lot of them have actually exited the constant hook up culture in a few sparse areas. You can tell who these women are as they are dating men who are around 5 years or so older than them (sometimes more of course) but from what we've seen, girls who are dating up have intelligently filtered out the constant hook up culture. To be clear here, the hook up culture is still the VAST majority. All we're saying is that we've seen pockets actually figure this whole thing out an realize that they are not getting anything out of it. Generally, they are on the much more attractive side. So to emphasize, career focused women and hook up culture women are still extremely prevalent… We've just noticed a slight change which has actually expanded the pool of decent women (no one should be taking a previous drug and party addict seriously)

The last thing we've noticed is that the pool of younger adult men has become weaker. This is due to the continuing trend of lower high paying jobs and more competition. Many of them are being forced to live at home as well (reduces where they can afford to go out). The "recession generation" those that graduated in the 2005-2008 time frame are generally split apart. So there is a large gap here at this point and they are between 32-37 years old or so (we're adding some wiggle room). If someone is living a good life and they are between these rough ranges they likely survived some terrible economic situations and really were better than most. On the flip side. The guys who got clobbered by the bad economic times are still playing catch up.

Not sure how to phrase this but in terms of the "social market" you see a lot of people who simply gave up on life in general. What we mean by this is that the competition has gone up to get over the "" and every year it just gets harder. So in the social market you can quickly figure out where a person is (socio-economically) by their views on hard work. If someone is in their mid-20s and downplays long hours… chances of crossing them off the list is high. If someone is in their mid-20s and agrees it plays a massive part then they haven't given up on getting over the hump financially.

Social Market: snowball effect

The social market or “social tells” have become so obvious that it hurts. You can almost figure out to the T who someone listens to on Twitter, YouTube, Instagram etc just by their comments. It has gotten to a point where we hear comments and know exactly what tweet/article they are referring to. And. They try to pass it off as original thought even though you are 100% certain it’s just a quote from someone else. Maybe this has always happened and we weren’t as aware. But. It happens almost every single day now. Someone will make a “smart comment” and you sit back and say (in your head of course) “that’s directly from someone else”… smile, nod, agree and move on.

Original thought consolidates which also consolidates the social market. The number of people with original thoughts is on the decline so these people are naturally drawn to one another. In order to recognize original thought, you have to be well read and read between the lines (this person is just someone who memorizes vs. this person is creating new connections). Over time the people who are actually making new observations all end up meeting one another down the line.

This has probably been the most interesting change over the past ~5 years. Preferences have changed quite a bit. Definitely a bigger focus on being physically attractive as a stand-out trait for men as most are out of shape. Definitely a bigger focus on travel. Definitely a bigger focus on “experiences”. While one thing has stayed constant: if a girl can’t experience something it doesn’t exist to her (like the millionaire who eats lentils and rice). The typical person in their 20s is now more interested in the trip to France vs. the expensive handbag. Now if you become rich all these material items come back again since there is nothing to do (boredom, a topic we could cover but really only addresses the rich)

Preferences:

There are several ways to improve your life to generally benefit. You can actually reduce your housing costs without a significant impact to your social life if you are willing to spend more on making your life an “experience”. You can avoid hearing the same thing over and over again by becoming well-read and avoiding people with unoriginal thoughts. You can also look for social tells to quickly filter out people who gave up on the process: 1) asking about effort and reward – to young people – delayed gratification etc. 2) asking about their views on earning money – if it’s “fun” or “annoying” is another big tell, 3) seeing what type of people they hang out with – if it’s the same people from 5-10 years ago it’s usually a horrible sign and 4) the classic tell on if they believe rich people are happy or sad… people who think rich people are unhappy have given up on getting rich and are looking for excuses to never make it.

How to Benefit Off These Trends:

1) we will see continued dispersion between rich and poor, regular theme we have had, 2) in 5-10 years the dating market will actually swing away from hooking up as the generation above them passes down information that it did not work and was detrimental and 3) decline in young population in expensive cities, increasing status signal.

Fun Predictions:

That’s a short summary. Also. We will have a Q&A on Sunday and will actually open it up to social questions for once since we took a lot of notes down on new trends we’ve noticed.
****

Updated Life Philosophy

Updated Life Philosophy

We’ve been blogging for a long time (over 5 years is certainly a long time to us). Our beliefs in life have evolved quite a bit so it is probably a good idea to update all of our readers on our latest philosophies. The good news? A lot of the big items remain the same: 1) putting “hard work” up front, 2) avoiding trading time for money, 3) focusing on learning how to navigate relationships and of course 4) the art of getting rich without killing your personality. Those items remain unchanged so lets jump in.

We have to put this phrase in quotes because Hard Work is overrated. People believe this means “long hours”. To us hard work means solving a difficult problem. This is real work because hard work can include digging a ditch with a spoon. Just because it is hard to do does not mean it is an efficient use of your time. That said our original belief remains unchanged. At age 12-24 or so, your life should be full of hard *problem solving* work. This focuses all of your energy on something that will result in the highest ROI.

“Hard Work” First:

This day and age we stick with our standard recommendation since we do not know how smart the reader is. If you want the lowest risk highest probability to become a multi-millionaire, going to a top college and getting a Career is the easiest stepping stone. So nothing has changed from everything outlined in Efficiency. The vast majority of our readers are in their 20s and should follow that path to a T. If someone completes the book and doesn’t have a second source of income within 3-4 years… something has gone horribly wrong. By the time they are in their 30s they will already have a business running and won’t be interested in their Career anymore. Maybe they keep it maybe they don’t but it really won’t be interesting anymore.

At the end of the day, there is no way to convince someone that they are wrong. Time and time again we see the same strategy pay off which is: Smile, Nod and Agree. There is no point in fighting people since they won’t like you after that. Once they don’t like you, they won’t take anything you say very seriously. It is a lose, lose situation. The one good thing about this is we can at least practice forgetting our own Egos. If someone has a Ferrari or makes $10M a year while you’re making $2M a year and drive a Honda Civic… Does it really matter? Of course not.

Feed Egos and Erase Your Own:

Funny enough, once you make it (whatever that means for you financially), you’ll become less “intense” and ego driven. People who need their Egos to be fed typically compare themselves to the next richest guy in the room or city. It just doesn’t make sense to us at all. But. This is how the world operates. We’ve also concluded that this is another “status signal”. In a rare case we’re going to use dating as an example. Generally, women don’t like talking to the “intense guy” who is all about work. This is because someone who has made it already… doesn’t care about work! It took us a long time to finally make this connection but it all clicks once you see it. A rich man is a man who has free time a high income. If someone is constantly working how “rich” can they be? This is a pretty big switch since we always assumed there was no “stepping off the gas”. But. You can absolutely step off the gas if you are able to outsource menial tasks. The numbers go higher even though you’re working less. You’re just more focused on the 2-3 things that matter.

and

Okay, never is a strong statement but we rarely see a negative ROI on either. People ask us what they should spend on when they get rich and the answer is always the same “whatever you like”. That said… We’d argue that your best spending will focus on 1) experiences, 2) time and 3) health. All three of these things rarely lead to buyers remorse.

Spending on Health and Time Never Goes Wrong:

Experiences include anything and everything you wanted to do that does not require a material purchase. This includes everything from travel to learning how to play a musical instrument to extreme sports. Enter anything that is not a recurring cost. The world is an enormous place and you’ll find a million things to do that don't require you to buy a fancy Rolex or Ferrari. While people in their 20s will assume this means hitting the clubs in every single foreign country on the planet (which is fun for sure), it can also include things like African Safari's and Hiking up Mount Everest.

Time is probably the most underrated. Time means services. We'd argue that you're better off hiring someone to clean your house/apartment, do the laundry and potentially cook as well before "upgrading your home". If you upgrade your home and are forced to use your own time to clean and organize… You've actually While you can afford the bigger place, you've lost a ton of money in terms of opportunity cost and quality of life. For some reason, Western Cultures focus more on buying more and more space and shun the idea of buying services. When you get rich (no doubt you will) try the services route first and let us know how it goes! Ironically, the people who jump into high-end cars and big homes typically end up more stressed than they were just a few years ago.

***lost time*.**

Health is significantly more important than money. If you can spend on your health, this is going to give you the best long-term ROI. Invest in the following: Food, Drinks, massage therapy, blood work and routine doctor appointments. All of these things will elongate your life and improve the quality of your life as well. Quality of life is key since being rich and in a wheelchair defeats the purpose of getting rich in the first place. So there you have it… Our three main areas to spend at will are experiences, time and health. It pays off rapidly and the rewards stay with you for a lifetime versus a few years like a nice car or watch.

For some reason, we've found that successful people are able to sustain long-term relationships for 10+ years. This means we are now recommending that people avoid individuals with "short-term" friends. If they were not able to keep a handful of friends over the course of 30-50 years… There is usually a big problem. Having 3-5 long-term friends/relationships shows that the individual was able to correctly pick out the future success stories within his peer group. If you have access to the internet there is a 100% chance that you can find a future successful person who is currently 20-40 years old. We are using big ranges because it erases the excuses from the equation. If you find an older person who does not have a few close relationships of 10+ years… start the Smile, Nod and Agree process.

Long-term Relationships:

For better or worse we wouldn't be surprised to see more inequality in the future. This is in the life philosophy post because it should immediately trigger the "no excuse button". With the internet, the playing field to get rich is essentially leveling out. Yes it is still significantly harder in third world countries. But. If you're in a first world nation you have all the tools needed to be on the "winning side" of widening inequality. We don't really have a big philosophy on inequality since "value" is how money is generated in the first place. The one thing we are excited to see is the growing level of competition. As hierarchies come down (being rich by being born with the right parents), we should see less and less nepotism which is probably a positive. If you end up on the right side of this inequality equation be sure to wake up with a huge smile on your face every single morning.

More Inequality:

Our views on *legal* marriage has not changed at all. We've never been against people having families or having a significant other. We remain 100% against a legal contract that simply increases your taxes puts you in a losing legal proposition. People continue to say we should "man up" on this topic but the facts have not changed. If you need to sign a piece of paper to get the girl to marry you, she didn't love you in the first place. No one really likes this topic since it is not possible to poke holes in it from a logic perspective. Instead the result is more complaints and "emotion".

No Change to Legal Marriage: and

It has been a long journey and we really should change the name of the blog. If anyone gets a good idea let us know. The only reason we haven't changed it is because it makes us laugh every single day. We started a website for the laughs. It ended up growing. We have a pretty large audience and have not ruined our privacy (

Need to Change the Name of the Blog: *thank you for teaching us all the tricks!).* affiliate marketing

We still get complaints that we should give all our books away for free and delete all ads. We just laugh because human psychology doesn't work that way. If we gave something away for free it wouldn't even be read. This was proven way back when we gave away free copies of . We make very little relative to our actual income and the cost of a drink at the club is more than reasonable. It forces us to engage with people who will actually do something with their lives! If we gave away our time entirely for free along with the products, the impact would be *lower*.

Human Psychology Doesn't Change: Mike Cernovich's book

This is probably the main point of the blog. For those that actually spent some time on Wall Street (the real kind), you know that the vast majority of them are insecure, boring dorks (complete with overbearing wives). We have been told this is also true in the corporate law environment. If you're going to get rich and give up your life doing it… Was it really worth it? Probably not. We could all get hit by a bus tomorrow so there is a balance that needs to take place. This website is more of a warning for people who stay on the treadmill as the clock reaches 38, 44, 48 …. years of age. The clock doesn't stop.

Getting Rich and Actually Living:

*****Note, we will answer the first 10 questions related to life philosophy in the comments section. Simply leave your transaction ID in the section and we will remove it and approve the question. First come first serve.*****

Updated Pattern Recognition and Social Observations

We try to do this at least once a year where we highlight new trends we're seeing. Naturally, the trends we see will be related to the environment we're in so you'll get a clean glance at things we've been doing lately if you're able to read between the lines. The range is quite wide from the upcoming generation (people in their early 20s) to ultra high-end where we've been lucky enough to hang out with some wealthy people out of our league (hey at least we got entrance to the cheap seats! Always want to be one of the worst people in the room if you want to get better).

We gave away our view of intelligence before, but in this case we're just narrowing it down to ultra rich people. Ultra rich is defined as someone who will be worth \$50M+ or is already worth \$50M+. That is ultra rich by any logical person's definition. We think \$10M is actually doable but when you look at \$50-100M+ it's quite the jump and we've noticed some strange commonalities between the ultra rich.

Ultra Rich People Quirks:

No we are not joking. Please google image search Charlie Munger, Jeff Bezos and Keith Rabois to start. You'll find that in many images one of their eyes tends to close while the other one remains fully open. It's extremely odd and once you see it you'll see it more frequently when hanging out around wealthier people. No we're not saying that people with strange eyes are all "geniuses" we're just highlighting a pattern we've seen occur many times. There are many geniuses with normal eyes and messed up ones. After all, for decades people have assumed that having glasses implied you were smarter. There might be something to this given that we've noticed a strange trend over the past year or so.

Off Eye:

Another interesting one is that a lot of them have either 1) a high pitch, 2) a slight lisp, or 3) an odd repetitive phrasing. The first two are extremely easy to notice, a slightly higher pitch and a slight lisp. This is why cartoon characters of geniuses always have a strange speaking pattern as well (the cartoon Futurama is probably the best example of this). The third one has been picked up, Peter Thiel is a great example and even though his voice sounds relatively normal, he still states "the" two to three times in a row and has a constant "but um" phrase he uses quite frequently. Our best guess is that smart people have to think of a way to "dumb down" what they want to say for a wider audience. To do this they either repeat the same phrase a couple of times or take blatant pauses. Since they don't really care about "appearing smart" since they are already rich, this results in odd speaking styles. For those that are still following the crypto currency space, the people in these arenas have the same issues cited in this paragraph (amped up at least 10x).

High Pitch and Talking Patterns:

We're going through this mental transition as well. Instead of trying to get cash flow numbers up, it eventually goes to a pure focus on ownership. While cash flow is certainly a top priority, the cash flow generated is a by product of ownership. If you own 10 different businesses that all deliver enough value to be profitable, it really doesn't matter what the cash flow number is over a 10-year frame (under the assumption margins remain flat to up consistently). What matters? Making sure you have a large chunk of ownership so you can control the direction of the business/assets. The same concept rings true, you don't want "money" you want "wealth" which is anything that generates money for you without the use of your time.

Focus on Ownership:

If people really believe we talk too "matter of factly"… we recommend they enter into a wealthy environment. When we say "wealthy environment" we don't mean a conference where they fake being happy go lucky and "anyone can make it" type attitude. We mean a closed door situation where everyone is trying to compete and get somewhere. You'll see a much more vicious side to the rich. They will immediately judge your worth with a single glance or 2 minute conversation. Seriously. We thought we were terrible with this type of attitude and what we learned is that we need to step it up dramatically. If someone reads this whole blog we'd say that is the main takeaway we'd write down at this point. You should be able to prove your value in a sentence or less. It is absolutely ruthless out there as everyone wants "attention" from rich people but they don't have time to listen to a life long story.

Very Fast and Judgmental: If your first sentence doesn't prove your worth, you're wasting their time.

This is really for people in their 20s. The number of openings for high paying positions are coming down and this seems to be reflected in the culture in two ways: 1) people no longer interested in having kids – both men and women and 2) significant change in the type of people that go out at night. This one is hard to explain but we'll try. The most attractive women are either going out to the most expensive places or they are giving up entirely and going out a lot more during the day. The number of attractive people you see walking around a park vs just 5-years ago is dramatic. This might be an east coast thing so we're interested in hearing about the general answer here but it's pretty clear. Women are actually taking the time to look nice and go out during the day since they don't want to go to bars/clubs unless they are ultra high-end (which is becoming less economical). Its actually a lot more common to see higher quality women in restaurants and parks than the clubs lately (again exception is ultra high-end and luxury house parties).

Slimming Optionality:

Our best guess is that the college culture has only gotten crazier with everyone hooking up with everyone else. Especially the people in the "upper middle" of attractiveness. The top tier ones (with brains) won't do this but it's pretty easy to imagine a bunch of 7s sleeping around town since they have tons of debt a very little to look forward to. Another one we'd bet on is an increase in general anxiety levels (panic attacks) as a lack of "going somewhere" looms over many people.

On the positive side of the ledger after those two negative observations, the quality of life has gone no where but up. Even low income people have access to fast internet and information if they like. So we're living in the best age in history (platinum age) to get rich… It's just a small number that actually make it. We're going to look into this information at the end of the year. We'd bet the tail distribution of earnings is showing up even for people in their mid-late 20s. Meaning even people who are 5-7 years out of college have incredibly large differences in terms of earnings (heavily skewed distribution).

All of this builds up to a strong pattern we have seen over the last couple of years. People who have high social skills are working less while earning large amount of money while those that have poor social skills are working incredibly long hours all of the time. This makes a lot of sense. Remember, we're only referring to high income people in this paragraph (and blog in general at this point). If you have a high income, you either have lots of fun so you don't care about making 30% more. And. If a person has weak social skills, their entire "self worth" becomes their career/business so they just keep working long hours forever. It is amazing to watch real time at around age 30. This is the easiest time in your life for social skills, energy and money. So if the person cannot have fun with everything working in his favor… he's not going to figure it out and ends up focusing all of his effort on making tons of cash. To make matters worse, the guys who have good social lives and make good money don't want to help these other rich people since they are likely "downers" to any event they would have. If you don't need money there is no reason to ruin your personal life to make a few extra bucks.

Lifestyle Observation:

Again. This is referring to attractive women, not your run of the mill person. They seem to have caught on to this shift in resources/quality of men. So you see the same girls trying to get into the same circles. They avoid the common person like the plague. Can't believe this is being written out in print, but over the last 5-years it appears that high quality good looking women are starting to make changes to their strategies. This is probably due to socioeconomic adjustments more than anything else. And. It could also be dead wrong and we're just benefitting from the move up the ladder.

Women Appear More Aware:

Combining the two prior concepts we're seeing a pretty large increase in insecurity. Men and women appear more and more insecure. This is highlighted by the skyrocketing growth of plastic surgery and the increased number of guys who get "upset" if you buy something expensive. The women probably feel pressure to look better due to Instagram filters and most guys (97% that don't even make it to a million) feel that they should be better than everyone else. Our basic observation (and prediction) is that this will continue for the next five years at minimum. The more attractive women are waking up to the fact that there are smaller high quality options out there (increase plastic surgery to compete) and more guys will talk about "minimalism" since they can't produce due a lack of talent (this also leads to hate against anything material).

Increased Insecurity:

As a bonus, the increased insecurity appears to be spreading into the "mens" section as well. Male grooming is a popular growth area (yes seriously) and we won't be surprised to see this increase in the future as well. If you have no skills/talent and can't make money, then your next best option is to become as attractive as possible to try and somewhat level the playing field (at least until age 40 or so). We're not against this strategy at all (as a temporary fix), it just shows how much has changed in a few short years. To put the bow on this section, if this continues we wouldn't be surprised to see men go through basic surgeries in the future as well (most likely liposuction).

Looking at this section you'd think an increase in "materialism" would result from increased insecurity. The catch? The average person doesn't have money. So the best they can do is a one time change to fix something and appear better looking. We've gone from insecure people buying BMWs/Mercedes to having plastic surgery and budgets for grooming/liposuction. It's essentially the same market just spun in a different direction. After typing that up, should really consider normalizing surgery for men and profiting off referrals. In summary, the new "insecure" spend a lot more money on physical improvements as they are less costly, stand the test of time (usually) and don't come off as materialistic.

Another one we've noticed is that the vast majority of the population is unhappy in the USA. This has actually gotten worse from 2010 (at least it appears that way). In fact, it's so common you can tell what a person thinks of you based on this comment alone. If you have your life together and are thrilled (you should be) anyone who says you're "unhappy negative" is really saying "I don't like you". Since you're a reflection of what they "could have become" as everyone believes they are the best, they have to come up with something negative to say that is intangible.

Increased Unhappiness:

So as a useful social skill test, you can figure out who everyone likes or dislikes within a group by saying "that guy/girl is so happy all the time don't you think". This seems like an innocent comment but their reaction to you will tell you what *they* think, which is the information you were searching for in the first place. If you meet someone new and tell someone else you think he/she is a happy guy/girl, they will now be forced to reveal if they like or dislike the person. It really is that simple these days. Luckily this blog is niche so people won't be using it any time soon. Take it to the end and it makes logical sense as well. Do you have any friends that you think are "always unhappy"? No. Hence why this social trick works so well and has been working so well for us the past 3 years or so.

You can tell a lot about someone simply by the way they dress. In the past, fashion seemed to be more similar. It was not easy to figure out a persons social life by their clothing… Now? It seems to be quite easy. In fact, its so blatant we can even see it in the corporate world. The type of suit a guy wears and the color ties he puts on tell you everything. Hint hint, the guys with nice accessories and a suit that doesn't fit correctly is the standard insecure corporate guy. The guy with everything tailored with the colors matching… that's the guy partying as soon as the day is over.

Severe Change in Fashion:

We read a book on management earlier this year called "No Hard Feelings". Holy smokes. The content wasn't mind blowing but the realization that there can be so many emotions at work. When you're busy outsourcing as much as you can you forget how many people are dealing with office politics day in and day out. "No one quits a bad job, they quit a bad manager" appears to be more true today than it has been in the past 10 years.

Emotions at Work:

As a quick summary, assume that everything you write to anyone who works for you will obsess over every detail from the time you sent it to the number of periods and exclamation points you use. As a repetitive secondary summary, for the love of God, do not hire anyone you do not have to hire. The book really highlights how irrational people are (that was our takeaway). Since the new generation has grown up staring at a computer screen/smartphone all day, they really read into every single detail since they are trained to do this. Photos, word choices, length of message… everything.

The general item to look out for? Expect people to spend more free time with their co-workers. Since people are becoming less family oriented and more focused on their work being their "identity" you should see more of this. This of course goes directly against our advice of assuming your co-workers are not your friends (they aren't). So you're in luck if you found this blog. Your co-workers are going to be busy making friends at work while you're busy building up your own biz and improving paid performance metrics at work (KPIs).

Our next post is going to be on markets/businesses we think will grow over the next several years. The beginning of this post essentially gives away "how we got the ideas" which is just a collection of consensus ideas from ultra rich people. Hopefully this post is of value to someone trying to make the next jump in life since we've given away very clear clues to pick out the winners in any crowd through social tells. (Yes this was also written on a phone, a new strategy while the longer posts will be saved for a laptop)

Updated Travel, Lifestyle Ideas and Q&A Announcement

Updated Travel, Lifestyle Ideas and Q&A Announcement

This post is inspired by twitter friend, . The funniest thing about his twitter handle is he "disliked this website" back in 2015 or so and then suddenly is much more positive on it. The conclusion? His life got better. Funny how that works. If your life is getting better and you're making more money, the website becomes more "likable" and the "ideas" become more reasonable. We saw a similar thing happen with Ed Latimore over the past 3 years or so. Unsurprisingly, after he inflected on his earnings the stuff talked about here seemed to resonate a lot more. Essentially the same "energy" is being omitted. The energy of getting better and moving up in life.

Steveonomics

With the introduction out of the way we're going to leave a "SHOCKING" item up front. . Back 5-6 years ago, all the locations were solely focused on partying hard. Unsurprisingly as you get older and richer you change up the venues as the same old "hitting the clubs" gets old. Make no mistake, you can still hit the clubs later in life, but as we mentioned on Twitter there is a transition phase into "restaurants and lounges" and less "bars and clubs". The worst possible transition someone can make is from clubs to bars because their finances are still a disaster and they can't keep up with the club scene anymore.

The places in this article are not 100% for partying

Now before all the hate comes in, we can all but guarantee the new "lifestyle" is a huge upgrade from the constant partying. Some will say "oh many but you must attract *less* girls!"… It's actually the reverse. When you get more money what we're referring to is bringing out a bunch of people to a nice restaurant that you frequent. Essentially, you will be going to places where "regular people" celebrate on a special occasion. That alone should explain the type of spot we're referring to. So as soon as you become a regular there we will promise you the staff and everyone else will suddenly become your friend and introduce other people to you. It's how the… The only downside? It's a little bit less "crazy". Anyone who has gone to the clubs more than 500-1000 times knows how ridiculous it can get. The upside? You never have to worry about some random drunk broke guy who paid $25 cover to get in puking all over your shoes. (second hint, something like this will happen to you later in life triggering the lifestyle adjustment).

snowball begins to roll

Short Destination Update

No matter what. If you're looking to party all four of these cities remain at the top of the heap. Our opinion is to focus on NYC and Miami but all four of them are perfectly fine if you're still looking to go all out. Luckily not much has changed allowing the quick rattle off: Vegas just stay at the Wynn/Encore or the Four

Seasons if you're bringing a girl. New York City, same old move just more concentrated: SoHo, Tribeca, Meatpacking. Miami: Stick with Brickell and parts of South Beach. Los Angeles: As usual there are only really five spots, West Hollywood, Venice, Santa Monica, Beverly Hills and Malibu. All of these are extremely different atmospheres and similar to Miami the best way to go is to be "connected". As usual if you're going somewhere alone with zero friends and no contacts, you're best off in Vegas and New York for the party scene. As a note, this section is entirely dedicated to "livable" cities with a decent life outside of just partying.

NYC, Vegas, Miami and Los Angeles:

As you travel more internationally, you're going to look at different ideas that do not involve partying so we'll give one easy one: Ski Trips / Snowboarding in Canada. Right now there is a good exchange rate for the US to Canadian Dollar. While you'll care less about saving on cost as you ramp up, someone who is "on their way up" is going to find a lot of value here. The high end hotels are essentially 33% off or more. You can honestly get a 5-star hotel for around USD $200 or less due to the current exchange rate. Pretty good deal for a fun week long ski trip. No point in going to places in the USA if you can visit a brand new city and have it cost less. Whistler is naturally one of the most commonly mentioned ones, but there are many of them on both the east and west coast so it doesn't matter where you currently live. It's a short flight and you get to visit the new major cities practically for free.

Foreign Exchange – Ski Trip:

Another strange thing… as you get older you have a higher standard for food. We're not sure if anyone is in that same camp but we'll go ahead and give you the answer: Go to Italy. Of course food is relative and we're giving a strong preference out here, but it has a lot of nice restaurants with high quality food. You can look for them yourself but a few are Combal.Zero and Le Calandre. Even if you're not interested in going to the high end, the "standard" food is higher quality for some unknown reason. You'll walk into bakeries and people will be sipping their espressos over a piece of glass as the pastries are all lined up below. It's a different experience relative to the typical US one where there is a line and very fast *MUCH* lower quality selections. The party scene/nightlife is just okay so bring a date with you if you're going to Italy would be the recommendation.

Interested in Food?

This is hilarious timing (another "coincidence") as steveonomics is apparently moving to the Carolinas. For those in the know there is a very big boating scene out there. So if you're going to stay in the area for a long period of time, we'd suggest getting into the scene. You'll meet a lot of high quality people here (if you can afford a boat you're probably in good shape), and it's the easiest entertainment sell. The clubbing/party scene in the Carolinas is not going to compare to the big four we mentioned up front, but the boating scene can be maximized both for dating and for financial opportunities in that particular area. with a boat in the Carolinas, you'll open up a lot of new doors if that's of interest to you. Of course, there is always Florida for boats, but everyone knows about that one.

Boats: Similar to dressing nice

Before the tomatoes are thrown, Dallas and Chicago are above Philadelphia/New Orleans… But we've noticed a lack of competition in these two "mid sized" cities. Never spent large amounts of time in either of them, but if you've got a week or two to burn and want to do something "different" all four of those will be surprising in different ways. In some cases the city isn't all that pretty but the people are extremely nice and the top competition you'll see is some dude with $90K a year driving a 3-series BMW. That's really the "top of the heap". So. If you're well off and you show up to the second two on the list… it's just going to be easy for you. The other two: Dallas/Chicago are both what we'd call up and coming. They are great for short periods of time. You don't want to be in Chicago during the winter and Dallas has a smaller selection of areas to go out (unless you enjoy driving a ton).

Tier Two US Cities (Dallas, Chicago, Philadelphia, New Orleans):

Oh my god you've changed! You're talking about Hawaii? Well… yes. Here is the reason why you'll probably go to Hawaii. One of the major issues with an event that … you'll likely go through a drug/alcohol problem. We got numerous emails from that post since it resonated with people who actually made it. The same thing happened to them! Unsurprisingly. Unless you were a total nerd the whole time (there are still a lot of those), you'll likely go through a hedonistic phase. Luckily. We've got a solution, take a one week trip to Hawaii. Try to find the quietest part (anything but Honolulu) and spend a week there. No alcohol, no partying, just high quality food and exercise. This will *reset* your dopamine levels. You'll be writing to friends more, texting and emailing more out of pure excitement for your latest achievement. In Hawaii, people move it is almost as if you're on a different planet. If you go from a big city like New York it feels like you've travelled back in time as people move around extremely slowly. Also, there are some cool wild life spots within Maui, Kauai and Oahu. So when you make your first pot of gold, we hope you remember this small paragraph. Don't celebrate your massive win at the clubs for a month straight, do the opposite and book a flight to a slow paced city.

"The Hawaii Trip":sends you into financial independence or more *extremely slow*

So to avoid losing the younger reader base, the same destinations are solid for partying. If you're young hitting cabo/cancun for Spring Break still works. Going to concerts/festivals is still popular as everyone is partying hard. Russia, Colombia, Brazil, and general Eastern Europe are still solid if your sole objective is to find attractive women. If you're on a budget we still recommend going to these destinations as you'll get a glimpse of what it's like to be high up the food chain across the board.

Standard Party Items:

Lifestyle Update

The reality is your lifestyle is going to change. While we used to be adamant about "value" and simply partying hard and never buying "high-end" items, it has significant value as you get older. The guys who are in their mid-20s going to clubs in Gucci clothing are posers because no one who has a large amount of high quality clothing is going into a club solo. Seriously, they are not. This sends the wrong message, that you're trying to buy attention. The real way to leverage the lifestyle update is to have everything line up. Going to a top tier restaurant 2-3x a week in nothing but high quality clothing every time sends a very clear message. You're well off and the clothing is just part of your life .

(the right image)

In a throwback we'll go ahead and do more of a step by step of a new lifestyle on days when you have no real work to do. Lets say you had an event, say you sold a Company or large equity stake in someone else's company. Maybe we know someone who just did this. Maybe… But. That is not the point. The point is that your style of life changes as follows.

You get up at a reasonable hour. Our guess is around 8am. When you're well off you begin waking up earlier even on the "off days" since you're more excited than usual to be alive. This puts you in a good mood in general. So you simply shower get changed and put on some clothing for the high-end gym. Something like the Equinox at minimum or it could be as high as those expensive luxury "clubs". Which path you decide really isn't for us to decide. So you hit the gym for a nice workout.

Wake Up:

After completing your workout, you begin setting up "the day". There is typically a Juice Bar near by or a place to buy a quick protein shake. Either one. Allowing you to message your small group of close friends. Lets be honest. You're probably dating someone and quasi seeing someone at minimum (typically more than one). Set up the usual date for either the afternoon or dinner.

Near the End:

A good way to prepare for a night out is a solid 60-90 minute massage. So you get a nice shower in, get a massage in and you'll feel like a million bucks. Don't really care about the cheap seats saying massages don't work. Professional athletes have them done all the time and anyone who has had them consistently know they loosen you up over time. Unless someone is a training professional athletes and says he never allows them to get massages, we're just not interested in their opinion. Always go where the money is and if the pros are all doing it as part of their health routine, you can imagine that is works. If it was damaging or didn't work, it would be cut out as many millions of dollars are at stake.

Head off to Relax:

There are lots of small ways to occupy the day if it is nice out. You can go out to buy some new items, ties, shoes or even *gasp* books. Essentially you're going to spend your time outside since this increases your social interactions for the day. Dressed up in nice clothing in case you run into someone you want to talk to. If you look terrible it reduces the chances they are going to respond positively.

Out for the Day Time:

During the day you'll be responding to messages from various people. People you're considering working with, your close group of friends, girls and unfortunately the customer service questions that always come up at the worst possible time. Try to push off the customer service ones until Sunday. And. Before it is 3pm you'll already know who you're meeting to go out. Also, in other situations, someone might have come out to meet you during the day to go ahead and buy some stuff and grab a coffee/drink.

If you're actually well off, in less than 1 month every single person in the restaurant is going to know you. It is *not* common for someone to go to a high quality restaurant on a weekly basis so you'll stand out like the Ferrari parked out front (everyone will know you by first name). Here is typically where the "going out" begins. Instead of going to clubs and bars you're either eating and drinking there or heading to a lounge that is also close by. Unsurprisingly, this also includes high-end hotels. High-end hotels typically have a roof top bar or nice lounge within the exact same scene. All set up perfectly for you.

Head off to Eat:

Someone always brings someone. This is just how it works. You'll go out with say 2 people and they'll bring a girl and her friend or her sister or cousin or whatever it is. This *always* happens. It's almost guaranteed. If you're going to a nice place to eat every girl is going to say "oh yeah for sure i'd love to go too!" since they wouldn't turn down a nice place to eat to start the night.

You'll have a list of places you typically go to (not clubs) and you'll bounce around to each one of nigher lounge type areas or roof top bars. This then leads to people splitting up or an eventual move to some person's nice house/condo. Always one of the two. If you're in New York it's 99% of the time going to lead to some sort of split up. Whoever you're with will have the group cut in half within 2 hours at minimum.

Start the Jump Around:

During this bounce around instead of drinking hard alcohol, it's more likely you're drinking wine/champagne and maybe 1 drink of some stronger alcohol (vodka/tequilla/whiskey etc.). Sure there are people who can somehow drink tons of hard alcohol at all times but it becomes less necessary over time. More like 2-3 drinks as the night gets "more ridiculous" as everyone you're with is 6-8 drinks deep.

Never understood why people take pride in staying until last call. The reality is that last call is also a signal for "lower quality people". You should be leaving early for an obvious reason. If it's a slow night then you'll be heading to some person's party/event (not sure why but there is always some "event" every weekend that you'll get invited to). This is unlikely but just like everything in life, some nights will be mediocre so you'll end up at one of these closed off private "events".

Leave Early:

After getting to your spot, you'll have your hangover cures ready to go, just chug them and move on. For those that are unaware, this is typically green juice, chlorella and some pedialyte or coconut water. Essentially looking for greens + electrolytes. The girl is not going to notice at all, or care. When you wake up you'll feel like a million bucks since you didn't drink as much, correctly spaced out your alcohol and re-hydrated before passing out (1:00-4:00am).

Get To Your Spot:

As a few added quick touches, it's a good idea to go ahead and buy a few extra tooth brushes, floss and mouth wash. Just go onto amazon and buy the single use mouthwash packages or the travel sized ones (about 1.2 ounces) along with a case of toothbrushes. This is a good added touch and no one will care, if someone asks just say "Oh… it's easier for travel which is why I buy them".

Mentality Change

The best way to describe the mentality change for people who are actually rich and *not* socially weird is this: no need to be competitive. While you will remain ultra competitive in your work (company or career etc.), the rest of the stuff becomes irrelevant. The majority of "competition" is really just a bunch of guys trying to claim they are "the man". If you really are at the top of the food chain, people simply know. You're not worried if someone isn't interested in you and you're not worried if a girl is interested in some other dude.

To drive the point home it's the same concept as usual. If someone says "trust me i don't lie" then you know for sure they are constantly lying to you. No one who is telling the truth needs to "tell you" they are telling the truth. Similarly, no one who is actually set needs to "tell you" they are better than you. They simply live their life and let everyone else decide. There is no point in trying to convince people and rich people know this. They just live their life and the "implied messages" add up. The guy doesn't seem to be emotional, he doesn't seem to get completely drunk, doesn't seem to care about the money for the drinks, food and black cars. He just seems to be enjoying the night. Anyone out "looking" is not in the same game since they have to take an "active" approach. Much better to sit back relax and only talk to the few people that interest you. If they don't work out (unlikely as they'll realize your a high value person), then you simply move on. Gone are the days spent analyzing and "thinking" of the best way to do something. The new reaction is "wow this person is crazy, i could fix their life with a phone call and they are spending their time trying to complain to me instead. Oh well. Their loss." As always, the classic: Smile, Nod and Agree. You'll be doing it a lot with people you're trying to avoid.

On that note, we'll hold our Q&A on Wednesday March 20, 2019.

****

Updated Ways to Protect Your Wealth Over 20 Years

Updated Ways to Protect Your Wealth Over 20 Years

Time is flying. The S&P is down yet again at roughly 2,200 (yes we realize the exact number is 2,237.40). Putting this in perspective, ten years ago it was at approximately 1,100. No we're not going to use exact figures since that's not the right way to invest over long periods of time. You want to use long-term growth rates, long term returns and think critically about what the market is "pricing in". In short, the market is a lot more attractive in just 4 days. Why? well if you went from 2,529 to 2,237.40 in just 4 trading days? It means you're down 11% in just four days. Think about that. It means you lost 1.5 years of normal gains in just 4 days. So with that we'l explain what is going on and what we're doing now.

At current levels (yes in just 4 days), now the market is what we would consider fairly valued. The market goes up about 7% per year over the long-term and over the last decade we're up around 7-8%. Depending on what day you use, if you include dividends etc. The problem? Markets usually undershoot to the downside meaning that when people start to panic (like now we're starting to see it), the CAGR will usually break down into the 5% range (sometimes less and in extreme cases go to 0% which is a clear buy sign).

Thinking Like a Rational Investor:

Start looking for distressed assets in about a week or two. It really is that simple, we were asked in the last Q&A why we have 3-5 years of income sitting in cash and the answer is clear, commercial real estate. Those apartment complexes will likely be decimated. The renters are out of work, the property is levered up to the gills and fire sales will begin. If someone reading this has been in the real estate market for a long time they know that distressed assets are already popping up. That's how fast the market fell apart. We cannot possibly comprehend how anyone was recommending real estate and stocks back in 2019 but that's a topic for another day.

For the readers who listened to our advice the last 3 years, first of all congrats on your massive gains in gambling and other such ventures we have highlighted. Second of all, you're now in a position of power but you need to act intelligently. If you want to buy stocks remember that we're at EQUAL risk. This means the only people buying now should be people with 20-30 year time frames or longer. If you press us on it, we think it still goes lower but at least we're no longer begging you to avoid buying it (this should make sense to people who have followed our blog for a long time). Instead of pleading for avoidance if you have a long time frame it's not insane to buy small amounts and do the dollar cost averaging strategy.

Readers Who Listened:

Now what do we officially recommend? Instead what you want to do is create asset protection. This means we already know that there will be price inflation again. You cannot buy corporate bonds, mortgage backed securities and even ETFs <— the world has gone mad with that last one… and expect prices to remain the same. The liquidity crunch and massive For those that don't like these finance words (we don't either) below is an explanation in plain english as to why stuff like gold, bitcoin, stocks and bonds are all going down.

printing is going to eventually weaken the dollar.

First: Sudden demand shock with zero revenues. Second: suddenly everyone needs cash to pay for everything – bills, employee costs etc. Third: to pay for all of this they have to sell everything this means stocks, bonds, gold, crypto, art work, cars, their pets etc. Fourth: after selling everything the dollar should strengthen because everyone wants US dollars to pay for stuff so you see this in DXY increasing rapidly in value. Fifth: the government quite literally floods the system by printing US dollars over and over and over again. Sixth (where we are now): the US dollar begins to stabilize and all of that printed money is now floating around. Seventh: now you should see the value of "store of value assets" like gold, crypto, and perhaps even some stocks begin to rise and then.. Eight: after we get through that stage assets begin to slowly go up in value. That last one is why people are now joking that their Lattes will cost $20 and iPhones will cost $20,000 by the end of this decade.

So if we're correct (as usual we may be wrong), we think we're somewhere around point six and seven. So this means you should do what? You should begin slowly spending your cash on store of value assets (gold, crypto etc.) and save a large chunk to pray for a distressed asset sale in about a month. If you followed the blog you probably have 4 years in cash, 4 years in crypto currencies. Everyone is different but years are easier to express the balancing. Over the next few days you want to have 2.5 years in cash, 5.0 years in crypto/gold, 0.5 years in equities. If this is confusing we'll use $100 bill. That $100 bill was in 50/50 crypto cash. Now those specific dollars (the $100 that's likely up 15% or so) needs to be split as follows $31.25 cash, $62.5 crypto/add some gold, $6.25 addition to just the S&P 500. Notice, we're not going to bother telling people how much crypto vs. gold to have because the risk tolerance level is incredibly high.

extremely small

In summary, we are now at "fair value" in our opinion. We do think the market goes down a bit so you can imagine that we're taking the $6.25 example and just chucking it into gold… But the downside is now limited and…. Now you know why all asset prices were falling like a rock. Panic selling to pay bills. Remember. Due to money printing this should reverse which is why we would begin if you have large reserves.

***slowly* reducing total cash balance**

For those that are entirely new. There is practically no chance our advice will be taken but we'll try anyway. Go ahead and check our 8 years of predictions from trump winning the election (we put real $$ on it not just talking about it), S&P advice to dollar cost through 2018 and taking it out in 2019 etc… After that, since we know no one will listen to all of the stuff we highlighted our basic recommendation is take 5-10% of net worth and inflation hedge. Period. No exceptions. This means the following three products: Gold, Crypto and TIPS (Treasury Inflation Protected Securities). You want to have some exposure to all of this stuff because it allows you to avoid hyperinflation potential. When prices begin to move they could move quick so at minimum avoid having all that cash destroyed. If your cash position was 20% (our initial guess) taking it down to 10% and buying inflation hedges can help you avoid a catastrophe.

For Brand New Readers:

Here is the fun part. Life is not about predicting the first derivative (say people go back to work), the game is predicting the third derivative. Most people can think about first and second level problems but the money is made in the third level. This is because it is not priced into the market.

Long-term Issues:

First derivative is people will be shaky. You're not going to suddenly hit the clubs, fly around and stay in crowded areas. This is pretty obvious. So the people who have the means to do this are the wealthy. The wealthy will likely fly less, lock down employees more and avoid being the first one to go back and move around.

The second derivative? This will naturally flow into the real estate market. Those massive commercial properties will have defaults. There is just no way to avoid it. Some areas are going to have big outbreaks and there is almost no way you can suddenly go back to "normal" world wide. Similar to what happened in Italy and China. Maybe we're wrong but that's the way it seems

Therefore we reach the third derivative. If we know that there will be financial distress for at least a period of time. IE. Parts of the economy will clamp up, its means asset sales will occur. During this entire fiasco we have to remember that Oil has also dropped to an incredible $20 a barrel (yes it moved around but it was even below this level for a second). So what does it mean? It means that Nevada and Texas are good places to look for a distressed real estate asset. Remember, this is the "good scenario". We know that this whole pandemic will have real impacts. It is absolutely insane to believe that tomorrow the government can announce "open for business" and everyone operates the exact same way. People with 401Ks cut in half are not going to hit the casinos and clubs. People who saw 40 year olds die are going to reduce business travel if they can. So on and so forth. So you should take the time and look into Texas and Nevada for potential properties in a distressed sale if you have a long-term investment plan.

Now you have our recommendations revised. What a wild month. For those that are not interested in financial markets and how to predict these cycles feel free to close the browser. For those that are interested in the thought process go ahead and read below. As a final note, please don't say we're "whip sawing opinions", when you lose 1.5 years of gains in four trading days that is a DRASTIC change in valuation. So in times of turbulence you have to keep your emotions in check and be ready to take out the machete (commercial property soon in our opinion).

More Technical Overview:

First if you've frozen the economy (which we essentially have), the businesses now need to try and make up for that pain. If you had a month of pain, that's more like a quarter of pain since you cannot reduce your fixed costs. A Company making $1M in revenue with $800K in costs will have a month of $0 in revenue and say $400K in fixed costs. At minimum he just lost 2 months of income (and has to find a way to close the gap). This usually means he's going to run leaner (not hire as quickly) and he will also be a bit more fiscally responsible likely holding more cash.

If that is the case, it means that Companies will likely be less focused on stock buybacks (take the micro example we gave apply it to huge companies). Instead they will take the money and they will start to reduce debt on the balance sheet. Many of these companies had to draw down on lines of credit. This means they had agreements for the ability to borrow $1B, $2B or more. These companies already announced that they are drawing down these credit lines. This means their books now have more debt on them. Therefore, the next quarter (perhaps 2-3 quarters), they will want to pay off excess debt from a rational perspective.

Now that those two steps are understood, apply it to the stock market. Stocks explained for dummies is as follows: some guy is on one computer pressing a green button that says buy. On another computer some guy is pressing a red button that says sell. If we know that companies will at least avoid purchasing shares (the guy with a green button), for at least 3 months or so… It means that the number of people pressing the red button is higher. Some people forget that this is what a market is (just a bunch of people clicking buy and sell). Remember. Up to 50% of buy orders (people clicking the green button) is really just the CEO of the Company slamming that button. If that goes away for 3 months, buyside pressure is certainly depressed for now. This is exactly why we're not yet ready to buy a bunch of stocks and if you want to take 5-10% of monthly cash flow, it's "okay" but not that exciting in our opinion.

Now enter the Fed. We've gone full blown jungle juice retarded when in comes to fiscal policy.

Unlimited QE is something that's beyond incomprehensible. **<— please take the time to watch the full video**

Dollars are flooding the market everywhere at all times. Flooding. So eventually this is going to catch up. See the game here? We know the dollars are going to go into assets at some point and as long as the economy is shut we know dollars will continue to be in massively high demand. In simple terms, the Fed is taking a machine and printing trillions of George Washington paper that you use to pay for food and throwing it out there for free (practically for free). This means those dollars are eventually going to buy stocks, bonds, gold, real estate etc.

Now when this begins to happen (prices go up), you'll see the standard goods and services being to rise. The coffee will no longer be $2.50 from starbucks and move up to $3.00. In an insanely complicated situation, now starbucks has to find a way to pay its employees slightly more so they don't starve while maintaining profitability. Hence, our belief… the unemployment rate will go up no matter what (you can't just pause the economy).

For those that didn't enjoy the above (wasn't a fun read we know)… What is happening is quite simple. The Fed is printing trillions of dollars and trying to give it to people who are losing trillions of dollars. They are losing trillions because the economy is at a standstill and fixed costs like rent, utilities and salaries must be paid.

Now for some more basic non-investing stuff. What you can do now to help everything in your neighborhood is as follows: 1) you want to spend wit your local restaurants still… They will be in severe pain, 2) spend locally for anything else you can afford – small grocery shops, chiropractors, all services – they didn't get the fast revolver loans at 0%, 3) do not surround yourself with older people, you may get infected and we have no idea how anyone can live with themselves if they cause their own mother/father to die, 4) have a very serious conversation with anyone over the age of 55 about remaining as quarantined as possible, walking outside when no one is around in a month isn't going to be a big deal, but going to a MLB game would be incredibly irresponsible and 5) if you are successful please try to keep your employees even though it is a easy reason to lean out. You will have a work force that is much more motivated and they will remember this gesture for the rest of their lives.

Focus on the Micro:

Our simple prediction is we need 7 days of data. We still think it's worse than people think based on the information we're getting from hospitals etc. That said, we're not foolish. Many people live paycheck to paycheck and if we have 40%+ unemployment or something like that, we're better off just living with the virus (mathematically). Our original idea of shutting everything down back in February is no longer possible (virus spread too quickly), so we should look at the death rate and come up with the best solution after that.

Final Predictions:

Best of luck to everyone and be sure to wear face masks when you go outside (at minimum wrap yourself with cloth).

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending.

Use Technology or Be Replaced (Also Q&A Announcement)

Use Technology or Be Replaced (Also Q&A Announcement)

Currently around 15-20% of sales are done online (this is a rough metric for retail brick and mortar vs. e-tail). Instead of bothering with the exact metrics the interesting thing isn't the future (likely grows to 25% to 30% etc.). The more important item here is that it used to be 0%. So if you got in early with a basic website selling something high margin (anyone remember ring tones selling for $0.99!), you made a lot. Why? Well to go from 1% to 2% is 100% growth at minimum assuming the entire market is the same size each year ().

hint the total market actually grows

This is one the main reasons why we would not go into a fund raising position at an investment bank, venture capital firm or even private equity. Unless you *already* have relationships, fund raising has changed dramatically over the past 20 years. Back in the year 2000, the idea of fund raising millions of dollars for your video game idea, movie, or tech start up would be a pipe dream. In 2020? This is not only feasible but it is likely cheaper as well.

Less Fund Raising Barriers:

If you can establish a small amount of trust though an online presence and generate content that's either informative, helpful or applicable you'll obtain a decent number of loyal followers. Assuming that these individuals would contribute $100…. you'll see that raising money without giving out large amounts of equity becomes possible.

What is the conclusion here? Try to use these new avenues and you should avoid using the old avenues (tons of costs). Giving away equity, paying large fund raising fees and diluting yourself overall is not a wise decision (long-term). If you continue to operate 10-20 years in the past you're going to lose hundreds of thousands of dollars (even millions) over the course of your life.

If you're not looking to automate every task possible, you're at most risk for automation yourself! Why? Well if you stay on top of automation you should be able to drive higher operating margins, free cash flow yield and revenue/headcount. These are critical metrics as the past was built on "human capital". Human capital drove the belief that managers should be paid a lot more since they have the headache of 1) managing egos, 2) incentivizing the right people and 3) making sure all of these people are doing their jobs correctly. In 2020, these concepts are becoming much more dated.

Automatic, Systematic:

In 2020, you want to drive higher operating margins and sales growth with a limited number of people. The bigger you get the bigger your margins should become unless something has gone wrong. This would have sounded insane back in the year 2000. Back then the belief was that some people were not good generators and were only good people managers. Writing that concept out now just seems laughable at this point.

We now have hundreds of thousands of middle office managers who are adding zero value and soaking up a ton of the OPEX budget. Get with the times and automate away their positions. It sounds ruthless but if you don't do it, your competitor will. Your competitor will then drop prices as well and run you out of town for good.

A simple example is running a budget. Back in the old days an actual person would track receipts and spending per person and flag strange behavior. These jobs paid decent wages even though software can do this much better (for free). Take a basic free software tool like mint and you'll see why it no longer makes any sense. You should code in a specific budget per person, shipment and transaction so that the item cannot go through without approval. Sure there might be a loophole or two that you miss, but you'll catch them over time as you review all expenses per person in a line-by-line statement. Why do things the old way when it costs more in time, money and resources? Doesn't make any sense at all.

If the 2016 election taught us anything it is that social media is the new media. It's strange that many people did not realize that was the official passing of the torch to social media (internet based). Social media is designed to be addictive, fast and easy to track. You even have main stream media outlets relying on social media to simply come up with content for their shows.

Social Media/Marketing Budgets:

Again you're either going to use this to your advantage or you're going to be used by it. From what we've seen over the past 10 years? There are really two types of people. 1) a person who uses it to make money and 2) a person who uses it to consume. You can guess which one makes more money over the long-term. With a simple Facebook/Instagram page and a few hundred dollars in ad spending… you've got enough eye balls to begin attracting attention if you flag your new business to all of the contacts in your cellphone as well.

You're going to learn about marketing at some point. Even established companies like Coca Cola are consistently spending money on marketing. Practically everyone in the world knows the brand. And. They spend to make sure they are always on top. Staying on top requires looking at new avenues and not knowing how to use social media if you're a young company is a death sentence at this point. ()

We'll delete all the exception to the rule stories from the comments section as they continue to miss the point and will fail long term by copying the rare exception

Assuming you're good at learning by yourself, there is practically no task you cannot learn. Back in the year 2000 people said things like "it's easier for kids to learn languages so you shouldn't try after age 20". Something along these lines. Those mental barriers are now broken as you can easily obtain all content in a foreign language to practice your skills and you can get online classes for cheap (sometimes free).

Research Tools:

It doesn't stop there, it includes coding, math, science, health, athletics, gardening, construction, knitting…. the list is endless. Since the internet is cheap, most people will use it for entertainment, consuming things like porn and TikTok videos. The average person cannot understand how learning is fun and they cannot comprehend enjoying the process of expanding your skill set. At this point, we're actually bored when we sit in front of a screen to watch something. The only reason for it? As you age your energy levels do come down so you're forced to consume a bit more than when you were 21. At age 21 you could be in full production mode 24/7/365. At age 50 or so, that's just not feasible as your body is not going to be able to lift and sprint for 4 hours a day like it could at age 21.

It would be crazy to look locally when building any internet/e-commerce type business anymore. Prices fluctuate wildly across geographies and the quality is easy to test and control. You should take advantage of this when looking for any task from design to virtual assistants. In fact, if you hire locally the chances of failure is higher since you've decreased your candidate selection to a tiny population sample. Come up with basic tasks to mimic the job, that's the "interview" and then decide from there.

Use Technology to Connect:

In addition to connecting, you should be able to monitor a lot easier. Since we're entering into a world where KPIs can validate results of almost any industry, you want to steer clear from hiring into non-performance tasks. If you can't validate the value, it is best to avoid especially if you're starting something new. Sales is the most obvious as you track conversions and decide who is good and who is bad. If you have basic tasks that need to be done you run a simulation of the tasks and see who can do the most with the least number of errors. If you're hiring someone based on skills that can't be tracked, you should probably curb that hire/outsourcing task for now. Over time, positions that cannot be tracked become popularity contests that are unprofitable.

At this point, you should be familiar with basic concepts like photoshop and CGI. If you really want to drive down costs, increase margins, increase profits and push out your competition, you must test new technology. This means you can replace your paid photos with digital ones since they look near-human at this point (). You should certainly cat-fish as an attractive woman for all of your customer service emails and you should certainly use machine learning to target your audience.

Implement Advanced Technology: *hint: there are ways to get this to work where no one can tell the person is entirely fake/a bot*

If any of those items seem new/confusing that is not a good sign. It is a bad sign because it means you don't have anything that will allow you to scale a bit faster than your competition. Remember. Anyone in the industry is already bogged down by putting out other fires (customer service, old technology breaking etc.). The one benefit of being new and young is you can make a lot more mistakes without suffering a serious penalty. By the time you figure out how to optimize it, the 200-400 people you annoyed with poor photos/design won't even remember being on your e-commerce website.

This is the cold hard truth at this time. Every single manager wants to improve operating margins without impacting sales. They are constantly looking for ways to reduce costs without any impact to top-line sales. This means you should operate in the same manner. On a weekly basis (at minimum) you should ask yourself if any of the tasks you did that week can be automated. If it can… or you think it can… you have a new weekend project.

Replace or Be Replaced:

People laugh at this idea and these same people are shocked when their entire business/income stream is automated. By consistently looking for ways to replace current tasks, you are able to save 10-15 minutes per week every week. This sounds like nothing until you realize it results in 50+ hours saved per year (over 5 full standard working days per year). You fill those free hours with new tasks and iterate over and over and over again.

If you want a simple example just look at Amazon Go. Everyone thought self check-out was an insane innovation to save time. Amazon said "F that" we're going for the jugular. Now in certain cities you have full automatic shopping. Scan in pick up things and leave. If you place something back on the shelves it automatically takes it off your bill. That's real innovation. You've now saved 5-15 minutes or so per person. People waiting around in lines and paying for goods.

If you want a sure fire way to lose everything, hang out with people who constantly talk about the good old days. Talk to people who believe that tech won't work and talk to people who refuse to adapt. You'll feel smart hanging out on the Titanic for a couple weeks but when the iceberg comes the party ends abruptly. As they say money is made slowly and lost all at once. From this you can see we're positive on the use of tech for 1) ads, 2) fund raising, 3) machine learning, 4) displacing repetitive tasks with code and 5) advanced visualization functions. As usual we could be wrong. That said, we wouldn't bet against these five and would continue to monitor them to reduce all of your costs and improve sales/profit margins.

Conclusion – Don't Bet Against Tech:

Next Q&A will be on Friday July 24.

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life.

Using Art to Make Decisions With a 100% Success Rate

Using Art to Make Decisions With a 100% Success Rate

While it is likely one of our competitive advantages, we realized that no one will follow this advice so we'll give it away for free. If you're having a hard time making a decision, personal, financial or otherwise you can utilize art to give you an edge. It sounds crazy but we've used it several times and it has not failed us once. 100% success rate. All you have to do is enter a large museum or art exhibit for a day. With that backdrop, we have no doubt that this will be an unpopular post, fading into the archives along with some of our other content.

For once you can interact with the masses (joke, you're going to do this alone). You'll want to find a very large museum with multiple levels. Ideally, the museum will also have various types of art (Body Art, Ceramics, Computer Art, Ceramic Art, Modern Art, Sculptures) with various materials as well (oils, paint, glass etc.). This will give you a wide range of items to view and create a consistency.

Step 1 – Large Museum/Exhibit:

Most people go into exhibits and swarm the popular items to take photos. This is not how you're going to operate. You'll put all electronics away and . This type of focus is going to be entirely on the present. Stand approximately 10 feet away from the first exhibit and stare at it intensely. This will unlikely be one of interest to you but you're doing it to focus entirely on exhibits. You will know that you're zoned in once you can hear people walking around but have no idea what anyone is saying.

Step 2 – Put the Camera Away and Focus: create a different type of focus

Take the speed at which you walk and decrease this by about 50%. Make sure the distance between you and the exhibit remains around 10 feet (don't focus on keeping the exact distance at 10 feet we are simply creating a rough framework). Walking by each exhibit slowly you'll stare with a blank expression as you walk by each exhibit. In addition, by moving quite slowly you'll give each item a chance to capture your attention. When it does stop.

Step 3 – Walk Slowly: Remember, this entire process you're thinking only about exhibits and focused on walking no other thoughts (a blank mind)

There is no need to read the explanation of the art that is usually placed next to the exhibit (for now). Instead stare at the exhibit and see where your eyes wander. Take some mental notes on what is most interesting to you. Maybe you're being drawn to photos of war, paintings of nature, specific sculptures etc. If this is your first attempt it is perfectly fine to scribble something on a note pad. The key is to find the consistency in *what* is drawing your attention. You'll end up spending at least 5 minutes staring at the same exhibit, otherwise it didn't capture your attention enough.

Step 4 – Stop and Stare:

Do not miss a single one. This will take time but you're only in the museum to make a decision because you're surprisingly unsure about what to do. By the time you've seen every single exhibit you'll have a small list of items that caught your attention. Typically, we've found that approximately five of them will be interesting (it may be different for you). On your return visit you can take out your cell phone and 1) take a quick photo, 2) take a quick photo of the artist and the description and 3) quickly read the description. You're done now.

Step 5 – See Every Single Exhibit and Go Back:

Now you have everything you need to make a decision. We suggest getting into a positive state of mind, think of a recent positive event, and begin the review process: 1) find out if it is a specific type of material that you were drawn to – paint, pencil, ceramic etc., 2) figure out if the artist is the same – you'll be surprised sometimes it is, 3) decide if the scenery is the same – war, nature etc. and 4) see if the descriptions have a specific overlap in symbolism.

Step 6 – Find the Consistency:

Here is the part where we'll lose everyone (hence the example piece below so you'll see we're not psychotic). The reality is that . It could be anything. Art is nothing more than access to the back of your mind. The item that you consistently find is your answer. If you're constantly drawn to sculptures of battle (war) it probably means the answer is keep fighting down the path you're on. If you're stuck between two choices and you are drawn to photos of the ocean, it probably means you're better off taking the more risky choice. If you're drawn to exhibits of torture and pain, it likely means the life path you're going down is not for you. So on and so forth.

Step 7 – Analyze and Make Your Decision: you're constantly thinking about your problem in the back of your mindIn short you're using art to help develop your gut instincts.

Art Interpretation

Now that the vast majority of you think we're insane at this point (by the way we're fine with that), we'll go ahead and use our twitter account as an example. Here's our favorite all time photo with our own description "The enormous competitive advantage of being born poor vs. middle class in a single photo".

IMG_5574

1) "The Flower that blooms in adversity is the most rare and beautiful of all…. You don't meet a girl like that every dynasty", 2) "The lesson of appreciation", 3) "The rich girl is bored with the abundance of flowers surrounding her. The poor girl appreciates the one flower", 4) our favorite response so far; 5) "It's assuming that the one who worked hard to grow all the flowers does not appreciate them or share"; 6) our second favorite response; 7) "Poverty is the best education"; 8) "Abundance vs. Scarcity Mindset"; 9)

Positive Responses: "The rich girl has grown bored of her decadence while the poor girl feels inspired and hungry to achieve greatness. I'll take that any day" "Golly… Being poor at the beginning is Gospel. Be prepared for success by being prepared for poverty until you figure it out. Period."

1) "For children, yes. But for adults with responsibilities, the reality is the opposite. The picture is comforting for child-minded adults", 2) "rich girl will eye for that one flower though having in abundance", 3) "I would guess that the flowers are the millions of deadbeats that the middle class has to takeover while the poor woman has 1 herself?", 4) "Middle class have hedges and rose gardens?", 5) "So middle Class is 1% now?", 6) "Except there is no middle class"

Negative Responses:

1) "Do the flowers represent resources available to the individual", 2) "Photo?…Illustration… Reminds me of Guy Billout's work… But his work made a heck of a lot more sense", 3) "It's assuming that the one who worked hard to grow all the flowers does not appreciate them or share, 4) "This would make sense if the flowers represent food but then it doesn't… hmm", 5) "Looks like; 'I beg your pardon, I never promised you a rose garden' AND 'rose ceremony' rolled up as one", 5) "the point is that the poor can more appreciate the small things in life but idk why a middle class woman has a million flowers", 6) "I was thinking the one person was happy with what she had the other person was unhappy at what they missed", 7) "Our joys can easily turn into sorrows, if taken to excess", 8) "Keep it Simple Stupid"; 9) "The flowers represent opportunities; the poor having little zealously grab any they can get & run with it, while the middle class are always looking for the next best thing"; 10) "Blondes actually don't have more fun".

Neutral Responses:

There is nothing wrong with any of the responses since it's a simple picture and people will interpret the art as they will. The part we'd highlight is that the positive responses mainly came from people who are fans of the content (twitter/blog etc.), not surprising! If you can use art to find people who will view the world in a similar way as you that's called a "coincidental connection" (something we don't believe in). If it can be used to interpret a person's mood at any given time, it can certainly be used on yourself.

Art can be used as a tool to see how someone else feels at the moment.

There is no way to check this but we'd wager that those who viewed the photo positively were feeling good at the moment. If you started from nothing and made it that photo will likely make you feel better versus worse. You'll recall your first win, your first success and your first step in the right direction. If someone started from nothing and made it there is practically no way they could view that photo negatively. If they are rich and happy today they won't view the flowers side of the fence as a negative.

Positive Responses Mood:

Likely unhappy. Trying to spin it as a negative likely means their mood is not good. It could be temporary or it could be permanent. We don't know. All we know is that the negativity should be avoided so we don't respond and move on. No point in making enemies since they will likely be in a better mood tomorrow (hence why we don't respond to negativity and delete all negative comments from the blog).

Negative Responses:

Now that all of you believe we're crazy, lets see if someone is currently trying to make a decision. Lets see if someone actually tries it and reports back (we doubt it but it would be interesting indeed). On that note, back to stacking chips and our next post will go back to business as usual. Outlining ways to get money and avoid .

Conclusion: burning valuable time

View on Wealth and Why We Don't Need to Check Prices

View on Wealth and Why We Don't Need to Check Prices

In bull markets, like what we're seeing today, a lot of people feel wealthier. They look at their portfolios and realize they are up say 20-30% and believe they are "way ahead'. Unfortunately, this may or may not be true in terms of their actual wealth. Why? Well wealth is relative to the people around you… it is not a dollar number. Dollar numbers are only useful for a snapshot, I.E a millionaire in 1960 was definitely wealthy and a millionaire today, is not in the same net worth bracket (not even close). In addition to that, wealth has absolutely nothing to do with your annual earnings. If you make $500K a year or $100K a year and both people save nothing… They are both poor. So we can take a look at this on a deeper level and help explain why we aren't investing aggressively this year or in 2019.

As stated above, wealth simply means Ownership of assets that generate cash flow or go up in value over the long-term. So a person with $1,000,000 in stocks is certainly doing well and that same person in 1960 would be elite due to inflation.

Wealth is Relative: *"You own more than the average person".*

Understanding that wealth is relative is quite difficult for your average person. The average person doesn't save much and their only view of wealth is based on what they see and feel. So if a person is spending $20,000 a month they are "rich" even if you find out that they only make $20,500 a month.

That is the easiest way to explain wealth creation. If there are 100 people in the room and your net worth goes up 10% while the other 99 saw an increase of 15% you're actually poorer in terms of wealth. We're not saying your life is getting worse (since the world generally gets better every single year for all socio-economic groups), we're simply referring to your level of wealth.

The only way to get wealthier is to increase your net worth at a faster rate than the average person.

Once we see that the above is true, the second rule you need to follow is that the only way to gain wealth is through investing. If inflation is 2% it means your relative wealth goes down every single year since you're generating a 0% return. I.E. it doesn't make any sense to hold cash unless you believe 1) valuations come down in the near future or 2) you need the money for some sort of payment (emergency money and to pay bills). A high cash position over the course of say 15 years, will result in a significant reduction in wealth.

Tough to Get Richer Without Becoming an Owner:

Investing is just a fancy word for becoming an owner in something. If you're not the owner of something it means you must consistently earn more than the average increase in net income of the S&P 500. We're keeping it simple with that example. While this is not difficult when you're young and earnings go up 20% in many cases, it gets significantly harder when you may have down years or flat compensation for several years in a row. Our best guess is that this is the main reason for low savings rates in the USA. The majority of people see incomes go up from age 20-40 and believe this will "always continue". Which then results in disappointment as it's certainly difficult to get a 20-30% raise when you're making multiple six-figures for any particular company.

Even if you don't want to become an entrepreneur and start your own business, you still need to put the vast majority of your money into ownership of assets (real estate or stocks for example) in order to maintain or gain relative to the population. It's simply how wealth and money works.

Now that we've mathematically proven you can't get ahead without being an owner unless you grow your net worth faster than the S&P 500… Why are we going into cash/crypto instead of equities… Well same old basic probabilities. Starting with the economic cycle.

The reason why we see consistent economic cycles is quite simple: 1) wage growth unlikely grows at the same rate as earnings for a Company, 2) as this occurs the value of the Company grows – say net income growth of 10% vs. expense growth of around 2-5%, 3) the Company hires more but eventually they cannot generate good returns with new employees – profits stop growing and may decline as they over hire and 4) as that happens, the cost of doing business usually goes up, creditors ask for payments.

Basic Economic Cycles:

The economic cycle is well known, but the concept of companies outgrowing wages seems to be lost on many people. No one asks the obvious question… The answer is they wouldn't. So unless the company is going to profit from a particular hire they are not going to pick them up which then makes it natural for net income to outgrow wages over the long term. Eventually, you can't really squeeze additional productivity out of the low performing individuals.

Why would a Company hire someone if they are not going to generate an economic return?

That brings us to today. Unless someone wants to make the argument that economic cycles are "done forever" and we're going to experience forever growth, we have to acknowledge that S&P returns are not independent events. If you've seen an increase for 10 years in a row, the chances of the next year continuing to grow at the same rate is unlikely. Roughly speaking, if you invested starting in 2009 (after the draw down but not the exact bottom) and stopped investing at the end of 2018 the S&P 500 has compounded by about .Think this through a bit, if we add the latest bull run (2019) the total would be around compounding (remember you didn't have to add, you simply had to hold).

11.5%12.3%

Since we know that long-term stock price returns are around 7-8% it means you're increasing at a rate that is 50% higher than the entire history of the stock market. This is absolutely fantastic if you already bought and not that great if you're looking to add since over the course of 30-years the average compounding should be closer to 7-8% not 12%… Only way to go to 7-8% over 30 years is to have returns that are by definition lower than 12%.

A final item we'd add is the assumption that economic cycles are normal and we're not experiencing independent events. The debt cycle is normal in our opinion, you increase loans, they result in bigger output than the rate, eventually no one can find a good source of returns, debt market tightens up, leads to recession… so on and so forth. Since we're now in our 12 year of expansion (keep it simple and say 2008 to 2020), that would mean the chances of next year being up is around 28% (90% to the exponent of 12).

th*Note: to all the real stats people out there we know this is definitely not the best way to explain it, the math is just used since its easy to confirm and helps explain the next point below.*

Building off of this same assumption (economic cycles are normal) it means that the expected payoff of each year invested in the S&P 500 declines during a bull run. If the average bull run is around 10 years (it's less but keep it simple) it means that each year should be up around 9-11% with a drawdown year, followed by another 10 years of upside. Since we know the chances of a bull market running for 20 years is significantly lower than a bull market running for 5 years, we should just take an expected value on the returns. If we use 28% it means that investing now is going to generate around 2.8% (assume 10% returns). Again this is simple but the point should be clear now.

The high-level explanation above should trigger an understanding of why diversification is so powerful. If the stock market pulls down this means other assets may go up in value (gold, bitcoin etc.). So? You actually want to be wealthy in all investment categories! Surprise, surprise, if money is going away from one asset class it has to go somewhere else.

What Does This Have to Do With Wealth:

Take a look at your options: 1) stocks, 2) bonds, 3) real estate, 4) crypto and 5) forced appreciation by investing cash in your own products/business/life.

At this point, we feel that we've got enough money in the first three categories. If the stock market continues to boom and you have 7-figures in there already, you're not really getting richer by adding another $50,000 for example. Similarly, if you have two rental properties worth $500,000, by adding a third one worth $300,000… Nothing really happens since the other two will step function up if the market booms. So you're left with only two options… asymmetric bets (speculative crypto assets) and your own forced appreciation which can generate returns higher than 10% without the risk of drawdowns.

"House Rich", "Paper Profits", "Crypto Rich", "Illiquid Stock". You've seen all of these phrases before. The goal? You want to be rich in terms of all of these categories!

Being rich in just one category and poor in another creates "wealth transfer" risk. In the situation where stock funds flow into crypto, you'd be absolutely burned if you had $0 in crypto. Similarly, if you had all your money in crypto, the government clamps down and you can't sell, you're instantly broke. Both are ugly. You see them all the time (WeWork, crypto bust in 2017 and more).

If we can agree that the expected returns of traditional assets is actually lower now (given a 12 year bull market), it means the ownership you want to pick up should be in assets that don't have clear winners yet. Crypto and your own ideas are very clear examples of this. Mathematically, using bitcoin as an example, there are only 10M real coins (large chunk sold and large chunk held by early investors for 5-10+ years). Assuming the long-term value is equal to gold (a few trillion or $150,000 per coin) or ~17x return, you'd have to believe the chances of this being unsuccessful is less than a fraction of a percent (around 0.15%). Since we think the chances of crypto being successful is a lot higher than 0.15% it makes it an investable asset from a risk reward perspective.

To wrap this all up, if stocks suddenly came down 40% and we hit a recession, it would likely make the crypto space less investable. Why? Well the implies return of the S&P would be near 10% again and we'd have to redo the risk reward profile across all of the asset classes.

As a final note, for those that really believe new classes like crypto are worth nothing… that's going to be a painful experience. The chances of a new technology being worth nothing after a decade is practically zero since it is usually legacy technologies that suddenly go the way of the dinosaur (fax machines). Your probability of it going to zero may be higher than ours, but we really doubt anyone can put a number under 0.15% in many cases.

By thinking in terms of probabilities and implied returns we can see what type of real risk you're taking with every single investment. Also. This prevents you from ever becoming "poor" again. This caused a ton of turmoil on our Twitter as we laughed at people who have a grand total of 1 Bitcoin being emotionally moved by the price. If one coin causes emotional volatility the chances they sell when it hits $15,000 or $20,000 is a lot higher and it also means they miss the point on what diversification and wealth really is. Wealth is about maintaining ownership of various assets on a relative basis to the group. It has nothing to do with the price.

How This Keeps You Wealthy: *If you are a large owner in every asset class wealth shift doesn't hurt you at all.Price means nothing since it's purchasing power that matters.*

While the poor (or eventual poor) focus on trading around, you should be focused on constant accumulation. If you're consistently accumulating assets/wealth, it isn't possible to fall behind over the long term.

Wall Street and Fashion – Don't Break the Bank

Wall Street and Fashion – Don't Break the Bank

One of our writers was recently pinged regarding "fitting in" and fashion. This is a topic we love. In fact, the answer is already in the quotes. and stay in shape. This is the best way to avoid being hated on at work and fitting in while not standing out as the "poor guy" in the office. You need a wardrobe that costs significantly less than everyone else and a nice body as well.

Get clothes that fit

Upper body looks:

Shirts are relatively more difficult as sizes are made for extremely poorly proportioned men, however below are the three key points.

- This is the example you want to look at. The 1 is pointing to the tighter fit around the armpits and chest area as it exudes a man with a "V-taper". Effectively you want to emphasize the chest up and appear to be wider than normal. This is also done from the back. You'll be doing a lot of lat pull downs, wide grip pull ups and incline dumbbell flies to get the taper.
- This is a photo of bad fit and "okay" coloration. Notice how the shirt is not hugging Mr. Trump's arm. Instead it looks like his vest is a parachute and his T-shirt was made for someone with arms twice his size. Another minus point as his vest/parachute should end right where his shoulder begins to leave the socket.
- This is "Okay fit" and bad coloration. Take your hand and place it over the face of Daniel Craig. Without knowing it is him you can still tell that the guy has a V-taper. Now take your hand and place it over the face of person #3… you can't tell if he has a good body. The shoulders of Craig are up and parallel, for person #3 the shirt is slightly baggy in the arms and incredibly loose around his chest. On top of all this he is wearing another neutral color for pants. Bad style. He should replace the tan with grey, black or dark blue.

With the basics out of the way we recommend shirts as follows.

Shirts:

- Buy 6 pocket-less shirts in thrift stores and find cheap brands such as Van Heusen and Uniqlo to buy up the rest.

No pockets:

- Wear shirts that are not see through. The best way is to try all of your clothes on shirtless and simply make sure it does not look cheap.

Material:

- If you find a brand that fits your chest and waist perfectly but the arms do not, go and get the arms taken in $10-20.

Tailor:

Each shirt should not cost more than $30-40 on average all in.Over time get 12 of them. No more no less is needed. The real key here is not blowing any cash on things your "super cool co-workers" can't notice. They are not smart enough to know the difference between a Brooks Brothers (bad quality by the way) and a tailored no-name brand. Most people in finance have a fashion sense that ends with "the pocket-less shirt"

$500 all-in.

** Note:Make sure to avoid extensive tailoring, for every man there is a brand that will fit his chest and arms, waist and arms or arms and chest… so stick with a single type of tailoring.*

Lower Body Looks:

Overall pants are easier to get fit in one area, the top or bottom, resort to a tailor for one part and you should be good to go on $50-60 per pair of slacks, no more than 6 are needed.

$350 all-in.

Pants:

- Simply make the pants come in close to your ankles. You don't want a parachute pant leg coming down where it looks flimsy or rap-star thug style.
- Make sure your pockets do not protrude when you stand up. If your pockets do not look like they are being squeezed a bit together they are fitting just about right.

Finally the last items… belts and shoes.

For belts… simply get something cheap that matches your shoes. That simple. Avoid brand names and if you work for an extremely d-bag centric group, find a way to get fake ones. If they try to really inspect your belt they might just be a switch hitter so I wouldn't worry about that ever happening. $30-40 for a decent belt… only need 3.

$120 all-in.

For shoes… the truth is you need high quality ones. Why? They last longer on an economic basis and are the most obvious feature when you walk into meetings beyond your shirts. We recommend spending $250 per pair of shoes… start with two and you need maybe 3 max. Just like belts.

$750 all in.

Important Key Notes for Shoes:

- . Get them off Amazon for $15 bucks a pop for your shoe size.

Get Shoe Trees

- Get heel plates from your local shoe shiner. They cost $8 and make the heel of your shoe last many months longer
- Get regular shoe shines. These will make your $250 purchase last for 5+ years. You can wear quality shoes for many years if they are well taken care of.

To have a solid business casual outfit selection all-in you're looking at This isn't that bad at all and it will last many years. The trick is to make sure you buy quality items, keep them in shape and avoid a constant wardrobe change. The impact you want is this – be slightly above the rest in terms of stylish looks and .

Conclusion: $1720 and $30 a month of maintenance. people will have a difficult time knocking on your clothes if you look better than them

One glaring omission here that This will be a separate post in the future, however for now stick with Black, Navy Blue and a Grey . That's all. Get one suit custom for real meetings and the other suits are not of great importance, show up to work slightly early hang up the suit jacket and it will become increasingly difficult for people to know you only own a few suits. For ties keep it simple, take note of the patterns people wear around the office and simply find the exact same patterns from a cheaper outlet. At the end of the day, this post focused more on exuding a presence and fit because

we did not include is suits.(three tops max)no one cares if you have Ferragamo loafers if you can't see them over your expanding waist line.
****

Wall Street Dating Economics

Wall Street Dating Economics

Unfortunately, you're going to spend the majority of your time staring at a computer screen, working excruciatingly hard and you will have minimal time to really have a social life. So what's the most efficient way to remain sane? The answer, after too much money wasted over the years, is to run a cost-benefit analysis on your pick-ups. In short, .

shoot for one night stands, alcohol only meet-ups and only use dates for girls in the 18-21 range that you would allow in your rotation

This one is the fastest and most economical as your entire cost should tally to around $40-100. . Cheap. At this venue you can shoot for anyone you find attractive and collect phone numbers while filling up your "drink meet up" pipeline. There is no reason to take them out on real dates since you already know they drink alcohol.

One Night Stands: Such as this one

Notably, when you go out at night do a quick venue adjustment to your wardrobe. If you know it's a hipster/dive bar scene, stick with v-necks and well fitted jeans. If it's in an upper scale scene you'll suit up and dress a notch above everyone wearing rolled up long-sleeve shirts and 7 for all mankind jeans. Your goal is to stand out just a little bit from the crowd so you're viewed as interesting.

This can get slightly more expensive as you want to move to different venues a few times to keep the fun exciting "everything happens in the moment" vibe going. We'll peg this at ~$100. Since the goal is to continue drinking and dancing as much as possible. The recommended approach is as follows.

Drink Dates:

- Drink venue, one cocktail each and maybe some small appetizer
- Venue change to dance floor/lounge area (much closer to your apartment)
- Feel the mood change as it hit's the peak, make intentions clear on dance floor
- Grab shots and leave to your apartment which happens to be ~5 minutes away
- $30 for initial drinks, $15 cab ride, $20 entry to venue, $25 more drinks, $10 cab

Since every player will go through a you're going to run into a few girls worth keeping around during those periods. In that case, you'll quickly realize While there are always exceptions to the rule this is a great guideline to have until your game is on lock 24/7/365. To drive the point home, take a look at how quickly expectations rise within a large city as a girl ages.

"Real Dates": dry spell,American women 25+ years old have priced themselves out of the market!

Expectations by Age

Calculating out a 3 day max date to close for your average player, you find that 21 year olds cap you out in terms of willingness to spend money on a date as the graph below depicts. Basically, as soon as her environment changes, surrounded by tons of guys willing to pay $250+ just to go on a date, her expectations start to skyrocket. In addition, since she's going to be in your rotation, a weekly or bi-weekly date is going to be next to inevitable.

Before the gripes come in about not needing that much for dates, this analysis assumes you live in a large metropolis where cash is abundant… ie. You should be living in an expensive area because you're trying to stack cash. Inevitably, she'll be getting hit on all day by guys trying to buy her affection which has an adverse impact on your bottom-line as well. Bastards.

If you're in the game long-term… The game of life that is, you want to acquire additional capital on a y/y basis (revenue/investment returns) and increase your net income margin (operating margin expansion). Funny enough, running your life like an actual business is not a bad operating model in the US, you just need to take a step back and realize why your expenses continue to climb, it is usually due to expectations. Keep your expenses flat and one day You'll be living in an area where expectations cap out well below the watermark.

Conclusion: you won't even need to compete in this hockey stick expense growth environment.
****

Wall Street: Past Present and Future

Wall Street: Past Present and Future

We haven't done a major Wall Street post in a while for a reason: not much has changed. In fact, we went through all of our recruiting advice, , resume advice and posts that talk about each industry… nothing has changed except the valuation multiples since the stock market has continued to work higher. Is this good or bad news? It's neither, but good news for us since we don't have to change anything. The posts we put upin the past are as close to "evergreen" as it gets since the industry hasn't changed at all. Also, people continue to waste their time buying modeling courses, debating online about $10K bonus differences and which bank is the "best". In short, nothing meaningful has changed at all. For fun we'll go ahead and highlight all the items to be aware of and unsurprisingly you'll see why we're glad we left.

interview advice

In the past we gave the following advice: 1) go to M&A, 2) worry more about getting promoted than getting the most prestigious bank – ie. better to be a VP at Citigroup than a career Associate at Morgan Stanley, 3) worry more about getting the right job experience when compared to a 4.0 GPA – this means a 3.5 GPA and legitimate experience kills a 4.0 GPA and no experience, 4) don't go into secularly declining industries like retail, focus on good areas such as Technology and Bio-tech and 5) don't waste your money on buying expensive courses since you'll be trained on the job anyway.

Past:

Quite literally nothing has changed from this advice. It is still the same. If people want to know more about our career advice they can always pick up our book but at the end of the day the same highlights above still apply. We thought people would figure this industry out by now but we *Still* get the same questions. It's honestly embarrassing at this point since it's not even a "hot" industry anymore and more people are interested in product management and going into technology positions today. That is where the money is. We've reached a point where engineering is outpacing finance even at entry level. To conclude this section, we're not going to link to every post but please use the search bar for all your questions. We can all but guarantee we've answered the major ones and nothing has changed.

This gets a little bit more fun. Why? We'll we've correctly given out bonus expectations *before* they are officially paid out every single time in December. How is this possible consistently? We know the guys who have access to year end budgets. It's never going to be 100% correct but it's been accurate since budgets are set in December, we release them at that time and people are still "shocked" when they are accurate in February/March when those payments are made. Anyway. As it currently stands, the year is tracking to be up again. Probably to the tune of 5-7% but that is an initial guess and a lot can change in Q4 if the market tanks or a lot of IPOs are priced in Q4. So we won't comment on the official number until December but you have our guess at this point in time. As a small note, remember that your bonus is deferred when you get to the VP level with a good chunk of it (typically around 50% or so) deferred over multiple years 3-5 years on vesting of stock. Less is deferred at the VP level and more is deferred at the MD level since your bonus is higher.

Present: (2017 numbers below).

If you thought Wall Street was competitive before it appears to be getting worse. Why? Everyone is fighting to be part of the next big deal. Despite numbers being up 5-8%, the big banks with the best rain makers were up double digits compensation wise and took up the majority of the press. What was swept under the rug is how little the low performers were paid. We can't confirm this since we don't know each bank, but we can say we'd bet heavily on many guys being flat or down last year if they were in a group/industry that did terribly. Instead of worrying about who those people were lets focus on how to make you more money. In short, join the group with the most revenue. If you're looking for money, focus on joining the group with the guys who bring in the most deals even if this means working 100 hours a week instead of 80 hours a week.

:[Separation of the Groups]

Pausing for a second again you can see why we're concerned about the competitive nature now. Essentially, the top paying groups will work their people hard making it difficult to start a side business. This is a negative trend for anyone smart enough to realize they don't want to spend 20 years on Wall Street. It is also bad for the internal work environment as everyone fights and claws to get on the next deal and work with the right people in the office. Luckily, our advice remains stable. Do the maximum to be a "top bucket" analyst/associate and that's it. The one benefit of working in an office is that your reputation is difficult to change if you leave a solid first impression the first 9 months.

As always you want to avoid these group. Unless you've avoided the news for the last 2 years you'll know that fund raising is slowly being disrupted by ICOs and other decentralized fund raising capabilities. This doesn't matter for the next 5 years but it doesn't help the industry in 10-15 years or so. The skills acquired in ECM/DCM are just not useful for anything. You're better off in M&A where you widen the exit options. As the old saying goes, if you don't know what direction to go in, choose the one that opens the most doors for you. M&A does that and is transferable into Private Equity, Hedge Funds (merger arb) and corporate development at any top tier company.

Avoid ECM/DCM:

We're sure people will still complain about the paragraph above. They know "so and so" who makes a lot of money doing ECM/DCM. That is great. There are also guys making a lot of money doing cash equities trading today… We all know that isn't going to last very long. Unless there is an extremely big reason for you to go into ECM/DCM our point is that M&A is the best "risk reward" group to jump into. Two reasons to go into ECM would be as follows: 1) you already have a side biz running that just needs funding and 2) your parent/brother is the head of the group. As you can see both o these are extreme situations and the move to ECM has nothing to do with the actual job function.

Before signing off on this sub-segment we want to ask one more question. Have we been in a major bull run for 10 years? The answer is yes. Before anyone calls us perms-bears we would tell them to read out prior posts highlighting our recommendation to keep buying the market ever since 2012. In short, we have never been bearish. Our point here is that bull runs eventually do hit choppy points and it has been over 10 years so far. It's much more likely we see a hiccup in the next 5 years and ECM is going to get cut a lot faster than M&A. In fact, when things hit the fan, M&A can heat up in some cases as companies are forced to sell assets. M&A is essentially more stable over 10-20 year cycles and ECM has secular headwinds (ICOs) along with heavy reliance on a positive equity market.

The industry seems to get smaller every year. While it may not seem like it, the logos we see on specific deals continue to favor the larger banks and top tier boutiques: Goldman, Morgan, Lazard, Evercore, Moelis etc. You can already guess what we have to say about this… try your best to join the winners. We're not going to sit down and argue about joining XYZ bank or ZYX bank since that is something 20-22 year olds do with no experience. Instead we'll simply say that competition for the top spots is continuing to climb. The good news? Mid-tier banks are actually getting easier to get into. This is great if you're looking to do investment banking for a few years and quit as you'll make similar money and don't have to compete with the best and the brightest. and the rare positions at the major aforementioned firms.

Consolidation of Banks: The best and the brightest are fighting for technology jobs

The turnover between the major banks has remained stable. Essentially, the industry still sees major turnover and people jump from bank to bank. The only thing we've noticed is that the jumps tend to be "closer to together". Meaning it is harder to jump from a mid-tier bank like a Piper Jaffray to a Major bank like Morgan Stanley. We're sure it still happens in special occasions, we're simply noting that the ability to move up in big steps has slowed down since the industry has consolidated and there are less general seats at each respective bank. Beyond that not much has changed from ~10 years ago.

Well so far the picture isn't great unless you're at a bulge bracket, within M&A or already pretty well off. Luckily we do have *some* good news for those that are still in the industry. There are a few things that should help: 1) hedge funds that consistently outperform will pay a lot of money and the fund flows will continue to go up, 2) if you're in investment banking, people get promoted within a lot easier when things go bad since no one wants to leave revenue on the table and 3) the competition is getting weaker so even if the people are "fighting hard" for the same slots, the actual people you're competing against are not as bright. Before moving on we should explain that last point further. While competition is fierce in terms of people desperately trying to get into the same groups and banks, the type of people applying are getting weaker. That's a fine point that needs to be separated. 10-20 years ago it really was the "best and the brightest" fighting for all of the slots. Now it's more like the B+ talent fighting to get into Wall Street. This is good since the guys you compete with are generally weaker across the board.

The Future:

Markets are becoming more efficient. We will never believe that markets are efficient as highlighted by consistent booms/bubbles and busts. But. We will say the market becomes more rational over time. This is good if you're a top performer since it increases transparency. An increase in transparency only benefits the top performers which are now well known (Tiger funds, Renaissance, etc.). This means the best performers are rewarded with even more of the pie and they will pay more (hopefully this is you in the future!).

To close it out on a positive item for Investment Banking, when times get tougher, you have a very good shot at getting promoted. If you are an associate and well liked… and the VP ahead of you hasn't been doing amazing… this is your chance to jump into a revenue generating role adding over $150K+ to your annual income. The firm will typically fire the guys in the middle (the VP/low end director level) and try to close the gap by promoting one or two low end guys to make up the revenue gap. Naturally, if you're underperforming and you're in the middle layer (VP) you should be working hard to make sure you justify your value to the company. As many of you already know, the low level generator roles are the most dangerous positions (similar to middle management in any major company).

Q&A Update: We had a issue with hosting so we're going to do multiple posts this week. In addition, we will be hosting our Q&A on Friday October 26th for 24 hours. Thanks!
****

Wall Street Pay

While everyone should ask themselves which they would be good at, usually starting at the sell side, its also important to look a the career progression below:

Wall Street Profession

Effectively the difference between investment banking and the rest of the sell-side is this, if you can sell garbage you'll make a lot of money. In addition, at the low-end its one of the best decisions because you'll get paid high even if you aren't able to sell (Analysts/Associates practically never sell) and aren't that great at your job. Your downside (excluding the 2008 disaster) is a $100K+ payout. Not a bad gig. Downside? You'll be cracking 80 hrs no doubt.

Investment Banking:

If you're less social, this will be a good job for you at the lower end as the "Analyst" (eg: Managing Director) will be client facing so you can hide behind excel sheets and earnings recaps. There are two things to consider here 1) your base pay can reach the 200K mark and 2) the upside is limited as 200K base will likely come with smaller bonuses (25% range). Downside? It's tough to move up unless your Managing Director retires, or suffers a stroke from his divorce settlement.

Research:

Welcome back to that Frat-tastic college environment. Again similar to research, the entry/middle level has lower pay relative to investment banking, however if you love being on the phone and sending out hundreds of emails quickly, this job is for you. Be honest with yourself. If you are not a likable person, you'll get crushed in this biz. Downside? Sales and Trading competes aggressively for "attention" if research analysts and investment bankers are "beggars in suits" you'll be competing for the attention of both clients and the good Managing Directors.

Sales and Trading:

If you can get a low end job and maintain traction in a Hedge fund? Don't leave. Notably, most hedge fund cats get started after racking up 2-3 years of experience. Unlike the sell-side, you can be an absolute asshole and still survive, why? How much green did you bring in, that's it. Downside? You're in a highly volatile environment and you're a slave to the two and twenty. 2% of assets, and 20% on above market rate returns. Of course the 20 is also substantial upside if you're the next Paulson, only need one great year.

Hedge Funds:

Enter at a young age? It's actually a rough gig as jumps are tough to make and you're a slave to the slow progress up that corporate ladder. The huge plus side to Mutual Funds is at the top end. 100x better than even a Hedge fund from a stability standpoint as your pay is effectively tied to assets under management, best gig in the world has to be Fidelity long-only with billions under management. Downside? Good luck breaking into the top if you're not connected, you'll need God himself to help.

Mutual Funds:

Conclusion: The descriptions and paths are relatively short for two huge reasons: 1) you can make large jumps in high competition environments (Investment banking, hedge funds etc.) so you can have just a few years under your belt but get paid like you have 7+ years of experience if you're good and This was mentioned previously but needs repeating, if you're extremely good at any part of finance you'll see so much green you won't need to worry about money by your mid-thirties that's for sure.

2) do what you will be best at.

Note:Privateequity was excluded from this analysis as was Venture Capital. The big reason why is more money is made when you have an actual stake in the LBO or the VC funding. If you have cash already or break into one of the MAJOR PE firms (TPG, KKR, etc.) then this is a great path for you. We may add a post for this route in the future.

WallStreetPlayboys Success Stories Start Rolling In

It is that time of the year. .

Wall Street Recruiting

So far so good we've received over 25+ thank you emails this month for the content we have added, in particular our posts on 1) , 2) 3) honesty and 4) were of most value according to our thank you emails. Notably, a common theme in the emails was "thank you for the " as we were quite blunt in responding to both positives and negatives within a person's background/resume.

Standing Out as a Non-TargetResume Template,Cover Letter Investment Banking Interview Q&A **honest truths**

Some Placement Key Stats:

~10 placements into bulge bracket banks (6 male, 2 female, 2 unknown)

~5 placements into elite boutiques (3 male, 1 female, 1 unknown)

~10 placements into undisclosed banks (unknown identities)

Some Key Quotes:

"My interviewer at [bulge bracket bank] was more impressed by resume after taking the advice from your blog" – hired

"The resume format definitely seems more professional I will be using it from now on" – hired.

"Thank you for removing pieces of my resume that I did not realize were unprofessional" – hired

"The key valuation metrics by segment, was a during the interview, I had to interview with multiple industry groups" – hired

great cheat sheet

"Thank you for highlighting key questions I will likely be asked based on my experience" – hired

"The Interview Q&A was what I was asked during my interviews! The Superday is more specific to each bank but every bank asked at least 5 of the questions you guys highlighted, thanks!" –

exactlyfemale hire

Note to The Recent Hires:

More likely than not the successful new hires are reading this post and to all of them, Why?

congratulations you deserve all the credit. Less than 1% of people take the time to find the truth even when it is readily available on the Internet.

Final Thoughts:

With all of the high fives out of the way, we suggest all of you go ahead and read our post on now that your future is even brighter. Finally, we hope all of you can survive 5+ years on Wall Street, few people will make it this far but if you do the grass .

preparing for your jobcertainly becomes greener
****

Watch the Company Man Give Away His Life

Watch the Company Man Give Away His Life

John and Adam walk into their cubicles for the first day of work: Since it's the first day, everyone drinks the Company Kool-Aid and heads out to "happy hour" (Note: there is nothing happy about happy hour).

"Welcome to Company X! We pride ourselves in client service, diversity, going the extra mile and of course grooming bright up and coming stars like yourself. Last year we grew revenue and net income by X%! You're joining an elite group of hard working individuals dedicated to gaining market share and building long-standing relationships with our customers"

John and Adam do well in year one at the company. They are both ranked within the top bucket at their firm. This means they both obtain an extremely high bonus equal to ~100% of their base salaries. John does slightly better since he is ranked as the #1 person and receives 100%, Adam does comparably well and receives 95%. Both become friends for political reasons and they continue to work hard selling as much product as they possibly can.

John and Adam – Year One:

Since they are friends for political reasons, they discuss how the bonus structure is created and how much they are being paid relative to what the Company makes in profit. After running the math for year two they realize that net income at the company will be up about 20% with revenue going up about 10% as well. However, when they receive their bonuses they are both up approximately 10%! Instead of growing their bottom line at the same rate as the Company they are increasing at half of the rate. Immediately, they realize they are never going to be paid for what they are bringing in.

Realization – Year Two:

Since John has been #1 at the firm for two years in a row now, he decides to focus even more on growing his Career. He begins putting a bigger difference between himself and Adam when it comes to total revenue generation. Adam on the other hand takes a second option, he does the minimum to remain at the top of the group. Adam realizes that he will be promoted so long as he is in the top 10% at the firm… and his income will only drop by about 5%. By taking option two he commits himself to developing a second revenue stream with his free time. Sure beats watching Netflix and sports replays everyday (or worse reading about politics).

Fork in the Road:

Both John and Adam have been promoted. They are now solidified as being top-tier workers while John makes approximately 15% more than Adam. Adam has become much more cunning. When the group gathers up to talk about bonuses he explains that he makes 10% less than he actually does (makes sure the lie down is believable). This makes everyone less likely to be jealous of him and they still view him as a top tier guy to know since he has been in the top bucket five years in a row. What they don't know is that he has developed a second income stream that now makes his income comparable to John. While John Makes $250,000 a year, Adam makes $210,000 a year with $40,000 a year from his other idea.

Time Passes By – Year Five: Every year he lies down.

John and Adam are now responsible for managing a small team of junior sales representatives. This is an important turning point and both see an increase to their total income. The value of creating a second income stream is now seen. Why does this happen? Well John has 100% of his income tied to the Company and obsessively hounds all of his employees to give 110%. Adam on the other hand attempts to leverage his time by giving away some additional responsibility when the junior employee shows she is good enough to make the sale. Not only does Adam save time, he also improves his political standing (he's a good "leader"). When the reviews come around again, John makes slightly more again, however his "360 degree review" comes in a tad below Adam. While John makes $350,000, Adam now makes $310,000 with another $90,000 coming from his secondary source of income.

Management Time Begins: John becomes a micromanager, Adam becomes a delegator.

John and Adam are now levering up. They both buy a property to live in and obtain a second property for rental income. The difference is that the leverage now feels even more stressful for John. Not only does he have to micromanage his employees he also has to perform otherwise he won't be able to cover his interest payments on the debt. His stress levels have gone no where but up for the last 7-10 years. Adam? He is continuing to stay in the top bucket (no more no less, essentially an A- student). He refuses to invest any more time than that and consistently gives one of his employees a 5-star review (the top in the group, focusing entirely on meritocracy/performance – highest sales).

Levering Up:

At this point, the people on John's team see a higher attrition rate, while he is still making slightly more money than Adam at the Company, the instability of his team makes it difficult to scale. Adam on the other hand sees minor attrition. He gives slightly more work to the star performer (Alison) who then receives a small promotion. Not only does she get promoted but Alison can now handle slightly larger accounts freeing up even more of Adam's time with a growing revenue line (no slow down). By shirking partially to build his other income streams he is actually gaining ground now. John makes $380,000 while Adam makes $350,000 and $150,000 from his secondary source of income. Their rental properties and current homes are running at rough break even so they ignore the values in terms of cash flow.

Churn Rate:

A new competing product emerges in their space. Unlike anything they have seen before the Company is no longer growing and instead is struggling to see flat-lined revenue numbers. Unfortunately both of them cannot earn any more money and since they are higher paid they are asked to "take one for the team". Both of them go down ~25% y/y and earn significantly less than they did the year before. John makes $300,000, while Adam makes $285,000 and his secondary source of income stays at $150,000.

Structural Change:

Unfortunately, the Company needs to downsize. John is let go. Most will assume this doesn't make any sense however, from the Company's perspective it can certainly happen. John does not have anyone on his team to fill a bigger role. Adam on the other hand gets paid less and has a person younger than he is that is ready to take on a bigger role. The decision has been made. Adam will take on slightly more responsibility and his trainee Alison will take on a bigger role as well. Adam and Alison take over a large chunk of John's business. John's income goes to (he does have some investment income of $40,000 a year). Adam makes the exact same amount at $285,000 and his secondary income is stable at $150,000. He decides it makes sense to commit more time to the Company this year just to make the new structure runs well, after that he'll go back to his business.

Firings Begin: zero

Everything is flat the next year and Adam finds time to focus more on his business. Adam is able to get his business up to $200,000 a year while Alison has taken on more responsibilities (her income goes up 20%!). Adam is back to generating almost $500,000 a year in total compensation with a 60/40 split between career and business income. On an after tax basis, he's actually earning more from his Company.

Stabilization of the Environment:

John is searching for work and it will take him a solid 6 months just to find something that pays ~20% less than what he was making before. It is harder to find a position when you're unemployed than when you had a career in the first place. In addition, he is living a terribly boring life given that his income stream is only ~$40,000. The Company man has done everything right in his eyes. He was always the #1 guy at the firm and yet he couldn't get through the layoff round. The one bright side is he does have transferable skills. He harbors quite a lot of resentment for the Company given that he always outperformed Adam.

What Happened to John:

The Company is doing better and Adam's business is still outgrowing his compensation at the firm. Alison has also been doing a lot better with her new accounts. Instead of stepping on the gas, Adam continues to lay off the gas pedal. He spends more time developing his other business line and even came up with a third idea that generates a decent $50,000 in its first year! At this point he Makes $300,000 from his Career, $350,000 from his second income stream and $50,000 from his third (not to mention his investment income).

A Year Passes:

Well after surviving the first round of cuts the Company goes through another tough patch. Luckily Adam was able to raise his hand for the next round in a politically correct manner. This gives him a nice severance package and Allison is now heading up the group with a couple of other junior employees. The company cannot figure out why Adam would raise his hand (he wasn't on "the list"). Five weeks later they find he is running a business (the third one) and believe that was his small amount of income. What they don't realize is that he now has two incomes $400,000 from his secondary source and $100,000 from this third source. His career goes to zero but he gets a nice severance package to .

Adam Gets Laid Off: buy yet another rental property

John asks Adam to grab "lunch" the standard corporate move to catch up with someone in the corporate industry. Always some sort of sushi or seafood place right in the center of downtown. John expects Adam to be a bit stressed but finds that Adam looks a solid 5 years younger than he expected. John on the other hand is back to the grind making good money at $400,000+ a year in another Enterprise sales position. Adam finally spills the beans and explains he makes more now than he did at the Company. John is shocked by this given that Adam doesn't have a "prestigious employer". Instead of asking about networking Adam just talks about some new rental properties, traveling and his new idea that made $100,000 last year (not much but he sees potential now). John begins to question a lot of decisions and wonders if it makes sense to put all his eggs in the company basket ever again. Unfortunately, it's a bit too late for John. He'll have to start from square one paying a hefty life tax to make it. While he gets some traction it just never gets above $5,000 a month.

Adam Gets a Call From John:

The math is painful but the risk avoidance is the real killer. Instead of looking at this from a pure financial position (which is bad) we should also look at the numbers from a risk perspective. When Adam begins to make $90,000 a year from he is able to instead of squeezing the profit line. This change in thought process is worth more than $90,000 (nothing compared to his overall income.)

How Does This Play Out Mathematically? his secondary source of income***think about scale*** *Note: we assume 45% of income as the savings rate and a 4% return profile.*

Networth Difference

Now the value becomes incredibly clear. While Adam has made ~47% more than John, If Adam believes in his third idea, he can sell the asset from Idea #2. While we have used a 10% discount rate giving the value of the assets $4M and $1.5M respectively, you could argue for both more and less (implies a 10x P/E multiple). Even if we give it a 2x P/E valuation that is $1.1M in equity value for his two assets. That $1.1M is approximately equal to John's $1.4M total net worth from a 4.5% yield in investments. This is why the quickest path to financial freedom is by becoming an owner.

.the real value is in ownership and equity

We wish this had a better ending but it doesn't. John and Adam worked in a sector that has now been largely automated. While there is a need for a few account managers to do some face to face interactions, the primary re-billing business has no need for material human interaction anymore. John ends up seeing a 50% paycut and now makes $200,000 a year (he made the same amount at just 25 years of age). Lucky for him, he was investing a lot of money so he has enough . The problem is that he is still friends with Adam. Adam is officially "living the dream". Instead of selling his Company he ended up hiring a couple of employees to run the business. It still generates $400K a year for him. His third business? Well that was a 10 bagger and now generates over $1M per year… John now questions if being a top performer was worth the risk… The risk of not diversifying his income streams.

What Happens Over the Next Five Years? passive income to survive

John finally asks how Adam was able to do all of this work while maintaining his career. Adam simply says . Instead of focusing on being the #1 person in the firm he realized that being in the top group was "good enough" to get promoted. While he would "lose" an extra $20-50K per year… that gave him extra to pursue other ideas. Instead of trying to go the extra-mile for the Company… he went the extra-mile for the person that matters: himself. While he never dropped the ball at work, he also knew relying on a single source of income was a dangerous matter. After all, he could never sell his career since there was no equity value and who knew if the business would last for 20+ years (quite a long time for change). Besides, if he was unwilling to lose ~$20-50K a year during his youth, then he never really valued his time in the first place. Finally, Alison who is still at the Company, has followed the path laid out by Adam so she is less worried about the near-term decline in the industry.

John and Adam Catch Up: "I decided to live efficiently"time

This is one of the cleanest ways to get rich. People believe working for a Company is "less risky" even though a Company is just a machine within an industry. And? . While there are many takeaways from this story (names changed for good reason) here are the big ones: 1) You don't need to be the #1 performer when you're working for someone else, 2) levering up can be stressful if you're relying on one income stream, 3) always lie down when it comes to your income in a corporate environment, 4) when you build an income stream for yourself, it can be sold so 5) companies look at return on investment, just because someone is being paid more than you does not mean they are first to get laid-off/fired, 6) learning how to delegate and leverage your time can be more valuable than doing everything by yourself, and 7) you only live once so you should give yourself a shot at being rich… besides it's the least risky option if you're living your life …. Oh and one last thing. The Company man has his life identity tied to his career… No need for further explanation.

Concluding Remarks: No one knows if that specific industry will last for 20 yearsyou should at least double the value of annual business income; efficiently
****

Weekly Workout Routine

Weekly Workout Routine

This post works under the assumption that you are working a professional job that will have sporadic hours and you are young enough to put in the work. If you're closer to the high end of the expected age range of 18-29, we would recommend taking out a single day from the lifting schedule. With that said, our assumptions imply that that you're not working 40 hours per week. You are likely working closer to 60 hours a week. This means your workouts need to be impactful, efficient and intense.

The best way to work out can be broken into two parts. Your typical work week and a hectic work week. Positively, you can stick to the basics of body building while maintaining a schedule that will make you want to jump off a bridge once every few months (slight joke).

Ideally you already know how to lift with proper form, if not you should certainly find an experienced lifting partner for 1-2 weeks of training.

Lifting Basics:

We'll begin by working under the belief that you have never touched a barbell or a dumbbell. We are also going to assume you're lifting to get muscular and do not have an interest in anabolic steroids or becoming the next Arnold Schwarzenwgger. Instead we are going to build 1) an aesthetically pleasing body, 2) spur on hypertropy and 3) give you endurance to last in a real life fight.

To help you understand the goals, here are the ideal metrics from an aesthetic standpoint to build the "golden ratio" around your entire body. Looks are about proportions. Simply measure your wrist, assuming you are not significantly overweight, and make the following calculations.

Wrist measured at connection point to arm.

6.57x

Chest:

4.57x

Waist:

5.57x

Hip:

3.43x

Thigh:

2.43x

Bicep:

2.43x

Neck:

2.29x

Calves:

1.86x

Forearm:

Feel free to make minor adjustments to the ratios outlines above if you notice proportional issues upon further examination, however if you can meet the metrics above, from an aesthetic perspective you will be in the top 5% (more likely 1% in the adult world). With that lets jump into proper form and a solid workout routine.

Lifting in Stages

The first course of action is to avoid injury. If you begin lifting heavy weights with low reps you are likely on the road to injury…. While we are fans of strong lifts or the 5×5 program, if you want to play on the safe side it is better to have higher reps (to get your form down correctly) and increase the weight from there.

Even more so if you're working an office job where you are seated all day. Instead we would recommend a three stage lifting cycle. Each stage will last six weeks. Once you go through two full cycles (36 weeks) you can safely stick with stage two then stage three (ignoring stage 1) if you're simply looking to pack on some more muscle.

Stage One Endurance: High reps low weight, 15+ reps of each exercise, 3 sets

Stage Two Transition: 10 reps 3 sets

Stage Three Mass: 6 reps 4 sets

Plan on having and you should be sweating after your first exercise. If you are not sweating, decrease the rest time or increase the weight. Generally speaking, lower rest time is the solution.

45 seconds of rest between each set

To wrap up our basic recommendations, you should superset with two exercises. When you are doing chest and back exercises you want to super set: an example being incline bench press with pull downs. After finishing your incline set immediately run over to the pull down exercise. We believe in this structure because you are a working professional and have minimal time to commit to the gym. Get the most out of every single minute you are in the gym.

Hitting the Gym

Welcome to your first workout.

The gym is a metaphor for life. You will do more reps, more sets more more more until you find out what your body is capable of. Every time you break a plateau it was the previous 1,000 reps that got you there and all that does is inspire you to do… 1,000 more reps.

At this stage we assume that you are lost in the gym and it is time to build the appropriate building blocks. For those that lift you already know the most important word in lifting. Form. No form? The rep doesn't count. No form? No noticeable gains. No form? Injuries. No form? You shouldn't even show up to the gym.

Now that we have annoyed you with the importance of form at the gym, we're going to provide you with a 7 day routine with an emphasis on proper form. From our experience the goal is to work out 7 days a week if possible when you're young (18-22) and adjust to 4-6 days when you're older (late 20s). So we will go ahead and go through a full week of exercises starting with legs.

Legs

Find the day that is slowest for you from a work-life perspective during the week. If you are working long hours it is usually Monday morning. If you are partying you are generally hung over on a Sunday so Monday is a good day to go ahead and get the heavy stuff out of the way (Saturday afternoon is a close second).

We suggest a quick 2-5 minute bike spin just to get the blood flowing. After that to help avoid injury spend 5 minutes getting loose with the following exercises. 1) lunges, 2) side lunges and 3) leg kicks. Keep it basic. By the end you should feel loosened up and ready to go.

Warm up:

Super Set 1:

This is your bread and butter starting workout. While you may be able to do a much higher load, begin with a weight that can be done 15 times. Remember the original rules (15+ reps, 3 sets). We suggest a double overhand grip to increase grip strength for the future stages. Classic deadlifts have one hand over and one hand under, since the weight is lower with straight legs, begin with the overhand grip and work on a grip that would emulate the movie Jaws.

Straight Legged Dead Lift:

Your hamstrings should feel stretched, a similar feeling to doing a regular stretch. If your hamstrings do not feel guitar string tight you are doing them wrong. Feet flat, no knee movement and mentally focus on your hamstrings. As always keep your stomach sucked in to keep your core stable and flex your glutes if you feel any instability issues. Proper form as always.

Notes on form:

Before we jump to the next exercise you are wondering. Why not a regular dead lift? The answer is two fold 1) perfect form, 2) no injuries and 3) additional upside from regular deadlifts for mass building. We want endurance and strength to prevent injury in 6 weeks.

: The best thing about this exercise is it can help prevent injury as you have a hard time going high up the weight stack. You also improve your balance and on top of all this we continue to work on your grip since the weight is in your hand rather than on your back.

One Legged Squats

During the load phase, coming down, you should mentally focus on the glutes and hamstrings. Your quadriceps will naturally work. Keep the weight in the same hand as the leg that performs the squat. Your resting leg should be doing exactly that. Resting. If your toes hurt it means you are pushing up on the reloading phase. Mentally lower on the load phase and remember to isolate one leg on the reloading phase.

Notes on form:

Super Set 2:

: With your legs already firing from proper form from the first super set, it is time to continue stretching the muscles and working specific sections to create the mind muscle connection that you will need in stage 2 and stage 3. Here, many beginners will struggle as the motion is difficult to perform. Place the weight on the floor, step to the weight, leg straight and bend over to lift the dumbbell off the ground.

One Legged Dead Lift

Remember that form is everything. To help stabilize you need to visualize properly, pretend your toes are claws gripping the ground, squeeze your glutes to avoid falling over and keep your leg straight throughout the exercise. If this exercise is difficult, don't be surprised, you'll have it down by the 3rd or 4th day.

Notes on form:

As you can guess we are super setting with a squat like motion that requires stability. Right leg, right hand holds the weight. During the load phase remember to mentally focus on your glutes and hamstrings.

Lunges:

The exercise is fairly easy if you did your one legged squats correctly. The bigger form issues we see here are 1) over extending your leg putting pressure on the knee cap and 2) doing the motion too quickly. Try to count to three on the way up and on the way down for each repetition. Keep your core tight through the entire exercise

Notes on Form:

Super Set 3:

For the serious lifters, you are laughing out loud at reading those two words. However when it is your first day in the gym, it is much smarter to build endurance and muscle while preventing injury. Six weeks of lighter low impact leg workouts can help prevent injury so we continue to suggest this route for beginners.

Hamstring Extensions:

Luckily there is very little that you can do wrong with regard to form. Simply make sure the equipment is appropriately set up. Back straight and do not away your body when working the machine. Your lower back should remain resting against the back at all times.

Notes on Form:

Similar to the above exercise, serious gym fanatics will not use this machine. Squats are the norm, but we will get to these later.

Quadricep Extensions:

Again, similar to hamstring extensions, the biggest issues are 1) lower back movement, 2) appropriate settings on the machine and 3) full range of motion. The one issue with machines is it is very easy to cheat by using your core to help you through the motion. Do not succumb to the ease of the motion. If it feels easy, you're doing it wrong.

Notes on Form:

Final Routine:

: This is another simple exercise to add to your routine. You should be tired at this point, so you can push out a few sets of weighted calf raises.

Calf raises

Calf raises are quite easy to perform, the biggest mistake made is full range of motion. When you decline your heels should be pointing downward (not flat) and the top of the calf raise should be feel as if you're trying to become a ballerina. Always choose lighter weight over cheating on your form. All the way to the top, all the way to the bottom. Also, do not use your shoulders to help push the weight up.

Notes on Form:

Arms

After going through a heavy leg day, you will notice that you are significantly more hungry and energetic the next day. This is because legs are highly anabolic. What this means is you're going to feel stronger in general throughout the next day. Arms are a weak point in general for most men, from our experience the added energy helps get through a few extra reps and add a little bit more muscle by going from legs straight into arms the next day. Finally, the bicep is a smaller muscle group so we suggest adding a burnout phase to increase endurance for this muscle group.

Since we will be working out arms instead of legs, we recommend doing a light 5 minute jog followed by weighted stretching. There is no need to jog for over 5-10 minutes since we don't want to waste your energy on the treadmill instead of lifting heavy weights. Break into a quick sweat, get off the machine and stretch out your triceps and biceps and simply get ready to hit the weights.

Warm Up:

Superset 1

Grab a bench and place it at a 60 degree angle. Pick up a lighter weight since we will be performing 15 reps and rest your upper arm on the bench. You should feel as if your arm is dislocated (ie: not helping you perform the exercise). Raise the weight up and if you want to increase the burn act as if you are flexing your bicep. When you relax the motion, slowly count to three on the way down and remember that it should feel as if the muscle is being stretched. Contraction, followed by a stretch.

Preacher Curls:

The biggest way to ruin this exercise is by engaging your deltoid. Any upper arm or shoulder movement will ruin the exercise as the wrong muscle group is being fired at this point. The same incorrect muscle group will likely ruin your subsequent exercises as well. Remember to mentally focus on the bicep, raise the weight as if you are flexing and stretch the muscle on the way down. If you feel your deltoid or shoulder engage, stop the exercise shake your arm and get back to the bench.

Notes on Form:

Grab a flat bench, put your knee on the bench with your thigh perpendicular to the bench. Right knee, right arm holds the weight and vice versa. Keep your head down and keep your elbow locked. Move the weight backwards until it is parallel with your flat back and squeeze the tricep. Slowly lower the weight down back to its original position.

Kickbacks:

There are several difficulties when doing this exercise for beginners. 1) keeping your head down, 2) full extension of the tricep, 3) maintaining a flat back and 4) remembering to slowly lower the weight. We suggest you go to the gym with a lifting partner on your first day to get the form down. Raising your head to look at the mirror will limit your range of motion on the kick back so a spotter/form checker will be of great value for you. Once the form is tight, mentally remember to extend and slowly lower the weight as many people attempt to lower the weight in a second or less.

Notes on Form:

Superset 2

Find a place to sit down, either on a bench or a step up box should work fine. Pick up the weight and place your elbow against your inner thigh. This will help prevent engagement of the deltoid muscle. Luckily after the first exercise your bicep should be engaged limiting negative form issues.

Seated Curls:

As mentioned, form issues are limited however the two main concerns are 1) using your deltoid and 2) twisting your upper body to ease the contraction. Keep your core tight throughout the routine, limit elbow movement and mentally remember to keep the shoulder/deltoid disengaged. Similar to the preacher curls, if the deltoid begins to work, stand up and shake out your arm.

Notes on Form:

This exercise is being mimicked during the warm up part of the routine. You are placing a heavy weight behind your head and raising it up from shoulder level to above your head. Depending on how flexible you are this will be harder or easier for you, if it is difficult you'll increase your flexibility quickly and if it is easy, you'll see gains due to wide range of motion. Keep your elbows in place, lower the weight behind your head to a ~90% angle and slowly raise the weight back up above your head.

Overhead Tricep Extension:

This is a great exercise to really stretch out the tricep and allows you to increase your ability to stabilize a weight. If you're having trouble performing the exercise at first, pick up a heavier weight to stretch your triceps (increasing range of motion) and get back to the exercise. The main issues with form here are 1) arching the lower back and 2) allowing the elbow to move. If you can prevent elbow movement with your back straight and go through the full range of motion, you'll quickly feel a burn through your entire tricep.

Notes on Form:

Superset 3

Find a dual adjustable pulley machine and set the cables to the ground. This exercise will require high concentration and an engaged core to prevent deltoid engagement and proper form. The best part of this exercise is the range of motion, unlike some of the exercises we will walk through later on, this exercise gets the full 150-180 degrees of motion. Lift the pulleys and take a couple of steps back, with the weights engaged fully extend your arm and tighten your core with a slight lean if you'd like. Raise the weights up to full contraction and slowly lower the weight.

Cable Bicep Curls:

At this point you're likely a bit tired from the previous exercises, however you should have an intense burning feeling when performing the exercise which will let you know if you are doing them correctly. When you are fatigued, you are much more likely to break form (core destabilization or deltoid engagement). To prevent a break in form, before you perform the first rep double check your alignment and core in the mirror. After you've confirmed your posture mentally check into your bicep and remember not to cheat towards the end of the contraction (many will try to use the shoulders at the end of the exercise).

Notes on Form:

Final Touches

This is a classic burnout routine for the end of your lifting session. You perform 7 extended bicep pumps, 7 mid range pumps and 7 near contracted pumps. The idea is to fully engorge the bicep with blood. By the end of this routine your arms should feel useless and tired, unable to lift heavy weight. To perform this correctly pick up a relatively light bar, stand feet shoulders width apart, back straight and go through the three sections of the workout. If you find that the upper piece of the workout is harder than the lower piece, you can start from the top and move down. Repeat this exercise for two reps and you should be fully burned out.

Twenty Ones:

The form issue is rather clear here, fatigue causing you to rock your core. The best way to prevent this is to stand sideways to a mirror, this will keep you mentally in check as you go through each repetition. You can double check your form halfway through and confirm that you are not moving your hips to make the exercise easier or engaging your delts.

Notes on Form:

Chest and Back

Now that your arms and legs are slightly sore, it is time to work on your V-taper. The V-taper is a function of low body fat (small waist) and a wide chest/back. Generally, most men do not workout to widen their back and will see immediate results with wide grip exercises and a dumbbell chest press or cable fly. Your back is a larger muscle group compared to your chest so we recommended an extra chest exercise at the end of your workout in stage one.

Superset 1

For a chest and back day we've found that a simple 5 minute jog will do the trick and you do not need to do much stretching if you begin your first routine with a lighter weight and perfect form. By the time you are done with your first set you should feel loose and ready to go. To be extra cautious, feel free to do a warm up set with the bar only to prevent any injuries.

Warm Up:

Pick up a relatively heavy weight, heavier than a tricep kick back and place your knee on a flat bench (right knee, right arm holds the weight). With your back flat and second arm supporting yourself on the bench allow your arm to fully extend. Slowly raise the weight until your arm is parallel with your back. If you wish to make the exercises more difficult, on the way down allow the weight to come in front of your chest a bit (beneath the bench) and slowly raise the weight back up (this helps engage the lats).

Bent Over Row:

Once your body is properly positioned the number one mistake is twisting your back to make the exercise easier. This is also why engaging the lats, by moving the weight closer to center on the way down, is actually quite difficult to perform. The best way to prevent this is to start with the simple raise and lowering of the weight and mentally remembering to keep your back flat. In addition, do not cheat the set by quickly lowering the weight, instead pause at the top of the movement and slowly lower the weight down.

Notes on Form:

Find a flat bench and pick up two dumbbells placing them on your knees. As you roll back use your knees to kick the weights up into your hands and lay perfectly flat on the bench. When you begin lowering the weights mentally tell yourself to flare your arms elbows out to achieve full range of motion (you should make a semi-circle type motion). Do not allow your lower back to raise off of the bench, this will prevent injury and it will also keep you honest in the amount of weight you can handle. When raising the weights back up, do not allow your arms to come in, maintain the same circular path for maximum resistance and range of motion.

Dumbbell Bench Press:

We like this exercise to start as it prevents a beginning lifter from going too heavy. Unlike a regular bench press it is difficult to move a heavy weight and you are less likely to arch your back to help you complete the exercises. With that said, the main issues to look out for are 1) full range of motion both on the decline and return, 2) maintaining a flat core and 3) squeezing at the top of each repetition to engage the chest. Once you have completed the first set there should be a noticeable pump in your upper body from the exercise.

Notes on Form:

Superset 2

Luckily chest exercises are difficult to do improperly. Simply take a seat and count to 3 on the way down and on the way up throughout the workout. Do not allow yourself to engage the shoulder or else you may end up with a "pinch" feeling during the workout.

Incline Bench:

In general as noted above, it is quite difficult to ruin your form unless the weight is too high. Keep your lower back pressed against the bench, keep your chest working and avoid lifting the bar backward which will engage the shoulder.

Notes on Form:

You'll see a large amount of gains in terms of the V-taper here. Take a wide grip on the pullup bar, maybe even use some fat gripz and get to work.

Wide Grip Pullups:

No cheating allowed here. Full range of motion down and full chin clearance of the bar at the top. Do not do "kipping" pullups or any action that will give you momentum as you'll develop tennis elbow or golfers elbow due to higher repetitions in a short period of time. If you're into cross fit that's fine, we can agree to disagree and would stick with slower motions to build muscle since we're looking for aesthetics here.

Notes on Form:

Superset 3

Not much needs to be said here, take a shoulder width grip and remember to count to three on the way down and on the way up

Flat Bench:

No momentum. No lifting off the bench. If your lower back raises off the bench the rep does not count and if you rush through each rep you're not going to build muscle.

Notes on Form:

If you're feeling confident you can jump right into a rack pull if your core is stable but generally would recommend a wide grip row. Either with your palms facing inward or your palms facing down, the goal is to simply take a wide grip on the machine. Focus mentally on the outer edges of your back, remember the goal is aesthetics!

Rack Pulls or Wide Grip Row:

If you're going to stick to a row, the main goal is to keep your back straight and chest up against the pad. Alternatively, in a seated position your body should remain vertical. For rack pulls, you'll want a spotter your first time around to make sure your form is pristine. No shoulder jerk movements and raise the bar with your back entirely flat. When coming back down do not arch your back, this will prevent injury.

Notes on Form:

Final Touches

Since you're more mentally focused on your back throughout the workout, it is usually better to end with an extra chest exercise. We would use a cable fly and focus on keeping your arms out as far as possible increasing the range of motion. Focus on the outer edges of your pecs and you should feel a solid burn throughout.

Cable Fly:

Similar to back exercises, do not lean or adjust your posture. Remain stable against the padding and prevent the use of your biceps by having your arm as straight as possible (full range of motion).

Notes on Form:

Concluding Remarks

Are people going to disagree with this set up? Yes. Can this set up be improved? Yes. If you do not want to follow any of the workouts it is actually perfectly fine. The one thing we can all agree on however is this: . Below is a list of the three stage cycle, decreasing rep count to build mass. Feel free to follow it, feel free to cut it down but at the end of the day, you're only going to get better with a minimum commitment of 4-5 days of real lifting.

4-5 days at minimum at the gym and compound movements for a beginner

Finally, if you absolutely hate the workout routine then the verbal notes on form should at least be helpful along with the metrics to an aesthetically pleasing look. Find someone with the look you want to emulate, ask them for their routine and get to work.

******

1) Cardio is not needed to build a solid physique, 2)If you must add some cardio simply take up swimming, 3) Diet has been covered in a previous post and without a , 4) a lifting partner will help tremendously, unfortunately most people can't even lift 5 days a week, 5) If you workout 3-4 days a week, you're no where near your physical potential, 6) when a week is hectic again, go with legs first since hotels will unlikely have a solid squat machine, 7) pullups can be replaced with pull downs.

Some side notes: strong diet you will not see any meaningful gains

As a commenter noted, if you are busy the clear days to skip are arms. The key to weightlifting is all in legs, back and chest since your arms will be hit in the process. We are simply setting the bar high to create good habits

Workout revised

What a Year – Mind Boggling Some Expectations…

What a Year – Mind Boggling Some Expectations…

Lots of brain cells were lost over the past 72 hours. People who believe that you can just "bounce back" from margin liquidations to people who still believe you can access Bloomberg terminals with a twitter link (which would mean their entire business is worthless). Instead of getting infuriated we're going to offer solutions as usual. For those that believe we're frauds, luckily we have a track record dating back to 2012 in print and unedited (trump election, stock market crash, sports bets, compensation updates etc.). Do we get them right all the time? No. And… as several long-term readers have noticed 80-90% accuracy over 8 years is pretty high and at minimum we have been transparent. More than the vast majority of people can say. We would like to thank the people who have followed for years as they are both 1) the people we're writing for and 2) the people who also hold us accountable when we're wrong. We're fine with this set up. See the comment from someone earlier this week.

"Guys you have no idea how much of an impact you've had on my life. Followed you since 2012/13. Literally 90% of your predictions come true. Everything in my life has been influenced from you.

This is just a short comment to say thank you for being the older brother figure, followed your sales advice, investment advice and now am sitting pretty in this situation. I wish I could contribute back in some way. I've already bought all 3 of your products. Keep doing what you're doing. Saving lives.

Please don't ever stop this blog.. I don't know what I would do without it."

The money printer is on fire. Print, print, print, 0% interest rates, print, print, print. Massive amounts of damage has already been done. The only time over the past decade or so when GDP was negative? The 2008-2009 financial crisis and the Stock market was cut in half. According to that metric it means you could easily see the S&P 500 break 2,000 and stay there for a while. The way you see the market recovery in the idiotic "V-shape" recovery that everyone is praying for is through massive printing, inflation and more 0-1% interest rate debt.

On to Solutions:

One thing we've learned in life is that people will always do what they are going to do. As soon as someone is committed to buying stocks they will buy. Period. They will not go back to our old posts suggesting to stay liquid in cash and crypto for over 2 years now. They just won't. So here is some advice if you are going to buy. (no we are not adding to stocks). We repeat, we are not buying a single share. We suggest a put protection strategy. If you are wrong you're not going to be wrong by "10%", you're going to be wrong by 25% in one of the most liquid investments in the world (if attempting to time the bottom on the S&P 500).

If and only if you're going to buy.

What does this mean, it means if you were going to buy $100 of S&P 500, for the love of god please buy $95 of the S&P 500 and buy $5 worth of put options that are way out of the money and a 18 month time horizon (maybe even less). Why? You need to find a way to make sure if you're wrong that you're not down 20-30%. That is absolutely critical and it is absolutely unacceptable to put your life or the well being of your family at jeopardy.

The other solution is unsurprisingly the same. Keep doing what we've suggested for 24 months now, stay in cash and crypto (maybe a bit of gold after the pull back). This is good enough. If you don't like crypto that is also fine. The value of the dollar is going to spike temporarily (already is and likely will) as people sell everything to make ends meet. When you sell an asset you're "trading it" for dollars so demand for dollars goes up. Cannot be simplified easier than that. Anything sold for dollars is demand for dollars by definition.

As you can see, despite all of the wild swings, nothing has changed quite yet. if you were long since 2012 (see our old posts – as an example), you have a cost basis in the S&P way below where it is trading today so there is no reason to add. That is what we would suggest at this time. Again. We realize it is a free market so if you're going to play hero and try to buy the exact bottom, please purchase some puts to limit downside significantly.

here from 2013

No fun and games here. A cascading pile of garbage. People who are in the middle class are unable to pay rent. In 2008-2009 around 60-65% were home owners, today around 40% are which means 60% are living in rented apartments. Those rented apartments are also levered up by companies. They don't own the building in cash. This means…. You have the renters unable to pay, then the building cannot pay, which then means a massive default is about to occur. Multiply this out for casinos, restaurants, bars, clubs, dry cleaners, shoe repair, clothing/apparel, gyms, dentists, etc.

What Exactly is Happening?

Unless this problem is solved quickly, you're going to see a cascading pile of garbage as debt upon debt is defaulted on. So at this point, we will make an assumption. As we think about it, we're seeing a higher likelihood of As many of you know we don't like to edit posts so we have to emphasize "At this time" since a lot of parts are still moving every 24 hours. It seems like the world has agreed to simply print trillions upon trillions of dollars. This means prices eventually have to go up. Also… This is where it gets tricky, . If prices of all assets are going up rapidly, the middle class actually loses the most. Think about it. For all the guys "praying to buy the dip", if there is a V-shape recovery the only winner is rich people (everyone else loses). We doubt the american population will be okay with that.

stagflation/hyperinflation at this time.the government needs to find a way to force the companies to raise wages if they resort to massive inflation

For the guys who look at the CPI and say "there is no inflation" we have nothing but laughter for you. You didn't bother to read a single SEC filing. What is happening? For the last decade companies have borrowed money with low interest rate debt and bought back shares of their own stock. This is fine if you have a lot of cash as you're returning value to shareholders. In fact we're completely fine with share repurchases if a company can last 12-24 months without needing additional financing. In simple terms again… If you borrow $100,000 to buy a home worth $400,000 but you have 24 months of cash in a bank account in case you lose your job. You are being financially responsible. What are many of these companies doing? They are buying that $400,000 home but they have 3 months of cash in case the business goes down. This is not responsible. We're not going to argue here with the exact number of months needed since that's for you to decide. But. We think everyone can agree that we shouldn't just give these companies free money for taking on debt to buy back stock. You wouldn't consider yourself responsible if you didn't have an emergency cash fund so why shouldn't these companies be held to the same standard?

Since some of you are numbers people here is what we are trying to say visually. You run a company and have $2M in the bank. Nothing to do with it so you repurchase shares of your own stock and take out some outside investors money. You have $1M left and can survive 2 years on that if things hit the fan. That is totally fine in our opinion. You had nothing else to invest in. But. What companies did is they had $2M in the bank, enough to last 1 year. They said "well fuck it rates are low" lets borrow $4M and just buy our own stock. This then means they have a net debt position of $2M accruing 2% interest. It works fine if you're profitable but then wham, recession and you could go bankrupt fast.

Short disclaimer: if you don't know what a buyback is, it is when the Company say Apple, takes money from the Company to purchase shares of itself. Apple in particular is probably okay as they run a very large cash position, so they are being fiscally responsible. Companies like Boeing? Not so much, as they were levered up with thin margins, less excuses there (a topic for another day if people are interested).

How much have companies spent on buybacks? Sit down first. Take a deep breath. Take a second deep breath. Corporate buybacks have accounted for more share purchase activity So where is the inflation? Very clearly in assets. So the companies are getting richer and richer and none of its workers get anything except for the ones at the top with large amounts of shares (and of course all investment "professionals"). The worst offenders don't even offer their employees 401K matching to participate in the growth of the company.

than all household purchases, all mutual fund purchases and all ETF purchases… COMBINED.

There is no reason to be coy about it. This is a complete mess. Now you have a halted economy and these companies are forced to stop buying back shares as they have to spend money to pay employees rent etc. Don't even get us started on the fact that buybacks actually *help* with taxes. That is right, the government is set up to reward the company for repurchasing shares. To emphasize, there is nothing wrong with buybacks. There is something incredibly wrong with borrowing money you can't pay back to purchase your own shares. That is beyond irresponsible. We won't repeat ourselves to re-read the paragraph three levels up (it should probably be re-read a few times if you're new to this). In simple terms once again, unless you were long assets for the last decade you fell incredibly far behind on the socioeconomic ladder. Partially by no fault of your own.

Unmitigated Disaster:

Want some numbers? Okay.

[You can look at the recent tweet by Marriott.]

Since we know most people don't like watching videos or reading in general, the punch line is that they are seeing 75% reductions. This is 3x worse than the great recession and dot com bubble which was 25%. Unfortunately most people do not understand leverage. How awful and painful it is. Go back to the basic business example we laid out earlier this week. You run a business with $100K a month in revenue, $80K in costs $20K in profits per month. If revenues are $0 you actually lose $80K which is four full months of income (per month you are closed). Now you run this number with real revenue. Marriott does $23B in revenue per year, that is more than $6B per quarter or around $2B per month. If its down 75%…. You can figure this one out… That is billions per month. Much more severe than 2008-2009. Even if they get a 0% interest rate loan, it has to be paid back over the course of time with future earnings (or default and bankruptcy).

Assuming that you care about the future of the United States you really have a few clear solutions. On a microeconomic scale do your best to help your local sized businesses if you can. We won't waste our time asking how much everyone is worth. If you can afford it, order catering, get your dry cleaning done, get haircuts etc all in your local area ASAP. They run on slim margins and when the doors open that's where you want your dollars to go.

More important Matters – Solutions:

The second solution is also why we don't think this is solved in a "v-shape" recovery. If it is a V-shape recovery 90% of people should not be happy. The second solution here is to actually cut all your airline and hotel stays to a bare minimum. Once borders re-open the virus is back out and could come back in massive form by Nov-Feb. This is a simple precaution you should take. We cannot stand it when people say we're exaggerating about "over run hospitals". We're very clearly talking about hospital beds and ICUs. They already have people in them and the "20-30 ICUs per 100,000" does not mean they are "all empty". People get lung cancer, they get into accidents etc. So You do not want to take that risk especially in the winter time.

The third solution is to have a SHTF liquid solution. Yes the situation is that severe that you should have some money (physical), some gold (physical) and a Trezor or Ledger with some crypto in it. There is just no exception to this if you can afford it, the world has gone mad with printing and you must make sure you're exposed to these stores of value in the rare case that fiat collapses or we go into hyperinflation. Not a drill. To make sure we're not pegged as idiots, it doesn't need to be more than a few points of your net worth. The point remains the same, it is your job to be safe if everything hits the fan.

The fourth item is to learn sales. Now. Not tomorrow. Not next week. Now. The main skill that will take you out of a recession or even hyper inflation if you remain employed is sales. People will need to make up lost ground and you need to be good at selling. Online, in person, on the phone it doesn't matter. As usual we prefer online as it is much more scalable.

The fifth item is for wealthier people. As mentioned at the start if people are going to try to time the bottom that is fine. Look at ALL of your assets. Find a way to buy protection with an option. Yes we realize you may "guarantee" a loss of a few points. But losing 2-3 percent when anything could collapse 25% any given day is a winning bet to make. Better to sleep easy at night focus on things that matter and lock in a 2% loss on items you're not comfortable with.

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending.

Since there is a lot of demand we will do another Q&A this Sunday. It will only be 6 hours long and as usual for purchasers only.

****

What Group to Join? Hint ECM/DCM is for Suckers.

*** we will be updating this post shortly. The comments were spammed due to meaningless rebuttals***

A few people have emailed asking about specific groups and what they should and should not do when they start an investment banking job. Some of the questions are quite specific so before we jump into what this post is all about here is an overview of the main "groups" within investment banking:

“Basically, this is what you will be doing… You will help raise money for companies in the form of Equity, hence equity capital markets. Sometimes the segment gets more spread but some examples of equity raises would be 1) Initial Public Offering, 2) Follow-On-Offering, 3) Registered Direct Offering. If we want to get more granular you may also work on some Private Investment in Public Equity (PIPE) deals as well. Bottom line? You’re simply raising money and are trying to convince your relationships that they should be interested at $x price per share.

Equity Capital Markets (ECM): *Yeah you know I want to work on IPO’s and stuff.”*

Generally most people have no clue about anything bond related because it is not “sexy” but to put things in perspective the bond market is than the equity market. With that said, DCM is similar to ECM in that you are helping raise capital, however in this case we’re looking at 1) Convertible bonds, 2) Long-term/Short-term Debt, 3) Subordinate Debt, 4) Mezzanine Debt, 5) Bridge loans (Pre-IPO) and anything else bond related. One segment in particular that would be heavily DCM related would of course be… Public Finance Investment banking, this would be equivalent to raising bonds to pay for a new bridge, sports stadium or other publicly financed facilities.

Debt Capital Markets (DCM): *“Yeah I want to work in the bond market yo.”* 4x+ larger

So no one really says that last part, however that is the jist. In simple terms, if you work for a major bank you will help advise in buying companies for your relationships or helping sell companies to larger companies. The reason why this is the most “prestigious” piece of the sell side is that it is hands down the most analytical. Unlike ECM/DCM where valuations are simple, usually taking the high end of comps and sticking a price tag on there (sort of joking), you’re working to get two parties to agree on a price for an entity and at the same time convincing them that the combination will be lucrative. The reason why you’re going to be getting killed should be relatively clear, you now have two or three bosses, your bank and the Company you are advising who will have no problems emailing you last second for anything they wish.

Mergers and Acquisitions (M&A): *“I want to help buy and sell companies and work all night.”*

This one becomes tricky as you may work on everything from Equity to M&A. In this case you are focusing in a sector but are getting to see the various transactions from M&A to Equity raises (debt would be unusual). This is certainly a good fit for those that want to work in a specific sector long-term.

Industry Group (Medical, Technology, Consumer, Financial, Industrial etc.): *“I want to know a space.”*

Other groups can include restructuring, leveraged finance, specific M&A shops such as a Medical only M&A firm or Industrial only Advisory firm etc. The other category can be good and bad depending on the prestige of the firm and your interest level, just recognize that you’re becoming more and more niche.

Other:

With the basics out of the way, lets take a high level look at how you should view your career. In order to survive Wall Street long-term you likely want to The reason why we recommend this is because it is next to impossible to know how good you will be or how hard you are willing to work. It is quite easy to say “I can work 120 hours a week with a MD yelling down my throat no problem!” it is a whole different level . In addition, you may not like this space for the long-term and may want to jump to

start in a position that is most marketable.to actually do this and do it properlyresearch, sales, hedge funds, private equity or otherwise.

With that said if you’re looking for a in Investment Banking to kick off your career, start in Here is why:

transaction based job M&A or an Industry Group.

You will have the technical skill set to move to ECM, valuing M&A is more rigorous than ECM

If you start in an industry you will have a chance to work in corporate development as a plan B if you’re unable to survive Wall Street hours

Your hours will be higher in both of these groups relative to ECM/DCM ()

No pain no gain

You will quickly see your skillsets, if you are better at excel and numbers M&A may be good, if you’re better at working politics/building relationships it may actually be smart to go into ECM/DCM and build up a client base in the future

Now that we’ve cleared up some general guidelines when deciding on what to do within Wall Street there is one last thing that we should leave you with. You will eventually need to choose your own path and focus specifically on a sector to become an expert in. This could be as specific as being “the guy” for picking medical stocks in a global hedge fund portfolio, to being “the guy” as the investor liason for any consumer equity raises. At the end of the day, when you find your talents you zero in and become known for that space. Once this is done, you’ll unlikely venture out of the sector/product but we should note that starting out niche can be a terrible decision, as almost nothing you learned in college will be applied on the job. One final caveat would be an extreme passion in a space, in that case you’re certainly better off joining an industry group versus a general M&A group.

Conclusion: Without becoming niche you will never become rich.

Remember, you want to be marketable when you’re young followed by building a reputation or brand for yourself mid-career.

Good luck.

****

What Happens When You Execute With Efficiency

What Happens When You Execute With Efficiency

When I was in my I realized I had been lied to by a lot of people. They didn’t mean to spread lies, but good intentions do not change the facts. I always got good grades in college and high school and did what my teachers and parents asked me to do and didn’t complain. Yet I was $35k in student debt and living with my parents after my ‘help the world’ attempt in the Peace Corps (literally one of the things this blog warns against). Sure I had “helped the world” but I was now incredibly unhappy and mostly felt like a loser and was definitely not helping the world. I was further demoralized when I found that my $40k/year undergrad degree was not helpful at all in landing me gainful employment in my chosen college major–teaching and coaching high school–since those jobs were scarce.

mid-20s

I wish I’d had a better framework for success at the time (would have gone), but I at least had the sense that my current situation was a dead end. When I decided never to teach high school again, my parents and friends freaked and that was the beginning of me doing what felt like going against the grain (aka the masses).

right into tech sales

I knew I needed a change but I didn't know what. So I moved to a world class city, got a job at a top 10 restaurant, and proceeded to work and party. Leaving a shift every night with a fistful of cash, booze and women around was a recipe for hedonism and soon after, I found myself in credit card debt and unable to even pay my tax returns. The no-interest credit cards I'd taken out started charging interest and that made a bad thing worse. I turned 28 and had no 401k, and nothing to show for the life I'd led except a pile of debt. I had a moment of reflection when I asked one of the cooks at my restaurant (guy was 34) about his 401k and he chuckled and looked at me like I was nuts. Why would he save money? How would he buy beers after his shift?

It was tough at the time but I had to look myself in the mirror (final straw was a basketball game that dislocated my finger and I had no health insurance) and recognized It was a but one that I needed to accept.

*"I am no better than that cook, and if I continue down this path I will end up just like him."*blow to my ego

For me, the problem wasn't working hard or having the energy to work. I've always been a go-getter and willing to learn, even though I'm not the fastest learner. The problem was I had the wrong mentality. I wasn't channeling my energy into something substantial or building a client base. I was working hourly. Right around that soul-searching time there were three key mindset shifts that (finally!) occurred to me to put into action, thanks in part to stumbling onto this blog: They are not for partying your ass off 4-5 nights a week like I was doing. Your energy declines around age 30 so you had better set future you up for success. Nothing wrong with partying per say, but ideally you are combining it with work. If you are ever going to be rich you need to be not time for money exchanges. You must have a product or a client base to sell to. This is non-negociable. Even a consultant making $100/hour will be spinning their wheels if the end goal is early retirement. Most people over-research and don't just dive in, even most smart people. They'll ask a million questions but they won't take a risk and try a new job or endeavor, because if they fail that would deflate their ego.

1) Your 20s are for working your ass off:2) You *must* make more than an hourly wage:paid on performance 3) Most people don't take action:

With these realizations, I needed to put them into action ASAP. Luckily I was in a top tier city and I was able to get a job at a technology sales company no problem by charming my manager and talking about all the good things I did with the kids in the Peace Corps (hey at least it got me something). These jobs aren't that hard to get and starting salary was shit, but the commission was rife with potential… Six months after making it off the 'starter' floor I looked at the guy in the desk next to me and he was also 34 years old like the cook at the restaurant. But when I asked him about his 401k, instead of laughing he offered to take fifteen minutes and work through the math of how he wanted to retire at age 45. He was the first literal millionaire I'd met. This was obviously a stark contrast with the cook, but then again most of the masses don't give much of a thought to their 401k and many live paycheck to paycheck, convincing themselves that "money is the root of all evil." This is of course a way of protecting their ego from recognizing their own laziness.

I spent a lot of late nights the first year at the company while not really even making that much money, but it earned the respect of a lot of the other sales guys that I was in this to learn and was willing to put in the work. When they saw I was legit they took me under their wing and were as open as could be with all of their tips. Not only did they advise me in matters of my job, but I also soaked up their perspectives on savings, 401k etc, even life and time management. For example I will never wait in a line again for food longer than 5 minutes (pretty sure I read that on the twitter feed of this blog). I will pre-plan my day better than that. If you wait in a line for a half hour you are saying your time is worth less than $30 an hour if that food costs you $15.

I did my best to mirror what the upper tier sales guys were doing and make it my own style, and eventually was able to develop my own way of closing deals. I have a much more laid back personality, so the aggressiveness and frankness necessary for sales was not natural to me. After a while I got the hang of it by simply not giving up and reading a few books. As far as numbers go at year 1 I was at around $35k, year 2 $50k, year 4 $60k+.

At about year one into the job I kicked my side business into a higher gear. I quickly realized that with a few simple changes in my day I could put in . My commute was about 30 minutes each way, so that hour turned into the time I would personally message clients and gain rapport. Many were shocked that I was taking the time to do so. It also gave me a sense of accomplishment rather than just staring out the window or playing candy crush like most of the masses during their work commute.

at least 2-3 hours of work into the side business without even working before or after work hours

Secondly, I simply turned my work downtime into time for my side business. This was especially useful during slow seasons and holidays. While other employees were complaining about 'how slow it was' and how they 'had nothing to do,' I would simply nod my head in agreement and slip my noise canceling headphones over my ears to tune them out while I worked like a dog on my side business (as this blog has stated many times). As I became more efficient at my job and handling my client base, I was able to do more work for the side biz while I was at work. I'm pretty sure at this point companies don't expect a full 100% output from their employees anymore, given all of the distractions for the masses (smartphones, fantasy, dating apps, etc) so just do the opposite and work on something long term while everyone else is checking their losing fantasy football team's stats every ten minutes.

"Smile, nod and agree"

Another key factor in all this was that by the 2 year mark of working in tech sales, I was making enough money that I was able to take a . Those paid off big time. People have asked me about choosing a niche and as far as that goes, Efficiency explains better than I can with many ideas for a product. The key is to get started and fail two or ten times, however many it takes. Failure is not a bad thing this is literally part of the process for finding your niche.

risk on spending big for some ads for the side biz

Now, in my 30s I am not "rich" but I am not living paycheck to paycheck. I am on the brink of quitting my job as the side business is doing very well and I need to capture the momentum, which will require full time attention. It is not an easy gig but it is product and client based, skills I developed during my time in sales. Next year I am forecasting 150-200k gross, plus the gains are passive since it is product based so I will build on top of that the following year. When it comes to choosing a niche, some passive product income is necessary if you want to get rich.

I also feel very happy that if need be I can always fall back on technology sales since it is a high need area. I would definitely look to do enterprise sales as instructed in this blog. Wish I had done that at age 21 or 22 (you can get into tech sales with an associate's degree). If you are in a job and you are not sure about quitting or trying something else my suggestion is to look at the guy who is one rung on the ladder or so ahead of you and ask yourself

*"Is this who I want to be ?"*in five years

In my case I decided I didn't want to be working in a restaurant with no savings hooking up with 6's. Looking back it is clear as day that I made the right decision but in the moment there was a certain inertia keeping me from pulling the trigger on trying something new. If I hadn't dislocated my finger and had the issue pushed, who knows I might have stuck around for a few more years. Most people react to their environment and not vice versa but you can be different if you choose. It just takes some guts.

in five years

I recently went back to the restaurant I worked at and, without prompting, the few people who I knew from my time there came up to me and gave a laundry list of reasons why they were still working at a restaurant. I didn't ask them what they were up to. It wasn't even on my mind to be honest. But they felt the need to defend their choice to remain in a dead-end situation. This was a red flag they had something else on their mind they should be doing.

This is indeed the greatest time in history to be alive, and all the negativity we are bombarded with is shocking. Nod, play dumb when necessary, and do not waste time trying to change the minds of idiots.

One question I've wondered about is why WSPs keep this blog? Like the writers of this blog, I am floored that more people don't just do the things written here and get their life in order and flood the market. But as I become more successful, I have started being asked by a few people in real life "how did I do xyz". I tell them, and often they nod with a glazed look and I know what they're thinking: "But that sounds so hard. I could never do that."

You can do it but you won't do it because of any rah-rah motivational post. Work on being a producer not a consumer on your down time and you will be surprised how far you can go. And read Efficiency – I wish I had read this book at age 18.

What if Game was a Category in Jeopardy?

What if Game was a Category in Jeopardy?

Alex Trebek is ready to start the show and for some reason "Game" is the drop down category. You sit back and smile. By god almighty if you don't sweep this category you're going to be back handed by your boys when you get home.

Lets start with some $200 category questions shall we? Alex Trebek gets on stage… You are selected and state…

"Game for $200 please"

1) This permanent mark suggests the girl has slept with 20+ men. "What is a Tattoo?" – correct for $200!

2) This night is the easiest day of the weekend to get a one night stand. "What is Saturday night?" – correct for $200!

3) This t-shirt is worn by weak competition on a night out. "What is a striped collared shirt?" – correct for $200!

4) This object is used to pay for drinks by beginners. "What is a credit card?" – correct for $200!

5) A man with no game will place his hands in this area while standing at the bar. "What are his pockets?" – correct for $200

Alright, this was too easy lets go to the $400 questions shall we.

"Game for $400 please"

1) This day is chosen for maximizing your date during the week. "What is Thursday Night?" – correct for $400!

2) This ethnicity will have selfies taken in a car. "What are Latinas?" – correct for $400!

3) This ethnicity will have selfies taken in a bathroom. "What are white girls?" – correct for $400!

4) Both Asians and White girls will purchase this smartphone. "What is an iPhone?" – correct for $400!

(Note Samsung for Latinas)

5) If a girl contacts you out of the blue she is looking for this. "What is sex?" – correct for $400!

Lets move on to the harder questions,

“Game for $600 Alex”

1) This ethnicity is most likely to touch your chest on the dance floor. “What is a white girl?” – correct for $600! (Note Latinas usually flirt with a knee touch when sitting and Asian girls will more likely do a light jab on your shoulder)

2) These two statements are made when you get a girl back to your place. “What are ‘we’re not having sex tonight’ and ‘I’ve never done this before!'” – correct for $600!

3) This can be used as an opener for both day and night game. “What is an assumption?” – correct for $600!

4) This metric is used to determine if your proportions are aesthetically pleasing. “What is the waist to shoulder ratio?” – correct for $600!

5) This ethnicity is most likely to text with proper grammar. “What is an Indian girl?” – correct for $600!

Getting to the home stretch here,

“Game for $800 please”

1) This color is best used as a pocket square to draw attention at night. “What is red?” – correct for $800

2) This shirt will work for all game scenarios, day and night. “What is a fitted white collar shirt?” – correct for $800

3) This message is best used to spark or restart a conversation. “What is a picture message?” – correct for $800

4) This is the most effective statement to close an American girl you meet at night. “What is ‘lets go.'” – correct for $800

5) This ethnicity sends the most emojis, emoticons and smiley faces. “What is a Latina” – correct for $800

Final section of the game, let’s close it out strong here.

“Game for $1,000 Alex”

1) These two drugs and five types of alcohol will help you the most in attracting 7+s. “What is ecstasy, cocaine, vodka, champagne, wine, beer and rum” – correct for $1,000 (long answer for that one… you should be sweating now)

2) After this event, condom usage for women declines by at least 3x. “What is college graduation?” – correct for $1,000

3) A girl enters her information into your phone. After seeing this item you know your chances of hooking up are high. “What is her last name?” – correct for $1,000

4) A girl mentions her ex-boyfriend before you’ve had sex, your chances of hooking up are now this. “What is zero mother f****** percent” – correct for $1,000

5) You can begin teaching game when it takes you X days of going out to obtain a new notch. “What is 7 days?” – correct for $1,000

Ahh screw it lets have some

daily doubles.

1) These colors should be used for your first suit. “What are navy blue and grey?” Correct!

2) This is the minimum percentage tip used to lock down a bartender. “What is 50%?” Correct!

3) If you are in a mini relationship this is the maximum days per week you should see each other. “What is two?” Correct!

4) A girl claims she has slept with 5 men in her life, this number represents the truth. “What is 15?” Correct!

5) Two 7s are in a restaurant with their boyfriends, you should observe this man for 5 minutes before leaving. “What is the ugliest guy?” Correct!

… The question flashes up.

Final Jeopardy

This is the easiest city in the United States for Game. “What is New York City” – Correct!

How did you do in Game Jeopardy? We may need to make this more difficult…

****

What Information Do You Need?

Most of our writers have been on vacation for the last week and will be returning. We’ll be writing up an article on anything you are interested in. Leave a comment or shoot us an email and we’ll write up an elongated answer on September 22, 2013.

To kicks things off, do you need a post on any of the following:

Personal capital allocation policies?

Usefulness of XYZ degree?

What Life is like in IB/HF’s/Research/PE?

Valuation of XYZ sector?

How to get a job on the Street in a single post?

When to leave the Street?

Let us know.

What is a Regular Person?

What is a Regular Person?

Cutting straight to the point, a regular person is someone who should not bother . They should immediately close the browser and go to a motivational seminar or spend their money on self help books written by unsuccessful people. If they are really ambitious, they can go ahead and update their resume and find another hourly or salary job that requires no change in responsibility or skill-set.

reading this blog

In short? Regular people should be avoided at all costs and you can see the impact they can have on this blog alone. For one reason or another, traffic has tripled here (again), we have to automatically mark hundreds of comments as spam (again) and for some reason they think this blog is written for them (it isn’t). This post is going to go borderline “nasty” in commentary towards regular people in an attempt to kick them off the website forever.

Regular people simply *slow you down*.

No joke, they are impressed by this. Regular people believe that $3,000/month while doing nothing is an “accomplishment”. They believe that it is obtainable by starting a website catered to other imbeciles like themselves and that it will free them up to “see the world”. In reality? $3,000 a month doesn’t even pay for rent in a major city and should be achieved well before your 30th birthday. Think about it. Even at 7% returns all you would need is just over $500K to hit this marker.

#1 Regular People are Impressed by $3,000 in Monthly Passive Income:

You would think that a regular person would be failing day and night to improve his current circumstances. But. In reality, he is busy being an expert on everything. You can compete professionally in tennis but somehow he will claim that he gave up his “potential” way back in high school. He “could have” been in the same position as you if he “wanted to”.

#2 Regular People Never Fail:

Since he has never accomplished anything… but… believes that he will be “successful in the future” he passes on more non-sense advice to anyone who will listen. He will give you advice on fitness (never even competed in college), money (doesn’t even make $250K), girls (he was the “man” in college) and your career (hasn’t gotten promoted in 5 years). Never challenge any of his ideas because he will get extremely upset. Much better to smile, nod and agree.

#3 Regular People Pass On Bad Advice:

Lets draw the line at tier 3 and above Wall Street professionals. This means you do not interact with retail clients at all. In short? Wall Street employees don't even interact with regular people on a work basis let alone care about their pocket books. Wall Street is a fee based organization and a performance based entity as well. No employee on Wall Street is interested in squeezing out $50 from a guy who makes $100K a year. It is a waste of time. Front office Wall Street employees are only interested in major institutions and company management teams. A regular person's Scott Trade account isn't even on the radar.

#4 Regular People Believe Wall Street Wants to Rip Them Off:

Since regular people are smarter than you when it comes to… well… everything. They deserve the best. This means they have no problem ringing up hundreds or even thousands of dollars of credit card debt. In addition? They have the audacity to complain when they are charged late fees! They are living well beyond what they can afford to purchase but… because they "deserve it"… they believe all fees should be waved.

#5 Regular People Live Above Their Means:

This is a major hint for those of you looking to make money. If you want to start a finance blog catered to the masses create one where you claim you were "up to your eyeballs in credit card debt but figured out how to solve your problems using this one quick trick!".

If you want to target the masses (idiots) you need to write extremely "moving pieces". The best example of a way to speak to the masses is Steve Jobs' 2005 commencement speech at Stanford University. It had everything lined up perfectly to go viral with "regular people". People saw the word Stanford and thought they were getting a sneak peek at "elite" advice. Of course Steve Jobs realizes he is on stage being recorded so his *audience* is really *the world* not just Stanford university students. So he created a pump up feel good speech that went viral. No doubt this helped his product sales. For those that actually read his book? You'll realize he was a tyrant just like the vast majority of successful people. Beautifully delivered and well marketed.

#6 Regular People are Emotional:

If you want more examples of how to communicate with regular people, just pull up videos of viral motivational speeches. These are all targeted at regular people.

The difference between elite and regular is subtle. Elite people adapt to their environment while regular people are *impacted* by their environment. Regular people are easily swayed by the opinions of strangers. Therefore, a new environment will actually change the way they think. . They are too scared to stand out so they will blend into whatever crowd you put them in.

#7 Regular People are Influenced by Their Environment: <u>Regular people are essentially chameleons</u>

Alternatively? Elite people will *adapt* to the new rules they are handed. Instead of simply trying to fit in like a chameleon they will figure out how to succeed in the new environment regardless of what other people are doing.

The difference between regular people and elite people is this. Regular people lie *up* elite people lie *down*. If a regular guy claims to make $100K a year he probably makes closer to $80K. Meanwhile. If an elite person tells you he makes $80K he probably makes $250K+. He is just giving a low ball number to avoid answering questions all day.

#8 Regular People are Liars:

Of course there are new money elite people who like to flash cash, however, most rich people enjoy hiding their wealth. They have already been "hit up" for loans and favors by their closest friends and relatives so they decided to simply hide it.

Try and poke around for clues? They won't have any interest in giving you information unless they find a way for both of you to benefit.

Another false assumption. Rich people are generally extremely logical. If you ask for a favor that you know he can easily do and he says "no" this does not imply that the person is mean. Instead? It implies that he has no reason to grant the favor.

#9 Regular People Believe Rich People Are Mean:

Regular people expect hand outs and this is exactly why a rich person is never going to say yes. A smart person who is good at networking is going to ask for basic advice, execute on it and show results before asking for any hand outs.

Regular people expect rich people to simply give them something for "knowing them". No joke. This is how they think. If they simply know the rich person they believe this entitles them to some sort of income.

If you meet a regular person in 2015 and run into him in 2017, you will be talking to the exact same person. His income probably went up by 3-5%, he gained or lost 2-5 pounds and his face is slightly narrower due to the increase in age. You don't have to ask him what he has been up to because he can summarize his entire two years in five minutes. He went to work for an hourly wage or annual salary. He hit the gym a few times but quit. He read a couple of self help books. The end.

#10 Regular People Rarely Improve:

It is very easy to tell when you're dealing with a regular person since his life never changes. It's the same story every single year and he has the same "accomplishments" to hang his hat on. The only difference is the accomplishments are now 2 years further in the past.

Over the last 10 years we have seen nothing but massive economic opportunity. Sure some cities have seen more benefits than others. But. Life in the USA has gone no where but up and to the right. This of course assumes that your life has improved. Regular people live for the past because they don't think their future is going to be any better. In short, avoid anyone who talks about the past. No one talks about the past if their future is brighter.

#11 Regular People Long for the Past:

This is what inspired this post in the first place. We missed a full post because of all the terrible questions and emails we received. Regular people cannot even ask a question without giving their life story as a back drop. Classic ways to tell if you're talking to a regular person:

#12 Regular People Ask Terrible Questions:

1) "Wow really great post I just had a quick question…. 10 sentences later… what are your thoughts on this" – We don't care about your life story. No one does.

2) "I read this book written by so and so what do you think" – It doesn't matter what we think. Reading more than 1 book every two months is a waste of time. Try the philosophies you learned and see if it works. That is your answer. If it doesn't work then it was a terrible book. If it does work it was a great purchase.

3) "What do you think is going to happen to the economy" – We don't care again. Even if the S&P 500 goes down by 50% it won't change our lifestyles at all. Funny enough, in the comments people said we were at the peak. Of course the market is up another 20%+ since then. Again. Even if it corrects down by 50%,

you should be running a company, so it will be meaningless anyway.

The easiest way to sell a regular position on a wage slavery job is to tell them that it pays extremely high on a "per hour basis". Once they believe that it is is the best position in terms of time for money exchange they will sign the dotted line. Why? They want to do the minimum. Without actually creating any value they believe that their time is valuable (it isn't). Instead of creating enough value around them (forcing their time to become valuable) they assume that their time is valuable from day one which leads to a life of mediocrity.

#13 Regular People Do the Minimum:

Since regular people refuse to create anything they will naturally avoid any revenue generating positions. They do not like risk or creativity. This is a given. Instead they expect to be handed a pamphlet that says do X then do Y then do Z. Make the pamphlet incredibly detailed so a robot could do the exact same thing. Then they will complain when a robot takes their job.

#14 Regular People Like Rules:

Naturally, if regular people dislike creating and thinking on their feet they will hate sales. (remember regular people never fail!) so this goes against their core belief system (they are "special").

#15 Regular People Hate Sales: Sales requires a person to be rejected hundreds of times per week

Regular people gossip more than soap operas. No joke. Since nothing is going on in their lives they will track your life like the CIA. In fact, even if you obtain a promotion at a different Company for the split second they find you "left" they will barrage you with emails and texts about how they "knew you were going to fail" (they assume you were let go). If you are on social media (you shouldn't be) then this will be amplified 10x when your Linked-in profile is changed.

#16 Regular People Are Waiting for You to Slip:

The bigger the divide between you and regular people becomes, the more they will hate you for it. They don't have the guts to tell you to your face and instead will try to find ways to take you down. It is much better to build a large moat around your life instead. Blend into the crowd, don't flash anything and avoid giving out information at all costs. Notably, even if you live in an upper middle class area, continue to do this since you may find that there is a large divide between you and your neighbors as well.

#17 Regular People Hate It When You Succeed:

They are simply boring. Boring type A people that you would never want to spend your time with. They are so easy to figure out that you can have a single 15 minute lunch with them and know that you have no interest in meeting them ever again. Is this judgemental? Yes. Is it true? Yup. You can box up a regular person within fifteen minutes (tops).

#18 Regular People Are Not Interesting:

This one is by far the most humorous. If someone is easily influenced by their environment then they are not socially aware by definition. We're extremely aware that this blog has been raided by regular people over the last 2 months and have no problem calling it out and losing the "traffic" since it is junk traffic to begin with (we also know where it is coming from). Regular people believe they are smart and make their own decisions (thinking they are socially aware) but instead, the same tired old "tricks" will work on them. Look no further than the ad space on yahoo to prove this theory to be true.

#19 Regular People Believe They Are Socially Aware:

Finally, regular people are easily upset. You can tell them that their favorite character on XYZ sitcom died and they will actually cry or become unhappy. In fact? Regular people may even hate an actor or actress if he is a Villain on a TV show! It isn't even real!

#20 Regular People Are Easily Upset:

Things like this are beyond comprehension for most of our readers (the ones around a few months ago).

—-

With the rant over, we are going to allow comments for a total of 5 days before they are automatically shut off to avoid seeing more "comments" and "questions" from the regulars. We will search for an intern or someone else to monitor the comments on a weekly basis (we hope to have a solution by the end of the month).

In the mean time, since we're clearly annoyed, feel free to fill the comments with bashing of regular people! They have temporarily ruined this blog so may as well get some entertainment out of it!

What is Decentralized Finance and Yield Farming – Easy Quick Read

What is Decentralized Finance and Yield Farming – Easy Quick Read

For one reason or another, we're getting a lot of questions about decentralized finance. Typically when a new industry is created, it is quite difficult to explain as most people are not involved. For example, the number of people who know the difference between bitcoin and ethereum is likely small. For fun we'll go ahead and explain what it does and that will then explain why we recommend going into tech instead of finance if you have the choice. Again. M&A is still around but we'd encourage you to avoid moving into capital raising activities.

In simple terms, we've found a way to make digital money that cannot be replicated. There is a lot more to this but that is one of the main ideas. Before, if you got a digital item it was easy to copy/pirate and send around. Photos, videos, music etc. While many will disagree and say it won't work, we have to go ahead and assume it does work. Otherwise the next step will not make a lot of sense. So we're going to assume that these crypto items (Bitcoin, Ethereum etc.) are worth something and can be used as money. If you believe they are worthless, then simply put that view aside for a second and read on.

Reminder of Basics:

If we have digital currencies that are secure, we could in theory let people borrow them. So if you own a single bitcoin but don't need to use it any time soon, you could lend this bitcoin to someone else and charge them an interest rate. We're not going to explain how all this stuff works since it's a headache. Just imagine you're holding onto one bitcoin and you don't need to spend it for the next year or two.

If We Have Digital Money, What Does this Do?

So instead of spending it, you create a loan with someone else who needs the bitcoin. Again. Assume that there is a small economy where bitcoin is accepted as a form of payment.

What you do is simply create a loan that says "I will give you 1 bitcoin if you give me 1.02 bitcoins back in the future". A easier and more intuitive example is a collateral based loan. So you borrow $1,000 US dollars and you let the person hold onto your 1 bitcoin until you pay them $1,050. If you don't pay them, and the loan balance keeps going up $1,100 to $1,150 etc. the person is able to officially take your 1 bitcoin (the person defaulted on the loan).

Now we can move onto the next set of implications here. If we can agree that a bitcoin/ether etc. has value and isn't worth nothing, this means we now have a peer-to-peer loan market (Uber but for loans). So you can run around this network and find the best interest rates and make a return.

Assume This Works:

So if you have one bitcoin and want to make a return on it, you can loan it to person A for 10%, Person B for 6% or Person C for 8%. Well all else equal you're going to loan it to person A so you can generate a higher return for yourself. You get to keep your crypto and earn a return on it as the coin is returned to you if the person fails to make a payment.

Since this is a peer to peer market, you can see how demand will change for certain coins/currencies. If the demand for Bitcoin is extremely high then you can probably get a high rate of return by lending it out. If there is high demand for ethers, you will get a higher rate of return for ethers. Now for those that are actually following the space you'll recognize that this isn't exactly what happened or how it works but we're really attempting to bring it down to the basics/high level concepts.

This part is extremely complicated for those that are not involved in the space. In short there are pools of money. So if you want to lend out your bitcoin you would actually put it up in a large pool of money that has bitcoins, ethers, etc. This pool is accessible by people who want to borrow the assets. Hate repeating ourselves, but this isn't exactly how everything works in perfect detail, but the concept is the same.

Yield Farming: *In addition, a lot of the pools then issues tokens that paid people for holding their crypto assets within the pool.*

So if you have different pools of money with different return profiles and each pool incentivizes people to leave their money there, you can see how the returns will be volatile. If you know Pool A offers a return of 10% and Pool B offers a return of 20% you're going to choose Pool B. That is level one thinking. Level two is that you could then in theory borrow from pool A and lend to Pool B. Since you have to pay 10% interest to borrow but can collect 20% in Pool B that's a 10% return on "borrowed money".

Well this all sounds good but who in the world is executing all of these loans/contracts? That is the point. It is done by code. Before, you had to go to an intermediary that would set all of this up based on a set of rules/laws. The rules/laws for liquidations and payments are all made with lines of code. We'll let the reader decide what this means for a lot of services we have today.

One Big Elephant in the Room:

Right now the vast majority of all loans are made using the Ethereum blockchain. Individuals send their bitcoin/ether etc into a pool of money to earn a higher return. By having it in that pool they may earn additional rewards for using that system. Since the space is new there are extremely high rates of returns. If you move money around in the system aggressively you can see yields upwards of 100%.

Explanation with Correct Wording:

To be clear here, the higher yields usually involve a ton of risk and that is no different here. If you decide to borrow from one pool and put it into another pool, if the price goes down/collapses you could get liquidated in a matter of seconds. Any time you see extremely high returns you should acknowledge that risk is typically high as well.

Straight to the point: if this works you are the bank. You don't need legacy banking services if crypto assets are able to function as currencies. You get to decide if you want to make loans (letting people borrow) and you can even decide on the interest rate. If you are asking for too much you won't get any interest, if you offer an interest rate that is extremely low someone will take the offer quickly (worldwide).

For Those That Need Direction:

Addressing Confusion!

In basic terms how this works. You put up $10K in bitcoin as collateral. You don't want to sell your BTC but you need cash to pay for something (the cash is really USDC/Tether etc. but just imagine physical cash so its easier to think about).

Well you cannot borrow $10K. Why? Because if the price drops the person who lets you borrow $10K loses money.

So you can borrow say $2K at an interest rate you two agree upon. Therefore the contract held on the internet holds your $10K and you have to pay $2K back plus interest to get your bitcoin back. If you don't pay and you owe *close* to what bitcoin is worth, you get liquidated and the person who loaned you the cash gets your bitcoin.

This is done automatically without an intermediary, credit worthiness is a dead concept because you two agreed upon the rates. You decided to take the loan at X% and he decided to give the loan at X%. If you fail to pay you lose your Bitcoin to him and if you do pay, you get your bitcoin back and never had to sell it.

****

What is Money? Fiat & Non-Fiat

What is Money? Fiat & Non-Fiat

For fun we decided this is a good time to explain the function of money. We use it every day. It will also explain why we're always going to hold some gold/crypto even if both assets went to zero (extremely unlikely in our opinion). "Money" is essentially a solution to the coincidence of wants. In simple terms, money eliminates the barter system and in theory is supposed to hold value over time (ideal situation). So we can walk through what money is and why you should never have 100% of your assets tied to one "type of money" be it the US Dollar, the Euro or even Gold.

Without money, you have a hard time making efficient markets and creating consistent trade. For example, it is unlikely to walk around during the day and find someone who is willing to fix your car in exchange for four Apple iPhones. Maybe this happens once in a blue moon, but it's not a good system since you have to search for a person who wants the 4 iPhones in exchange for car repairs. With a standard accepted form of money, be it cash, gold, bitcoin or otherwise, you have at least created an asset that represents the medium of exchange. IE. if everyone accepts one of the forms of money, everyone "pegs" their services to this asset and the markets become a lot more fluid for trade/transaction. In our view, this is the most important use of money. If people accept any asset as money, it's winning in a big way.

Coincidence of Wants:

Small amounts of Inflation is not a big of deal. Why? Well anyone who owns assets (homes, stocks, etc.) will not be impacted by inflation. If the price of all goods rise, that means the price of your asset will rise as well (over the long-term). If people want to argue with this just look at inflation and compare it to the price of the average home (national comment, do not cherry pick) over 30+ years.

Onto Inflation:

The next step is understanding the upside and downside of inflation. The *upside* of inflation is the part that no one talks about (mentioned above). If you buy a home for $200K, and put down a $40K downpayment and *borrow* $160K this means 80% of the home is borrowed money. Now if you are *borrowing* money do you want the debt to be inflated away or do you want deflation. Of course you want inflation. If the price of the home rises by 3% per year (in-line with inflation) and the debt amount remains flat, you're making money. Why? It means the $160K you borrowed on day 1 is no longer worth $160K it's actually worth less… inflation eats away at the money you borrowed.

The downside of inflation is the one that everyone is aware of. If you are unable to acquire assets and have all of your net worth in cash, it means you will be worth less at the end of the year. So if your average joe saves $10K in a year, he will have the buying power of around $9.8K by the end of the year (we're making up an example). So by sitting on cash under his mattress he's becoming poorer.

Since we like to summarize things in single sentences: . If you knew that the price of food/water is going to go up 20% next year, you'd stock up. If you knew the price was going to fall 20% next year, you'd spend a minimal amount and wait (quite simple!)

1) inflation incentivizes spending the money and 2) deflation incentivizes saving the money

Here we're going to open up a debate. Something for everyone to think about. In our opinion, the ideal money is able to act as a form of money *world wide*, the value slowly erodes at a rate of 1% and there is no debt associated with the money. In an ideal world, there would also be a second type of money that is also accepted *world wide* and *maintains* its value exactly and has no debt associated with it.

What is the Ideal Money:

Since we don't live in an ideal world, the biggest component is world wide acceptance followed by a minimal inflation/deflation associated with it. Again. In our opinion, you want some inflation otherwise you can't create . With a minimal amount of inflation (1-2%), you force individuals to become 1-2% more productive per year to maintain their lifestyles. This seems reasonable since you want to incentivize talented people. The smartest people in the world should be incentivized to take on some debt and create products that will make the world a better place. The last thing you want to do is incentivize the smartest people to stop working entirely and go live on a private island.

productivity

By making sure the value of the money erodes slightly, you force smart people to think of ways to make the money more productive. Investing in new ideas, products, services etc. This drives up productivity and increases tax revenue for your country. If individuals in your country get richer, they pay more taxes (of course!) which is good for your government. As our wealthier readers know, mid-low income earners don't actually pay anything in tax (they have deductions etc) while the wealthy pay the vast majority of all taxes.

Moving onto how the world operates today. Right now about 60-65% of all global reserves is the United States Dollar. The US Dollar is the reserve currency as the economy is the largest, we're open to trade and we have a highly democratic organization (polar opposite would be something like North Korea). Even if a country has the largest GDP, they need to be a trusted trade partner and open to interactions otherwise there is no reason to use the currency worldwide.

Reserve Currency and Worldwide Problems in a Nutshell:

If your country is the reserve currency it means one simple thing: you will act as a net importer of goods. Why? Well if everyone uses your currency as the trusted transaction vehicle, the demand for your currency is the highest. So if the US dollar is used for deals between the EU and South America, they would need to buy or hold US Dollars to make trades. Since it's the global reserve currency, the value of the dollar remains strong and it becomes harder for the US to export items to other countries. This intuitively makes logical sense.

Now we're going deeper into the rabbit hole. This all seems fine until you have a massive global pandemic that causes businesses to freeze. These businesses are not making money and cannot pay their debt. Guess what. Their debt is likely denominated in US Dollars. Why? Well, if the vast majority of transactions are created using the US dollar, they need to have loans taken out in US dollars. Meanwhile everyone is trying to sell assets to covert into US dollars, making the dollar stronger.

Enter COVID-19 and Shattered Supply Chains:

Since the prior three paragraphs pack a ton of information into a single place, think about the following process: 1) US dollar is reserve currency, 2) companies and countries globally use the US dollar for the majority of transactions – international trade, 3) since interest rates have been low a lot of these companies have a lot of debt, this debt is naturally denominated in US dollars as this is the currency needed for trade, 4) COVID-19 causes the global economy to pause/halt for 3-6 months so far, 5) companies and individuals have to scramble for money to pay off their debts so they 6) this means the demand for the dollar goes up making the debt even more expensive for the foreign country and finally 7) the US government steps in to print a TON of money to try and devalue the dollar and prevent the death spiral from continuing.

sell everything in exchange for USD;

On crypto twitter (and gold twitter), you'll see the meme "Money printer go Brrr". Now you understand why they are printing the money. The government is attempting to stabilize the global economy by printing the difference in lost GDP. We can argue about the *correct* way to do this but the step by step should make it clear.

We've done our best to explain money in a short post. If you think about the investment risks present in your life you think about the following: 1) stock market corrections, 2) single company investments that could go bankrupt, 3) sudden drop in demand on levered investments like real estate, 4) sudden loss of property due to a natural disaster – need for insurance and 5) business competition and potential career loss.

What This Means for You:

Few (if any) think about sudden currency devaluation. We don't think about it in the United States since we're the reserve currency at this point in time. Countries like Argentina, Venezuela, Lebanon and many others would understand this risk. So. You as an individual should never have 100% exposure to a single currency. US Stocks, US Bonds, US currency are all based on a single nation. Instead you want to own a form of money that isn't tied to the same nation. You can do this by buying a small amount of fiat (government currency) in other nations and by buying an asset like gold and bitcoin which is not tied to any sovereign entity. Gold, Bitcoin etc. are insurance against Fiat collapse in your country.

For some historical context, reserve currencies last for ~100 years or so. Gold (since it is not tied to a government) has been around for many hundreds of years and Bitcoin is a new "digital gold" that has been around for just over 10 years (a drop in the ocean). While many will laugh at the 100 year comment, the last major worldwide pandemic was also about 100 years ago in 1918-1919 with the Spanish flu. For fun, the US dollar has been the reserve currency for around 76 years if we use the Bretton Woods agreement as the official start of the US dollar becoming the world's reserve currency.

Fiat money is government backed currency. Since most governments are in debt (just see the US debt clock website:). It is clear that there is potential for the currency to collapse. From a "business perspective", taxes are a contribution to your government for the services they provide (school, infrastructure, defense etc.), think of it as a subscription based payment for residing in the country/state.

Moving onto Fiat Money: https://www.usdebtclock.org/world-debt-clock.html

With this in mind, it means that countries with high debt/GDP ratios are at risk. Check out this simple website: . As you can see the countries that had high debt/GDP ratios are also the ones at risk for default (general comment) as Lebanon saw currency collapse, Italy has been on the brink the last few years and the Cyprus collapse is well known.

https://worldpopulationreview.com/country-rankings/debt-to-gdp-ratio-by-country

This basket includes metals and crypto currency. Gold, silver, copper, palladium etc. can be used as a form of money as it dates back hundreds of years. Crypto currencies can be used as money in niche instances (also not backed by a government). The strongest counter argument to crypto currencies has been their reliance on adoption. IE. unlike gold/silver/copper which have real world use cases, crypto currencies need to rely on pure adoption to drive growth. Unlike commodities which can have underlying demand (used for industrial equipment).

Non-Fiat Money:

Using gold and bitcoin as comparisons, gold is hard to transport, can be faked (see the latest China scandal) and is arguably less secure (easier to steal). Bitcoin is significantly easier to transport, cannot be faked but does not have a real world use case beyond "transfer of value/store of value". IE. if people stop using bitcoin entirely (we think next to no shot of this happening), there is no other use case. Gold can be used for industrial applications even if it's no longer used as a store of value or type of money.

With a basic understanding of the two types of money: fiat and non-fiat, it is difficult to see a complete collapse of fiat money in our lifetime. It would require a complete global overhaul. That said, it is extremely likely that we see continuous "fiat currency collapse". IE. 1-5 countries default and their currencies collapse. This leads to *some* ownership of non-fiat currencies over a long period of time. Also. If the global collapse occurs, you'll own the insurance which is non-fiat money.

The Broad View:

With the summary of money out of the way and why everyone reading this should own some gold/crypto, we're ending on a positive global note. It has been a tough year but we feel like we're hitting a turning point. We'd be lying if we said we thought it would get this bad but here we are.

Feels Like a Turn:

The good news? As of July 4, 2020, it seems that we're starting to hit a bottom in terms of *morale*. More bankruptcies will occur, however, it feels like we're starting to get comfortable with the end result (high single digit to double digit unemployment for the near/medium term). The last stage of grief is setting in and the majority have accepted the results. This will lead to corporate restructuring by the end of the year (Q4 or so) and then we're back to rebuilding (likely a 2-3 year rebuild similar to 2008-2011 where it took three years to really get some confidence back).

Make no mistake, more bankruptcies will come. And. . That is the key to rebuilding.

We're prepared for it this time and don't have unreasonable expectations

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life.

****

What is Rich?

What is Rich?

While we no longer answer questions on this blog we continue to receive this one over and over again. We'll go ahead and answer the question and as always, no one will agree on the definition. But. Lets get started.

Definition: *"A rich person is someone who have to work will be happy for the rest of his life."* does notand

The second part of the quote after the and is significantly harder to achieve than the first piece. We'll start with the part of becoming rich first… Money.

easiest

Part 1: Income Related Needs

For most people, this is the reality. While it appears to be a lot of money for a college aged student, a million dollars doesn't go anywhere if you were successful as an adolescent in the first place. Assuming you wanted to get the most out of your life, living on $40K a year in Flint, Michigan probably isn't on the to do list. Ambitious people do not enjoy sitting on the beach every single day drinking Mai Thai's… Watching their body degrade over time. This leads us to the second issue in answering the question… Your location will materially impact your financial needs for being "rich".

A Million Isn't Enough:

Before someone tries to reach the definition of rich (financially), the primary problem is finding a city or cities where you'll be happy to live over the next 40+ years. The result of this problem is the need to travel to at least ~40 cities over the course of 10 years (hence no reason to buy a home in your 20s). Even with that backdrop, most find that they will prefer a dual city life living half the year in city 1 and the other half in city 2 (New York and Buenos Aires for example)

Location or "Locations":

This is where the math becomes extremely complicated. If you're only able to cover food, shelter and your utilities, there is no way anyone outside of a Buddhist monk will be happy. With a list of several well off individuals, it seems the baseline is ~3x or more of monthly rent would cover lifestyle/entertainment expenses. Notably, we're using the phrase rent to refer to the cost of living in a place you may own (IE: at least ~4K/month – multiply by 3x – for a 1 bedroom in soho, even if you own the property outright)

Lifestyle Expenses:

The last real item on the list is a *growing* Healthcare & Disaster Recovery fund that remains untouched. This will make it next to impossible for you to eat into principal (let's draw the line at ~$500/month minimum or $6K per year per person).

Healthcare/Disaster Recovery:

Summary Examples:

Very likely to describe the vast majority of our readers at this point. We aggressively spam comments and keep the haters off of here so it generally results in a readership similar to the one we've tailored to.

Bachelor:

Low 7 figure net worth. Lets assume $2M (minimum). At 5% returns this is about $100K per year. We'll assume a 20% tax rate getting us to $80K per year. At this level you can live a great life in 99% of cities in the world (let's cross off the top 10 or so from an expense perspective) and it would look something like this:

The Stats:

A single guy in Austin, Texas: $6,666 a month income – $1,500 "rent cost" – 3x ($1,500) – $500 healthcare = $166 remaining for wiggle room.

—

Forone reason or another, it seems that most individuals who successfully sell or create a small to medium sized business (SMB) tend to have a family or a spouse. This post is not going to bother giving an answer as to why or if it is a good idea (since there are always exceptions). Instead we'll just crunch the numbers.

Successful Business:

A successful business that has been sold should generate . This brings in $250K in cash flow or $200K in after tax money if we continue with the rough 20% tax rate.

The Stats:a net cash *event* of ~$5M

$16,666 per month – $3,000 rent cost – 3x ($3,000) – $1,500 healthcare. This leaves about $3,100 a month for raising a young boy/girl in a top tier public school (or home schooling).

Family in Los Angeles:

In short, the bare-bones minimum to start on the definition of being rich is around $2M in cash/liquid assets within a 2-4 day settling period. Importantly, as mentioned at the beginning of this post, getting the money is the easiest part of becoming rich. We stated above that being "happy" is the part that most will struggle with. There are many financially well off individuals with nagging wives (looking at you *many* lawyers and bankers) and there are many rich engineers with negative social skills (just go to a tech city). All of this aside, the second hardest item to obtain is a healthy mind and body which is part two of becoming "rich".

Summary:**financially**

Part 2: Physical Health Related Needs

Unless you were born into a wealthy family (good for you!) chances are your body is used to consuming garbage to put it bluntly. Fast food, boxed microwaveable meals, canned goods, pastas and so on. Many people in the United States (roughly half) are overweight and continue to shorten their lives by consuming garbage on a daily basis. Slowly killing their bodies.

Retraining Your Tastes:

The gut is the second brain because it tells your body if you're moving in the right direction. In fact, if you're not well off financially as of today (which is fine) we would suggest *starting with fixing your diet*. You'll gain more energy and focus than you can possibly imagine by simply fixing what you consume.

There should be *no thinking* involved when it comes to walking to the gym. (more likely some form of exercise twice a day! Yoga and lifting for example). Building your body is literally no different from building a Company. If you put in the work every single day when you are older you will continue to reap the benefits even as your body slows down. Muscle memory is absolutely real.

Daily Exercise:*Similar to brushing your teeth you should be doing something physical every single day*

You do not need to be 5% body fat and lifting a new personal record every month. However. You need to feel energetic. You should be bouncing off of walls relative to your age suggesting health and vitality.

This section is *not* for people under the age of 25. If you are under 25 your body can take an immense amount of punishment. Those that are under 25 should continue to push as hard as they possibly can because the tank refills so quickly there is practically no such thing as "over training" or "over working".

Recovery:

Once you surpass the age of 25 you should *know* your limits. If you don't know what your limits are at this point then you did not bother working hard when you were under 25. This is "mean". This is also true. Eventually you find your breaking point on when it is 1) time to step away from the computer, 2) time to avoid that extra rep and 3) time to stop chasing that sales lead. This is simply called experience.

We don't know what the breaking point is for you. It is probably much later than ours to be honest, which gives you a competitive advantage. But. Some breaking point signs include: 1) Discombobulation: Where you are suddenly leaving items in the wrong places and using things incorrectly. A great example is putting items in the freezer instead of the refrigerator because your head is not in the right place. Another basic example is placing your keys into an obscure drawer or thrown on a piece of furniture instead of your usual designated area. 2) Pinches or Buckling: if you are exercising hard and feel a "pinch" or you sporadically buckle… You are done. There is no reason to push past a pinch or buckling as a tear or strain will set you back several weeks or months. Stop. Move slowly. Relax. Ice and… Go Home.

Summary Examples:

This is a great spot, an inflection point for most. If you're more of an Ectomorph it means your primary activity is eating a bit more and making sure you fill out your frame. Your goal is to find your physical breaking point and where your body simply feels "too heavy" since the primary goal is putting on muscle mass. Opposite of this would be an Endomorph, where you're constantly trying to cut body fat down with intermittent fasting, more high intensity training etc.

Male in His Mid-Twenties:

Simply put a person in his mid-twenties has plenty of time to constantly exercise (5-7 days a week) and find his ideal weight to wake up invigorated every single day.

Here you've moved on. You already know where your body feels best and it is usually a tad lighter than you were in your early twenties (notice professional athletes tend to lean out a tad as they reach 30) to prevent your heart from over working. That said you have a few set routines and know your body extremely well. You can prioritize rest and recovery a bit more since your work outs are extremely focused (4-6 days a week) and the diet piece is on track.

Male in His Thirties:

On a side note, you're stretching, foam rolling and loosening up your body consistently. Something you didn't worry about a decade ago.

Staying healthy is significantly harder than obtaining money. There is no comparison. Generally, the individuals who are healthy but not wealthy are unable to condense their exercise efficiently. Spending 3 hours in a gym per day (unless a college or professional athlete) is an utter waste of time. The real trick is being *consistent*. If you are able to remain in near tip-top shape with 5-6 hours dedicated to your health per week, you will have enough energy to push aggressively towards your financial goals.

Summary:

Finally, we're moving onto the most complicated piece of being happy which is your relationships and view of your own life. We don't know if there ever will be an answer but we'll attempt to make the grey area of life make sense.

Part 3: Personal Relationships

A person is rich ($2M+ minimum). A person is healthy (extremely energetic). A person is not happy.

This person still fails our definition of being "rich". Being financially well off and with all of the energy in the world is simply not enough if they are unhappy. A cheesy line is . That is a bit far fetched as many people may prefer being alone (they would be happy) but the point shines through. A person with money, 9% body fat and depression is not a rich man.

"you're not rich if you have no one to share your life with"

We have a few posts scattered on here regarding this topic and instead this will be a condensed version. If we had to summarize it in a sentence it would be this: "most people are not worth your time". Hopefully, that caught some attention given the more soft spoken paragraph above. Most people will be perfectly fine earning a middling wage of $100K a year and giving life advice based on their non-success. Most people will not understand why you become irate when a person who makes a fraction of what you make gives you advice. A homeless man giving advice to person who makes $100K a year is *exactly the same* as a unhappy man who makes $100K a year giving advice to a happy go lucky multi-millionaire. We repeat. There is no difference!

Friends:

If you wish to obtain friends you really need to find three things and three things only: 1) soft touch relationships, 2) no overlap in business or finances – no need for each other and 3) similar view of the world around you.

Those three items are incredibly difficult to find in any single person. We recommend searching far and wide from the gym you attend to internet bloggers you enjoy reading. There is no way you will find 5-10 people who fit the above three items in your day to day life. It just won't happen.

We do not have a formula for finding them. Again. We do not have a formula for finding them. If you're lucky enough to find five you will be one of the happiest people in your city. Just remember. If you break one of the three items, you're putting the friendship in jeopardy. A good friend is always busy doing something but has time to visit when you're around sporadically. He does not need you for money and you don't argue about useless topics such as politics.

This is much of the same. We really do not care if you want to get married we simply believe it is Just give her the ring (a nice one if you like) give her the wedding, but do *not* sign a contract giving the government control over your life.

Dating:not an intelligent move financially.

The saddest people we know treat dating like a sport. They expect their partner (girl) to actually live up to their own standards! We'll break the bad news now and tell you that if you are a multi-millionaire, physically in shape and have a load of real friends… No one is going to match you eye for an eye.

But. Your personal standards will never actually be met.

*You absolutely *must* have high standards.*

Why? Women always date up.

If she didn't look up to you in the first place (IE: think you're one of the best catches of her life) then there is no way she would have gone on a date in the first place. Instead of expecting an equal partner, you should find out exactly what matters to you the most and look for those 3-5 qualities instead of a laundry list of items that simply won't be found. Reiteration. Your equal will have no interest in dating you. This goes for all of the authors here as well. Reality.

The final item on the list will come as a shock to . Even if you have everything above from money to health to friends to a great dating life… You're still not going to be happy. You will need to find something to build, grow and improve upon. For us this is simply business and finance. For others it may be art and a family. Who knows.

Mental Up Keep: regular people (we think we've finally banned them all!)

What we do know though, is that if you meet all of the criteria laid out above, you will People will not understand your decisions because you are living a much more fulfilling life. Maybe you take the first contract that pays less than the second contract option. Why? Easy you didn't want to do the other task and didn't think it would be fun!

***not do anything you do not want to do*.**

In short, once you're happy and your decisions no longer make "rational sense" to the common man (IE: lazy slob) you're no longer touchable.

Summary of the Post:

- From a pure financial perspective the bare minimum to be considered rich in the United States as of 2015 is about $2M for a single person and about $4M for a person considering having a family
- Finding a city where you hope to spend the majority of your life is incredibly difficult. There are literally thousands of options and you must find a few that fit your needs
- Financially savvy individuals never touch their principal and always have a slush fund that is increasing to prevent disasters from eating into the pyramid they have built
- Before bothering with money, health is *always* more important than wealth. We realize how funny that looks given the name of this blog but we've said it many many times before. Health >wealth. You only have one body and one mind.

Find your breaking points before it actually breaks on you

- If you have five friends that meet our criteria: 1) constantly busy, soft touch relationship, 2) does not need you financially and 3) sees the world in a *similar* manner as you… You're an extremely rich man from a friendship perspective. Look far and wide for these individuals, there are no tricks as less than 5% of the human population will meet this criteria
- Women date up. This is not a politically correct comment but it is true. Find what you want in a female and do not expect to meet your equal because your equal is always looking for a different man to look up to. Reality check.
- If you are rich, healthy, have friends (or a family)… You're still going to build something or perhaps work for money. Your life will not make sense to normal people and your decisions will be made to maximize general happiness. However. If you're working because you *have to* then your incentives cannot possibly be in the correct place.

What Isn't Going To Change? And Q&A Announcement

What Isn't Going To Change? And Q&A Announcement

After the COVID-19 outbreak started, many people started asking "what will change in the future". Instead, it's usually safer to ask "what isn't going to change". That answer results in clear investment opportunities with limited risk. We say limited as no investment is risk free, even a currency in your country. When we think about the future, most want grand explanations full of dramatic shifts. The reality is that the future will see an acceleration of technology and an individual should prepare for the new environment.

If you've been following the blog over the last 8 years or so, you've seen a slow and steady shift to technology instead of finance. This isn't because we're negative. It is because it is happening. If computer systems can beat the #1 player in Go (or any game at this point) and can drive cars in the future, it is certainly going to be able to do basic accounting/math problems. The artificial intelligence can quickly calculate the impact of a merger on financials without an excel jockey in the middle.

Technology Will "Eat The World":

Technology will continue to make our lives easier… If true… this means that we should be over-exposed to technology from an investment perspective. Take the S&P 500 and look at the mix of the various industries, oil & gas, real estate, financial services etc. Simply take this mix and buy more of the technology sector. Sure. You may lose money in a particular year, month or week. And. Over the next 10-years you'll eventually see technology become a more and more important part of the index.

Knowing that technology will continue to push forward at rapid rates (self-driving cars, curing diseases with AI, drones and new automated delivery devices) we can conclude that working in an industry that continues to help technology is a positive as well. For that we have to go "up stream" and move to the supplier side.

We went from everyone wanting to create a blog to everyone wanting to create a brand to everyone wanting to have their own e-commerce store. The good news is that this trend will continue. You should then think about businesses that can move upstream. In simple words, you want to sell all those picks and shovels to the people creating brands and companies.

Moving Tech Upstream:

Some simple examples include: servers, manufacturing and logistics. If we can agree that people want to create their own "online brand" and push to internet based businesses, it means you want to be the "helper" for all of these people. You don't care who wins in this case as some of them will fail and some of them will succeed. You're just there to help them run their business by giving them servers, a manufacturing facility or offering a warehouse for storage.

Yes this is our next point of advice for anyone who is young. If you already have decent cash flows, you want to try and move upstream. This is less risky as you're simply a picks and shovels play on the future of commerce. You don't need to "win' which is the hardest part of building a brand. Instead, think about the billions of people who will attempt to create commerce businesses online and ask yourself "how do i help them". This gives you a stable return with less risk.

With the current set up, wealth inequality is going to continue to rise. Currently, money printing is continuing at a rate we've never seen in human history. Billion and Billions and Billions of dollars… printed out of thin air. This money is not going directly to the people who are unemployed it is going into the "economic system" which is just a simple way of saying asset prices. The rich are spending *less* because they cannot travel, cannot spend on fancy trinkets and cannot go to expensive restaurants as frequently as they did in 2019. So all of this money has to go somewhere and it's going into assets (stocks, real estate, gold, crypto etc.).

Wealth Inequality:

In addition, the companies that were forced to shut down (hair salons, restaurants, bars etc.) are taking out 0% interest loans due to specialized programs. The problem is that debt needs to be paid at some point. So if you are a small business owner, you're probably better off shutting it down entirely and waiting until the pandemic is over before trying again. If you were already levered up prior to this, then you're in for a rough decade. Having a partially opened business at "25%" capacity when your operating margins were already low at 10% is not going to help you as you won't be able to cover fixed costs. If we can agree that inequality increased recently, it means scarce assets will continue to rise in value (beach houses etc).

Outside of technology with COVID-19 or without COVID-19, more and more money will likely pour into the healthcare industry. After something this drastic, countries and companies will look into pandemic planning. They will also invest in the same healthcare trends that were here prior to COVID-19 (aging population as baby boomers are largely retired at this point).

Healthcare Investment:

Unless you're an expert in the field, it's probably best to avoid betting on specific stocks. You can simply look at the industry and make sure you are exposed to some of those trends in healthcare, bio-technology etc. Just buy the basket. If you have extra money sitting on the sidelines… you should be sprinting (not running) to put those dollars to work in a real asset if we're going to continue to print money (devaluing fiat currencies).

It's highly unlikely that zero emission policies go the way of the dinosaur. The future is electric and we know that electrification of vehicles (cars, trucks etc) will continue. In addition, we know that alternative forms of energy will ramp up (reliance on oil is going to go down). If people believe otherwise we'd love to hear it. From our own research, it seems unlikely that digging oil out of the ground is energy efficient long-term.

Some Specific Changes (Tech and Healthcare):

Electrification ideas are actually quite easy to find. Wait for companies that have real units/volumes. Tesla has been a good example, battery companies will come around and solar panels will eventually work. Cost declines are real when it comes to these industries so you don't need to invest in questionable companies with no real volumes (just look at Nikola for an example of why it isn't worth it to invest in companies without units).

Another good example is "going up stream again"… but for technology. Instead of looking at the past, ask "what type of products are needed for electric vehicles?". This changes the mix of commodities. So you will likely see an increase in commodity prices for minerals used in electric vehicles, solar panels etc.

Mental health is one area that needs to be addressed. This blog is probably one of the least empathetic areas on the internet. That said, anyone who has seen a wide range of economic spectrums knows that people (in general) want/need to feel appreciated/valuable. The worst thing is to feel "useless" and "good at nothing".

With artificial intelligence ramping up (for better or worse we're using it and seeing it), it is clear that many jobs will be automated. There is no way that the government and tech companies will create a seamless and perfect transition into the new normal. Structural unemployment increases and we need a way to both offer new education systems and mental health care systems. .

You do not want to see a society where everyone has nothing to lose

If riots are bad now, the prior sentence would be 10x worse (or more). Hopefully the tone shines through, we're not kidding when we say it's a big issue. That said, the chances that the average person will agree is low, so you're better off owning the bio-tech/healthcare industry in general. It's hard for the average person to understand exponential change in job losses.

On a more likely note, healthcare spending will shift into disease research (due to COVID), life extension (continued from past) and new equipment to detect diseases. Those three have been going on prior to the pandemic (COVID accelerates one of them) but even if we solve COVID tomorrow, the main three will remain as "big problems" for society to solve.

The last one related to both technology and health is actually our water supply. At this point, we do have the technology to remove salt from ocean water. The problem is that the cost is too high (equipment needed). In the future, we'll likely develop new solutions to clean/purify water that were unavailable in the past. If you want to see how serious water issues can be, look at Flint, Michigan in the United States. That is a city in a first world country. If you extend that problem globally it becomes a serious issue that needs to be resolved.

Prior to the pandemic, individuals were still loading up tons of debt to go and get educations that may or may not actually benefit their long-term future. This led to a large debt burden for huge chunks of society. If you were a millennial, you watched 9/11 followed by a great recession followed by this pandemic. Meanwhile, you were told to go to college and that college did not guarantee any increase in income (or any income at all)… pretty sweet deal!

Higher Amounts of Personal Debt:

That aside, many companies took the interest free loans to stay afloat so the amount of debt is simply going up. This is going to lead to a very long drawn out recovery from an economic view (not talking about stocks in this case). In short, doesn't make sense to own any bonds… especially those safe ones like student loans.

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life.

Newer Readers: 1) Efficiency2) Triangle InvestingSpending for Maximum Return**We hold Q&As 1x a month for purchasers only.**

Specific Q&A announcement. On October 1 we will hold another Q&A. This one will focus ONLY on investment questions or ideas. We will provide opinions and see if a specific topic Q&A is better when it comes to improving quality.

What Should Change Over 10 -Years and Q&A Announcement

What Should Change Over 10 -Years and Q&A Announcement

In a change of pace we're going to talk about the past and emphasize how quickly things can change in just 5-10 years. In such a short period of time it is possible to switch from being a "consumer" to a "producer". It is possible to start billion dollar companies and it is is possible to change your life in a positive or negative direction quite dramatically. The odd thing about making dramatic shifts is that you have an extremely hard time remembering how it all happened. There is no "one event" that signifies a shift but more of a snowball of events that occur getting you to the destination. Hopefully a lot of the items below will either be 1) something you relate to or 2) something you will relate to in about 5-10 years.

These calendars are not the same at all. Say what you will about "every rich person is different" but . Here are a few: December and January are some of the worst months. New years isn't much of an event as you're usually planning real events (promotions, products etc to start off 2019) which occur in January. February and March is a nightmare due to tax season and organizing an insane amount of paperwork. April – June is more stable. July – August is significantly more relaxing. September-October is similar to June and July. That's a good general guideline of what a year looks like for someone who is in the producer camp. In fact, this kind of helps explain the whole "miserable rich person" stereotype/belief. During the holidays they are much more focused work and the last thing they are worried about is decorations (they are probably the ones shipping all those items!)

Producer vs Consumer Calendar: there are always a lot of similarities

The consumer calendar or what we would call the normal person calendar is just not the same. If you've been in the lower class or middle class its pretty similar in terms of the calendar. January – March there is a lot of work as most people in this group are employees trying to ramp a new product/business line. April is okay since there is no significant work for a W-2 filing. May is similar to February. June to August is relaxing as most of the higher ups are on vacation. September – Mid-November is a last second grind similar to January to March. Mid-November to December is incredibly slow. This is quite different from the prior paragraph and should give a good overview of how your own priorities will change.

As a fun note to sign off on this sub-section, 2018 was the first year where no contacts messaged with "what are you doing for New Years". Everyone already knows what is happening… Absolutely nothing. You're spending your time ramping on new projects and trying to set up 2019 so that your total income is up year-over-year. No guarantees on your income, but, working hard when everyone else is busy watching football and eating is usually a good formula for success.

When you go out at night it's hard to remember how fast things have changed. We're using a few years of wiggle room. But. There was no iPhone, no Uber/Lyft, no Instagram and no Airbnb. Sure the first iPhone came out in 2007 and Airbnb was founded in August 2008, yet the point remains… A ton can change in just 10 years. In fact when you go out to eat, drink or party, the chances you talk to someone who was born to remember life “before the internet” is quite slim. At this point it is hard to remember flip phones let alone life before WiFi. . Realistically we’ll take the under on creating the next Uber since the chances are so slim… But… Creating $100,000 or $200,000 business? Sure easily achievable. This is not a “for us comment” and is a for “for you” comment as we think it’s possible for quite literally anyone.

Billions Over 10 Years: *The main point here is that you only really need one good product to get rich*

Flipping it around to the potential negative… in a word socio-economic changes. Taking a look over the last 10-years you’ll have to chalk up a lot of success to luck. In fact, we’d question anyone who if they made it to a million dollars or more (you need a little luck) in a short time frame. Luck cuts both ways and many people can fall into the “Have Nots” quickly. This is something we’ve noticed in dramatic fashion. By the time people are 30 they are squarely stuck treading water or they’ve made enough money to not have serious worries ever again. It is excruciatingly rare to see someone in-between and if they are it’s usually someone with more time freedom and a not as much money (traveling but clearing $80-120K a year). Looking back, having a secondary source of income that can cover at least 40-50% of your living expenses is enough to change your life forever. If you were making around $100,000 a year after taxes and another person was making $60,000 and $40,000… We’ll bet on the second guy making it 10 times out of 10. There is something mental/physiological that happens when you realize you will always have some money coming in. It makes your main income producing work improve and at the same time your cash flows will unlikely go into the red any time soon.

does not believe in luck*The #1 cause of this downfall based on our own analysis is relying on a single form of income to pay bills.*

What does this mean? It means we wouldn’t be surprised to see more tension between the “haves” and the “have nots” over the next few years. There has been a distinct cultural shift that is difficult to ignore unless you’ve stayed in a bubble the past decade. More and more people are searching for ways to make it into the “top of the triangle” and the people at the top are becoming more and more annoyed at the constant asks. Unlike the positive solution in the above paragraph we have no answer to this one. As more and more automation comes out and it becomes harder for individuals to add value to a process, this will lead to more consolidation of money to the top. If you’re good at reading between the lines, this is one of the reasons why we’re against student debt for anything that can’t be paid back rapidly (a year or two post graduation). It is related since student debt forces the graduate to “break even” for several years before being able to .

gain any investment momentum

One of the main reasons why generational wealth doesn’t work and why parents aren’t always the best people to ask for advice is this: change of value. 30 years ago it made complete sense to go to college. No one was doing it and it would get you far ahead in a legitimate career. This is the same for the typical MBA program as well where obtaining a top tier MBA resulted in a significant increase in earnings. If you look at the same strategy today… the Math doesn’t add up so well. The hardest part about looking back on what worked in the past is admitting that it is no longer a viable strategy. Similarly, if you go back and look at interest rates in 2006, they were at 5%… If this blog was around then it would say “just park your money in 5-6% returns and focus all your energy on a business/career”. Instead that strategy blew up and had to be revised.

What Used to Work Changes:

While these items are all in hindsight, if we look at what is happening today.. the same repeated mistakes are happening again. A good example of this is going into a fund raising position. While this has historically been a smart way to make money as you’re taking a spread on large money raises, the space is becoming less and less lucrative. Spotify direct listed for an IPO without fees and Slack may do the exact same. At the lower levels of fund raising it is also becoming easier and easier to obtain money directly from individuals and this is only going to accelerate in the future. As this continues (that’s our bet of course so it is biased), what you’re going to see is a contraction of fees and more value being shifted to positions where actual returns can be justified. The easiest example would be real estate where the agent can at least add to the process by helping you negotiate a higher/lower price and build a business around being an exceptional seller/buyer. This adds a lot to the process and is completely unrelated to someone simply connecting two people who have never met (becoming increasingly easy to find them via a search or your own personal contacts).

For fun if we look back over the last 10 years here are some things that no longer work: 1) levering up for education without specific knowledge and the ability to repay quickly, 2) ignoring the stock market and having risk free returns drive your net-worth, 3) paying for any type of education that leads to no increase in income, 4) working in a position that can be quickly automated – vast majority of ad purchasing and bulk of manual labor and 5) large number of brick and mortar businesses due to high-cost and barriers to entry (Amazon killing pricing by commoditizing the offering). There are a lot more but we picked out 5 that are difficult to argue against – even for the people who don’t understand statistics and enjoy the whole “exception to the rule argument”. Also as a note, one strange industry has stood the test of time and that appears to be real estate. At the end of the day people need somewhere to live so it’s hard to shoot blanks here.

“Objects in Motion Stay in Motion”. While this is a phrase usually reserved for physics we’d say it’s a much better rule for life in general. If you have upward momentum or downward momentum… it is quite difficult to turn that ship around the longer you stay in that same direction. A good way to think about it is added weight. If you’re in the ocean and driving a boat, every year weight is added to the boat. By the time you’re 40-50 years old or so, the direction is already set and you can’t really do much to suddenly change course unless a dramatic event occurs. You’re either headed to live in Antarctica at that point or Miami Beach.

Physics Applies to Life:

To see if someone is moving in the right direction is based on how much they have invested as a percentage of total earnings over a 10-year span. Add up all of the earnings over a 10-year period (after taxes of course) and figure out how much the person has kept. We’d go ahead and wager that if the number is below 25-30% or so… momentum isn’t on their side yet. This only gets exacerbated over time. If someone has made $2M over the course of their 10 year frame and has $1 million that isn’t even close to someone with $500,000 as they are 7-10 years behind already. The difference is less related to the dollars they have and is more related to the time that they can purchase. The first person simply needs to pay the bills for 7-10 years to live a comfortable life, while the second person has to build and pay the bills to get to the same two million dollars. Not even close to comparable.

Graphically it is essentially a line chart. If you’re starting at zero, the original direction doesn’t make a big change initially. A chart with an exponential looks pretty similar to a chart with a steep vertical line for the first 5-6 iterations. Once you look out twenty iterations… the charts don’t look similar at all. One looks like it is going to a different destination entirely while the other appears to be flatlining. Does this mean you have to grow exponentially out of the blocks? No. Does it mean you have to find a way to make the curve turn up exponentially and compound? Yes.

Generally, if you’re younger it’s hard to tell which people are on the linear path versus the exponential path. To decide if it’s the correct one (without numbers) is the phone check. If you look back 10-years and are talking to the exact same people, that’s usually a bad sign. It is a bad sign since the person hasn’t moved into any new direction and the chances that the right person was found on day one is highly unlikely. Typically you have contacts you’ve known for 10 years or so… But… It’s highly unlikely you’ll talk to them frequently (a couple perhaps). Another good general rule is the skills you have to earn income. If it has been 6-8 years and there is only one way to earn money (with reasonable likelihood) this also sets up negatively for the next 10-15 years.

Take a look at every major decision that is made and they will likely compound in a big way over 10 years. Some big ones are 1) your first field of work, 2) your first location to live, 3) the amount you invest between ages 21-25 and 4) the amount of leverage you take on related to consumer goods vs. financial assets. If these four decisions are made correctly it’s almost impossible to *not* start with the “line graph” moving in the right direction. Undoing any of these four is like climbing out of an enormous hole in the ground. Instead of focusing on small decisions that might make a few extra dollars here and there (or save a few extra dollars) the fixed costs, linearity of compensation and investment percentage will determine the slope of the graph. In fact if you talk to someone who has amassed a high net worth, they can usually pin point only 3-4 events that really changed their life. Yes the grind and 100s of hours of work are a given… Yet… it consistently comes down to a few key decisions.

Decisions Compound:

Financial leverage is the best explanation here. If you buy any asset on 4x leverage your gains are not made immediately (unless you get lucky or flip the asset like a fixer upper house). Generally what happens is the spread between the rate of return and the cost of paying down debt creates a value gap. If we think about this further and include inflation it means the "cost of carrying debt" goes down even if your return is just enough to cover the payments. Now we would never recommend levering up to buy an asset that doesn't generate a return well ahead of the interest rate on the debt. Yet. Even a break even number isn't a loss since you're using someone else's money to give you an asset.

Another interesting thing you'll notice is that age makes time blow by. There is no way to pin point exactly why this is, but it is likely because each year becomes a smaller percentage of the total life you've lived. If you are twenty years old, two years is 10% of your entire life. When you reach forty, two years is just 5% or less than half. So on and so forth. So when you look at the gains you make from age 20 to thirty from a percentage standpoint they look incredibly high and replicating this gain is quit difficult. Similarly, this begins to blur the years together. You'll look back and say "I've known you for 6 years?" or "We used to think $XXX was successful"?

Time Flies By:

This brings us to a theory on trust. If you've lived to age 40… anyone who made it has been a close colleague/friend for about 20 years if you knew them since college (50% of your life). If you were fortunate to know someone since you were kids, that would expand the percentage to a whopping 80-90% or so. Naturally, as you get older the number of people you're going to trust then goes down. This is an interesting way to take more risk if you're older. A form or risk taking for someone in their 30s-40s who is looking to "level up" again should give more responsibility to younger people that they do not know as well. Feel free to take that to an extreme or less extreme.

The last one is similar to the "what used to work changes" theme. Essentially, it's hard to blame people for making mistakes when an entire generation (10-20 years older) is pressing them to go into something that no longer works. While we could say that a 20 year old should be smart enough to to figure out these types of decisions on their own… it just isn't as easy when you include the *amount* of pressure instilled on the younger generation. If your entire family and the school system forces you down a specific path, it isn't easy to step back and say no particularly since you're cutting loose a fall back plan. At the end of the day each generation is simply trying to survive so they encourage the younger generation to go down a path that gives them the highest probability chance of survival (life is difficult for the majority). Ironically, the highest probability chance of survival is rooted in un-teachable skills which conflicts directly with the advice being handed down to each new generation.

Trying to Survive:

One of the main reasons we recommend keeping a basic journal is seeing if your problems and life habits are changing. This was essentially the inspiration for the post. 1) if your general annual calendar isn't changing this is a bad sign, 2) if your day to day contacts are not changing and item number 1 isn't changing… this is a second red flag, 3) if you're trying to squeeze more results out of the same toothpaste tube – a job/career single form of income, it's not a smart decision, 4) the initial decisions being made today will have an exponential impact on your life 10-years later – it doesn't matter if you're 20, 30 or 40 years old, 5) risk isn't just financial and while leverage is the most common one cited, who you trust with your time and where you place your time is the biggest lever you have, 6) trying to pass down advice only works if you're up to date on the problems of the generation below you, otherwise it's just not possible to place the same tired advice that worked 20 years ago onto someone living today and finally 7) spend a lot less time worrying about the growth being 10%, 5% or 15%… focus more on growth being a single negative setback or a minus 10%… can negate many years of work.

Putting the Pieces Together: *positive*

Back to normal posting focusing on money going forward, we'll also hold our Q&A this Friday on January 18.
****

What Type of Intelligence Do You Have?

What Type of Intelligence Do You Have?

We have already beaten it into everyone's heads. The only way to get *wealthy* is to start a Company. The only way to become well off is to go into . The rest is non-sense. No performance, no money, no exceptions. With that horse beaten to death, lets see what you're good at and determine which industry you should work in.

Silicon Valley, Sales or Wall Street

1) Why You Need to Determine Your Intelligence Set Early

2) Intent – The Broadest Talent

3) Numerics – The Most Difficult to Replicate

4) Synthesis – The Most Adaptable

5) Artistic – The Call Option

1) Why You Need to Determine Your Intelligence Set Early

You simply do not have time. We tried to explain this in our post on living a but it needs to be a non-debate.

balanced life*You do not have time.*

We hope that the vast majority of our readers are young because we can prevent them from ruining their lives chasing skirts at the expense of their future. You are going to get more physically attractive from 20 to 35 if you eat healthy and stay in the gym. However…

It will become exponentially difficult to learn new skills as you age that are ****equivalent to your competition**.**

We highlighted part of that sentence with 4 stars because it is paramount to understanding that you do not have time. Lets assume that you believe you can learn a new skill at 20 just as fast at 30… Great.

It doesn't matter! Too Late!

Why doesn't it matter? It doesn't matter because everyone starts from *zero*. If person A is equally as smart as you but starts building his salesmanship skills at age 20 and you start at age 30… Good Luck! While you may improve at the same rate as the 20 year old, you won't be as good as him until you are 40, you're cooked.

Now that we have spooked everyone… even if you've made some bad decisions… there is nothing you can do but fix it (take action). If you're 18 (hopefully) or if you're 30 (long-road ahead) the only way you're going to get better is to find your primary intelligence and leverage it immediately. Get into the ring and get ready to take .

all of those losses

2) Intent – The Broadest Talent

Some of you are going to read this section and believe it means "Emotional IQ". That is certainly close. The difference between intent and Emotional IQ is that you don't need control of your own emotions to have an amazing ability to recognize intent. Intent is an all encompassing skill that is fully transferable to every aspect of your life (except one): Business, Sales, Social Environments.

The elephant in the room? Minimal transfer skills to Silicon Valley/Quantitative Finance.

Do you ever wonder why Quants and Engineers are usually the two groups with the worst social skills? Do you ever wonder why they are so brilliant… yet… have a hard time in group environments? Well now you know. They have low abilities to read intent.

The good news is that intent is the easiest skill to learn. You can go from zero skills to moderate abilities in a year (maximum). The trick? If you recognize that your talents do not lie here, don't bother going into a pure sales role! You're going to be better off in a specialized business, Silicon Valley or Wall Street (Remove Investment Banking and Sales within Wall Street).

With the basics out of the way. here's a good bullet point checklist to see if you're good at recognizing intent:

1) Can you correctly read the difference between passive aggressive behavior and dis-interest?

2) If you are shown an advertisement can you determine if it is "good" without seeing the numbers?

3) Can you correctly read the difference between insecurity and an outright lie?

4) Are you able to tell when someone is lying about their achievements (up or down)?

5) When an acquaintance of yours says he/she is going to do X do you know with certainty that he/she will or will not do it?

Now that you've read these five questions you can now test yourself. You can use this as a quick quiz over the next 6 months and see if you have a *talent* for intent. Find at least 10 situations where you will have to ask *each* question to yourself and you need to try and get 50/50 correct. Try it anyway.

This is next to impossible.

If you are able to correctly recognize these behaviors 50-60% of the time (you're at the median). IF you can correctly recognize these behaviors 70-80% of the time (you're at the 1.5 standard deviation). If you clear 85%… You're extremely talented. If you're at 50% or below, ignore it as a primary talent, if you're at 70%+… Get ready to invest aggressively in your salesmanship.

For fun, lets go ahead and assume that you're good at this. You are able to correctly determine the *intent* behind what someone is doing 70% of the time. Congratulations! Now you can move on to building up your encyclopedia of reference points.

1) The best way to determine if someone is being passive aggressive with you… or is dis-interested in you… is to give them something they need. We would wager that everyone meets at least 5-10 of these people per day and don't recognize it.

Once you've got your list of people, you can see if you were correct. Give them an item worth about $20 that they *need* and see how they react. If they feel uncomfortable? They had no interest in you. They were not being passive aggressive. If they are extremely excited (fake) or they don't even say thank you (blunt) they are being passive aggressive. It really is that simple gentlemen.

If you don't want to spend anything and want to do it the long way, here's another method:

For the most part, when people give you short answers (assuming they are not meaningful) they don't care about you. If they try to gossip with you… You're likely talking to a passive aggressive person (hence why the vast majority of women gossip and are usually passive aggressive).

2) We put up a tweet of a fantastic advertisement we saw on Yahoo! It was for a skin care product with a "free trial" <– affiliate 101. It was so good you can view the advertisement below.

This one was an easy one to peg as "good" because of the advertisement copy: *horrifies surgeons* (ie: fake bias of positivity), *shocking trick* (IE: laced with emotion), *weird solution* (IE: targeted at morons looking for a magic cream), *younger* (IE: solution to the problem, clearly targeted at women 25-40 or so).

1)2)3)4)

Untitled 2

After clicking on the headline copy you enter the sales page. The sales page is also beyond fantastic. The details in the woman's face are extremely close to looking "real". That's what a good sales page should look like. Looking down you find the following: "botox injections" (Ie: pre-selling the product at a higher price point since botox is relatively expensive – cost of most generic skin products is below $1.00!); "recent clinical study" (IE: again, biasing the reader into believing in positive results), "contraction of facial muscles" (IE: how morons would understand how skin ages – making a connection by talking in this form of prose), "free trial" (IE: set them up for recurring billing).

1)2)3)4)

IMG_3002

That is how it is done! If you can correctly see solid ads, you're going to be swimming in money later… by writing them! This ad is simply fantastic. It is targeted at an extremely lucrative market as well.

Insecurity (decline of looks) + Income (women 25+ or married with access to hubby's $) = Cash Flow Machine

Pro-tip: As you can see… all good businesses target insecurity & fear. A great example is anyone who works in the industry knows that these courses are useless (you are trained on the job). But. Everyone wants an "edge" on their competition! In of not being able to perform up to standards, they sign up for modeling courses that won't help them at all. They could have just learned how to model But… That's too much work. Everyone wants "hand holding", making them less self-reliant and weaker performers in general… Sigh.

"Investment Banking Modeling Courses!" ***fear****for free* sitting at their desk.

3) If someone is insecure and you need to befriend them… You know what to do. The person is so insecure about topic X that you should simply big him or her up on topic X. Lets say your acquaintance has a lot of contacts that you want to sell your product to. Unfortunately, he is an extreme liar when it comes to getting girls (you know this). In order to get him to like you… Ask him for tips on picking up women!

Highlight the insecurity as a positive.

While it may sound counter intuitive… it works every time. He gets to give you "tips" while you get to build a relationship with him. He claims to be good at this (he's not) but here he is giving you advice. As you do this over the course of a few weeks he is incessantly lying through his teeth about how good he is and how you should do X, Y, Z. Unless the person has no heart at all, he is going to mentally feel bad about this. Over time as he lies to you about his conquest and you "believe it" he is going to feel bad about lying to you every single day. Then you pitch your product. He'll say yes.

Finally, if he was outright lying to you and it wasn't an act of insecurity… He won't give you any tips.

Side Note: This piece of advice was by far the most uncomfortable part of the entire post. It seems down right crazy. The problem is that you're going to have to *bend the rules* a lot as you go into higher stratospheres of income. In the end, if you're selling a legitimate product that you know he and his friends need… You've done nothing wrong. Your approach was slippery, but the end result was beneficial for . As always, art not science.

<u>*everyone*</u>

4) There is not much you can do here. If someone is a colossal liar, so be it. If someone is lying up or down by 10-15% about their achievements… They are probably normal. In fact, when your resume is handed to someone, everyone in the recruiting department assumes a "15% exaggeration factor".

The real benefit is catching the people who *lie down*. These people are the smartest ones in the room. They lie down because they want to see how you react when *you believe* you're doing better than them. As you all know… the guy who tries to "convince" you that he's rich… Is never rich. If they have to tell you they are ____ then they are not. Other people will tell you.

5) This is the easiest game to play during new years. When someone says they are going to do X for their "new years resolution" keep a quick journal and see if they follow through. If someone actually follows through with what they said they were going to do… Get ready to bring out the recruiting forces.

Anyone who says they are going to do X and actually does it consistently is already in the top 10%. They may never make it to the 1% or become exceedingly wealthy, but they will *never* be average. Why? If someone consistently commits to a task and completes it, they are of value.

The only exception to breaking a resolution, is in exchange for something better. (Example: guy says he will increase his income by $20K after switching firms. Instead. He starts a side hustle and makes $40K. Clearly this is a perfectly fine reason for avoiding the firm switch).

This type of intelligence must be cultivated. Even if you're scoring below the 50% marker in our "exam" it is a necessary skill to at least develop. Develop your skills to the 60% marker and move onto numerics and synthesis. If you're scoring in the 70%+ range out of the gate… here are the obvious career choices for you: Affiliate Marketing, *Sell-Side* Wall Street, Enterprise Level Sales, High End Promoting/Marketing <– only if it can be scaled, no hourly wages.

Concluding Remarks:

3) Numerics – The Most Difficult to Replicate

Ahh it finally hits you. Why in the world does everyone assume that being good with numbers is the end all be all of intelligence? Now you have the answer. It is nearly impossible to find this type of talent. This is both a blessing and a curse if your skills lie in numerics.

99/100 times we will wager that someone with numerical skills (enough to become a Quant or high level engineer) has social issues. They consistently use logic to explain *emotional* behavior of humans (practically you meet will have control of their emotions). Out of frustration, they end up being outcasts, particularly when it comes to dating.

<u>no one</u>

With the negative paragraph out of the way… Why? This type of talent is nearly impossible to learn. We will go so far as to say that it *cannot* be learned to the 1% level. You've got the gift or you don't. You can try to fight reality and claim this is a "limiting belief", but we've simply never seen it.

<u>They are going to clear low to mid six-figures (or more) every single year without skipping a beat.</u>

If you know someone who was not very good at math land a career at Renaissance Capital coding as a software engineer… Please let us know! (hint: they don't exist).

Fortunately, if you're good with numerics, you can quickly see if this is your talent because the stair steps are clearly laid out for you.

1) Are you blowing through the math section of your SAT (lets draw the line at 750)?

2) After blowing through these exams did you step on the gas pedal through an elite university? IE: you were not studying hard yet landing A-'s or better in complex courses?

3) Can you read a statistics report and immediately laugh at the findings?

4) Did you get through the 5+ round process to work at Google or as a Quant? (obviously you're good, ha!)

Now the questions above seem ludicrous… Because they are. This is the only form of intelligence that is easy to test and easy to measure. This is also why society focuses so much on it, they can easily *prove* if you're good at it so it becomes a primary measure of intelligence.

No matter how many people read this post, we can easily say that less than 2% will say "Yes" to all four of the questions above.

Now before we sign off on this topic we can create a baseline of understanding without becoming a Quant. So here are some quick math questions:

1) A person earns $100/hour and works a full time job. How much do they earn?

You should be able to do this in 5 seconds or less

The answer is: ~$200K. Instead of taking a calculator out… the answer is simply 2,000*hourly rate. Now you will never be fooled by BS claims of riches.

2) A stock goes up 10% on day one and declines 10% on day two. How much is the stock worth in 50 days?

You should be able to do this in about 10 seconds

The answer is: ~75% of original value. Regular people will need to take a calculator out. They will never understand the power of compound interest. The "true answer" is closer to 78% but once you realize that it is losing 1% in value every two days, the number pops up after one iteration.

3) You invest $25,000 at age 25. It grows at 5% per year. How much do you have at age 40?

You should be able to answer this one in 5 seconds

The answer is: ~$50K. The true answer is slightly higher but you simply know that it would take ~14 years to double. You round up so call it a wash. Double.

Wow. This is by far the most boring section we have ever written on the blog. Numerics is likely interesting to a very small subset of people (the ones that are extremely good at it). Positively, if you have mediocre skills when it comes to numbers, the door is wide open for a wide range of careers or business opportunities.

Concluding Remarks:

If you are extremely good with numbers… congrats! You'll always be well off (financially). Become a Quant or a high-end Software Engineer.

If you are mediocre with numbers: Investment Banking, Merger Arbitrage Hedge Funds, Sales and are all up your alley. If you're "good" with numerics. Engineering is still on the table, but becoming a high end Quant at a competitive Wall Street firm is not.

Real Estate

If you found the questions above to be difficult… You should immediately improve your baseline understanding of numbers. Once basic algebra becomes easy, the high level numbers when looking at a business will be easy to calculate.

While you can go ahead and try to bring a calculator and excel with you to every meeting, it is *much* better if you don't. Why? You can synthesize the data on the spot and play dumb if they give you too much information.

4) Synthesis – The Most Adaptable

Similar to intent, synthesis is the second unspoken form of intelligence. In short, you're probably a fantastic person when it comes to networking. Why? You can quickly make a connection with someone. You synthesize his or her skills and put them in contact with the right people to fulfill their needs. (transaction complete!)

Ever notice that solid real estate agents are always able to network like it was engrained in their brain to do so? They are natural synthesizers and of course… this leads to solid "leads".

The real interesting part about being able to synthesize information quickly is this:

*What *type* of information can you synthesize quickly?*

If you can synthesize 1) numbers, 2) emotion and 3) intent all at the same time… You have a wide range of career and business options ahead of you. If you're heavier on one versus the other… We still have solutions for you. If you're able to synthesize basic numbers and intent – You want to steer towards transactional work (Investment Banking, Private Equity); If you're able to synthesize emotion and numbers – you should look into portfolio management; If you're able to synthesize emotion and intent… but you are not good with numbers – every single product sales position is yours for the taking.

1) 2)3)

Similar to the other section lets see if you're good at synthesizing:

1) Can you correctly predict who will like each other in your phone? Everyone believes they can do this, very few can do this accurately.

2) Can you determine what type of asset your friend(s) are willing to purchase? Everyone has a different investment strategy, but can you figure out the next "big move" someone is going to make?

3) If you have twenty meetings in a day, can you remember all of the numbers you were given without checking your notes? How accurate were you and can you connect the dots to see if anyone is lying? (Fun fact: if you meet at least 20 people, someone lied to you in the meeting and the numbers will prove it)

4) You read an in-depth statistics report and compare it to a report you had read 6 months ago that contradicts the new data. Without referring to the second report are you able to determine which one is accurate *without* emotional attachment to either?

The first two items are easiest to test as you have access to information at your finger tips: the contact function in your phone. If you can correctly predict the moves of your friends, you're going to be very good at sales, Sell-side Wall Street, fund raising for a Private Equity firm and selling real estate.

On the other hand… If you find the first two tasks to be difficult, but find the next two tasks to be easy… You're better off working as an engineer or at a quantitative heavy hedge fund.

What started out as a "quick post" has somehow ballooned into a much more lengthy article. The good news is that the post can be summarized by the Venn diagram below.

Intelligence/Skills Overview:

Intelligence

For fun, here are some clear examples of the overlap:

1) James Harris Simons – would clearly fit into synthesis and numerics, Renaissance Technologies (purple)

"Why don't we have enough teachers of math and science in the public schools? One answer is well, if they knew the subject well, they'd also know enough to work for Google or Goldman Sachs or God knows where." – James Harris Simons (No surprise he is a mathematician!)

2) Ken Griffin – would fit more into intent and numerics. (yellow)

"We manage risk and provide liquidity. We are not a hedge fund… We use our capital base to provide liquidity to capital markets and to absorb the risk of risky assets… Our goal is to find underpriced and mispriced assets and hedge away the risk… We mitigate the macro risks that global macro managers take. We are the inverse of macro fund managers." – Ken Griffin (no surprise they run a market neutral book!)

3) Frank Quattrone – Would fit into intent and synthesis (light blue)

"I did nothing wrong. I am confident that the investigation will show that." – Frank Quattrone (Unquestionably the best Tech Banker today, unsurprisingly cool as a cucumber when being investigated)

4) Pure Intent (green) – . Zig Ziglar. Affiliate Marketing.

All sales all the time

5) Pure Synthesis (dark blue) – Head Hunters. Glocap.

6) Pure Numerics (red) – All of the quants and engineers gathering and organizing data but not yet in position to "pull the trigger" on the meaning of said data.

If you have no skills in any of the three categories… You should get to work . Of the three skills, Sales and Synthesis are the *easiest* to learn (numerics is the hardest to improve upon).

immediately

Now you see why it is so important to find out where your "intelligence" is the highest. You can quickly steer your life into a specific career or business model. If you know at age 20 that your skills are in sales and synthesis… Don't bother with becoming an engineer or working at a numerics heavy hedge fund. You'll get paved.

Instead, go into Banking or Private Equity and suddenly you'll find yourself moving up the ranks! The belief that everyone should go into X career is simply non-sense. If you can make Vice President or above in any of the fields mentioned here you're not going to be hurting for money. You will be raking it in. Making at and you won't even be thirty.

**minimum*$300-400K a year

Finally, if you're older… Then time is not on your side. You need to find out which area is best for you… starting yesterday. Get cracking on improving your skills in that arena. You need to work *harder* than everyone your age since you are playing catch up.

5) Artistic – The Call Option

We've separated this section out for a reason… It is a winner take all market. We can throw athletics into this category as well. If you're truly at the top of the food chain in terms of artistic abilities or athletic abilities… You're going to make a lot of money.

While Lil' Wayne may fail a standardized test… He'll make more money in a year than most people will make over 5, 10 or even 100 lifetimes. If that's not a form of "intelligence" we don't know what is. We'd happily trade his artistic/rap abilities over a 90th percentile score on some meaningless aptitude test.

The Action Bullets:

– If you're not where you want to be financially, time is *not* on your side. This is a stone cold reality. It only gets harder. If you don't take action today, you're simply giving the competition a head start.

– What are you good at? Intent, Synthesis or Numerics? You don't need to be good at all three (if so congrats!).

– If you find out you're not great at any of the three (scoring below 50% in all categories across 100 test runs) then you should invest in Sales first. There are too many products that need to be sold and there are too many ways to make money in sales. It is also the easiest to learn.

– Do not fit a square peg in a round hole. If you're great at numerics there is no reason to change your life and try to become a real estate agent. There is money everywhere. Again. Leverage *your* talents not what other people are "telling you" to do.

***leverage your talents*.**

– If you're in the top 1% when it comes to the arts… Congrats! Go ahead and go up the food chain and make that $$$.

****

When Does the Snowball Effect Occur – Short Musings on Momentum

When Does the Snowball Effect Occur – Short Musings on Momentum

Compounding is one of the most important concepts to understand. Everyone knows about inflation and outpacing inflation is the only real way to increase your net-worth (passively). The problem is that most people give up before the game works in their favor. It seems like you're climbing up a hill with no end in sight. Oddly, once you get to the top of the hill, the momentum or snowball effect takes place quite rapidly. For fun we're going to try and calculate exactly when that happens. This post is entirely made for entertainment purposes.

Rough Benchmark $3-5 Million?

You will continue to earn money. The amount of money you earn will be able to cover your living expenses. This is an important point. Notice we said "living expenses". This means your active income (working for money) will not touch *any* investment gains. It is also a moving target. If you're living in Thailand earning $3,000 a month and spending $3,000 a month this is enough. Similarly, if you're living in NYC earning $10,000 a month and spending $10,000 a month, It is considered equivalent since we're focusing on your investments creating a snowball effect for you. Also. We assume you're under age 45 or so otherwise you'd probably want to work less.

The Only Rule: this is considered equivalent.

Unsurprisingly, we'll go with "absolutely not" here. If we assume you earn $25,000 a year from this (5% returns), it would actually be a lot lower due to taxes. Even if the tax rate came in at 20%, this is $20,000/year or $1,666/month. Think about it like this, unemployment income is approximately the same at the "high end" and no one would get wealthy saving 100% of an unemployment check.

Is $500,000 Enough?

The key here is figuring out the second leg of reinvestment. If you re-invest $20,000 in after tax money at 5%… That is only $1,000. Compounding isn't really helping you much unless your active income is contributing quite a bit more.

Still not there based on the math. You're definitely closer but it still doesn't move the needle. Now you're looking at $50,000/year or $40,000 or so after taxes. $40,000 would lead to $2,000 in extra income in Year Two. This is still quite small ($166/month). Yes you're able to put away an average income (just on investment gains) but this doesn't snowball the year after. The second year out you're only up an extra $2,000.

? Okay How about a Million

Quite close to the snowball effect. At $3 million you can now generate $150,000 a year or around $110,000 per year. This is getting very interesting since the incremental $110,000 per year now gets you $5,500 in year two as well. To keep the math simple, it means in Year 2 your ability to spend just went up by close to $500/month. This is almost equivalent to having another rental property. It's not quite there but it is close.

How about $3 million!

We'd say you're there at this point. At $5 million you're generating $250,000 a year without lifting a finger (ideally). This is around $200,000 in after tax income if structured correctly. Now you're looking at an additional $10,000 a year built off of the passive income alone. This is close to the after-tax cash flow of a basic home (average rent in the USA is around $1,000 a month – without expenses accounted for). We'll go ahead and call this the "snowball point". Somewhere between $3-5 million is when the game is officially over and your passive income surpasses four working families. An insane amount of momentum. Essentially, if your passive income is enough to buy a median home, it's pretty difficult to not have momentum since saving for a home is difficult for most working families.

How About $5 million?

Working Backwards

To make the math simple, we're going to use $4 million dollars. Assuming we're in agreement that this is enough to have the "snowball effect" take place, we can now take the age of 41 and solve backward to figure out how much needs to be saved. It's much more likely to be non-linear (since real gains are not made by 5-10% increases in a salary) but we'll outline two different paths for fun.

In the linear world someone would need to save $112,000 every single year for 21 years. Think about that for a second, with 5% returns (no correction ever) you're barely at $4,000,000 by the time you're 41 assuming you put away six figures immediately. This seems impossible. It seems impossible because there is practically no "career" in the world that we can think of where you would *save* $112,000 in your first year (emphasis on post-tax). Even high paying technology jobs cap out at around $250,000 after undergraduate education is complete (possible to save low 6-figures if you had no living expenses).

Now that we see the "save slowly" math doesn't work we can conclude that the vast majority of 1) use leverage or 2) own their own businesses. Anyone who has followed this blog for a decent amount of time will say this is redundant (true) but it's always good to see how illogical the masses can be. There is just no way to get to $4 million if you were to go to higher education by the way, you'd need to save around $225,000 per year (every year) to do this in just over 13 years.

multi-millionaires either

Three Ways to Get There

Since we have gone full circle and can conclude "working and saving" is not going to get you to the *Promised Land* there are really only 3 alternative options. None of these are mutually exclusive. You can try to do all three, a combination of the three, or master just one of the three.

This is the most common method to accelerating wealth and the answer is the same boring investment: Real estate. It's the most obvious and the most boring because it is the easiest one to calculate. With leverage of 4-5x or so a 5% return suddenly turns into a 20% return (yes we are doing napkin math). Want to know how much this moves the needle? Well instead of saving $112,000 per year for 21 years, you'd only need to save $18,000 per year to reach $4M in 21 years.

Option 1 – Leverage:

Of course the elephant in the room is that 20% returns are insanely high and secondly that leverage is diminished over time (can only have four loans out at the same time). But. The point remains. Levering up and being correct early accelerates your returns in a big way. Even a move from 5% to 10% would be a huge change in compounding ($62,000 required per year over 21 years at 10%).

Well… any business that actually works. A business can always be sold which accelerates your ability to jump a gap. For example, using the same $112,000 a year example… at age 30 you should have about a million dollars. But. If you had an asset and sold it for $1 million, you'd have $2 million dollars, a number that wouldn't have been hit until age 35, compounding alone if an asset is sold would get you to $3.5M (very close by age 40 without saving for 10 years). More importantly, the more successful you are the more likely the exit value goes up. If you've been around for twenty years and already made it to $4 million (without a sale!) you'd always have the optionality to hit the exit button pushing you into a new realm of wealth.

Option 2 – Any Business:

Our blog focuses on this option and option number two the most. We focus on option three here because 1) we don't see many websites talk about it and 2) we think it's the lowest risk for the highest reward. If you're already earning a six figure income the chances you work inside of an office is particularly high. We don't know what the percentage is, but we'd wager that most high earning professions are "white collar" in nature which means you have access to the Internet. With the internet you can now double down on income being earned which accelerates your earnings. If you could cover just 30% of the needed capital per year, it suddenly becomes a lot more feasible. Alternatively, if the second source covers living expenses only (they'll also feel rich). It's essentially a win win. We do nothing but laugh when people say this isn't possible since we've already had multiple individuals succeed with our blue print while the negative nay-sayers can't even earn $10/hr extra during their free time in front a computer (if you're desperate for cash you can always do freelance work online… if you can't even find freelance work we doubt the person even has a basic white collar position!).

Option 3 – : Multiple Income Streams*hint:*extremely

As a fun poll let us know what number is the snowball point for you!

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality … You'll probably like . When to Sell Your First Company (Part 1…)

When to Sell Your First Company (Part 1…)

As many of you know we're selling an online business over the next 3 months. The first part is probably the toughest: deciding when to sell. It's important because you'll need to set it up in a way that the buyer is interested and you no longer have interest in scaling the business. In addition, unless you've built a massive company, the payout needs to exceed the amount of time you're spending on it (i.e opportunity cost). Our guess is the first sale is typically done incorrectly (as is the case when trying anything for the first time) and the skills acquired will be worth 100x in the future.

What to Do Before You Hit Sell

Funny enough, you better have a good idea of what to do after you sell before deciding to sell in the first place. This doesn't make a lot of sense logically, since you're trying to create an event. The problem is that you'll be bored with a lot of money on your hands (a bad equation). We assume the typical person reading this blog is in their 20s to maximum of 40s which means they are not old enough to hit the "escape button" and move to an exotic island.

Step 1 – Have Something Else to Do:

How do you create something to do? Quite simple, if you only have one business you need to create a second one that is scalable and profitable. It doesn't necessarily need to be online, perhaps you also have a small real estate business or you run a few franchises in your city (you already know we would prefer two online businesses over anything else). This dynamic makes it a lot easier to sell your first business. You're going to hit the exit button and immediately turn your attention to your other idea. In a perfect situation, your second idea is growing significantly faster and you see more upside in the other project. Since you were able to run two companies at the same time, there is no doubt that upside will be seen by dedicating more time to it. In short, the first and most important item on your list is "what will you do after".

If you run your operations perfectly, you will unlikely receive a lot of bidders. This seems illogical, but you have to put yourself in the seat of acquirer. Would you buy a business that is perfectly run? Of course not. If you can't make it better then there is minimal upside for you in purchasing the asset. Maybe you used minimal paid traffic (only one source). Maybe you didn't sell all the possible product lines related to your niche (easy for them to create one). Maybe your advertising effort wasn't fully scaled. So on and so forth. While you should have parts of the operation run near-perfectly (otherwise you wouldn't be making any meaningful amount of money anyway!) there should be "meat on the bone". Without a carrot or reason to buy, you're losing out on a large number of bidders.

Step 2 – Leave a Strategy Untouched:

Now that you have a solid company that could be improved (not a major over haul improvement) you'll have to calculate the maximum cash flow per year you can make by going hands off. This is not something that we can give to you, some people would prefer selling an asset for 4-5x income… others would prefer keeping it and reducing the income by say 30-50% by outsourcing all of the tasks. Remember, the implied assumption is that you can teach someone to run the business. We don't know what type of Company you have, just see if the entire process can be outsourced/automated. If so then you're going to come up with your own conclusion: sell or keep.

Step 3 – Calculate the Outsource Cost:

If it is already clear that you're going to sell, you can skip this step. If however, you're still on the fence you can take a big risk. Hire a contractor (no employees) to try and fix one of the issues with the business. In step 2, there should be a couple of issues with the website so you'll have a third party come in and fix it. This a material risk because you will impact your cash flows and if the person does not add enough net income to offset his cost… you're in the red. We would recommend against this strategy but we have seen it work in the past. In short, you can roll the dice and maybe it does work but as you can see we have failed at this in the past!

Step 4 – Hire a Contractor:

At this point, you should have a very good idea if you're hitting the exit button, now we're going to go into the "double checking" part of the equation. This means you're going to see if there is any long-term opportunity that will be missed. In addition, it means you're going to make assumptions about the growth rate of your industry (demographics, not third party research). Two complete opposing example would be and . The diet pill market is enormous and relatively stable from a growth rate perspective. People are not getting any thinner any time soon and they will look for a quick fix. Brain pills on the other hand… This is a newer concept and while the market is smaller it is growing pretty rapidly right now. The clear answer? If you're still on the fence but you're in the diet pill market with stable growth go ahead and sell (nothing will change) if you're in the brain pill market… You got more work to do!

Step 5 – Market Research: diet pillsbrain pills

Now that you have a good handle of the market you'll have to decide if you're a market leader or not. It is unlikely you're #1 otherwise you're making tons of money and are exiting to an eight figure pay day (enjoy the incline!). The important question is if you're going to benefit from the growth of the overall industry by maintaining a #5 or #6 position. This part takes the most amount of work. If you were able to build a large following in a notable niche, the question is entirely around market share gains and your relative growth rate. If you think the market will consolidate to one or two providers… hit the alarm button and sell now. If you think it will remain fragmented… it is going to be tough to sell (your numbers will trend up in a steady state fashion). If you've gone through all five steps and land here with a niche market that is growing rapidly… we feel bad for you because it will be a headache of a decision to make.

Step 6 – Market Share:

The summary is quite simple: 1) make sure you have something to do after you sell – if the answer is nothing you shouldn't sell yet, 2) leave part of the business run imperfectly, 3) calculate the return on a sale vs. the return on outsourcing and 4) triple check (quadruple check) market share and market growth rates. The fourth part is probably the most difficult. If you are still on the fence after step 3, we'd say a good "rule of thumb" is to sell an asset if it's in a large market and only growing in-line and to . This could be for a niche market or a large market. As soon as you're growing "in-line" with the industry, a sale can make a lot of sense.

Conclusion:*never* sell any asset outpacing the market growth

What You Don’t Do

While the most important part is “what to do”, avoiding big mistakes is also part of winning. The good news is that several of the mistakes are easy to avoid (no skill), the last two take some time to learn (a good thing as you’ll make even more money in the future!). No doubt many people will still make the same mistakes, but we’ll try.

Partnerships just don’t work. If someone bids on your asset with some sort of “profit sharing” agreement, just avoid it. It’s not worth the headache. You’re better off deciding with 100% confidence that the asset should be sold or kept. We have no doubt that some people have pulled this off, that said it’s typically for very small scale ideas. If you are ever in a partnership scenario with a large sum of money on the table, suddenly contracts, “friendships” and everything under the sun go… right out the window. Trying to decide who is “adding the most value” between two people is horrific to say the least.

No Partnerships:

This seems obvious but we’ve seen this happen before. If you’re “done” with the product, don’t let it bleed out and die. You’ve probably seen this 100x before. . Not a large amount but at least it is profitable. Then they decide one day “hey this isn’t worth my time I am just going to let it go to zero”. This results in less money 99.999% of the time. Just sell it. Don’t give up… just sell! Even if you get a low-end valuation, you’re going to make more money by selling. As an example…. If the asset typically sells for 3x earnings… your biz will probably dwindle to retrieve 2x earnings if you let it run to zero. Be smart. Sell it.

Never Shut Down: Someone has a website making $X thousand a month

If you’re already ultra rich, you can feel free to gift a Company to someone. We’re guessing this isn’t the case. The reason you don’t sell to any friends or family is you’ll inevitably give them a discount. We know this sounds “unemotional” but that’s the reality of business. You have a personal life and a business life. If you end up selling the asset for a fair price you’re better off just giving your friends and family money as a gift instead. Hopefully, you’ve read between the lines. If you sell to friends/family they will inevitably ask you to help them run it, ask you more questions and blame you for any issues. A lose, lose situation.

Don’t Sell to “Friends and Family”:

No one wants to buy anything from someone who appears to be extremely smart. Make it seem like you’ve stumbled onto a decent business and you’re leaving to do something else. If you come off as incredibly intelligent you’re going to scare off buyers. They will wonder “this guy seems like he is a genius why in the world is he selling?”, which is not a good set up. This is more of an art than a science and if you come off as an amicable guy who is moving onto another venture, the sale will be quite smooth.

Don’t Appear to be *too* Intelligent: As usual, do the opposite.

This is the hardest one to get down right. If you’re used to flipping internet assets then it will be obvious… if it’s your first time… You’ll probably get it wrong. In short? This is a skill that you’ll acquire over 3-5 years or so. When you fix a website the revenue/profits go up in a rapid fashion making a “knee in the revenue curve”, this is when you want to hit the exit button. The numbers are going up (perfect set up for a sale) and if you sell before they plateau you’ll get the best multiple (earnings valuation). If you sell when they plateau… your multiple goes down in a big way.

Don’t sell after the “Knee”: You want to sell while numbers are going up and are about to plateau.

These are really the big five mistakes that are made: 1) partnerships, 2) giving up/shutting down, 3) selling to friends/family, 4) appearing to be intelligent hurting the sales process and 5) not selling when the asset still has upside potential. Like anything in life, the first sale never goes perfectly, but you can easily avoid the first three since they require no thought (simply avoid!). In future posts we’ll begin walking down the sales process.

Conclusion: If you have other comments be sure to leave them below and as usual no questions.

For the newer readers… if you’re interested in learning more about making money, staying in shape and doing so without choking off your personality… You’ll probably like . The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality

Efficiency, Get Rich Without Giving Up Your Life
****

“Where Do I Start?” the Easiest Way to Stop Making Excuses

“Where Do I Start?” the Easiest Way to Stop Making Excuses

While time for money exchanges are not the way to get rich and never will be (something we have explained hundreds of times on this blog) the one question that never gets asked is “what is the opportunity cost”. While we emphasize that it won’t make you rich, doing some tasks when you have free time or “double booking your income” is the easiest way to step your toes into the water. For example, if we look at your typical office worker, they spend a large amount of time doing meaningless things like watching YouTube clips and mainstream media reading. The first step is sitting down and “double earning” on your time. While we went all out internet business from the start some individuals need to start even smaller to realize the opportunity even exists.

Before listing off various ways to generate some fast income, think back to times when you were in a bad spot financially. Typically you’re forced to 1) ask around for a quick freelance job, 2) sell something you don’t need anymore, 3) do something that pays less than you are worth or 4) ask a friend for a few bucks. Now this is not something you should be doing ever again but we realize it happens to a lot of people and the four items above are the typical ways to make a few bucks. We’ll create a general guideline here: 1) if you’re worth under $100,000 you have to be proactive every working day, 2) if you’re worth over $100,000 but under $500,000 you have to be proactive on both freelance work and selling, 3) if you’re worth over $500,000 you can focus entirely on selling and 4) if you’re a millionaire or better you’re focusing on simply scaling your ideas as the average millionaire has around 4-7 streams of income. This is a good way to think about how “active” you should be and when you should work “hard” and avoid kidding yourself that working smart is the way to go (without being rich yet). Notice, we try to avoid asking people for money entirely as this teaches bad habits, causes you to obtain something for “free” at the expense of your reputation. Not a good idea.

Being Proactive:

This is a general time for money exchange at first. No one likes it. But it can be done at practically any hour of the day depending on what it is. You can start as low as a virtual assistant while concurrently working your desk job to as high as software coding for others while working at Google. The game of life always works in the same manner, the faster you create momentum (the Google engineer example), the faster you fall into other higher end money making opportunities. We’ve mentioned this before but physics applies to personal finance: objects in motion stay in motion.

Freelance Work:

Ideas for freelance work: 1) review people's resumes, 2) offer them mock interviews on the phone as well – this works particularly well for highly competitive industries, 3) virtual assistants always have some income, 4) tutoring and anything educational could also work remotely depending on the topic and 5) the classic "finding accounts" for anyone in affiliate marketing or an industry with the need for many IPs and addresses (there are a ton of these).

Are any of these positions sexy? No. That said, we know several people who do this when they graduate college. They work at a solid company or investment bank and can't think of a good way to make money instantly. So they go down the freelance work route for the first 6-12 months. This results in around $1,500 a month (so we've seen) after taxes. For those that are already rich, this isn't much, but if you're a college graduate an extra $1,500 is around 30% to your monthly income (quite a lot). Generally, speaking $100,000 in base is really ~$5,000-5,000 a month after taxes since you'll be contributing to some sort of 401K plan with a match attached to it.

Before moving on this is one of the worst ways to make money but the trade off is clear. If you're doing something like this and it targets an extremely high-end niche (like software engineering interview help) you make a lot more money per "hour" but it's incredibly difficult to outsource. That's the trade-off. If you do something like work as a virtual assistant, that pays less but it is possible to train someone else to do it (future VA business potential). Keep this in mind when you decide which route to go. Unsurprisingly, those VA positions you see on Fiverr or other "individuals" helping you out… are outsourced to someone else! The main account just leverages his high quality reviews to get new tasks and takes a cut as someone else does it for him. (surprisingly, not a bad business model if you're willing to build up a reputation over a long period of time)

Think back to when the internet came out and the main reselling market was a place called eBay and eventually something called craigslist. While these are still around, it was interesting to watch as some individuals turned them into full on businesses while others never really "put it together" and only made money during hot product seasons (most common was reselling video game consoles like the latest Nintendo product, believe this also worked for Sega Genesis as well if anyone remembers that old console)

Reselling and General Mark Ups:

Simple examples today include reselling physical coins, stamps, some sports cards, sneakers (very popular) and Legos. In the future we have no doubt this idea of "scarcity" value will continue in a large number of industries and could expand into digital items as well. Either way there are several ways to make money here all it takes is a little bit of proactive behavior: 1) reselling hot products – the laziest and easiest way, 2) learning about a specific niche and collecting items that should be of value in the future, 3) taking the time to actually search for items and 4) creating or selling popular products yourself by holding inventory on the books – clear business model in the future.

Normally we would only talk about the last one, something that scales. But. Everyone has to start somewhere. Maybe you only have a few hundred dollars or a few thousand dollars to try and create a return. In that case, in rank order you want to do 1) hot products, 2) collecting items you can already put a price tag on and then 3) deciding it is something you want to do, so you search and scale. Now before we move on here, there is no need to have an "interest" in the item you're selling. This is feel good nonsense as we know many people who have made a living off of reselling collectables with no true interest in them. In fact, being extremely interested in something could hurt your numbers. If you're interested in something you are more likely to attach personal bias to the value of the item and over value it relative to the real market number. Instead, the key to going down this route is simply having the knowledge base to learn about the product and scale it up in the future.

Rough estimate on how much you can make? We'd say if you simply look for hot products and never take the time to specialize you'll make around $10,000 a year pretty easily. This is lower risk, lower time commitment as well. The downside? By doing this (and nothing else), you're not going to scale it up in the future. If you decide to learn about a topic and scale it (purchasing or holding inventory) then it's an actual business that we will now cover as well.

Now we've reached the fun part of the post, scaling up your basic idea into something recurring or sustainable. We'll go ahead and use the collectable/hot product idea as they can be combined into one idea (so the concepts all stick). The first one is acquiring larger amounts of the hot products through your classic VPN and email hoarding technique.

Scaling Up:

For those familiar with affiliate marketing, one of the issues for the black hatters is that they run out of accounts. According to recent reports even white hat accounts are being banned frequently (luckily our stuff is extremely clean at this point due to long-term reputations – a topic for another day). We'll go ahead and say the vast majority of affiliate marketing is "grey hat" at best. Either way, if you have your Facebook or google account banned over and over again, you need to go and find a new account which is a hassle. New IP address new email etc. that is not tainted with a bad reputation/background.

How does this relate to buying hot products? It. Is. The. Same. Thing. You go ahead and create a bunch of bots (or pay someone to do it) and collect thousands of different IP addresses and emails. Why? Simple, now you can buy a lot more of the hot product (versus doing it yourself which will only get you a few units). You automate the process and simply hold a small amount of inventory at a time. This is also less risky as a new product with "limited edition numbers" will unlikely break the bank and it will have a 100% return policy.

Assuming you've got this down then there is basic supply chain management. This sounds fancier and more complicated than it is. If you scale up your niche you simply need to know where to ship the product to reduce your costs and improve your margins (taxes, shipping costs etc.). This one is a lot more complicated and is industry specific as we don't know what product you'll be buying, shipping or selling. The long-story short is that as you scale you can actually expand margins a bit by doing everything in a tax efficient manner.

Great news here… How much can you make? Since all of this can be run with a computer and a bunch of online logistics you could make more than $100,000 per year. We know, $100,000 a year doesn't sound like a lot given that everyone online makes "millions". That said making six figures is a substantial windfall for you… tax breaks!

A lot.

Take a step back and look at it from a bird's eye view. If you were making around $100,000 from your regular job and now make $100,000 from your online business, we'll bet practically everything we have that the online business will out-earn your job on an after tax basis. You can now deduct costs from your cell phone, wireless bill, part of your rent, your travel in certain cases, gas mileage etc. This is a huge deal as W-2 income is taxed based on the income while your online business is taxed based on your profit which has a lot more wiggle room associated with it. Simplistically, a W-2 is taxed immediately while in a business you receive all of the money, deduct expenses and are then taxed on the net amount. A huge difference financially.

Before moving on, we've never done a people management business but the concept there is the same. If for some reason you're great at hiring and training virtual assistants, it would result in the same benefits. You get to receive money up front, pay your employees and then get taxed on the net amount. Unfortunately, no matter how much we can "describe" these high-people management roles, we've never done them so we simply leave it at that. It's an arbitrage on what people are willing to pay and how efficiently you can train someone to do it for slightly less (collecting a spread)

One reason why people don't enjoy going to work is that they are going to get the same result regardless of how hard they work. You work in investment banking and do 50 page decks and this changes to 100 page decks? You get paid the same assuming your ranking in the firm is in the same tier.

View This as a Game:

Now in this new game, the VA scaling game or the product sales game, you are getting what you kill. It's an exciting feeling that you should view as a video game and not view as a "job". It isn't a job because you're collecting income based on your ability to think creatively and find mis-priced items in a market place. For people who grew up playing video games it's pretty similar to those old school RPG games. You kill a few low level monsters (like the hot product sales), then graduate to fight the medium level monsters (dealing with multiple accounts at the same time) and then finally go to the final stage of managing a large number of sales with transportation logistics across the USA (or your country).

The odd thing about this whole process is that once you get to a point where you're earning money yourself , the "a ha" moment kicks in. That's one thing we've noticed. Many people get stuck in the in-between part where they are working hard to make money (but have to put in tons of their own effort). Hopefully this post clears that mis-conception up. You can start at the absolute bottom (doing it yourself) and remember that this is just the start. Within 5-years you should have outsourced a ton of the work to see income in your accounts when you wake up in the morning.

Fun Side Note: *while you're sleeping*
****

Why and How to Keep a Journal

Why and How to Keep a Journal

Practically no one keeps a Journal… Practically no one reads. Knowing that everyone else is avoiding these tasks… We know that these tasks will improve your life. So lets get cracking… For all of the people who hate on journals, this post should break down exactly why you should have one and how it is going to 1) increase performance and 2) force you to develop better habits.

The truth is that writing a single page in a word document will take less than 10 minutes. This is because all of the information is new, fresh and easily recalled. The 10 minutes you invest in tracking your own progress is going to show relative strengths, relative weaknesses and clear areas where improvements can be made immediately. All of these items are going to be difficult to track without consistency (consistency is key – day or night is not impactful).

Why Should You Write:

A journal is personal compounding interest. You won't see any noticeable gains unless you do this for at least 90+ days in a row. Why? It will be difficult to spot trends and see holes in your diet, workout, mentality and overall progress.

The benefit? Once you've established the habit you will be hooked as you'll make at least one adjustment that will benefit you immediately. If you do not see at least one or two holes over the course of a year, you should stop immediately… because it simply means you're not taking it seriously.

Enough with the over view, can you show a real life example?

Training journals are extremely common for weightlifting, sprinting, distance running, swimming etc. The difference between a high end journal and a low end training journal is this:

1) Athletics, the Most Common Example:

Simply tracks reps and weights

Person 1:

Tracks reps, weights… and also tracks muscular trends and soreness.

Person 2:

This is the difference between good and great. You're making a mind muscle connection and you're actively searching for areas to take your skills to the next level. If you are properly tracking your muscles and performance, you are now in a significantly better position to break a plateau.

Anyone who has attempted to break a plateau will know one thing… It seems impossible to crack for weeks at a time.This is the difference between Person 1 and Person two from the example above.

Training journal says "Squat: 3 sets of 8 reps at 275 lbs".

Person 1:

: Training journal says "Squat: 3 sets of 8 reps at 275", right IT band and hamstring is tighter than left.

Person 2

For serious athletes, you already know the solution to this. You attempt left legged and right legged jumps to see if there is a muscle imbalance. What happens next? When you run and jump to touch an arbitrary marker (vertical jump markers, a basketball backboard, a football goal post etc.) you will notice that there is a significant difference in the height (call it 2 inches instead of the typical 0.5 inches for left foot vs. right footed jumpers). Now you've confirmed the muscle imbalance and turn to your training regimen and realize the following… You've been running 200 meter sprints for the last 4 weeks.

If this is true the answer is simple, you're going to run the 200 meter sprint clockwise instead of counter clockwise forcing more pressure on your right leg during the bend of the turn. Your 200 meter workout suffers by a half second to a second, however your body adapts within a week or two and the next thing you know… You're now squatting 3×8 reps of 305lbs.

Not Sold yet? Not an athlete? How about this…

While calorie counting is all the rage these days, if you're a busy person who exercises it is best to start simple by monitoring exactly what was consumed and ignoring the total calorie count for now. If you want to go from good to great you can add the exact portion sizes, however, this routine will keep you honest about what you have actually consumed.

2) Diet: Track your diet at a high level.

How is this going to help? You're going to break bad habits.

Three years ago I personally had a bad habit of eating a chocolate glazed doughnut every single Sunday of the week (being honest sometimes two!). This was like clock work, I would rush to the bakery eat and then move on with my day, an odd habit. While it doesn't sound like much, just like other things in life the small efforts compound and add up. I couldn't seem to drop the last 1-2% of body fat I wanted.

After reading about the negative impacts of heavy carbohydrate consumption after lunch, I decided to track my diet in my regular journal. Things started to change. Instead of going to grab my glazed doughnut I was grabbing a banana and mixed fruit cup instead (an extra $3 no big deal). Within 6 months I noticed a slight change to my body fat which allowed me to reach my goal.

Why did this happen? This happened because I forced myself to write down what I ate and had to stare at the results every single day I double clicked the word document. Once you write down chocolate and maple glazed doughnut two times in a row… You start to shake your head. It becomes harder and harder to write down the bad decisions.

You change.

Still not sold yet? Believe your exercise routine is perfect? Believe your diet is impeccable? How about this…

Everyone reading this blog should have lofty goals. If they are not lofty you're not aiming high enough in the first place. With that in mind, how are you going to reach your goals if you are not learning something new? How are you going to retain the knowledge without writing it down? How are you going to debunk previous beliefs without tracking them? You simply can't.

3) Mental Growth:

For this one, lets turn to the work force. We already explained the and keeping a journal can help save your career as well. Every day you need to learn something new within your field. It can be as small as knowing your preferred color template or as large as knowing about a firm wide layoff.

importance of politicsManaging Directors

Write it down.

Many people are going to read the Managing Director example and think this is brown nosing when in reality it is simply people skills. If you know your superior is a hard core Boston Red Sox fan it is probably smart to avoid bragging about a New York Yankees win. Even if you are a Yankees fan, a socially intelligent person is going to avoid the topic entirely. Think about the you have. You certainly avoid some topics on purpose since you simply don't see eye to eye. We all have plenty of these. This will save trouble for both of you.

close friends

How is this going to add up? Keep light tabs on people, events and obtained knowledge. If you believe this is brown nosing, again you're missing the point. This is akin to knowing your best friends birthday or knowing his or her favourite food when you happen to be in the same area. There is a difference between being thoughtful and a suck-up. The difference is that you're not changing your personal beliefs to adjust for them, if you disagree with them, simply avoid the topic (see foolish people who argue about politics).

Fast forward 6 months. By this point you should know the quirks of the people within your office. You should know which groups dislike each other, which people love each other and which ones are simply apathetic. This is going to do a lot of leg work for you. Instead of worrying about prioritization and wondering what a certain person wants… you're going to have a quick document to check and confirm your beliefs. You can laugh now but if you do, you'll see that you have wasted your own time. Knowing that person A prefers to see Document 1 first instead of Document 2 first is going to change your entire workflow. In addition, everyone in the office will believe you are simply more efficient than others.

Do this correctly? During your performance reviews the first thing they will say is this:

"You seem to make the work environment easier for everyone around you"

If that doesn't give you an edge, nothing will.

If you're not sold on a Journal improving your physical and mental health then we do not know how to proceed. However… If you're looking to add this simple exercise to your life, below is a template that has been adjusted over the years.

We suggest a digital document as it is easier to search for information on a historical basis.

Day Month, Year

Today, I realized work was going to be lighter than usual so I decided to add an extra cardio workout at the end of the weight-lifting routine. Highlights of the day were 1) finishing document X and sending to client Y, 2) improving bench press by X lbs and 3) limiting caffeine intake to 1 cup of coffee.

Meal Summary:

Breakfast: 1lb mixed berries, 1 cup coffee, 16oz water, 1 cup almonds, 4oz ham and 2 fish oil tablets

Lunch: Half chicken, side brown rice, side of mixed vegetables (broccoli and cauliflower), 16 oz water and 1 banana.

Snack: Carrots and celery sticks. 8 oz water and 2 fish oil tablets

Post Workout: 300 calorie protein shake and 16 oz juice (carrots, apples, kale and coconut water)

Dinner: Half pound of salmon, mixed vegetables (zuchinni and carrots) and a handful of olives

Workout Summary:

Bench Press: 3×10 reps X LBS… No noticeable changes

Close Grip Row: 3×10 reps X LBS… No noticeable changes

Incline Bench: 3×10 reps X LBS… Personal record by 10lbs, right side seems stronger

Wide Grip Row: 3×10 reps X LBS… No noticeable change

Decline Bench: 3×10 reps X LBS… Notice left side soreness

Rack Pulls: 3×10 reps X LBS… Notice lower back pain is gone

Run: 3 miles easy run – Felt good today due to lower effort at work

Knowledge Gained:

1) Reminder that managing director Y is going to have his second child in about a week. He seems to stress with personal issues so better to avoid this week.

2) Left chest tightness means I should probably switch to dumbbell bench press to fix the imbalance

3) Finished chapter X of X book which suggests I change my email message pattern to Y.

4) Friday is going to be a longer than expected work day as XYZ project is running a bit slow. Going to prepare for this by taking off a bit earlier on Thursday as most people are out of the office at that time

Knowing the workload is likely going to be higher, I plan on reading a bit more and decreasing intensity at the gym. Will stick to weight lifting and avoid cardio giving me an extra 30 minutes to read book X on topic Y. Given the lower expectations for lifting, I plan on eating a tad less as well.

Plan for Tomorrow:

———————

****Bonus: Every year, you're going to add 400+ pages of writing. This will improve your typing speed and writing abilities as well. Just remember to write the truth and you can look back and see the performance for yourself.*

Why The Ninety Nine Percent Don't Understand Wall Street

A friend of ours tracked down this discussing this and the negative comments are exactly why the haters will remain in… the Ninety Nine percent. If you read the article and your takeaway is that we are 1) unhappy, 2) leeches or 3) angry about our lives here's some good news for you we already know what your We are creating a platform to motivate and inspire. In addition, if you're interested in getting into Wall Street we are giving you the tools you need. Maybe we are just stealing from you though… feel free to explain.

reddit threadarticleday looks like because you're a loser.

This is going to be a relatively long post because no one else is going to take the time to explain all of the "philosophical" arguments in a single post but lets get this started.

If you believe this is true have fun working in finance for your first 5-7 years because you won't be seeing any sunlight but that's not a problem because you're certainly working harder than us already… Right?

1) We Make Money By Doing Nothing. Myth.

Thank you professor in no job experience. Let me ask you a simple question. If we told you that we can sell your current house on the market for 10% above the current bidding price you are receiving… are you willing to give us 200bps? Now if you own a business and we can get you 10% higher on your Multi-million dollar business now would you be willing to give us 200bps? But maybe… you believe raising capital has no value.

2) We Create Zero Value. Well that zero value argument died in a hurry.

This one is another automatic gag reflex. Let's take a second to remember a story:

3) Capital Raising is "Free Money".

"There once was a time way back in the past where a young man had a great idea for a website. This young man was extremely competitive and rebelled against everything from his Ivy League Institution to job offers from major corporations. The idea was so great but he Flash forward just a few years later and that Company is now worth tens of billions of dollars, the story is so great that they made a movie about it, that company is called

just didn't have the capital to grow the business.Facebook."

Wait, that story was awful because we wanted to choose an example that actually adds value to Interesingly this guy IPO'd his . Lets move along.

your life. own life

If you believe that capital raising is bad, then you must ask yourself these two questions. By correctly delivering the business proposition to investors and finding people to outlay real dollar bills you are adding a lot of value, one might say you'd be fit for a job in

Is the recognition of talent or a solid business idea a useless skill? Is salesmanship a useless skill? Venture Capital.

Hard work is hard you should just quit. If you don't enjoy working hard you are going to fail at life. The difference between a winner and loser is entirely If you find someone who enjoys failing more than us please send them our way. Failing is fun because failure is just practice.If you get blown out by a 9.5… good you're closer to the next one. If you lose your job? Guess what it is time to grind and find another one, you might even get one that pays better.

4) These Guys Are Depressed. in your mind.

We will tell you one thing with absolute certainty, if you work as hard as possible you will become a more successful person. Knowing this statement is true since hard work leads to results how can hard work be depressing?

It can't if you want to win.

This is going to fly above most people's heads. Lets go take a jaunt to a fundraiser shall we? Hmm… why is this place full of successful people? If a man is starving, dying of thirst, sleeping on concrete and you hand him food he will be infinitely happier than the "life experiences" you received backpacking through a jungle with your iPhone and iPod. When we die, since we won't be having any kids in this lifetime, every single penny will be dropped into a charity. Maybe this makes us bad people.

5) Money Buys Happiness. Successful people want to help you win and part of helping you win is giving you opportunity.

If you're busy blaming other people for your life failures: Wall Street, Corporations, your parents, your brother, your Facebook "Frienddddsssszzzz", your 5'6″ height and your brown instead of blue eye color and you are not working hard you should blame yourself. If your number one instinct is to try and bring someone down, you should try bringing people up instead.

A real man of value makes everyone around him better.

Lets take a quick glance now and see if we're the bad people or not, you can take your life advice from us where we received this email just under 2 hours ago.

"Hi WSPs,

Wow, I don't know what to say. Thank you so much for putting so much work to edit my resume during Easter weekend. I really appreciate it. Now I am going to work in it per your suggestions and get back to you ASAP…

Thanks again and have a good week ahead,

Name"

Or you can take advice from some broke reddit keyboarder whose name is

"Throw in the Towel".

"What a terrible read. This blog didn't motivate me at all. If this is his average day then this guy's life sounds absolutely miserable. Do something you enjoy guys. Wealth is not everything like this idiot is saying."
We are trying to build trust where we can all win. The decision is yours.
****

Why We Fail at Achieving What We Most Desire

The best way to tackle this is to look at the "average day" of the "average man". For the lazy, the conclusion sums everything up in just a few short words. Look at the below routine and ask what would happen if you choose "instead".

We hit the snooze button instead of simply standing on our feet. We repeat.

We Awake.

We reach for a morning coffee at Starbucks instead of doing 10 pushups. We repeat.

We're Groggy.

. We sit and sigh instead of greeting everyone with a smile. We repeat.

We Have the Monday's

We eat what we "want today" instead of what will help us become healthier. We repeat.

We Eat.

We have the same friends we have known forever instead of branching out. We repeat.

We Retain.

We buy things online instead of asking if we really need the product. We repeat.

We Consume.

We head home instead of going to the gym because we "feel exhausted". We repeat.

We Finish Work.

We read about today's news instead of gaining wisdom for tomorrow. We repeat.

We Go Online.

We watch TV and the lights cause us to stay up late instead of reading a book. We repeat.

We Relax.

We sleep when we are tired from accomplishing little instead of pure exhaustion. We repeat.

We Sleep.

Hopefully this post has been slightly annoying or even repetitive. That is the point. The theme remains the same.Not you though, you're better than that.

Conclusion: We fail at achieving what we most desire, to obtain what we desire in the moment.

****

Why You Will Never Really "Retire"

Why You Will Never Really "Retire"

The reason is actually quite simple. If you become successful in life, you're a person who enjoys becoming better every single day. You don't enjoy sitting around drinking a bunch of beers and eating French fries for 10 hours straight in front of a TV screen. You enjoy getting better at *something* every single year. It could be your physical fitness, your online business or your ability to read social situations. No matter what, you find an area in which your skills are lower than you want them to be and look to improve that area of life.

As you get better and better at what you do the number of people you compete against gets smaller and smaller. The level of competition needed to get into the top 10% or so is incredibly weak. We have only been writing for a short period of time (in the grand scheme of things) and we have an inbox full of people who made it through various routes: real estate, investment banking, online business etc. They are now hitting a point where each jump is harder because your competition is actually legitimate. You slip up once and you'll be passed immediately. Below is an email we received that highlights the change in pace (redacted his personal information).

Small Differences:

"About three years ago I decided I would give the information a try for a full year. I was working at accounting firm (redacted) and followed the plans to try and get into investment banking while improving my fitness since I was slacking after college. People don't tell you how much harder life is after college since you are trapped in an office for a large period of time. Fast forward a year and I got into investment banking and made just over $110,000 while I lost over 10 pounds of fat. Sure it wasn't a major change like some of your other readers but now I'm on track to make $200,000 this year with a small business on the side. What I noticed is that it's getting harder to move up since the people I have to compete against are actually trying just as hard as I am! Do you have any advice for staying on the course when you visibly see the difference?" from your book Efficiency

We do have an answer here. The answer is this This is e. Once you get into the top 10-20%, you know what it feels like to succeed and there is nothing that comes close to that feeling. Not even close. So instead of asking us how to stay the course ask yourself You're going to come up with nothing. Your other options are boring things like drinking with your "buddies" who are low value and have time to waste on just "hanging out" and giving up to live a life you left behind already (clearing $70-90K just getting by). Both options should make you feel sick.

"what else is there to do?" another rigged game in lif*"What else can I be doing that I won't regret in 5-years?"*

The real issue this person is struggling with is the *small differences* issue. This is why we gave away our PED routine (already regret that one). If you get to the top 10% or so, it's going to be a large number of small choices that will make you jump into the top 5% and beyond. Small differences include: 1) do you check your website design every month or every quarter?, 2) are you able to go to the gym 5 days a week instead of 6 days while seeing the same performance improvements due to intelligent training?, 3) are you pushing off those email responses to "tomorrow" or are you doing them all before you go to sleep at midnight? and 4) are you still holding onto some people that you know won't make it as they have given up or slowed down for good?

These are things that don't show up for months/years at a time. As you know (if you're improving), all results take long periods of time to show up. If you are a millionaire at 30, it's because of the decisions you made in your 20s. Now that you're competing against other millionaires… You're all making long-term bets and battling it out to see where you land at So. You have to stay the course and make tons of small difficult decisions even if your energy levels are lower and you're feeling tired. These will add up and you'll continue moving in the right direction. Besides, what else are you going to do? Just drink and hang out for 40 years? No thanks.

age 40… Not age 33.

_

"I have 'Like Minds'… Do we have time to socialize and to hangout aimlessly? No. Do we want to do that? No. We want to work. I enjoy working" Kobe Bryant

One of the best things about your first major win (like the email we highlighted above) is that you *should* get addicted to that feeling. The "should" part is important as it's a quality of a future winner anyway. If you remember that high (how you felt at that point in time), it should be impossible to replicate. This assumes you really did something that you didn't think was possible within your time frame.

The Self Fulfilling Prophecy:

If the above is true then all you have to do is remember how it felt and ask yourself if it's better to give that up for good. Your answer is always going to be no. Sure. You may not get the exact *same* high every time, but it sure beats any other high you will get in the future. This is also why we acknowledge that practically every single one of you will go through a bender phase after you get rich.

In rank order in terms of dopamine rush: 1) financial independence, 2) 50% change in your annual income, 3) first real profitable sale in an online business while you're sleeping, 4) one time windfall of 3-5% of your net worth or more. The last one is critical, if you've trained your mind correctly you won't be excited by one time windfalls (lottery or a great stock option call) and you'll be more excited by the recurring revenue (items 1-3).

As you can see we do have one big concern we bring up consistently on this blog. The recognition that it's difficult to maintain motivation past the financial independence level since the dollars don't have as much meaning behind them anymore. The good news? After your first bender (or five), you'll have nothing else to do. And. You'll focus on the second option again which is increasing your income or net-worth by another 50% which shouldn't be easy at all.

As another note, you get to a point where "hanging out" just doesn't sound appealing anymore. Sitting around watching something on a television with 5 other people doing nothing every single week gets incredibly boring. It's actually more enjoyable to sit down and read something that will improve your life. A few hours (maximum) per week hanging out is beyond enough. Why anyone would enjoy hanging out with their friend every day after work for 5+ hours is incomprehensible (everyone in the room is quite literally getting worse).

Whilewe'lldo everything in our power to slow down the ticking hands of time, even at old age, there are things you can do to improve. Maybe you'll be less interested in your own net worth and you'll change your focus to charity, your kids and some sort of elaborate bucket list. The end result is still consistent interest in improving your life. By this stage in your life, you've tattooed a habit of self-improvement onto your bones and there is no going back. How anyone can live life hanging out and "chilling" doesn't make much sense since it's incredibly boring to you anyway.

Even At Old Age:

As a note, if you look at the ultra-wealthy, many of them do things such as consulting/advisory services. They sit on boards and work less hours while focusing more on high-level strategic changes. They don't bother with any more work that would be considered "grinding". You become more of a speaker/influencer at that time.

We do get some emails that effectively say that "this isn't worth it". This is great as we can instantly ignore them and never speak with them again. They gave us a great gift! They let us know up front that they will never make it in life. A deleted contact is gained time in many cases. You can work with winners instead.

"This Sounds Terrible":

When we read this post we're actually excited. There is nothing fun about sitting around. Going to the gym hitting a new "personal best" or having a personal best revenue day is *really really really* exciting. That is something that normal people cannot relate to since they haven't felt it before or don't think it's worth it. If it were possible to generate sales 16 hours a day and go to the gym for 16 hours a day we would do it. Unfortunately that isn't the case.

So with that we're only focused on the winners in life. If you ever feel like quitting instead of watching some crazy motivational video talk to yourself rationally: . You'll be back on your computer sending those emails within seconds.

"What else can I do that I won't regret in five years"

For those that are unfamiliar with our blog we have three high quality products in order: , and 3) . In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending.

Winning in Each Stage of Life

Winning in Each Stage of Life

Making transitions in life is probably one of the most under-rated skills. Similar to any high speed sport, the need to change speeds, directions and "run the game at your pace" is a critical skill. This occurs in life as well as we move from cranking long and hard hours to saving/investing to spending as much as we like. It isn't easy to make transitions because it requires you to learn a new "mental model" or whatever the self-help gurus are calling it these days. Any successful person you meet will talk about numerous big and life changing transitions they have made. We'll run through this in chronological order.

When you're extremely young, it is not clear where your skills are. While a few lucky people are born as a child "prodigy", the vast majority are born with a set of skills that range from 1 standard deviation below to one standard deviation above. The key is to shot-gun approach and try everything you can. After shot gun approaching your life, you'll find a handful of things where you're good at the task. The best example is in the physical realm (which is why we will always be interested in sports!). If you find that you're not very ambidextrous, you'll probably move into sports like golf and tennis and away from sports like basketball and soccer which require both sides of your body to be used frequently. On the other hand if you find out that this performance difference is immense (for some reason one arm/limb has significant strength), you may end up as a field goal kicker or shot put thrower. Either way, as you learn each and every nuance of how your body works, you'll decrease the list to select few.

Shotgun Approach:

This is typically the first failure in making a smooth transition. Many people do not bother to accept the reality of their skillset. If someone would make an excellent tennis player but then focuses on volleyball because they enjoy the sport more… this will typically lead to a disappointing result. Now to be clear, we're assuming the person is attempting to win and not doing this as a hobby. Since accepting reality now refers to making money, we can apply this to your soft skills. If you're unable to be a solid software developer/coder, it does not make sense to enter this field today just because it is "making money now". Instead if you find that sales comes easy to you… it's time to focus on that segment. Sure a top tier engineer may out earn you, but it's better than being a bottom barrel engineer and earning less than you would as a top tier sales professional. We've seen this mistake many times. We still get the same questions "which career to choose" and the answer is always the same… . If you're going to be one of the best at it, we place the chances of making no money at around 0.0001%. Unless you decide to be a social worker.

Accepting Reality: the one that you will be best at

Assuming you've done the first two big steps, you're now in the big leagues. Competing against other rational people who were able to analyze their own abilities and choose the correct path. Now here is the kicker… The big problems typically begin around this age 18-22. We'll put a band around it since some of you won't even bother going to college because you're already making money! 1) getting into a financially responsible situation, 2) avoiding the complete death of your personality, 3) giving up control, 4) sending the elevator back down and 5) re-learning how to spend liberally.

Competition Now Goes Up! *The Big Problems Are*:

This is a big one. It is not possible to know how you'll react when you start making a good amount of money. This is different for everyone. If you grew up lower middle class and make $100K/year out of the gate… . We don't know how you'll react but most people get a big surge in confidence and… Irresponsible spending and investing. We rarely talk about saving/frugality here because it isn't the best way to get rich but one thing we can recommend is "learning" how to deal with the large amount of income (large is relative to what you were previously earning).

1) Financial Responsibility: This is going to be a big dopamine rush

Interestingly, this happens all of the time from age 20 to age 60. Even if you're in your 40s… You may get a big one-time windfall and the exact same thing would occur (potential to lose it all through irresponsible spending and poor investments). For those that have made it, you'll notice that your "friends" or anyone who knows you're rich will "assume you will foot their bills". This is how regular people operate. You shouldn't allow for this and more importantly, if you find yourself doing it … that is an enormous burning Red Flag. People always say this is because they have no idea how much more responsibility they will have. As you move up the chain, it is harder and harder to lay low.

"If I had $XXX I would…"

Since you'll be taking the financially responsible route we continue to recommend The Company offers *free* software tools that will keep you honest in terms of spending, net-worth growth and portfolio diversification.

. Personal Capital

This is a topic that is avoided by many: Elephant in the room. For anyone who has at least a decade of work experience (Career and Business owner only), they will recognize that many people give up everything for the all mighty paycheck. They may be incredibly deadly at the negotiation table… But they don't have much else left after that. Many are trapped in dead-end relationships (marriage or otherwise). Many are out of shape with health problems that will take well over a year to solve. Many live a life of quiet desperation.

2) Maintaining a Personality:

We hope that many of our readers already see this (a few years into work or otherwise). We think this life transition is more important than money because a bad investment or two (losing tens of thousands for example, or even a few hundred thousand) can be recuperated. Fixing a bland life that wasn't living cannot be fixed. We can't get our time back so there is no way to "undo" the hours of slogging away and living a repetitive life.

If so this is probably the most important pitfall to avoid.

Most won't like this part but we think the easiest way to prevent "personality death" is to spend the first five years (at least) with the following basic rules: 1) stay single, 2) stay out of debt and 3) spend at least two nights a week outside of your work/professional circle. Steps one and three are the hardest. Most are not comfortable with meeting new people on the fly and it is quite easy to get complacent with a normal relationship. The standard path which suggests: 1) college, 2) good career, 3) work hard and meet significant other, 4) locked into a relationship by 30 at latest, 5) kids and 6) death. It seems that this . The best way to avoid it is to follow the outline we gave and watch as your friends and colleagues fall into this death spiral. Once you see how their lives change you'll have a good grasp of when/if you want to live a more predictable life.

path is so engrained that even financially savvy people fall into the same trap… do the opposite *Hint, keep in contact with a few women during your college days to get a good glimpse of what is to come. Generally they will get married much earlier*

If people do not like this outline then we'll make it easier. Unless you've already done everything you would like (personal basis) there is no reason to get trapped in the standard path. Once you've done/accomplished everything you wanted to do, feel free to take a look at a more predictable and stable life. For those that are skeptical still, for good measure… Look at the higher ups at your organization (if you have a job/career) and ask if you'd actually want their life. We know what you're thinking already: No.

This is where the big money is made. While technology allows us to build massive businesses/organizations with a single person… eventually your time will become incredibly constrained. If you've made it to this part of the transition game, you've already made it. You're making good money, you've avoided the standard path traps and on top of all this… your personality hasn't been beaten down by corporate policies (you got out just in time!).

3) Giving Up Control:

Here you're going to have to release control of all the items that don't generate large sums of money. If you can't do this you'll be forced to work long hours with nothing to show for it (flat income line). As you can probably tell, this is an important topic to us at this point and has occupied 20%+ of our thoughts lately. There is no real easy solution except for outsourcing the lowest skilled task and moving from there. Experienced people will likely laugh and say it is easy but we haven't cracked this code yet. Our strategy has been slow and painful (as evidenced by the difficulty in updating this blog). If anyone has suggestions we're outlining our leverage plan as follows: 1) outsourced admin for the most basic tasks – product returns, payment issues, organizing calendars, etc., 2) new email address to separate important people from less important people and 3) new accountant. While basic at first, this has already opened up several hours per week. The key now is finding a way to maximize those free hours and eventually hiring another employee for conferences/industry updates so the calendar automatically fills itself in.

Pausing here for a second, one item that is probably overlooked here is "separating important from unimportant people". This may sound rude but it is the reality. It will also happen to you as well. Many of your contacts will fall off the map after making bad life decisions and on the flip side many people will likely reach a new level of success (a good thing). If more and more of your friends seem to succeed it is inevitable for you in the near-future. Ideally, a few will pass you as proof that it is possible and you can succeed in time and drop an email later to catch up once the amount of value you add is roughly equal.

We've clearly done this in the form of a blog. As a basic way of giving back to strangers we'd suggest something that is break-even to slightly profitable. The reason is psychological: people don't take free content seriously. We proved this many times in the past and as long as you over-deliver relative to the measly cost you're charging you're helping more people than a free product (no one reads free e-books). This is no different than giving a child something for free versus making him earn it by working for it. Even if it is the exact same product, the product that required work is taken seriously and appreciated (the one that was given for free is treated like trash).

4) Sending the Elevator Back Down:

Now starting a basic blog is definitely not the only solution. There are millions of other ways which include: 1) charity work, 2) teaching and 3) the extreme example of adopting kids. The point is that you'll get a lot out of sending the elevator back down. Even if it seems like something you would never do, we'd suggest you try even for selfish reasons. Many benefits include: learning to communicate better, being forced to understand all the concepts better since you must pass on the information and increased empathy as you watch someone go through the struggles you once had in the past. Of these three the last one is probably the most valuable as you realize there are many people who have to work even harder than you do for the same result, seeing it in front of your own eyes will help you in your personal life.

Once all of these items are complete you're essentially "done". There isn't much for you to prove and there is limited upside to making the numbers on the screen go higher (net-worth). So you're now in a new position where you evaluate where your life is going to go over the next 30 years or so. If you want a family… If you want more free time… If you want a dream house/car… so on and so forth. We can't really answer this one and we've already spilled the beans on where we think we are (around three or four – financially independent but not willing to go entirely off the gas yet). The good news is that the end is clearly in sight so it's at least time to prepare.

5) Re-learning How to Spend:

A few ideas we have worked with include: 1) ratcheting up spending every other month to find which activities generate , 2) organizing all cash flow items into a single umbrella and automating the deposits and 3) increasing travel to the handful of places that appear "livable" long-term. By doing these three things (and talking to successful people that are 50-60 years old) we think the preparation is largely complete.

the most "utility"*Note: successful to us is not necessarily successful to other people.We define success as 1) happy, 2) financially independent, 3) growing income and 4) solid social skills.*

Essentially there are several big stages in life and each stage of the "game" offers a different problem that has to be solved. The big stages are: 1) disorder of knowing nothing about your skills, 2) specialization in the correct task that offers the best return, 3) giving up control of basic tasks that you "could" do (learned from step 1) to scale, 4) this leads to accumulation of knowledge, money and status, 4) combining these items you'll now have a money printing machine to free up *time* which you will never exchange for money again and finally, 5) you begin giving back at a reasonable rate while figuring out how to maximize your happiness. While it appears easy, we'd say there are less than 0.1% that get through this mess. .

Summary Stages of Life: Even the financially rich fail in many of these steps

On that note, with a basic and clear warning about following the masses… We'll host our next full fledged Q&A on February 10 at 3pm EST.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like . The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by

Efficiency, Get Rich Without Giving Up Your LifeClicking Here.

Work Life Balance

Work Life Balance

Lets state the obvious here. If you're looking for a career or business opportunity with "work life balance", you've already lost. The implied message by searching for this position is that you view work and life as separate. You don't like your work.

If you don't like your work, you'll be putting in the minimum, barely scraping by. You slowly work up to a middling position that pays $150K per year. You've set out on a path that will be painful (long-term) once you hit the decade mark in work experience.

The Outline

This is generally the threshold where people can decide if they like their work. Remember, otherwise you're better off starting a business (again in something you can scale). Is it better to put in the long hours when you are young or when you're older and playing catch up against the people who are already in the industry? The answer of course, is when you are young.

60+ hours a week:there are only 3 careers worth pursuing

60 hours a week will break down as follows. In at 8am out at 8pm like clock work. 4 weekdays during the week you spend . One night a week (choose Thursday) you socialize to avoid becoming a type A boring person and prevent yourself from developing unhealthy *black out* drinking habits. You read on your free time Friday night and you set aside saturday night for fun. Finally, Sunday should be spent on new hobbies, new businesses and any other way you can reinvest in yourself.

1 hour at the gym after work

But what if you work 80 hours a week in investment banking for 2-3 years? This is easy, you can maintain the same schedule. Do not allow people to trick you into believing it is not doable. You are only 22 years old.

You simply leave for the gym when the office is empty, work longer on Monday-Wednesday and slot out Sunday for additional work as well. Pay your dues over 2-3 years so you don't have to be average like most people in their 30s. There is almost nothing worse than having $100-150K in the bank at 30. You're starting from scratch again.

Generally, people will work for 40-50 hours a week. If they spend 56 hours a week sleeping (8 hours a night) and another 50 hours working… That leaves only 62 hours a week for "life" which will include chores, commuting and other miscellaneous tasks. Now let's see what happens if you enjoy your work… You've now increased the amount of life you're living by over 30%. Instead of burning 106 hours a week doing things you must do/don't enjoy… You now spend just 56 hours a week sleeping and the rest of your time is filled with fun activities.

Work is Life:

Run the math.

Does it make more sense to spend 2/3 of your life doing things you enjoy or only 1/3? The clear answer is 2/3. Work life separation is for people who believe everyone hates their job. This is false.

If life is work and work is part of your life, how do you find balance and avoid becoming a high strung hyper competitive person? The answer is in the remainder of your *personal* life.

Balance:

As soon as you step away from the computer, away from the meeting and away from your company issued smartphone… Rest all thoughts. The key to balance if you have a stressful job is to realize that you cannot change the circumstances from your bed, at the gym or at dinner. The following should be your mantra.

"Ignore what you can't control, take action when you can and learn to know the difference between the two."

You will be able to track down role models for work life balance very quickly. If they work in intense professions or run competitive businesses and do not speak of them… they are in balance. They also exhibit emotional control.

Notice the definition of balance is different, work is still part of your life, you simply do not think about it when you cannot take action.

Finally the bigger question is… "How do you maximize the amount of years in your life?" The answer is to slowly take your foot off the gas as you exceed the age of 35-40 years old. Instead of being high strung, you allow for a slow deceleration in total hours spent on work.

Years of Balance:

(Note: As many of our readers know, retirement is a scam/myth since life at 60 versus 35 are night and day. Don't even get us started on the government's ability to raise the retirement age)

The key is to find a life balance between ages 25 and 55. You want to grow a business/career you enjoy over the first decade, become more efficient over the second decade and begin coasting during the third decade. Pretty simple outline that can be adjusted as a reader sees fit. If you're on track to be worth a couple of million dollars by 35, this is going to be a no brainer operation for you. While you'll enjoy your work, the dues have already been paid and the need to work 80+ hours a week will be far back in your rear view mirror.

The Excuses

With the answer to the "work life balance" question out of the way the following people will attempt to send you on the wrong path.

This person comes in three forms 1) person who had no options in the first place, 2) person who believes he can catch up later and 3) person who believes he's too talented to work 60+ hours a week. All of these personas should be ignored.

:Live it Up in Your 20s Guy

If you don't believe that this group should be ignored, look ahead 5-6 years and see what questions they are asking.

- "Does money help get girls", you only ask if you've never had any
- "How did/do you make $X per year", doesn't bother asking what skills are useful or where to obtain them in an intelligent manner
- "How can I get into X industry", thought he was special so he never did any research

All of their questions shift to income production since they didn't put the big blocks up early. It won't be a pretty future as the result is "cost cutting" where they develop a scarcity mindset to save money (see frugality not minimalism). If you take nothing from any post in this blog, do not listen to any of the these people.

This was mentioned above and is entirely false. This excuse suggests that a person has no interests or passions… At all. If you've gone through life and have zero interests, then you have lived an extremely dull and boring life. No doubt about it.

Everyone Hates Their Work:

In addition, the implied strategy by this group of people is to minimize the number of hours of work. They will toss around the phrase "most dollars per hour" as the holy grail. We've explained ad nauseam how this doesn't work and you will find that agree with the thought process.

the vast majority of the middle class

Finally we come to the third most common excuse "all of life is luck". Once you go through all the reasons why they should have made better decisions, instead of taking ownership, they will claim success is all luck. Considering that luck is simply a function of capabilities and timing, they missed out on hundreds of opportunities. They never developed the capabilities to take advantage of the situation in the first place.

It Is All Luck:

—

End of rant.

Let's get to work! Well, more appropriately, let's get to LIVING.

****

Working With a Psycho Managing Director

Working With a Psycho Managing Director

This is going to spur on some horrible nightmares for the Wall Street folk that read this blog. For fun we have gotten requests to outline what life is like if you work for a psychotic person on the Street. Needless to say it isn't pretty.

So you've been asked to work on a new project with the most intense Managing Director in the office. You're shaking your head. You walk in with the rest of the team to go over the material. The problem? he moves his chair so he is only looking and facing the right side of the table where the Senior Vice President is seated. You may as well be a chair. The meeting lasts over 20 minutes and he waits for you to get up and leave before shutting the door (still no eye contact of course).

The Red Flag: *He doesn't even acknowledge that you are in the room*

Welcome to the bottom of the totem pole.

Realizing the dire situation you are in you do everything in your power to avoid being reprimanded. Your company color code matches perfectly, there are no missed commas, instead of triple checking your work you have quintuple checked every single cell and formatting error known to mankind.

The Turn:

The slow moving train wreck begins.

All of your colors are wrong. Why? Your new psycho Managing Director friend does not like the Company color scheme so for his books the colors are different. You have to change every single slide in the 50 page book that you've created…

You're such an idiot. It could have lost you the deal…

Didn't you know there is a huge difference between Red 0, Green 0, Blue 240 and Red 0, Green 0 and Blue 241?

Color

After spending your evening changing all of the colors in the boilerplate slide deck you look over and see your psycho SVP making edits to the document. Naturally, you know this is going to be horrible since a psycho Managing Director will only work with an equally psycho SVP.

The Grind:

"Hey why don't we add a quick and dirty accretion/dilution analysis… You know just as an appendix."

Well your night is done. You grab the material and intelligently pull up an older pitchbook to make sure the format is exactly the same.

The horror continues.

Usually, most Managing Directors are perfectly fine with the Company template but instead your new best friend has decided he likes a different format. You're going to try and save yourself some time by copying the exact format and also realize you'll be redoing a lot of cells.

Build the Model:

You are a horrible banker.

Because a " – " instead of a "0" makes a significant difference in deciding if a deal is worth it.

![format]

You're still sane. You put in some eye drops because you know you'll be working at least 20 hours today. Then it all hits the fan. It is getting heated. You know what this means. He is going to take his anger out on the team.

Emotional Roller Coaster: Your best friend Managing Director is on the phone with his wife.

Your SVP's phone rings and he heads into the office. 30 minutes later he is walking quickly to his office with 20 pages worth of new content.

You're done. No where to run.

Your SVP calls you into his office.

The Blow Up:

"Joe just spoke to an important client and noted that we need to add all of these items into the book"

(Lie and you know it)

"This isn't that much work right?"

Of course not. (Now you are lying and you know it)

"Great! You know we really like your positive attitude around here!"

Smile and nod. (Well did I just accidentally get the wrong SVP to like me I better not get staffed here again)

SVP goes home and you're finally alone.

You go back to your desk and crack open a redbull or begin chugging coffee.

Near All Nighter: Whatever needs to be done will be done.

Fast forward.

The sun is starting to rise in the background and you can catch a couple hours of sleep. No use in going home.

You're on tilt. No one cares that you didn't go home last night and you certainly don't get to complain about it. You're walking to the restroom and cross paths with your new best friend Managing Director.

Good Morning:

He looks at your shoes, notes they are not shined and shakes his head. Of course he ignores you.

You come back to your desk and see the final edits before the meeting that will occur in 3 hours. Thank the lord that this train wreck is over with.

You feel like death. Your body is giving out and you know the banker twitch is coming at some point in the near future. All you have to do is get the printing crew to get the books bound and you're set. You click print…

Printing Disaster:

Pause….

You know that when you work with a psycho even more things tend to go wrong so you run to the printing center on the second floor… Lo and behold…. No one is there, just your luck they are on "break" whatever the f*** that means.

The meeting is in 25 minutes. You frantically put the books together and finish the task in a mere 15 minutes.

10 minutes before the meeting you hand over the final presentation to the SVP and watch as he hands the document to the Managing director…

"Why weren't you at the desk for the last 10 minutes you need to learn to prioritize and multi task appropriately" – SVP

You quickly explain you bound the books, but of course neither of them listen to you and continue to walk to the meeting room.

You sit back and close your eyes. You then go back to the client folder and have a horrible realization. Your Managing Director has pitched this company for the last 5 years and has landed zero deals.

All of your work has a zero percent chance of turning into anything. Better work on those politics.
****

You Are Taught to Be Poor

![You Are Taught to Be Poor]

This is the primary reason to avoid the mainstream media. The goal is to teach you to be poor. While most say they "wish they were rich" they harbor deep seeded negative beliefs about money. Call it Hocus Pocus if you wish. It is most certainly true.

Negative associations with money will make life a headache for you. You will "angle" to obtain money. You will make negative assumptions about those with money and you will make many excuses in your mind to avoid the effort to obtain it.

If you are not rich (yet) but want to be rich (a good thing) you will likely see yourself in a few of these negative beliefs. Lets toss them out the door. In order to obtain money, you must associate zero pain with the process. As usual, lets get started…

This is the primary excuse for the masses. The acquisition of wealth requires too much work. They believe this because they trade their .

1) You Have to Work Too Hard: time for money

Make no mistake… you will work extremely hard. But. If you choose you're going to find leverage. You will slowly gain momentum every single time you learn a new way to generate income and eventually you will believe that you deserve to be rich. Your income will rise.

the right path,

By continuously chasing event driven income your hard work will become much more efficient. The time it took to generate say $1,000 in revenue will now take half as long… Slowly but surely you will generate $5,000 in revenue in the same time it used to take you to generate $1,000! If you keep working at it, the ball keeps rolling. Just remember, hard work is not to be vilified. If you know that you are doing the right things to improve, how can it possibly be "hard work"? It can't.

You know the drill. Practically every single movie and TV show vilifies the rich. You learn this by watching old shows such as the Simpsons (Mr. Burns) to watching recent movies such as Horrible Bosses 2 (Greedy business man values $5M over his own son). Of course this is all a hoax. But it doesn't stop there.

2) You're Taught That Rich People Are Greedy:

You learn this same idea in college! You see many charts and graphs that describe how the "1% generate $x more than average workers". You learn that the 1% control X% of the total wealth. You learn that the minimum wage has been flat-lined on an inflation adjusted basis. You learn many fun facts built to… vilify money.

Unlearn these beliefs. The truth of the matter is that the amount of wealth one has is practically 100% related to the number of lives that have benefited from his or her products. Lets ignore the trust fund babies as the exceptions. If you look at Bill Gates, Warren Buffet and anyone else in the top 100 rich list you'll find a material correlation between charity work and net worth. You will also find an extremely high correlation between how many men/women use their products (from the companies they own) and their net worth. What a coincidence? We think not.

Instead you should believe "greed" is good. Not in the way most think. Greed should be applied to your relationships. You should be greedy when it comes to meeting new elite people. Is it a coincidence that every single person reading this post would happily fly across the country to have dinner with Bill Gates? Of course not. You will become rich by being greedy with your contact list. The more people you help (that are not angling to burn you later), will send you even more money in the future. Assuming you're not angling to burn them? You'll be sending them more contacts (money) as well.

Rewire your brain and realize rich people are not angling to take from you. They are angling to find a way to help you. This way you're a customer for life. Both parties win.

can

This is another funny one that the media tries to teach you. If you become rich you're going to lose friends! So don't become rich or else you will lose all of your close friends! Non-sense.

3) The Negative Stigma of Being Rich:

For anyone who has made money, they know that they can find out who their friends are based on their own success. If a reader writes in and says he made $10K, $10M, or $100M there is going to be nothing but applause on this side of the internet. This is rare. Most people will become jealous and you may lose a "friend".

The term friend is in quotes for a reason. What type of "friend" is going to be unhappy when you succeed? That's right no friend at all.

When the media gives you examples of people who became rich and lost friends they are trying to ingrain a negative association with money in your brain. Don't let them! When your friends say that "you changed" when you made money, you'll know exactly what to do. Throw two fingers in the air and delete them from your contact list. If they cheer for you and offer you a drink, you know that they are very good friends of yours indeed.

Finally? You'll be shocked at who is happy for you and who flips the script on you.

This is just a ridiculous one. Many people believe they should not work harder because they are going to have to pay a higher marginal tax rate. As usual this is just another excuse and a weak one at that. If you make $200K and are taxed at 30%, but then make $400K and are taxed at 35%… You still made a lot more money right? Right.

4) You Have to Pay More Taxes:

If the example above isn't good enough, we have a clear answer for you. Start a Company. You can write off the vast majority of your expense line items.

Since the media portrays the rich as evil people who angle to squeeze money out of everyone, most assume that this is the way to get rich! The only way to get rich is by cheating people out of their money and finding a way to sell snake oil.

5) You Have to Take Advantage of People: This is completely and utterly false!

For anyone who has worked in sales or started a company you know that the number one thing you need to believe in… is… the product! If you wouldn't even use the product yourself it becomes significantly harder to sell it. In fact, if you don't like the product yourself then you shouldn't sell it at all!!! What is the point in selling a product you wouldn't use yourself?! All you are saying is that the product isn't good enough for you. If it isn't good enough for you it shouldn't be good enough for your customer

because the customer won't come back.

So there you have it, another belief destroyed. If you are taking advantage of people, you're going to lose a **recurring customer**. This is a terrible idea. Instead sell a product you would use yourself. This will increase the chances of the customer returning and also increase the chances of the customer buying another product! As they say, the vast majority of your income will come from your current client base.

Now do you see why the rich get richer?

There is no non-sense advice here. The effort required to earn money is significantly higher than any other activity. However. Having no life is a myth once you get rolling.

6) You Won't Have A Life Outside of Work:

After years of hard work, it could take a year it could take 10+, you will eventually hit your stride. When you do… your This is an enormous and unexamined positive of becoming rich. Forget about what money can buy you and think about how free you become! This is a foreign concept to most but is certainly true. If you can earn money doing something you enjoy… what exactly is your life and what exactly is work? You're already doing what you want to do.

work becomes part of your life.

Here is a touchy subject. People assume that in order to become rich you must become part of the 7 deadly sins which goes against your faith. We are not here to discuss religion, however we can certainly offer a solution to this negative belief. By proving that you can be both rich and spiritual/religious.

7) It is Against Your Religion:

If you sell a product, generate revenue and grow a company that helps people… None of the deadly sins are triggered.

– You can avoid lust by getting married (we disagree on getting married, but to each his own)

– You can avoid gluttony by staying in shape which is unrelated to revenue generation

– You can avoid greed by building a business/career that helps people

– You will factually avoid laziness assuming you are not a trust fund baby

– You won't suffer from wrath or anger since your finances will make you stable on an emotional basis

– Envy will be avoided, instead you will cheer when others make it financially

– Pride will be taken down immediately, for anyone with a lot of experience you know that there is always always always someone doing better than you

So there you have it, you may become rich without triggering any guilt associated with your religious beliefs.

This is true. Strangers will judge you. Strangers will also judge you by your physical attractiveness. They will judge you by what you wear, how you speak, how you walk, how you smell and the color of your clothing. How is this any different? Ask yourself if you would rather be rich or poor and then ask yourself…

8) Strangers Will Judge You: *How are they going to know?!*

So long as you avoid becoming famous, how exactly are people going to know how how much you are worth? They won't. This myth is already debunked.

In addition, even if you're the type who likes flashier items (cars, watches, etc.). Then you probably want to be surrounded by people who also enjoy the same tastes as you. It's a filtering process in itself.

This one is beyond laughable. Look at any of the Forbes rich lists and see if they have families. The majority of them do. If rich people have families how exactly are they going to "die alone"? It doesn't add up.

9) You Will Die Alone:

No where are we saying that you need to have a family to become rich, instead we are pointing out the flaws in what you are being taught. Secondly, if you look at the reasons for divorce in the USA (surprise, surprise) finances are a major reason for the split! If there is any lean in the argument… it is that making you rich will make it that you die alone. You'll be a high valued person that other people will want to keep around.

less likely

The final frontier. There is an assumption that you will get bored once you make all this money! Again this is false. The only people who are bored when they become rich are In addition, if you build all of the necessary skills to become rich how exactly are you going to be bored?! You're going to be learning, growing and meeting new people constantly! If you are afraid of becoming rich due to boredom… here is a quick list of things you can do:

10) You Will Get Bored: *boring people.*

– Buy your dream car (or any dream item for that matter)

– Start a boys and girls club for children in need of resources

– Start a charity

– Start your own school

– Travel the world and learn multiple languages

– Learn to dance, sing, play a musical instrument or become proficient in a new sport (you have all the time in the world!)

As you can see, the list will be as long as your imagination.

—

Now what is stopping you from becoming rich?

Do you see yourself in any of these negative beliefs?

Get rid of them. The media is psychologically stunting your growth.

You're being taught a lie.

****

You Don’t Want to Sell? Too Bad.

You Don’t Want to Sell? Too Bad.

Everything is sales.

That’s right, even if you’re reading this blog to eventually obtain a job on the buyside, at a top tier hedge fund… you must learn how to sell. Why? You need to sell your PM on the position you want to take. You need to sell your value to the firm. You need to sell your firm on your ability to take on more responsibility. You need to sell yourself to be hired in the first place. So if you’re reading this blog solely to position yourself for entrance on the buyside… This post still applies.

Proof that Everything is Sales

Make no mistake you’ve been selling since you were 16-17 years old. You sold yourself to a top tier school in order to be given the chance at a good education in the first place. Yes you need to have the credentials (high grades, top marks on standardized testing) but as soon as you wrote those essays… You started selling.

Your marks and grades are your marketing tools, a product demonstration so to speak. The essay is the presentation. If you can’t convey your potential you’ll never gain admission. Congratulations, your first college acceptance letter was your first meaningful sale.

Lets call what they really are… a sale. You are the product again. You obtained the interview which means your product is in the running.

Interviewing is Selling: investment banking interviews

This is similar to a bake off for an IPO. You’re one of the people chosen to be part of the process and your job is to sell yourself as a package to the firm. Lets make no mistake about it, you are selling as soon as you begin a phone interview.

In fact you are selling any time you pick up the phone, otherwise you shouldn’t be on the phone in the first place.

Don’t believe that dating is selling. Tell us why someone should date you in the first place? You’re selling now.

Dating is Selling:

You’re the product once again, do you come with well groomed hair? Do you have perfect fitting clothing? Are your shoes shinier than the gold watch on your wrist? You’re allowed to walk on stage to make your presentation now.

Are you making her laugh and have fun? Are you presenting yourself as the best option to her? Are you clearly showing you have high value? If you’re doing all of these things without coming off as insecure… You’re a great at salesman.

So you’ve got a crystal clear resume with an impeccable track record. Selling is getting easier, but guess what… You’re still going to sell. Why? Negotiating is selling as well.

Negotiating is Selling:

For anyone who has worked for two months on Wall Street they will realize job markets are not efficient. Many guys get paid more than they are worth or less than they are worth without even realizing it. Which bucket do you want to part of? The higher paid bucket.

Are you anchoring the job offer to the highest market rate possible? This works in lock step with dating, the more offers you have (girls who want to date you) the more the firm must pay up and match your other options. If you’re a great negotiator, you’re a great salesman.

Yep. Even this is sales. Why should people want to hang out with you? Do you make people happy? Are you an interesting person? Can you improve the room when you walk in?

Having Friends is Sales:

If you answered yes to all four of those simple questions, you’ve got a lot of friends. No need to check your work, you’re selling yourself as a friend appropriately.

Are you becoming more convinced that everything is sales? (it is). Then this post is doing a great job in selling you on the truth. If you’re sold, then it is time to move onto the most important step…

This Blog Post is Sales.

How Do I Sell?

Selling is a life long commitment, you’re going to learn additional tactics to improve your sales presentation… Every single day. With that said there is a simple question that will become a building block for your sales career.

What feeling am I attempting to transfer?

One of the best sales books on the market, states that sales is

Zig Ziglar’s Secrets of Closing the Sale**simply the transfer of feeling.**

If you only take away two things from this post it is that 1) everything is sales and 2) sales is the transference of feeling.

Lets look at clear examples of the transference of feelings:

you are transferring the feeling of

Interviewing: *trust, intelligence, reliability and consistency*

- This will show up on your resume. If you have high marks, great previous performance reviews and stellar recommendations… The trust is already partially built.

Trust:

- This is sales. Can you convey your resume appropriately in an interview setting without coming across as a boorish?

Intelligence:

- Can you dispel the interviewers that you will be unreliable? This is another part of the sales presentation.

Accountability: *fears*

- Is your track record several years long with glowing recommendations and references to call upon? How else can they know you are going to be consistent?

Consistency:

you are transferring the feeling of

Dating: *excitement, security, popularity, confidence and sex*

- Can someone logically predict what you are going to do with 90% accuracy? You're a boring person who will struggle in the dating market.

Excitement:

- Are you in shape? If a fight broke out, would you at least be able to hold your own? If not you better get into the gym to increase your perceived value of security. It goes without saying, money is the biggest security asset of them all.

Security:

- You're moving up or moving down, life is about momentum… If you're passing excitement and security you likely have many people contacting you to hang out. If not… It's time to get to work

Popularity:

- Do you ask for permission before every single choice? If the answer is no you're building the assets of a solid leader.

Confidence:

- Do you make your intentions clear and dress appropriately? If not you've got some wardrobe reshaping to do.

Sex:

you are transferring the feeling of

Friends: *loyalty, fun, happiness and positivity*

- Do you have at least 3 friends you have known for over 10 years? You're passing the loyalty test and are clearly a good judge of character.

Loyalty:

- Be honest with yourself, if someone had to ask an acquaintance about your personality would "happy go lucky" be the answer or "gloomy". If the answer is gloomy you've already lost the battle.

Fun:

- Just like laughter, a happy person is contagious. Are you happy for the vast majority of the day? If you're spending more than 10% of your time unhappy, something has to change immediately.

Happiness:

- Do you spin all events in a positive way. Do you have control of your mind? If so you're moving in the right direction.

Positive Spin:

you are transferring the feeling of

Product Sales: *value, trust and many others (product dependent)*

- Do you believe in the product yourself? Don't be mistaken you can be the product as well. When you approach a woman do you truly believe you're the best person for her to meet (belief in product)? If so your game is likely good. Similarly,

Value: *you should never sell a product you do not believe in.*

- If you are only selling products that work and that you believe in, you're building trust. Would your friends and family trust your opinion on a product? If so you're building a solid sales foundation.

Trust:

- Before the sales presentation, ask yourself "what is my customer's problem". You do not attempt to sell Justin Beiber concert tickets to Marilyn Manson do you? Adjust your product to be sold to your audience.

Product Dependent:

With the examples out of the way, you should have a clear understanding of how an intelligent salesman will think. He will always think, what you are looking for comes secondary, which will immediately result in improved results.

"what is the other person looking for"

But Sales is Dirty and Dangerous!

If there was a single lie you've been told that is false… This one is certainly it.

Sales is not dirty or dangerous

In fact it is the exact opposite. It is clean and safe. A poor salesman will sell bad products, a poor salesman will not service his client appropriately and a poor salesman will constantly fear job loss creating the idea that sales is dangerous.

As always, In this case your , so he avoids it. Bad move.

"What is everyone else doing? It's the wrong move". average person believes sales is a poor career

Again, sales is the cleanest and safest profession you can have assuming you do it properly. If you're selling a product you believe in, your job becomes easier. If your product is legitimate, the customer is happy and receives more value than he paid for. If your customer is happy he will refer you to new customers making your job even easier. Finally, if you have a lot of happy customers loyal to your opinions, you'll always have a Company waiting to hire you. Even if there is a recession (something the doom and gloomers have been predicting for the last 2 years in this incredible bull market), the salesman is first in-line to be hired since Not a single one.

no company in the history of mankind will turn down recurring and clean profits.

What Are You Waiting for?

Are you going to wait for your next career opportunity to show up or are you going to go and ?

make a sale

Are you going to wait for a friend to set you up on a date or are you going to walk up and ?

make a sale

Are you going to make improvements to your product or yourself to make it easier to ?

make a sale

If you decide to wait? Time never stops and you're simply getting older. Better

make that sale.

****

You Want to Quit

You're walking around your hometown and see nothing but couples walking around. You walk into the mall and its harder to open a girl since she's being guarded like Fort Knox by her slightly overweight boyfriend. Even worse, your family attempts to drag you down, encouraging you to settle down with a "good girl". Consumerism is on overdrive and it seems like you're losing your touch in the game…

<u>Too bad for them because you're better than that.</u>

You take a step back and dig deeper than the surface.

Those couples invading the clubs, bars, malls and your everyday life… They are stuck living a life they have been told to live

Those couples are slightly overweight and have let themselves go… They quit on themselves

Those couples are likely up to their ears in debt… They are running purchases on their credit cards again

Those couples have an odd way of always encouraging you to find a "serious partner"… They are trying to take you down

At this point a light-bulb goes off in your head as you realize that sticker in front of your computer is hitting home. You suddenly realize, if the mall is packed and clubs/bars are over run with couples… the gym is empty. You go back to the basics. You lift for 2 hours+, spend 4+ hours reading a book, spend 3+ hours practicing a language. You don't over eat or over drink at the get together, you blend in and continue chugging along.

<u>Pain Today or Regret Tomorrow.</u>

What's the point? Pre-season is where winners are made. See you in Spring.

<u>The holiday season is pre-season for a seasoned player.</u>
****
