$1 Million, 10 Years, Zero Excuses

[$1 Million, 10 Years, Zero Excuses]

We've gotten some mail regarding our requirement for posting here. Which is a $1M+ net worth and at least 5 years of front office experience. For some, this seems "impossible". But. The math simply doesn't lie. If you're 27 years old and you've made Vice President in a revenue generating role, you're already making ~$500K per year (yes we're back to 2006 compensation levels already). In less than 3 years you'd have at least $600K assuming you saved $0 during the years you made ~$200-300K per year. Enough of that. We're going to outline a step by step process for *anyone* to generate $1M in net worth even if you *don't* want to work on Wall Street. Will it be easy? No. Nothing worth doing ever is.

1) Job, Career and Business

2) Building Transferable Skills

3) The Quick and Dirty $1M Math

4) Targeting and Selling to the Right Market

5) The Only Sale That Matters is the One that Converts

6) Cruise Control and Real Work Life Balance

JOB, CAREER AND BUSINESS

If you found this blog you're in luck. You can easily tell the difference between a Job, Career and a business as follows: **1) Job:** Trading time for money (Hourly wage or fixed Salary), **2) Career:** trading performance for money (Income is primarily from performance. Delivering results.), **3) Business:** You have created an establishment that will make money while you sleep (product sales, outsourced work flow)

That summarizes every single position in the world. 80%+ of people will not understand the paragraph above (luckily our blog is targeted to the 20%) and they will continue to trade their time for money. This makes it impossible to become rich and around 33-35 years old they become bitter/jaded as they did not hit their goals.

Job: A job is only acceptable as a temporary position. You can take a job only under the condition that it is 1) not minimum wage and 2) you can transfer the skills to your future career or business. No exceptions to this rule.

People who are willing to work for free are *begging for help*. In addition? The only person willing to hire free labor does not have the power to afford *quality* paid for labor. How are you going to learn from someone who can't even afford to pay you $15-20 an hour? You're a human being and deserve to cover your bills even if you are learning for the most part. Besides. If he's willing to pay you? He's thinking of ways to leverage your skills long-term as he finds what type of intelligence you have.

To drive the point home. If you're even thinking about taking an unpaid position, we're going to assume you're lazy. Why? If you're actually willing to work hard (60-80 hours a week when you're young)… Then? You would have put in the time to find a position you *would* be paid for! Doesn't get much simpler than that. The only person who is willing to work for free is simply a fool.

Perhaps there is an exception to this rule? We haven't seen it. Maybe if you get to work with Warren Buffet you can go ahead and work for free. But. Working for any large company for free (or even worse a small one) is simply a bad move. Your time is worth *at least* $15 an hour.

Career: A career is a performance based position. Do not be fooled by high salaries or high hourly wages. Even if you're making $100 an hour that is only $200K per year. The Company will do everything in its power to prevent you from making more money than that.

The deadliest company trick in the book is paying someone *more than they are worth* in the early years (22-27 years old). Then… proceed to pay them *less than they are worth* as they remain at the Company. This is a classic move done in high salaried positions such as consulting. Dangle the carrot of making partner, burn them in their early thirties. One out of ~40 make the partner jump and get that equity. You see this trick time and time again in many industries.

Reiteration: *A career is a performance based position.*

Many careers (pure sales in particular) provide extremely *low* salaries with large performance upside. Think 30/70 split where 30% of your compensation comes from salary and 70% comes from performance fees on a quarterly, semi-annual or annual basis. Absorb the pain. The beauty of a sales role is that the skills are transferable into *any* industry! If you are good at sales you will always have income. If you can convince someone to fork over $50K for an enterprise B2B product, you're going to have no problem selling cars if you hit a rough patch in your life.

The second variation of performance is *equity*. This is where the engineers come into play, not the ones who work solely for a capped salary. Equity is just a cute word for ownership. You are in a performance based position because your net worth is directly tied to the valuation of the Company you work for. If you can expand the Net Income line by $100K… and it obtains a 10x earnings multiple… That's a million bucks. Just make sure you're able to negotiate a fair slug of equity so you get more than $2 of that $1M valuation increase.

Business: In this situation you leverage all of your skills. Every single talent you have is poured into your business. A business is something that makes money even as you do nothing. Of course if you do nothing for multiple years it will likely die. But. You've created a system that makes money in your sleep.

Etch this quote into your brain: *"You are hardworking or you're smart. You cannot be both."*

When you have no skills, you're forced to become hardworking. You're killing yourself day in and day out to learn valuable transferable skills. Eventually, you have learned enough. You jump from working hard to leveraging all of your talents into scaling an actual company/business. At this point, once you're generating meaningful revenue, you're looking to *hire* hardworking people who don't have the skills to start a company *yet*.

This is a huge jump. The building phase takes a lot of effort and once you're generating a meaningful amount of money… you need to be able to *spot* talent. If you can do this, they will help you build a meaningful business.

After they learn the ropes? They will probably leave to start their own venture. Long-term, you both win.

In Short: If you're young, you may need to take a job to build small skill sets to get into the career you are longing for. Once you hit age 22 you should not work in a job ever again. Business or career only. In our opinion, it is best to learn the ropes in a career for at least 3-4 years before starting a business. If you're already running a scalable business, then this entire section could be skipped!

BUILDING TRANSFERABLE SKILLS

Now that you've got the framework… It is time to define what a "transferable skill" is. In short, a transferable skill is an *intangible skill*.

Funny. Many people think that tangible skills are the best but those can be outsourced. We talk about this a lot on the blog. Anyone can learn how to build a financial model. Anyone can learn how to read a graph. Anyone can copy and paste numbers from an SEC filing. Anyone can do basic arithmetic. In short, if it can be learned in less than a month it's *not* a transferable skill.

Transferable skills are any skills that are unique to you. A simple person to person example? A fast twitched athlete would be unique to you. This would directly oppose a slow twitch endurance athlete. Neither is good nor bad. They are simply unique to you and your development of them will determine how good your talents are.

On a more important note, lets focus on transferable skills for money making:

Sales: You already knew this one was coming. If you're good at sales you will always make $200K+. Emphasis on good. You sell to people with money (primarily older women worried about their fading looks) or you sell extremely expensive items to wealthy men. That's generally how the market is split up. If you are good at sales you are not selling to your typical middle class man. Why? He is usually a weird frugal guy who refuses to buy anything. *You sell to either women or you sell to wealthy men* who are willing to pay a premium for high quality products/services.

Networking: This is somewhat similar to sales. The only difference is that you don't need to transfer a feeling. It is a lot easier than sales. Become a trusted source of good information. Then? Link two people who will *mutually* benefit. You will collect a commission for doing this. Why? It has a lot of value. If you're able to realize that Person A needs Person B's skills… And you're the person who figures it out? That skill cannot be taught. *It is valuable and not replicable by a sweatshop in India*.

Production Improvement: This is *largely* overlooked. Many people say "I can't think of a new idea or product". So what? It doesn't matter. What about improving the actual efficiency of the product or business. This is either on the cost side or on the revenue side of the equation! If you tell a company that you can reduce its costs (Total Cost of Ownership = TCO) by 25% at a cost of just 5%? They are going to hand you money. On the other side… If you can improve their sales funnel that results in a revenue increase of 5-10%? They will pay you a few hundred basis points for that product. *You don't need to recreate the wheel. Make the wheel run smoother.*

Basic Maintenance: The most obvious example would be property management. Creating a quick stream of income in a niche neighborhood and managing properties for wealthy individuals. Once you gain the trust of a few wealthy men? They will refer you to other wealthy individuals looking for some monthly income. Once you've gotten the tasks down (insurance, good tenant screening, solid marketing of each rental property) it becomes a easy monthly paycheck. Notably, you can do this for many other industries as well. Just look at TaskRabbit as an example of outsourced services for menial needs.

Continuity: Ah yes, the holy grail. You affiliate marketers who keep visiting the site from StackThatMoney are all nodding in agreement. You're able to private label your product and you've set up a monthly rebill. All your income comes from the re-bill and gaining the customer is the real headache. The manufacturing of the product is meaningless since anyone can set up the infrastructure in China (even an imbecile can do this!). The real skill is getting the quality up, getting the sale up and making sure other people don't try to steal all of your market share.

The best example is one everyone knows of… NetFlix. Probably the best re-bill on the planet.

In Short: We don't know what you're good at. Maybe you're better at creating the product. Maybe you're better at selling. Maybe you're better at improving efficiency. We simply don't know. What we do know however, is that you need to find your niche skills and begin leveraging them. Time is not on your side and if you waste it trying to target meaningless niches you're going to go belly up in a hurry.

THE QUICK AND DIRTY $1M MATH

Many people skipped the first two sections and jumped here. A million bucks in 10 years is not that difficult. We would wager that you'll clear this figure in 7-8 years instead of 10.

*"Can't be too upset as I've made it many times over already based on your benchmark of 1 mil by 30, but had to stop for a moment to **think about how much more could have been achieved if I had read this post 10 years ago**"* – Stealthy1Percenter

Before we simply brush off this number as easily obtainable we're going to outline the requirements here. Assuming you start at $0.

1) Give up three years and you will be free; 2) You will not work less than 70 hours a week for the *first* 3 years; 3) You will have two forms of income by year 5-6 at minimum; 4) You will not waste your time fixing weaknesses and will focus on your strengths; 5) You will not try to regurgitate another product unless it is *the only* product and you will take second place (Pepsi vs Coke as an example)

If you break one of these rules you're unlikely going to succeed. We're not too worried about your spending habits or your current skills because it is incredibly easy to make $100K a year if you work 70 hours a week for three years. After year three you will be efficient and you won't crack more than 50-60 hours a week unless you made bad decisions. Besides. To make $100K a year you only need to make ~$27 an hour. A typical career will pay you north of $100K out the gate if you're in a major city. If not? Well follow the path below anyway:

Year 1: As stated above. Your first three years are going to be dreadful. You will encounter many battles with self doubt. You will fail many times over and over and over again. You will work hard. By the end of year one you will realize that the only people who watch motivational videos are for weak people. You will fade into the abyss as you are forced to drop contact with many people due to your rigorous work schedule. In year one here is your goal. **Find your talent.** Only in year one are you allowed to work a "job". You will likely work *two* jobs if you haven't found a career yet. You work in one that is focused on Intent (sales, people connection) and you will work in another focused on Synthesis (networking, efficiency). Once you find out which one you're good at, you jump into that career. **Net Income: $80-100K. Net Worth ~$40K.**

Note: Numerics is left off. If you are good at numerics you don't need to find where your talents lie

Year 2: You are now in a performance based position. It does not matter which type of performance you choose. You are simply leveraging *your* talents. Do not listen to what other people are "telling you to do" you're following *your* talents. Why? The masses don't know anything anyway! By year 2 you must have a career at *minimum*. If you're extremely talented go ahead and jump into business. But. Generally, you're going to spend a couple years in the career zone. You work on your business ideas on the side. Finally, if you're only working 50 hours a week, find a side job for another 20 hours. Don't settle and break the rules. **Expected Income: $120-140K. Net Worth ~ $80-100K.**

Year 3: The last two years have been awful. You feel like you haven't accomplished much but in reality you have. Your skill set is currently being honed and you've got some money in the bank to show for it (likely near $100K). For some, you're going to spend more time on a side business (section 2 on using your transferable skills) while others still need a bit more time in their career. This is typically a dark and boring year but you're much more efficient. 70 hours are clipped and you're only up about 10%. **Expected Income: $135-155K. Net Worth ~$150K.**

Year 4: By now you know what you're doing. You have at least one idea for a business that is based on your transferable skills: Sales, Networking, Production Improvement, Basic Maintenance and Continuity. In an ideal world everyone hits the continuity button! That said, you're now going to focus about 45 hours into your career and that remaining time is going to be spent on your side business idea. You're going to see a minimal increase in earnings for the year and build up a brand/reputation. **Expected Income: 150-170K. Net worth ~$225K.**

Year 5: This is typically a banner year for those in a serious career. Around year 5 you're finally generating real revenue for a firm. You are also hitting your stride in efficiency. If you're still working 60+ hours a week then you're either a poor employee or you are not well positioned politically within the firm. When you make the leap on Wall Street this usually means a 50% move in compensation. If not? Well you're still in the low 2s range. Since we don't know a person's specific career path we'll assume another 10-15% move as you're still spending a good 20 hours or so on your side business. **Expected Income: $170-200K. Net Worth $310K.**

Year 6 – 8: Now we're into the good years. You should be hitting your stride and getting ready to pull the event button soon. If your side business has been growing for about 3 years, this is usually where the traction starts to show up. If you wasted your time trying to copy products or you wasted your time targeting niche fields with no money… You're going to be in pain. Since you're reading this post we assume you didn't make that foolish mistake and you've got traction. Either A) it's now generating a decent amount of money for you ~$50K or B) you're realizing the growth is outpacing your career income growth! You either quit or gather a team so you can have two forms of income (we suggest gathering a team, but if you're real greedy… quit and go it alone). Your income should continue to go up by about 10% but we'll flat line you at $200K + $50K from the side… You're saving $125K easily. **Expected Income: $250K. Net Worth: $685K as of year 8.**

Year 9 and 10: Well you've made it already. By giving up three years of your life (pretty meaningless since your early 20s are the most energetic years) you're now a millionaire. You're about 31 years old and you put away another $250K + market returns on all of your investments. We can squabble all day about how much you will actually have at 30. But. In reality, $1M by thirty is easily attainable with this game plan. In fact we'd go ahead and say you'll *exceed* this number over the course of a decade. Using Wall Street as an Example by 27 years old you should be at the $350-500K marker and that alone will push you over the next 3 years. The real smart ones simply build that second form of business income and throw it into the bank. $50K a year is an easy sum to achieve even if you are lazy and decide to write copy on the side. **Expected Income: $250K. Net Worth: $1M+… Call option with an *event* sale of the company.**

In Short: Now you realize why it is important to put the big blocks up first. If you're trying to catch someone who is already in year 5 of the described plan you will be hurting. Year 1 effort is always significantly harder than year 5 effort from an energy standpoint. In addition, this is a clear step by step year by year outline of how to leverage your skills to make money. Don't bother listening to other people who claim it is not possible because they are not willing to put in the work.

Find that career. Find that side income. Scale. The side income will *more likely than not* be neck and neck with the career income by year 8 on the time-line. Will happily bet money on that one.

TARGETING AND SELLING TO THE RIGHT MARKET

Now that you've got the 10 year *blueprint* lets make sure you don't throw up a huge mistake on the side income piece of the equation. The career debate is already dead as you simply look for performance based income. Anyone arguing for hourly wage non-sense is simply drinking far too much kool-aid.

How Do You Find the Right Market?

1) The Right Market is Willing to Spend Money: The word choice here is critical. This is also why we laugh when people try to target middle class men for money. Middle class men are generally cheap guys who are having their money spent by their wives (hint right there). The "right market" is the market that is going to spend the money. Not necessarily the one that is making the money. If your buddy is making $100K a year but he's the same guy haggling for a $10 discount for his broken iPhone screen… He's a tough guy to sell to. If your friend is hitting 28 and she's single looking to find her man by maximizing her looks… She'll be easily sold to (okay enough with the hints you already get it)

2) The Right Market is the Masses or the 1%: Those are the two segments. Rich men are willing to *pay up* for quality and status. This is why Ferrarri's exist and this is why the largest companies in the world cater to the high end or they cater to your regular Joe Blow (80% of the population).

Generally speaking, a rich guy knows that he gets what he pays for. But. He is also smart. He will research your product and prod with intelligent questions.

Average Joe is the reverse. He is driven by emotion and will buy based on how he feels. If you can make him "Feel good" or make him think something will "easily solve his problems" without doing work… He'll buy. This is exactly why products sold to the masses come with ridiculously idiotic statements like "guru's hate him" "this one weird trick" "research science approved" (typically unrelated) so on and so forth. Joe average is going to buy based on feeling. This is why he likes motivational junk, quick fixes, and of course **pain.**

3) The Right Market is Sold in the Right Way: As long as your product is legitimate should you care about the sales technique? No. So long as you're not doing anything illegal it does not matter "how it is sold" the only thing that matters is *if it converts!*. Remember this when you're starting to sell your product.

Rich People (top 20%): If you're targeting smarter and richer people (this blog) you're not going to use phrases like "one trick!", "approved by Kim Kardashian" so on and so forth. You're going to have to spend a lot of time building a brand before even mentioning products you use. Even then? Simply disclose you make a few bucks off the recommendation.

Average People (bottom 80%): Now… If you want to make money faster… You're targeting Jane regular. Yes we've switched to Jane regular for a reason. The number one complaint about women is as follows: *"women are emotional"*. This is a wet dream. This means they are easy to sell to! If a person's mood is easily influenced… It means that they are easily convinced to buy!

Take it to the extreme. If you're trying to sell to a Monk or a girl who is scared of losing her looks… Who's easier to sell to? The answer is easy. The emotional one. The girl.

Reiteration. So long as your product works and does as advertised, it does not matter how you sold it. An emotional person is *not* going to respond to logic and reason so don't use it! Type in 8th grade level English and make the sale. There is no value in using "verbose" language. Funny. Even with the word "verbose" in quotes it looks like a junk sentence.

In Short: You're really looking for three things. You're looking for people who will actually spend money. You're looking to target a lucrative market. You're looking to sell "correctly" and the correct sale is an emotional one. This is the topic of the next section.

THE ONLY SALE THAT MATTERS IS THE ONE THAT CONVERTS

The best part about this section is we *can* give you "one quick trick". **Stop trying to sell with logic. Start selling with emotion.** This is the most mind boggling concept for people who focus primarily on numeric based skill sets. Engineers and Quants in particular attempt to apply logic to humans and it simply doesn't work. People make their purchasing decisions based on emotion and feelings. This applies to wealthier people as well. The only difference is that the wealthy person *does research* and makes sure he clears enough "utility" from the purchase.

"A person is in *Pain* or they are seeking *Pleasure*. Provide a solution to *get rid of the pain or provide a solution to obtain pleasure*. That is how you sell" – Wall Street Playboys

Generally speaking, pain sells more. Everyone knows this. This is why men who seek money will shell out thousands of dollars for get rich schemes and women who seek beauty will pay top dollar for any physical improvement. That really boils down the two sexes in a single sentence. Men want money to elevate their worth. Women want looks to elevate their worth.

Now that we've given you the "trick" to selling… It is 100% easier said than done. You must communicate at a much lower level to sell to the masses. Do not bother with insane vocabulary. Do not bother with logic. Do not bother with statistics.

The typical phrase is "Keep it Simple Stupid" or (KISS). You can go ahead and remove the first S in that equation when targeting the masses. Keep It Stupid (KIS). If your sales page or advertisement cannot be understood by a 12 year old… It is not a good advertisement. Lets look at some examples:

Infomercials: Infomercials are not there for fun. They are spending money on the airtime. Notice… What products are being sold? Primarily: 1) lazy products, 2) depression/insomnia products and 3) alcoholic recovery products.

Lazy Products: This makes complete sense. The type of person watching lame infomercials is likely a stay at home mom or a lazy person. They see a "cool gadget" that will save them 5 seconds on dicing tomatoes… This gives them an extra 5 seconds to watch more television! Hooray!

Depression/Insomnia Products: This also makes sense. A lot of *late night* infomercials are targeting people with sleeping issues. Someone is up watching TV all night at 2 in the morning. Typically, before these commercials come on, at around 10pm or so they have "dating products" because if you're at home watching TV on a Friday/Saturday night you're likely lonely.

So sign up for eHarmony! Then when the viewer has not taken action and feels depressed at around 1am… Boom! Here are some depression/insomnia medication products!

Alcoholic Recovery Products: The last subset is the alcoholic recovery section. A lot of people come back from another depressing night out trying to score at the bar and stumble onto their couch to watch TV. Many of these people have serious alcohol issues and the infomercial is right there to "save them".

Pleasure Commercials: This is obvious and you don't even need to read this section. Go watch the commercials for any major sporting event and you'll primarily find beverage and insurance commercials. Alcoholic commercials are clear as day. You're watching a fun event. You want to be entertained. Nothing better than a "cold one" to increase your pleasure.

Alternatively, there is the insurance side. You think this has nothing to do with pleasure? It does. In fact it's *both* pain and pleasure. The other main audience (besides younger people watching for fun) are middle aged people with families. They constantly think of their kids (they probably play the sport as well) so here's a great way to take a hold of your family. Get solid insurance in case anything happens (fear of loss, family combined with pleasure, feeling responsible).

Now if these examples were "obvious" then you're in great shape. It's time to create your own ads! Learn how to write good copy and see how good you are. Be warned. This is easier said than done.

If you've watched ads and wondered *"why in the world is that a popular ad"* you're going to "un-learn" those thoughts! Chances are… if the ad is on prime time television… it is Return on Investment (ROI) positive.

We're not kidding when we say Keep It Stupid instead of Keep It Simple Stupid.

In Short: The primary lesson here is the same. It does not matter "how you sell" so long as the product is legitimate. If the best advertising technique was to show overweight people mud wrestling on television… You should do it (note: never works!). The only good advertisement is the one that *converts*.

CRUISE CONTROL AND REAL WORK LIFE BALANCE

Now that you've read this post and everyone who sees this is a millionaire (joke) it's time for a more serious matter. *Real work life balance.*

If you've followed this path and find yourself with a solid 7 figure net worth and multi-six figure income streams you're allowed to find balance. For the vast majority of people, they have not earned this right (yet). They should align their ducks and get to work.

Once you feel comfortable, you should now focus on your health and the power of 1%.

Health: No lies. During your first 3 years, your health will likely suffer a bit. You're going to work so hard you will *actually break* at least once. Once you reach this limit you'll know when you've gone too far. After a good 5-6 years of nearing the line but never crossing it… You should now shift your focus to *maximizing* your health. Again and again. While money is immensely important, the reason why you have it is to keep your health! By being rich you're able to eat healthy, get some sun, live without stress and help people who have helped you in the past. The point of getting money is not to buy a Tesla (you can if you'd like) it is to eliminate every negative aspect of your life.

If you hit your first million in your late twenties this may mean working 40 hours a week still. If you hit it when you're in your mid 30s it may mean 25 hours of work per week. We don't know. Just make sure you're maximizing your health because that was the entire point. If you're rich and stressed out/unhealthy you're doing something terribly wrong.

Make Small Adjustments: Begin fiddling with your business and your career. Can you give up some of your income stream in exchange for time? How much time will you save? How much will it cost you?

Many people attempt to do everything in a small group of 3-5 people. This works… until? You cross a certain net income level. At that point you have to expand. Do your best to maintain your equity and simply offer a higher salary to the person looking for a job.

The power of 1% is certainly real. Do this five times. **5% of a full week is 8.4 hours.** That is a lot of time! That is literally a full day of work you just avoided. In other words you could spend 8.4 hours at the gym, eating healthy, reading a book and taking your dog for a walk. It really is up to you. But. 8.4 hours is a long period of time to have freed up!

In Short: If you've followed the path outlined here, your goal is to *avoid money addiction*. We really need to do a post on this but most wealthy people are *not* addicted to getting the money. **They are addicted to making the money!** It is simply a game they are playing and it is the hardest game in the world (picking up girls gets easy after about 3-4 years). But. Once you're free, you're allowed to strike a balance. Consider your health. Consider your social life and don't fall victim to the money *making* addiction.

CONCLUDING REMARKS

We've reached the end of the post. It truly is possible for anyone to obtain $1M in 10 years. Maybe we have too much faith in our readership but who knows. Below are the bullets:1) A job is a time for money exchange only done to *temporarily* build skills for a future career or business; 2) Never work for free or for minimum wage; 3) A career is a performance based income stream and a business makes money while you sleep; 4) Find transferable skills: Sales, Networking, Efficiency, Maintenance, Continuity; 5) Simplistically, if you can average ~$200K+ a year over a decade starting at $100K and scaling to $300K+ you will easily become a millionaire if you want. You won't have time to blow through all the money anyway; 6) Again and again, frugality is a joke. If you're busy earning? The saving part takes care of itself. You don't get rich if you don't invest in your skills. Example: "research ways to save $5" vs. "spend same amount of time making $25". Option one leads to $5… Option 2 leads to $30 with the same time spent!; 7) Target the right market. Either emotional people in the 80% or wealthy people in the top 1-20%. 8) Sell with emotion not logic. Logic does not work. 9) Pain sells much better than pleasure. Particularly if you can target an insecurity.; 10) If your product is legitimate, how you sell it is irrelevant. The only thing that matters is if it *converts*; 11) Creating good ads/copy is *NOT* easy. Particularly if you're a logical person. You're going to have to dumb down your writing and intellect to an 8th grade level at *maximum; 12) You didn't get rich to be an unhealthy fat person. Your health is number one. Your money can also help your friends and family who were there for you when you needed them during the dreadful "down" years.

****

10 Free Copies of Gorilla Mindset

We've been busy to say the least. That said, we did get the chance to purchase our friend mike's book "Gorilla Mindset". The bad news? We are only 30 pages into it and will read it when business slows down.

We see eye to eye with Mike on a lot of topics and think that many readers here will benefit so we're going to give it away (a hard copy) to ten readers of the blog.

1) Leave a quick comment on why we should send you a copy

2) Please provide a one paragraph review when you've finished reading the book (5 or more clean sentences)

That is it. Provide your contact email when you leave your comment and we'll take care of the rest privately via email.

*****the giveaway is already over. For those that are skeptical we are paying mike cash and will not alter any words on the actual book review. We simply don't have time to read at this time so this is a cheap option. Coins really.*****

****

10 Obscure Reason We're Happy to Be in the USA – Also Q&A Announcement

Being born in the United States immediately vaults you into the top 5% in the world (roughly speaking from a "luck" point of view). You don't need to do anything special and you get to start well ahead of everyone else on planet earth. Sure there are exceptions such as rich families abroad, but we're talking about a general rule of thumb. Also. You're born in the platinum age for making money which means there is absolutely no excuse for failure.

1) No Talent? Clear 6-figures: We've already done a post on making 6-figures if someone is as talent-less person. Having no talent means that the only skill is "working hard". Individuals can easily make this by going into the looks industry or any sales role for medium value products. Seriously. People think we're trolling or clowning on people but we're not. We have verifiable proof that you don't have to have any skill to make 6-figures. You don't need to be a good athlete to become a personal trainer for example. All you have to do is get in shape and show up. Again. We are all for this idea if someone doesn't have any skills. We'd never take fitness advice from these people but the market exists since so many people will pay for "hand holding".

Secondarily, you can just work in multiple sales roles. If you have no talent you won't convert a lot of your leads but you'll still be employed for a long time. Why? Most people are too scared to pick up a phone and "dial for dollars". Even without a knack for sales, you'll improve through sheer volume and the income will become stable. Good economy or bad economy, someone needs to sell the products.

2) Flattened Access: Unlike other countries, everyone has access to the most important tools. The Internet is free (libraries if needed) allowing you to learn about anything you like. People like to claim that it's not possible to move up socioeconomically… and it just isn't true. The truth is that a flattened access market allows for the cream to rise to the top. If you're in a developing country the opportunities are far, far, far smaller. In developing countries (for those with real travel experience), there is merit to the whole "you need to be born rich to have a chance" argument. In the USA… it just isn't true which is fantastic. Before the complaints come in… an **incredible** 80% of millionaires first generation.

3) Speed In General: Speaking of internet access… If you've tried to use the internet in third world countries it can quickly turn into a disaster. Moving slowly is a general "rule-of-thumb" in developing countries. People don't show up on time (5x worse than the United States), coming to an agreement can take days or weeks when it would normally take hours and older infrastructure makes overall movement slower. Moving slowly is probably the biggest reason for remaining in developed countries as it's difficult to offset the long-term costs associated with this.

4) Limited Freedom: If you're rich, it's a lot more dangerous outside of the United States. Being rich in a developing country can lead to kidnappings/violence. A short trip is perfectly fine as you won't develop a reputation in a specific city/country if you go out a few times a year. Try living there for an extended period of time popping bottles 4 days a week and the crime will come out and find you. This is the second largest reason to remain in a developed country. You can do what you like to an *extreme*. The only exception is if you become famous and ultra-rich… then you're forced to have body guards (likely an awful experience).

5) Access to Leverage: Leverage and debt allows you to increase your net worth over multiple years. By being born in the USA you're given access to the "carry trade". High-yield currency funds low-yield currency (spread gained). This is something that you will likely do in the future and the first time you set it up you'll realize how fortunate you were to be in the United States to begin with. Even the rich families in developing countries have to jump through hoops to invest in other currencies. Complex set-ups like this are simply unavailable.

6) Ample Communication Avenues: It's pretty easy to keep in contact with people across long distances. Smartphones and computers allow for seamless video chats making the human connection a lot stronger. Just 20 years ago this would have been laughable as a voice chat is just not "personal enough". Since the vast majority in the USA have access to smartphones you're given an opportunity to develop real tangible contacts without leaving your office/home. This is unbelievable. In fact, we will all but guarantee that you'll work with someone without ever meeting them face to face. It has already happened to us several times and the result was positive.

7) Food Quality: If you live in a major city you get access to food from across the world. Good luck trying to have various choices in a mid-sized city in a developing country. The options fall off a cliff! If you're in New York, Los Angeles, Chicago or any other Tier one/Tier two city, you can "see the world" from a food point of view. While major cities in developing countries have a lot of options, it's not even close to a major US city.

8) Lots of Insecurity – Money and Friends! This is actually a benefit. The vast majority are deeply insecure about "where they are in life". This causes them to try and claim they are important at all times. All you have to do is make them feel that they are important and you'll get the next sale. Seriously. This gets easier by your 30s. At this point the winners are already in the limelight so the ones that "didn't make it" usually try to pick fights and nit-pick. It's actually entertaining at this point. As soon as you see someone in his 30s being overly competitive about everything or "working really hard"… You know his life went to hell. So unlike other countries in the United States you can meet all of the important contacts without any effort. Guys in the USA try to "fake" being rich, "fake" being important and then claim being well off doesn't "work" for socializing. The joke is on them because they don't know what a rich guy acts like… since they aren't actually rich.

9) Lots of Autonomy: There are a lot of rich people in the United States which allows you to blend into the crowd or stand out depending on the mood you're in. This allows for extreme levels of freedom. You don't have to react to anyone. The only people who struggle to reach high levels of autonomy are in debt (unfortunate for them). Unless someone is easily influenced by peer pressure (no one over the age of 18 should feel this), you can live life based on your own principles.

10) No Need for Lots of Help: It's the same cliché, everyone talks about needing people. The reality is we've seen people make hundreds of thousands of dollars while having next to no help or friends (software is crazy!). This isn't a path we'd recommend, simply stating that it's possible. In other countries politics and contacts are a lot more important than in the United States.

—

Q&A this Friday July 12.

It has been an insanely busy year. People can call us crazy but we're sticking with our belief that by 2021 or so we'll see a downturn. Money is being made hand over fist right now. Debt is cheap. Unemployment is at record lows and the Fed is helping pump up the stock market for an even longer period of time (hinting at a a rate decrease soon). If we're right this will be the best decision we've ever made (killing ourselves now and striking when the iron is hot). We are praying this market does last another 1.5 years, the more S&P all time highs the better (already exposed). Therefore we apologize to all of you! For lowering the content this year but it's just part of the game.

****

10 Ways to Change Your Life Today!

[10 Ways to Change Your Life Today!]

The title speaks for itself. Every year the world is going to get tougher, but you're smart enough to put in the work. If you continue to challenge yourself mentally and physically the punches that life throws your way will seem like a cake walk.

1) Get Rid of Bad Information: In the age of the internet this is probably the number one skill we can all improve upon. Obtain good information. If you've read this blog before you know we don't enjoy writing articles that do not have actionable steps so here is a good cheat sheet for getting good information. ***Do not take advice from people with zero real life experience, do not take advice from people who had an easier life than you and do not take advice from people who complain.*** It will be difficult to hit all three items on the list but that is the point. You wouldn't allow an accountant to perform plastic surgery on you and you wouldn't take "game" advice from a guy who is clearly a 9.5/10 on the looks scale. Life just doesn't work that way. No matter how well someone sells you on his opinion, he or she doesn't have the right to an opinion unless they have accomplished something. The manosphere gets angry when feminists attempt to tell men how to be men… Well men in the manosphere should not be giving any advice based on zero real life experience either. If you're not a millionaire or a billionaire you certainly don't have the right to give advice on what you would do with a million dollars or a billion dollars, get it first then state what you have actually done with the money. If you look at the Ask Us Anything section of this blog you quickly see we don't answer questions about consulting, working as a chef etc. ***Why? We have never done it before, we don't have the right to an opinion and we are not in a position to give advice on those topics.***

"How can you criticize someone who is better than you at X? Life 101: if they are better than you, you're opinion doesn't matter" – @WallStPlayboys

2) Smile in the Morning: Yep you're laughing at the computer screen right now. These guys are turning into hippies! Nope. We're dead serious. If you wake up in the morning you probably feel a bit bad, the alarm clock is annoying and you simply are not in a good state of mind. Before you do anything, walk to the bathroom and smile for a full minute (60 second straight!) and place the palm of your hand on your head. After looking in the mirror for 1 minute you'll immediately notice two changes 1) you're in a better mood and 2) you're suddenly awake. As much as we humans like to believe we are in control of our emotions, physical changes will absolutely impact your mood. You should also talk to yourself every day.

"The next time you wake up and walk to work start singing out loud" – @WallStPlayboys

3) Read Daily: We went through Google analytics and generally speaking the readers of this blog are between 18 and 35. This is the perfect age range for reading… well every single age is perfect for reading, but no matter what you do, you should have a regimen where you spend 30 minutes to 1 hour reading ***everyday.*** Not every other day, not 360 days out of the year, 365 days out of 365 days. If you are not reading something that helps you earn more, become healthier or in some way improve your life, you've wasted the entire day.

"Go to bed smarter than when you woke up." — Charlie Munger

"read 500 pages like this every day. That's how knowledge builds up, like compound interest." – Warren Buffet

Both of the men mentioned above have more knowledge and power than anyone you will ever meet in your life time and they have the same routine of reading hundreds of pages per day. In-line with point number one in this post, if the vast majority of successful people read daily, it is probably a major life tip.

4) Remove an Unhealthy Habit: While we believe in themes instead of goals, lets at least remove one nasty habit today. If you work in Investment Banking, Private Equity or a Hedge Fund, we already know what habit you can replace. **Stop drinking redbull.** This is a lot easier said than done. While \$2-4 a day is not going to be noticed by your bank account, the health impact will be immense. Switch to the free coffee provided at work or stick to water. If it isn't natural the chances of it being good for you are quite low.

Assuming you don't work in finance, then we suggest you find a simple daily habit you can remove. Maybe you have an addiction to chocolate, chips or fast food. Cut one of the habits out and do it today without looking back.

"Health over Wealth" – @WallStPlayboys

5) No More Negative Friends: If you read our post on choosing friends you likely have a good core set of people to turn to. Lets turn it up a notch. Even if someone is making more money than you, it may be time to find a new mentor for making money. At the end of the day, negative people are a waste of your time. ***Complain Complain Complain and no actions to fix anything.*** Yes life can suck, yes you're going to have horrible awful things happen to you… but? ***There is nothing you can do about it.*** You have two choices in life 1) fix the situation or 2) leave the situation. If the person you are speaking to is doing neither, they are losers.

We know, you're thinking that is harsh! Well it is the truth. You cannot control what people wear on a daily basis, you can't force someone to lose weight, you can't force someone to do anything because it is beyond your control. ***Do what you can do to fix your own life and help others fix their life.*** Control the controlables. The rest is noise.

"The first person to complain can withstand the least amount of pain" – @WallStPlayboys

6) Upgrade One Outfit: We will always be minimalists and that does not mean you have to dress like a homeless man. You can have flash without spending a lot of cash. Take one item in your wardrobe that looks hideous (we all have a few shirts/pants that should have been retired in the 90s) and throw it away, forever. Spend some time and pick out a new outfit to wear. The rule of thumb is this, ***you should physically feel different when you put it on.*** If you wake up in the morning and change into your new outfit and don't feel some bounce to the ounce… then it is not the right outfit.

"The room should improve when you walk in, because you're better dressed than the rest" – @WallStPlayboys

7) Revamp Your Resume: Read our guidelines on writing a resume and get to work! 2014 plans and budgets are currently being set at major investment banks, hedge funds and private equity firms. Even if you're not in the finance industry, if you have not updated your resume in the last 12 months, it has no value anymore. The macroeconomic climate is 10-20x better than it was back in 2009, don't sit around waiting for opportunity to knock on your door. How important is a resume? Well if a good resume hits an interviewer during the initial screening period (phone calls) they might even call you and schedule an interview that week. How do we know? ***We've done this before.***

"Did you get that job because you did well in the interview? No you got that job because you sent out hundreds of resumes" – @WallStPlayboys

8) Pick a New Hobby: Even if you are 30, 35, 40, 50, 60 or even 70! It is time to add a new hobby to your life. Do not live a life of slow death. As we get older we will certainly develop preferences (favorite wine, favorite food, favorite restaurant etc.) the trap is you're not expanding your horizons. Are you going to die from the new hobby? No? Then it's a good one to pick. If you decide to take up piano, tennis, chess, cooking, singing (we can go on forever) for a full year, you're going to learn something. A new hobby for a full year means you're going to learn something about the subject and even more importantly you'll learn something about yourself. You may even like it.

"If you're not expanding your comfort zone, you're dying" – @WallStPlayboys

9) Become a Kid: This is probably as cheesy as point number three if you don't read the whole paragraph. Turn back the clock. When you were 5 or 6 years old you had so much energy your family had to reign you in. Why? You were happy to be alive. If you want to have the same energy as a 5 year old child you should be happier than a 5 year old child. Kids don't want to go to sleep because they are happy running around and having fun. Your life themes have absolutely changed but if you are taking actionable measures to achieve them you should be a happy go lucky person. You will never meet an unhappy person who wakes up and works towards the things he truly wants. This is no different than being a kid. ***They wake up and say this is what I want and they do what they can to get it.***

"Why bother sleeping in when you can make your dreams a reality" – @WallStPlayboys

10) Befriend an Enemy: Yep. No matter what you do or who you are, you're going to get haters, trolls, losers, weirdos, idiots, and straight up psychos who dislike you. Even the president himself has a low approval rating, you just can't win them all. Instead take one person, someone who does have a lot going for them and turn them around. Make them like you. For those that can read between the lines, this is called sales and or game. This will do two major things for you it will 1) teach you to never spend your time trying to bring someone down and 2) it will improve your interpersonal skills. Similar to your new hobby, you may end up liking the guy as well.

"You gain nothing by bringing someone down. Even if you succeed you're creating a mindset of negativity and anger. You lose either way" – @WallStPlayboys

Good luck to everyone who tries to complete this list!

****

10 Ways To Evolve Your Game

10 Ways To Evolve Your Game

You'll look back in several years and laugh at who you used to be. Instead of going through the easy changes here's a side by side sample of what you may be doing wrong.

1) Dress Code

Old You: You're getting ready. Your clothes are all over the place. Colors range from white to black with a few "lucky shirts" jeans and multiple colors of the black shoes. You haven't decided where you're going but you always end up at the same spots your friends recommend. You jump out of the shower and you opt for the safe bet. Dress shirt with collar, untucked, sleeves rolled up, jeans and a pair of those black shoes.

New You: Blazer and slacks is the minimum. The longest distance of the tie matches the longest distance of your lapel. Your tie does not match your colorful pocket square. You've had the jacket tailored because your chest is 8+ inches larger than your waist outgrowing the classic European 7″ drops suit. If you don't have a date, you already know what night it is and what the best spots are, a quick check in the mirror and you're good to go.

2) Preparation

Old You: Your boys come over. Or you go to your boys spot… Shots. You start talking about how this is going to be the best night ever as you cling your $2 glasses together for those shots of grey or patron. Amped up and nearing high intoxication you are ready to go, smartphone in hand texting some guys who are running late and "missing out". Before you head out you jam to the latest top 40's song, something like this:

New You: You have a small brown paper bag with ingredients for a 12 ounce juice. Collards or Kale, and just enough apples or pears to make the juice tolerable. You take it down to make that hangover softer the next morning. You pour a single glass of champagne and do a few stretches to warm up. In the background your simplistic sound system is popping happier low-key music and you are a few minutes away from heading out the door.

3) Entrance

Old You: You enter with your buddies, likely getting ID checked due to the wardrobe and pack of guys with you. As you enter you B-line it for the bar to order the first round of many. It is too early in your mind to engage with anyone so instead of scouting the setup you simply post up at the fastest place to grab a drink. You all order similar drinks, either beers or one drunk guy in the group is asking for yager bombs already.

New You: You enter quickly. Instead of heading to the bar you go straight to the bathroom so you can diagnose the traffic spots, the people who are in large groups and who is in pairs. You decide on the most optimal place in the bar, usually the direct line from the bathroom to the bar and you step up to order something with strength if it is crowded or a light glass of champagne if it is currently slow. You turn your back to the bar at an angle to allow people to order but maintain the spot since you'll be doing a quick chat up soon.

4) First Interaction

Old You: It's real early in the night. You are already borderline drunk and you see a girl is eying you. You don't have to do much to start the interaction so you simply say hello. After 5 minutes in the conversation you think she is not really ready to have a long conversation so you ask if she would like a drink, she says yes. You order the drink, chat for a few minutes after handing it to her and she quickly states "I need to find my friends". Nexted. You place your hands in your pockets.

New You: It's real early in the night. You are sober and you can tell a girl is eying you. You simply say hello, but mentally note she is furiously checking her iPhone, likely to meet the rest of her group. After 5 minutes in the conversation you say "what do you drink" she says her favorite drink and you motion her over. You move to the most open area of the bar and stand directly next to a semi drunk man in jeans and a rolled up collared shirt. After grabbing drinks you say cheers smile, take a sip motion for "one second" and walk away for what she thinks is a moment. As you walk the drunk guy begins talking to her and you note that she'll be glad to see you later in the night.

5) A Foreign Accent

Old You: You hear a few people nearby talking in Spanish. Naturally you ask if they are from (Spain/Mexico/Cuba etc.). Conversation goes okay and one catches on and she mentions she just graduated college. You say "oh what do you do out here", her eyes gloss over but you don't notice it because you're fairly drunk. She gives you the basics of her life. She tells you her major, you tell her yours, her feet are already pointing to the dance floor as she scans for other suitors.

New You: As you're walking to a different area of the club, likely near the stairs, you hear people speaking Spanish. Instead of making the assumption you listen one extra time to make sure you got the accent right. Nope, Portuguese. A glance over and you catch eye contact and say "Oi, tudo bem?". They laugh and one asks how you know and you simply say you went to XYZ city for work. One chimes in "What do you do?" (you notice this will veer into a boring conversation) "I sell drugs for a living". They laugh since no attractive girl actually cares about what you do for a living. At this point you're deciding to continue the interaction or go back to girl one who is standing tapping her foot out of boredom once all her friends have arrived. You grab her number by handing her phone over with the add contacts feature showing to the most interesting one saying "you have to go talk to a friend".

6) Dance

Old You: A popular song comes on and you catch eye contact with a decent looking girl. You go chat for a few minutes. Both of you are tipsy so you dance in American style which consists of barely moving your hips and flailing one or both arms in the air. You got lucky today so she leans in and is giving you obvious cues she likes you. You make out with her immediately… You didn't note her friends 5 feet away as they laugh at how drunk you guys are. After 5-10 minutes you meet her and her friends and end up spending the next 35-45 minutes of the night hanging out with them.

New You: You hear a specific song related to group two, you know they can dance and head over for a second ending the interaction with girl one for now. By your surprise only one girl knows how to dance and she can only speak Spanish. Instead of letting the interaction turn into a long 30-40 minute spell you simply say, "Vamos" and stand within eye sight of the group. You dance on one because she looks bored, she missed the entire previous interaction. After 2-3 minutes before the song ends you head back to the same group who are undoubtedly happy and cheerful.

7) Logistics

Old You: You live with your roomates and can't find a way to bring the whole group because they won't leave the girl with you alone. Your boys have all blacked out and did the classic Irish good-bye. Tough situation. You settle for a number and give the girl a kiss on the cheek to neutralize the obvious caveman game you were running in direct sight of her friends. Not that bad. You head back out and stumble on your way home grabbing some Street Eats on the way home.

New You: You notice girl one is a bit annoyed you didn't dance with her. You tell the second group you have to go and dance with your "friend" and you will call the original girl soon. She smiles and says okay. You walk over to girl number one and she's a bit annoyed "so you don't want to dance with me?". You laugh and say "Of course, lets go" and head to the dance floor. You dance on three instead, slowing down the pace so its easier to convey body language. Naturally giving some isolation dance moves for her to have a great time, laughing and smiling. During one of the spin moves you glance at your wrist and see it's getting late but you know of a cool spot just down the Street. You bounce with her, friends already approve as they haven't seen a sloppy makeout session on the dance floor.

8) Texting

Old You: You abide by a 24-72 hour rule and text with the same message every time. No process a simple "hey how are you" or a "how's your day". You don't notice a varying response rate based on her interest. Instead you simply try to set up a meet as fast as possible. You shoot maybe 5-10%.

New You: You have a system. If she responds to your initial message from the night before she's sending emotionally charged messages or she's flat. Instead of wasting your time, you stack your messages. You call the ones with heavy interest and let the other ones slide with a text since you know they are low probability. Luckily you've learned to not get stuck in text messaging hell.

9) Voicemail

Old You: WTF is voicemail?

New You: You assume the sale if she doesn't pick up. Letting her choose to hit you with a call or text, by stating they can do either. You don't waste your time asking for her to respond. Within an hour a message hits your phone.

10) Date Game

Old You: You know of a few cool spots in town and take her out to drinks. You show up late. You are wearing the same jeans and collared shirt. Your go to move is to hit the dance floor and aggressively escalate.

New You: You dress based on her personality, conservative with a tie or relaxed without. You hit a spot with light food and drinks. Everyone in the spot knows you because you're a regular. You quickly bounce to a new venue a block away, no line for you. After slipping through you chit chat, sitting side by side of course, with a drink in hand. You dance but it's on beat, on three and you don't bother with going aggressive. You sell her on going back to your spot for champagne…

Are you evolving?

****

10 Working Life Truths You Don't Learn From Business School

We got quite a few emails on how important being political is within an office environment, reading between the lines it seems that many people believe simply being friendly with the "right" people will get you promoted and moved up. Believe it or not this is false. One or two of you may be right next to the CEO's son (yes you're screwed) but at the end of the day performance will get you to revenue generation much faster than politics as you can quickly use your performance to give you the correct political footing. With that said here are ten items no one tells you about the work force.

1) Performance Is First: Nowadays, many people come into the Street and likely other professions as well, with the belief that if they do not have the right "politics" they will never get promoted. This is simply false. Most companies will have a handful of political elites, people hired solely because of their connections, but the vast majority get jobs by having the right credentials. Since this is a website dedicated to Wall Street the best way to break down performance on the Street (entry level) is as follows: 1) error free work, 2) punctual, 3) thinking 1-2 turns ahead and 4) sanity checking numbers. Once you jump to revenue generation, your performance is practically entirely tied to your revenue numbers.

Unfortunately more and more candidates come into the Street and believe if they simply "suck up" to the right revenue generators they will be promoted. Instead they are shown the door. If you want to have a long career on Wall Street you cannot simply do an average job, you need to do work ahead of time that you believe will be handed to you during the next turn. In short as an entry level hire **your job is to save the team time.**

2) 80/20 Politics: Once you've established yourself as one of the high performers in your class now you can position yourself amongst those that matter. Some firms require that every single higher up pulls for your promotion, but at most banks, there are likely 1 or 2 out of every 10 higher ups that do not matter. These people should simply be pushed to the side in terms of your work load and your goal is to consistently be teamed up with the correct groups.

3) Responsibility Over Prestige: Another major issue that comes up is the balance between responsibility and prestige. Always choose responsibility. At the end of the day if you're generating revenue for Jefferies, you'll be making more money than an Associate at Morgan Stanley. Your responsibility level and actual tasks at work will determine the speed at which you get promoted and the speed at which your bank account will grow.

4) Generate Revenue, No One Cares About Education: Another major trick to Wall Street is that as soon as you start making the firm money, no one cares about your background anymore. Every business in the world has the same rule: find a way to make me money. If you have a MBA from Harvard or a BA from Williams College, at the end of the day if the person with a BA from Williams College brings in more deals, trading volume or has a better P&L… The person with the BA will always be paid more. To reiterate, as soon as you begin making the firm money, no one cares about your credentials.

5) Attitude Only Matters for Entry Level: It is terrible to type out, but it is the truth, as soon as you begin bringing in revenue no one cares if you are a tyrant to work with. Naturally this causes an intense environment as entry level employees are expected to be happy regardless of the workload/mundane task and the revenue generators do not care about the happiness of their underlings. Knowing this dynamic the best move to make for an entry level employee is to turn in perfect work for the first year and position yourself away from the tyrants. Secondly, when you begin generating revenue, attempt to de-load the quality entry level workers so you will have the best resources when you need them.

6) Personal Email is Only Personal: Another goal you should have is to never use your personal email for work purposes ever again. In an ideal situation all job applications should be sent in from an alternative email address, a connection to the opportunity. Putting yourself in the hiring managers shoes, you will always choose a resume in front of you that has been recommended to you from a close contact than an obscure but strong resume that was handed to you by HR. **Always.** With this in mind, do everything in your power to avoid 1) online resume submissions, 2) Linked-in applications, 3) cold networking and 4) headhunters. By the time you've established yourself on the Street the higher paying jobs, more likely than not, will come to you via word of mouth.

7) Headhunters Don't Care: Now that we have mentioned them above, headhunters do not care one bit about you. Repeat that once or twice if you need to, headhunters do not care one bit about you. Instead they are simply there to generate revenue as they get a commission when you sign the dotted line. Tread carefully.

If you decide to use a headhunter you need to treat each interaction intensely: 1) pre-sell them on your experience, 2) push them for guidelines on all in compensation and 3) up sell your current position. Lastly, one dirty trick they attempt to play is the "prestige jumping role" where they simply try to slot you into a more prestigious bank for the same or worse pay. **Don't take the bait.** If you must go down the headhunter route, keep the rules above in mind and a few opportunities may come down the pipe.

8) Careers Are About Momentum: Another thing you don't learn in school is the importance of momentum. Many times you see analysts or associates on the fast track to a promotion and they decide to jump ship to a new segment of Wall Street (typical examples Analyst to PE shops, Associate to Buyside long-only etc.). Unfortunately, this may **cost you hundreds of thousands of dollars**. Before you jump ship from any platform, assuming you are liked, sit down and ask if you can obtain more responsibility at your firm. If the answer is yes 9 times out of 10 you should stay.

Why? If your group is interested in keeping you for the next jump, regardless of what that jump is they are interested in keeping you around for a longer period of time. You have built forward momentum at your firm.

9) Financial Independence Improves Your Work: You would think it would be the reverse and you would be wrong. As you accumulate assets and eventually pass the point where you can live off of your savings forever, you have **less stress in your life.** With less stress in your life you can actually perform better on the job as a large weight has been lifted off of your shoulders. You no longer enter a state of mind fog, looking into every intricate detail and begin operating smoothly. Notably, the bias in this example is if you reach financial independence quickly, the job itself is likely quite easy for you.

10) Never Burn a Bridge: Finally, the last thing you want to do is burn a contact at your old firm. More likely than not you will work with people that will dislike you and you'll have a few people looking to put a knife in your back at a moment's notice, but do not purposely burn a bridge.

That wraps it up, all of the above should be taught in college but unfortunately there is no class on career management.

****

20 Rules for Your Twenties

20 Rules for Your Twenties

Many of our emails tend to come from MBAs and college students so we decided to compile a post of twenty rules that you should abide by in your twenties. Notably, we have each messed up on at least one of these rules in some form or another but if we could go back and become twenty again this is the blueprint. You can make tweaks to this list as you wish. In addition? You will likely make some of these mistakes even though you've been warned! That is simply part of life. Don't beat yourself up too hard and good luck out there!

1) Minimize Debt: This is one of the biggest items on your to do list. Debt is a vice around your wrists that is slowly cutting off your blood circulation, if you don't release the pressure you'll be dead before thirty… the Prime of your life. If you are able to spend money on assets that depreciate in value (cars, clothes etc.) you better be debt free and saving large amounts of cash.

2) Change Your Friends: We have given a quick blue print to choosing friends, however the biggest mistake is not upgrading your social circle as you move on. We know, you read the word upgrade and immediately thought the word is heartless. It is not. You need to surround yourself with like minded individuals, even if you have known a childhood friend for 15 years, if they begin using drugs for entertainment purposes and falling off of the grid you have to say goodbye. Your life is too short to spend catching falling knives.

3) Learn to Help Others: This sounds contradictory to point number two, however it is paramount that you learn to help those that wish to improve. The key is their interest in improving, if you attempt to convince a man of self improvement when he does not care, you'll burn a bridge. Hyper competitive and intelligent young men tend to develop a "put down" mentality where you compete at each others throats 24/7. Not only is this not sustainable, it is not healthy and does not help you in your career. Instead, pass along helpful information and you will find your friend count increasing.

4) College Should Be Tough: Everyone else goes to college to drink and try to sleep with hundreds of women. These guys usually end up unemployed or making $40K a year at a soul crushing job with no skill set to jump into another industry. Their entire life is now 100x more difficult to fix and you'll be shocked at how difficult it is to come back when you've built no foundation. Build a foundation. You can have fun in your spare time.

5) Get Internships: Even if you have a 4.0 GPA from a top university, no one will care if you have zero work experience. In addition to obtaining line items on your resume you will realize that your network expands drastically. You'll be in contact with people in their 30's who are well outside of your current social circle of 20 somethings.

*Note internships was intentionally plural.

6) Find Mentors in Their 30's: By the time you are in your low twenties you should have a handful of men to speak to regarding life decisions. Each man does not need to know every aspect of life, however the more the merrier. You'll quickly realize that your peer group is older than you as soon as you receive your Diploma (MBA or Bachelors). This is a good thing. Generally speaking, older men make hiring decisions.

7) Your Co-Workers Will Screw You: This is the most common miss. If you are in the same peer group, none of your co-workers are out for your best interests. If you party with your direct co-workers, as soon as layoff rumors begin making the rounds, be certain you'll be thrown under the bus . See point number one for why they would be more than happy to see you fail.

8) Read Books Daily: If you are not reading books outside of the classroom you are allowing the collegiate system to have more influence on your upbringing than it should. The topic of interest is less important than the act of reading. You can read about health, fashion, coal mining, animals, chemistry, art and the list goes on. Reading is similar to investing as the payoff is far in the future, one day you'll have a chance to make a connection with a higher up on an obscure topic and ideally you'll have the ability to add to the conversation. Don't forget that wealthy men and women are typically eccentric.

9) Learn About Basic Fashion: Before we get comments about books beyond finance, you can simply start with learning about basic fashion. Learn what colors work for your skin tone, eye color and hair color. Once this is mastered find the right brands to accentuate all of your positive features and build a sustainable wardrobe. Better to learn and earn before you have some cash and see it burned.

10) Exercise Five Days a Week: Unless you are forced to burn through 100+ hours a week for several weeks straight, you should find time to lift weights five days a week. No excuses. Your health is the only thing that will outweigh your aspirations for wealth. A man who has a healthy mind and body with a heavy wallet is free. There is nothing more valuable than complete freedom to do as you wish.

11) Procrastination is Valueless: If you find yourself procrastinating on tasks it means that you have nothing to do with your free time. In an ideal situation you are constantly moving and improving your life. You don't have time to procrastinate because you're too busy taking action. The day you find yourself sitting and staring at a computer screen for 2-3 hours in a row is the day you either walk outside to exercise or immediately buy a book online. This is the minimum.

12) Ignore the Lazy: You will meet many people who suggest you simply relax and live in the moment. Avoid these men like the plague. You should live in the moment for a calculated risk not to simply feel good for a short period of time at the detriment of your future. Much like investing, 20 years from now they will have a hard time getting by while your life is already on cruise control because you've built an unbreakable foundation.

13) Don't Get Married: No matter what you do, do not tie the knot in your 20's. The truth is that many women in their twenties are most attracted to men in their low thirties. **Run the math.** Your future ex-wife is still in high school right now, so don't fret over anyone within ear shot for a long-term relationship. We recommend not getting married but if you decide to keep one, wait until your 30's.

14) Go International: By the time you're in your mid 20's you should have some international exposure that will wreck a lot of your current beliefs. By experiencing a new culture you'll quickly see how many of your ideals are based on a US cultural phenomenon. You can do this with a single briefcase and you can do it alone. You'll force your body into survival mode in an unknown city, your confidence level will grow by leaps and bounds.

15) Face a Major Fear: Heights, snakes, fights, the major fear you have does not matter compared to your ability to tackle it. If you're afraid of being beaten down in a street fight, you should get into a ring and take a few kicks and punches. You should jump out of a plane if you fear heights and you should even consider purchasing a snake. There is no substitute for repeated exposure to eliminate a major fear in your life.

16) Turn Family Into Friends: For many, your family members are dragging you down and for others they are a positive in your life. The key is to separate your life decisions from their opinions – their opinions should have no weight on your emotions. At this point you should not use your family as a safe haven in life. If you lose your job, if you want to move cities, if you want to take a risk, it is on your shoulders. Remove the safety net.

17) Stop Complaining: Maybe you didn't land that Bulge Bracket job, maybe you didn't get ranked number one in your class, maybe you hurt your wrist and can't lift for a month**, no one cares.** By the time you're well into your 20's your interest in complaining should be zero. Complaining gets you no where. All it does is increase your stress levels. When you are stressed out, no one wants to be your friend. If no one wants to be your friend, your contact list is not improving and if your contact list is not improving…. you're dead.

18) Wake Up Early: Unless you've obtained a job in investment banking where you'll eat garbage for multiple years straight to earn your stripes, you should wake up early to get ahead of the rest. Read, go to the weight room, build a website, it does not matter. Your brain functions well in the morning, use your most productive time to invest in the most important person in the world. Yourself and your future.

19) Earn a Voice: Many men will destroy their careers in a few short years by never earning a voice. When you are in your twenties there is not a single person who will care about your world view so it is best to remain quiet and diligently improve while waiting for an opportunity. Instead of dishing out advice, take advice and remain quiet. As soon as people begin asking you for your contributions you're officially of value. You have earned your keep in a specific niche.

20) Fail: The last piece of the puzzle is the most obvious and the most undervalued. Fail as many times as possible in your twenties while you have the time to recover. We do not recommend dropping out of college as a failure or taking up a humanities major as a failure (this is simply financial suicide for most), instead we recommend you fail at trying to create value. Try to create a mobile app. Try to learn how to code. Try to learn a foreign language in a year. Try everything.

Assuming you follow these rules, you'll look back on your life when you hit thirty and know, not believe, you have done everything to make your life better. If anyone attempts to say you've worked too hard, write them off as whiny complainers who have to live with the knowledge that they could have been better. They could have improved, they sold themselves short.

****

20 Things You Should Realize After 1 Year On the Job

20 Things You Should Realize After 1 Year On the Job

After you graduate college within one year you should have multiple realizations. To help you jump ahead in the learning curve, or in other cases question your own decisions, here are twenty things you should realize after a single year of work experience.

1) $100K is Not a Lot of Money: In short it is not. Not even close. Looking at the facts, if you are making $100K a year that is approximately $5,000 in post tax income per month. With the average rent for a studio in a major city like NYC at $2K+ this means that you cannot even afford to live there (using the 1/3 of income as rent rule, you need at least $6K post tax). If you cannot afford to live in your own place in a major city… You're no where near rich. Times have changed.

2) Successful People are Nice: In college you're taught to hate the rich and believe that they are all a**holes. In reality, the elite are actually easy to get along with… the catch is they don't enjoy wasting time. If you're of no value and don't have potential they will quickly move on since there is no point in building a relationship. This isn't mean, this is realistic. There are many other promising people that they can spend their time with. In short, no one is a snowflake.

3) 60 Hours is Longer Than You Thought: When you graduated, you believed that 12 hour work days (or 16 hours for those on the Street) would not be that bad. In reality it causes you to be excruciatingly efficient. If you work 14 hours in a day, your mind becomes tired by hour 10. You have not had the chance to work out, do laundry, or relax… Time to make adjustments.

4) Your College Friends Go Away: As mentioned,if college was the best time of your life, you did it wrong. You may keep one or two around who are equally successful, but if the gang from college is primarily together, there are serious problems. Your friends in college will be quickly replaced by business associates, as they say *"It is hard to hate someone that makes you money"*

5) Reading Increases Communication Skills: You will be writing an email or talking on the phone one year after graduation and you'll struggle. For some reason the words are not flowing as much as they used to… The reason? You're not reading as much as you should. Pick up a few books and begin reading 100+ pages a week at minimum. It keeps your brain fresh and you will come off as more mature and polished.

6) Consistent Sleep is Better than Hours Slept: In short, it is best to sleep at the same time every single day of the week. While 9 hours a day may sound better, if you are not sleeping at the same time your biological clock goes haywire. Waking up at the same time on a daily basis will allow your mind to run like a well oiled machine.

7) Women Are Not Honest: Women are better liars than you. They have better people skills in general. What this means is you'll believe a lot of the smoke and mirrors. Once you realize that they are simply human, you'll intelligently adjust your phrases to catch them in lies that determine their level of loyalty. You won't be surprised that less than 5% will pass.

8) You Can Get Stronger: Assuming you are dedicated to being fit, there is no reason to be in worse shape than you were in college. Your body continues to get stronger through your late 20s. Use this to your advantage. Negatively, you need to walk around more frequently since you'll be sitting at a desk for the most part.

9) Complainers Are All Losers: There is no debating this one, as soon as someone complains about topic X, be certain they know absolutely nothing about that topic.

If they complain about the economy? They are broke and unsuccessful. (S&P at ~2,000 today by the way)

If they complain about women? They are not doing well with them.

If they complain about office politics? They have poor social skills.

If they complain about Life? You get the picture.

10) Cost Doesn't Matter: The idea of "big purchase" versus a "small purchase" should be squashed. The only question you need to ask is "What is my return?". If an item costs $500 or $5,000 the only thing that should matter is the return on investment. If you need to spend $10,000 but it is going to return

$20,000 in value to you, there is no need to spin-wheels on the decision. Buy it. Price doesn't matter.

11) Learn to Enjoy Sales: There are few professions that pay well. This creates an issue where you must choose between a performance based sales position or a performance based analytical position. The rare positions that are 100% analytical (quants/engineering) usually come with a steep social cost… Terrible people skills and a poor social life. If you don't believe this, go find some engineers/quants and take a hard look at their girlfriends. You won't be happy.

The choice is clear. You need to learn to sell. Selling includes promoting yourself as a brand and selling yourself in an interview. It includes selling a product or service. It even includes convincing a girl to go on a date. This is a much better skill to learn than any Excel or PowerPoint which can be outsourced to India for pennies on the dollar. You can apply it to everyday situations as well.

12) Becoming a Millionaire is Not Impressive: Run the math. You'll see that becoming a millionaire is not a difficult task at all. You should reach this mark by your 30s and becoming a multi-millionaire before 40 is not a far stretch by any means. Over a 15 year period, if you put away just $1K per week you're looking at $1.3M+ (7% return assumed). At this point you're ~36/37 years old and this assumes your income has not increased since your second year as a 23 year old investment banking analyst…

13) Your Contact List > Your Degree: When you graduated college, you looked up to your professors. If this is still the case after a single year of work… you're in the wrong industry. Regardless of your profession, your contact list will determine your pay grade much more than your degree. A top degree is certainly a pre-requisite… but as soon as you begin your career your focus should shift. Obtain more contacts, contacts and contacts.

14) You Dressed Like a Slob: This happens to everyone, after a year passes by you should be donating clothes to charity like you're doing laundry. You'll realize your wardrobe did not reflect your skin tone appropriately. Your clothing did not fit. Oh… and your hair needs to be redone as well.

15) You Never Worked Hard in College: There are extremely rare exceptions, but for the most part… You'll realize college was a cake walk. Even if you worked 1-2 jobs, took a full course load and stayed in shape. It is still absolutely nothing compared to real life. You'll be put in your place quickly when you see your first credit card bill… with hundreds of convenience store purchases. Adapt or die.

16) You Must Embrace Technology Quickly: The world is going to evolve. Stay on top of it. Conveniences that were previously relegated to the rich (chauffeurs – Uber, full disclosure – SnapChat, direct criticism – Yelp) are going to be available to the masses sooner than later. If you are not embracing it, then one of two things has occurred.

1) you were unable to adapt or 2) the technology shines the light on your weak spots

Don't let this happen to you, once technology passes you by it will take significantly more effort to catch up again.

17) Learn to Avoid Technology Addiction: This is a tough line to draw. While you should be on top of new changes you cannot become glued to a single application. This will cause you to miss new changes and will distract you from more important matters. Find a time frame for each usable app, email checks 2x per day at max, automatic alerts for important applications and a synced calendar should solve your headaches.

18) Always Choose Responsibility: Most people are afraid of responsibility. You should jump at it. You're not going to get paid a lot more by doing the same task over and over again, it is not how businesses work. Any time you have to make the choice between a few thousand dollars and a change in responsibility… always choose responsibility. You will be seen as more mature and much more qualified for the next big project that comes down the pipe.

19) Mediocre People Will Ruin Your Life: Once you realize a person is mediocre you need to leave them. There is no exception to this rule. As soon as you realize a person is mediocre you need to leave them. Mediocre people will try to compete with you, they believe they are smart and they will never show any meaningful improvement over time. When they catch a few lucky breaks here and there, they are first to jump on twitter/facebook/group text messages/emails and play their sirens loudly. Just ignore them and move on.

If you are unsure if a person is mediocre put them in a position to lie. If they bolster simply cut them off. Now, if they sandbag you… temporarily reconsider your position.

20) You Should Embrace Embarrassment: Every year you'll take a look at your old beliefs and laugh at how wrong you were. Take this in stride and strive for more embarrassment. If you consistently change major views, this means you're getting better. As you know, if you're not getting better… Well you may as well be dead.

****

2014 Book Recommendations

We received a few requests via email, twitter and the blog for additional book recommendations. Instead of giving out loads of financial analysis books and self improvement items we complied seven books for improvement and an additional seven for fun and entertainment value.

Seven Must Read Books for Improvement

1) How to Get Rich: Simply put, this should be the first book on your list if you're interested in becoming wealthy. This is not for people who believe that $1,000,000 is a lot of a money, it is for people who truly want to approach the nine figure net worth area. You'll learn quite a bit, from a high level, regarding wealth creation. If you don't want to pick up the book here are the key highlights: 1) you'll never be wealthy working for someone else, 2) America is still a power house – look up GDP numbers for proof, 3) if you are not willing to suffer through tremendous amounts of pain, you'll never be wealthy, 4) you will lose friends and even family members on your path to wealth and 5) even if you complete all four steps you might not make it.

2) How Rich People Think: This is second in line. We listed How to Get Rich first because everyone should aim as high as possible and they should understand the amount of sacrifice it takes to become wealthy. How Rich People Think is more example oriented and is tailored to people who are interested in becoming multi-millionaires. You will find that many people (see average people who don't matter) will dislike this book. Overall, you're picking this up for the following reasons: 1) to destroy a poverty mindset, 2) force yourself to become someone of value, 3) improve your ability to distinguish between poor and rich people upon hello, 4) eliminate some poor financial planning ideas and 5) gain inspiration to start a business <– noticing a trend?

3) Guide to Rational Living: We have read this book a few times and it is particularly important for a young twenty something male to read. Today, everyone attempts to make a mountain out of a mole hill. If someone dislikes your post on Facebook many youngsters act as if the world is ending. This is not only unhealthy but completely irrational. We recommended this book, in particular, for people who are struggling with depression. The truth of the matter is that the modern world has very few life threatening issues so our minds create stress over things that do not matter one bit. Remember… If a person you do not know can ruin your day, you've lived a privileged and pampered life (ie: you're being irrational).

4) What Every BODY is Saying: This book will help you in both the workplace and in social settings. It is said that 80% of all communication is body language driven and 20% spoken. This book will change how you carry yourself from a primal standpoint. You won't walk the same, you won't talk the same, you won't sit or stand the same ever again. You become conscious of the room/environment and you're now able to get messages across in a much more intelligent manner. As stated in the first sentence of our review, if you're looking for a book that is going to help you in both the work force and in your personal life, this book is for you.

5) Trust Me, I'm Lying: It is one thing to read the news it is another thing to believe it. If you're reading this blog you are likely of above average intelligence and realize big media is a large scam where they simply come up with new fads for diets, products and services you don't need. This will open your eyes even wider. You'll go through new blogs, products and services and laugh at all the lies they are trying to make you believe. You'll find that many top tier websites have articles written by people who have accomplished absolutely nothing. The most glaring and obvious ones are in 1) personal finance where the writers are all broke, 2) diet where the authors are selling magic pills and 3) economics where people make macroeconomic commentary but can barely make $10,000 a month. Simply put it is a joke. They use the platform which has established trust, abuse it and sell you products you don't need. Before we continue rambling here, simply pick up the book and begin questioning where you are obtaining your information.

6) How to Win Friends & Influence People: Many people prefer a book titled "Influence: The Psychology of Persuasion" however we prefer Dale Carnegie as it allows you to build a framework. Both books are great but this is our choice. After reading this book you'll change your word choice and you will definitely see an improvement in your game. Instead of ruining the book for you, since it is also a must read, one major tenant is this "the vast majority of people do not like criticism". Needless to say, you can use this as a measuring stick for finding out who will be successful in life… those that enjoy receiving criticism and thrive in stressful environments.

7) Steve Jobs: Likely the most influential inventor of our generation, Steve Jobs highlights a lot of working principles of success: 1) sickening work ethic, 2) perfectionist and 3) clarity of vision. After you read this book you will realize that if people call you extreme or crazy or too much to handle… You're walking down the path to success. The only way to be successful is to be extreme, that is how a bell curve works. To be at the right tail of the bell curve means you are an extremity. If you are a sports fanatic, we suggest reading a biography of a top athlete (Tiger Woods, Michael Jordan, Pete Sampras.. etc) and reading this book immediately after. You'll find a startling amount of overlap in mindset and work ethic.

Seven Entertaining Books

1) Al Capone: Say what you will about criminals but they are generally some of the smartest people on the planet. They are not nice and you certainly do not want to end up in jail but these books can teach you a lot about human nature and are certainly entertaining. If you have an interest in how a criminal enterprise is run (see an intricate business) and want to be entertained, this is a great book for your long, legal, business flights.

"When I sell liquor, it's called bootlegging. When my patrons serve it on silver trays on Lake Shore Drive, it's called hospitality" – Al Capone

2) The Accountant's Story: No mainstream media website is going to tell you this but… the vast majority of successful people have used drugs to get ahead. With that said, you'll likely become interested in how illegal drugs are made/processed/sold and how this multi-billion dollar business can continue without being shut down. Well… look no further, since Pablo Escobar is the undisputed king of the cocaine business. While the book is choppy (jumping time periods multiple times – ie: it is not chronological). You'll learn a lot of startling facts and you will no longer knock on the IQ of high end criminals. They are smarter than us and smarter than you as well.

3) Catch-22: Sticking with our non-chronological theme from book two, we also recommend Catch-22. We all know you cheated in middle school/high school by using cliff notes to pass the examination so pick up the book and read it cover to cover. Any book that is able to enter the English language is certainly going to grab your attention, remember to read carefully as the chapters will intertwine.

"A catch-22 is a paradoxical situation from which an individual cannot escape because of contradictory rules."

4) Fear and Loathing in Las Vegas: Title is self explanatory. Drugs, partying and delusion. Really gotta stop reading all these drug related books… Needless to say it's entertaining. If you're looking to turn off your brain and relax this is the best step down from a television (which you shouldn't own). At least you can tell people you're reading.

5) Brave New World: Another book off the reading list you never actually read, Brave New World should make you appreciate the ups and downs in life. If your life is truly a utopia where specific medications are made to make you happy, you will feel that something is missing. Without the downs in life you will never appreciate the up times. This is quite appropriate today, where people are unable to go a single day without their Smartphones.

6) Striking Thoughts: Bruce Lee is known for being a martial artist however he is also a prolific philosopher. This is in between self help/improvement and entertainment since the book is written by an outstanding athlete. If you are into zen type readings, not sure how else to describe it, you'll enjoy this book.

7) King of the World: Follow the intensity to find the answer. Simply put if an athlete is both charismatic and on top of the world, you should listen. Muhammad Ali is another great athlete who should be recognized more for his mental strength and views of the world. Like all great athletes and successful people he is inspired by competition and does not allow people to tell him what can and cannot be done. Instead of spanning his entire life the book focuses on his life during the 60's but it is a great read nonetheless.

"Impossible is just a big word thrown around by small men who find it easier to live in the world they've been given than to explore the power they have to change it." – Muhammad Ali

Note: If you have outstanding book recommendations please feel free to leave it in the comments. As a side note we have no interest in television or movie recommendations

****

2015 Review and 2016 Outlook

2015 Review and 2016 Outlook

2015 is coming to an end. It has been the best year in history to make money. The best year in history to be single. And. The best year in history to start another company. 2016 is looking better than ever but instead of putting the cart in front of the horse we'll review the year (both positives and negatives) and move onto 2016 expectations.

2015 Positives

Writing Style Established: We've finally established a consistent *writing style* although we continue to mix up the format. Overall, happy with the progress here as the blog was abysmal back three years ago with chaotic content that could have been summarized in a solid tweet. Importantly, with the new and established writing style all of the terrible posts have been turned into solid tweets causing our twitter account to grow.

Twitter Use Solidified: We've also established the point of the blog and the point of the twitter account in 2015. It will continue to be a micro blog about topical items and will *not* be used as a "connect" feature unless we get bored. Running a micro-blog is more helpful and we won't waste our time dealing with trolls. We'll continue to build our own audience separate from any sort of "movement".

User Base is Up: We're on the line here with creating our first product. Yes it will likely be an information based product but we're not going to sell anything until our metrics are hit. Will it make us a lot of money? **No.** The blog continues to grow and we make a lot more money elsewhere (Wall Street is not our primary source of income). In short, user base continues to grow at a nice clip despite materially lower post count.

2015 Negatives

Decline in Posting Rate: To no surprise to our readers, an actual company (or companies in this case) and a career is significantly more important than a hobby blog. This blog took a massive hit in posting rate and we've tried to ramp it up now that things have cooled off. Disappointing.

Still Arguing With Failures and Losers: We wasted time arguing with people on the internet and even more-so in real-life. While the rate was down a solid 50% we're going to try and decrease this again by another 50%. If a person is too slow to figure out what is legitimate and what is not, we're simply going to click ignore and move on (we've already met multiple people in real life including some of our excellent commenters!). Mediocre people *practically* never turn it around. It is much more efficient to find someone who is above average but younger… than find a fool in his early 40s and $200K to his name… Sad and pathetic.

They had 40 years to figure it out, while there is still a "chance", the probability is so low it is not worth your time. Hat-tip to Felix Dennis for that one.

User Base Not High Enough: While we've mentioned this as a positive, it didn't actually hit our metrics. Both a success and a failure. If we were able to keep the posting cadence up we would have been ready for a product launch already! However. The user base increased more than expected given that were only posting 1x per month! In short this was both a win and a loss for 2015.

2015 Articles We Didn't Write

Since we failed to post as many times as we wanted we're going to highlight interesting articles from 2015 that we didn't write! Here are some interesting posts we read while in transit.

The Paradox of Rest – Mikael Syding: *"If you want something done, give the task to a busy man. Ask somebody with all the time in the world, and it will take exactly that long"*. This is probably one of the best quotes we've read and it is entirely true. Resting is not limited to sitting in front of a TV screen or taking cat naps. Resting is really a form of changing tasks in your brain. Using this blog is a great example, it's fun, we don't take it seriously and it activates the creative part of our brains.

How Much Do Independent Authors Make? – Mike Cernovich: *"Every author keeps their sales data secret because of an "embarrassing" reason."* In short, Mike outlines the e-book industry and gives you an idea for how much money you'll make by being an author. It isn't great. People write to us asking if we're "hating" on the sales and the answer is always **no**. We actually ***agree*** that writing online is definitely not the best way to make a living *if you want to make money and get rich.* In fact, his sales numbers are incredibly impressive. Generating $100K as a one man shop selling e-books to a market for *men* is no joke. We wouldn't even sell a fraction of that based on his data! Read the article before you believe you'll get rich selling books and stop complaining that he has monetized 10+ years of effort.

5-MeO-DMT, The Spirit Molecule, Pineal Gland, Consciousness, and Atheism – Mike Cernovich: We actually feel uncomfortable posting that link here, which is exactly why it belongs here. There is no reason to add an explanation, when you read or listen to the post you will believe what you believe and we will all move on. Yes we realize it was written in 2014 but we found it this year.

How To Write A Sales Letter For Your Blog – Robert (30 days to x): *"It will take you between three to five years before you figure out how to actually make any money. Most niche sites will cap out around $15,000 a year. If a website is earning more than $30,000 per year it's almost always operating off of paid traffic. The owner is* ***buying advertising space somewhere.*** *Sites that get organic traffic and less than 10,000 visitors a day aren't going to earn a more than a $10,000 to $20,000 per year."* Simply well said and true. This is why we aggressively hammer the point down of needing *paid advertising* to make money.

Machiavellian Maxims – Illimitable Men *"When people don't like you, their questions are attacks. Sometimes these attacks are disguised as concerns, other times they are blatant. Whenever you're asked a question, judge the legitimacy of the question. Insincere questions must be met with insincere answers, if any answer at all."* This post is almost a darker refresher of the book 48 laws of power. We usually do not like list posts but this is a solid summary of the dark side of human nature. We found this blog this month and will check it sporadically.

2016 Expectations

No Q&As for the Masses: We made this change in 2015 (for comments) and it was probably one of the best decisions we have ever made. **Going forward we will only provide Q&A's to **email subscribers** and they will be held on Twitter on a Monthly/Quarterly basis depending on schedule.** We are shutting down the free-for-all Q&A's on Twitter as too many of the questions are terrible so we never respond. Importantly, for every single subscriber you will have significantly less people to compete against.

– Facebook will be the first place to receive post updates

– Twitter will be a micro blog and also provide post updates

– Subscribers will receive access to Q&A's and we will respond with @ instead of .@ to minimize interactions with regular people

Continued Page Growth: We have three triggers in place before we start a product to sell. Page views, users and email subscribers. If the three triggers are hit we'll get started. Until then we'll keep steady with the stream of information/content.

Final Comments

On a personal note, reading took an enormous hit this year so we were unable to 1) read as many books as we wanted and 2) were unable to read as many blog posts as we wanted as well. With that said we're happy to hear about interesting posts/books that people found in 2015.

*****No Questions Allowed They Will Be Deleted*****

****

2019 Investment Banking Compensation

2019 Investment Banking Compensation

We are updating the total Investment Banking compensation numbers for 2019. Excluded from this overview is investment banking analysts as the variability has not moved much. Simply put an investment banking analyst should make $165, $190K, and $215K in years one, two and three (plus or minus $5K depending on how good or bad the bank did). The reason we have excluded the exact break out of base and bonus is two-fold: 1) analyst base salaries are a bit less standardized now with $85-90K being the rough mid-point, 2) the bonus is being adjusted and despite a weaker market (explained later) the non-revenue generators won't take a large hit in mediocre markets. We made similar points last year, the only adjustment really is that most banks have moved to about 85-

90 Base/ ~75 bonus for the good analysts for a first year payout (as usual 100% of base as bonus is reserved for the top-tier performers, we focus on the top 25% or so). Note if the bank did poorly, you're going to see even more volatility and the total could very well be below last year.

Budget Setting and Bonuses: As always, bonuses are set in Q4, despite being paid out around February-April, so it is relatively easy to get the Street range, this year bonuses will be down for revenue generators and likely a tad up due to talent retention of junior employees. This is better than expected if you are a junior banker and bad news if you're a VP or above.

Why? This is an important concept since it is the first time we've had a clean down year for revenue generators in quite some time. Investment banking is a "long sales cycle" business, meaning lots of nothing followed by a large deal due to a great relationship. If we look at this year as a whole deal flow is certainly softer in aggregate. This means less fees so by definition the revenue generators had a smaller pie to work with since the entire market was down slightly.

Now you'd think that the "bottom always gets burned" but investment banking is a bit different. They don't want to burn the "cogs" of the organization because it doesn't make a lot of economic sense. Even if you take the entire investment banking analyst class and pay them down… This is still peanuts compared to paying the under performing MDs down 20-40%.

The long story short is that you don't want the entire junior class to leave. Technology companies are certainly on par with investment banking (corp dev at a top company for example) when you look at dollars per hour. So you want to make sure you don't have to deal with more turnover than usual.

So Who Takes the Hit? All under performing revenue generators and even senior management (extremely heavy hitters who can clear $10M in a year, head global investment banking to take an extreme example). The extremely high paid individuals will move their number down to keep the high performers happy as a lot of their money is tied up in Company stock. Hopefully we've done a good enough job of explaining this and it makes logical sense from a business model that has a long sales cycle measured in years.

The Punchline: Numbers will be down about 5-9% if you include everyone (associates to senior management) at all the major/relevant firms. Some will be down a lot though. The under performing MDs will be down 20-40%, the top performing MDs will certainly be up if they were on the major deals and the senior managers at banks that struggled will be down more than double digits (oh and if you get a classic "zero" they are telling you to leave as usual). In general, assume numbers are down and depending on how the market ends it could be down double digits but we're somewhat optimistic since the market was really the issue (not a lot of deal flow).

What is a Top Person: A top person is someone that is either generating a large amount of revenue or someone the firm is promoting. The first one is obvious and people who are working on the larger deals are typically the ones being promoted anyway (funny how that works!). Essentially, a top person is someone who is already generating a ton of money or someone who works for a guy generating a lot of money. If you're a good junior banker the top person will want you on his squad, simple as that.

Overview: Generally, the lower level (excluding new hires who have only been around for 6 months),will see less volatility. Banks view junior employees (anything below Vice President) as fixed costs so they typically don't see much volatility. As are minder we're attempting to build a picture across the Street which includes everything from bulge brackets, elite boutiques and middle market firms(excluding the tiny shops that have limited deal flow). If you look at the numbers, you'll see that the real money is made when you're generating revenue(Vice President, Director, Managing Director). This is because Wall Street is no different than playing in the World Series of Poker. We've said this before but it needs repeating.

No one is going to get rich working as an associate and you're only making money at the revenue generating role and more specifically once you close a few deals (Directors typically have brought in quite a bit of money). In addition, once you reach Director level or even Vice President you'll quickly realize starting your own company will make you more money than working for someone else (hint, hint, hint, never put all your eggs into Wall Street).

If ~$300K seems like a lot of money, look at the real math. If you live in a major city like NYC, then you can assume that you'll see about 64% of what you make (figure is around ~$192K). This means you're getting around~$16K per month. Rent alone is going to run around $5K if you're living in a good part of town and the rest of your living expenses will usually approach $4K a month or $9K in spending per month… Saving around $80-100K a year isn't going to get you anywhere soon. Once you hit $500K or so, then you'll see an inflection as a single person because you can put away ~$200K and not see much of an impact to your life style.

Before the Debate Begins: The "average" or "median" is becoming extremely difficult to calculate. Why? Well more and more of the top people are paid more and the bottom tier people are being asked to leave via a terrible bonus. The strategy of making sure you're barely in the top quartile is material. You absolutely do not want to risk being in the middle anymore as it swings your pay down by a wide amount. To give an example, while the "average" Vice President makes around $500K, you could easily make 50% more if you're at the top (yes that's a quarter million dollar difference or more!). This difference only gets bigger and bigger as you move up the chain. Also. If you are the same Vice President but you're awful at your job, you'll receive a fast and swift "F You" bonus that could cause you to make less money than you made as a top tier associate(okay *easily could*). The "conference room" will be the next call.

To add to this volatility here are some incredible numbers that have occurred over the past 3 years and anyone in the industry would know the right banks (hint major M&A shops). A top VP in an extreme year has cleared a million, a top Director has gone to $2-3M if a major deal was made. That's an enormous spread. Enormous. Remember… these are so rare so you should go ahead and assume more normal numbers, around $500K at VP level around $800K at Director level and over $1 million as an MD

How Do You Calculate Your Bonus as a Revenue Generator? You will get around 10-15% of what you kill. This is the rough math and makes all those occupy Wall Street people scoff and get on their knees. To generate a $1M bonus you'd need to bring in $10M to the top-line at the firm, roughly speaking. This is certainly not an easy task and most people will get stuck in the $300-400K bonus range where they get some small deals, sign up some retainers, some poison pills, some fairness opinions etc… but never really get the big money.

Things Have Actually Changed! You're seeing a bigger and bigger change between banks. When looking at the chart we have to emphasize that there is a big difference between being at Joe's Investment Bank and a top tier Boutique. This will cause a lot of people to look at the chart and say "that's way too high" (bad bank or group) and the top banks to say "wow that's terrible I am never leaving here". We can't decide if this is a good thing or a bad thing but one item we will say… We'll make a bet that numbers actually pull back again (we made this comment in 2018 as well and were actually correct! Get a lot of things wrong but this one was right as 2019 looks like it will be slightly down) .

The Buyside Story is Still Seeing Pressure: For another year, passive investing has outperformed active managers impacting the number of roles on the buyside at hedge funds& mutual funds. Private Equity has seen low rates help their investments (this may change if rates continue to go up) as cheap money has improved the ROIs on investments particularly if the debt is set at a fixed rate. We think you're going to see headcount reductions at hedge funds and long only funds in the near future. You have already heard of several if you follow financial news.

Key Way to Avoid Confusion: If you're looking for one line, just assume you'll be down as a revenue generator on a "like for like basis" and similar to maybe even up a tad as a junior banker (Banks avoiding additional attrition). Given all the base salary changes we adjusted them throughout all levels to reflect the evolving environment. This means some of the totals look better than the other ones depending on *when* the base salary was moved up for the group. Also, remember that *getting a promotion usually leads to bigger jumps* and if you were simply going from associate 1 to associate 2, not much happens and that would be reflective of a "10% like for like" jump. We've said it before and we'll say it again, do not switch banks if you can get promoted since it's just too much money to leave on the table (yes we are sure there are rare exceptions, but highly unlikely it ever makes sense)

24 Hour Q&A is Here

Now closed thanks.

****

7% Return Profile and Beating the Market

7% Return Profile and Beating the Market

For various reasons this has been under attack lately.

"Given all the changes in the economy how are we ever going to get 7% returns!"

Well the good news is anyone (not everyone) can get 7%+ returns over the long-run assuming that you are able to ***control your emotions***. As mentioned previously, it is psychologically more difficult to handle a 50% downtick, this is also why the short end of a long-short book is much more difficult to control. Notably, the largest reason why the 7% return profile is under attack is the interest rate in your bank account which is roughly 1% if you stash it in a money market account. ***Get everything excluding your emergency fund out of there.***

"7% is impossible"

Bonds: Starting with the more obvious lets look at long-term bonds, how about the Barclays Capital Long-term bonds. The total return has been 45% since June of 2007 excluding dividends this alone represents a 6% CAGR, add in a couple percentage points and you're already there.

Many naysayers are going to look at the numbers and say "but this is just one index" or "this is a short time period" so with that said here is a list of bonds you can buy, simply pick what you like. (iShares Barclays 20+ Yr Treas.Bond, Vanguard Long-Term Bond Index, iShares Barclays MBS ETF, Vanguard Extended Duration ETF, Vanguard Long-Term Bond Index, iShares IBoxx $ Invest Grade Corp). Effectively find a large long-term bond index, low fees and continue to invest monthly and you're good to go.

Stocks: If for some reason, you believe stocks will continue to outperform bonds over the long-run (as it has over many decades) simply buy SPY. It really is that simple, yields 2% and should warrant a long-term 5-10% growth profile with a higher standard deviation.

That is all. Stop reading. Do not pass this line until you are 100% committed to the idea that you're doing nothing but losing money sitting on over 2 months in living expenses.

"Above Market Rate Returns"

Alpha: Lets move onto beating the market or "alpha". Of course, more naysayers will point to "average hedge fund return" in a particular time period and say you can never beat the market. ***Ignore them.*** By saying you cannot find a good security effectively means you "cannot find a good business to invest in". Considering that the entire business of Private Equity is to lever up and fix a company, you would then need to say that Private Equity is a bad business and should not be profitable long-term… KKR, TPG and the like have held up just fine. There are always good businesses to buy, ie: invest in. Working for a start up, is no different than putting a large sum of cash into a single company, in fact, it increases your risk and reward profile as your job is also liable if the company goes under.

Know a Space: With that said, the best way to find a strong business to invest in is no different than any other part of life, spend hundreds of hours researching a specific space. Know it well. Diligently go through every single SEC filing, read hundreds of transcripts, read hundreds of research reports, be able to understand the dynamics to the T on everything in one space and start hunting. ***If you're unwilling to spend many grueling hours learning a niche space, or don't have the time, go back to the top of this page*** and invest all of your capital into baskets of long-term bonds and stocks with no fees attached to them.

Reap Rewards: To hammer in the point that above market rate returns can be seen, just pull up Berkshire's stock relative to the market… here it is.

The Company's portfolio has consisted of many securities over time (Sees Candy, Wells Fargo, IBM and others), and the relative return is quite impressive. Back of the envelope if you look at the beginning of Berkshire, it grew 2x the market rate… a CAGR that exceeds the S&P by 2x is beyond phenomenal over roughly 30 years.

Conclusion: If you have any doubt that you'll be unable to watch your investment decrease by 60-70% in a single year, you should stick to the long-only camp. In addition, we believe it is possible for anyone to learn one space and get smart to achieve above market rate returns. Notably, the number of people ***willing and able*** to put in the work is likely well under 1%, so buy a basket and get your money out of that checking account.

****

8 Takeaways: Brief Hangout with Mike Cernovich – Danger and Play

8 Takeaways: Brief Hangout with Mike Cernovich – Danger and Play

Recently had the chance to touch base with Mike Cernovich from Danger and Play. We don't spend too much time together as we are both busy pursuing multiple projects… But we do have one thing in common…. We hate wasting time.

With that said we generally meet once maybe 1.5x per year to catch up and here are the main takeaways (WSPBs perspective).

1) People in their 20s don't have their priorities straight

It took less than 15 minutes to figure this one out. For some reason people in their 20s are constantly asking for "game advice" and how to "get chicks". You can see the tension in the nightlife environment. It is practically a war zone of men trying to one up each other.

Why is that? It is a product of men in their 20s having backward priorities.

Lets assume that you master the "game" and get "the one" for you. Now she enters your life which is full of… nothing. You didn't put the big blocks up first so you have nothing to maintain her interest. How long are you going to be able keep hand in the relationship? Maybe a year. Maybe less… Then she'll begin making demands of you. You lost.

Then these men jump back on the treadmill ignoring the big blocks (financial security, health, ***long-standing relationships with high quality men)***and return to asking more game related questions. ***What a waste of time.***

Mike is actually a much nicer guy than us, he won't say it but we will.

If you're picking the brain of a guy who is netting 500K page views a month, a successful lawyer and a well educated health freak about how to land "one night stands" you're wasting his time and your own. Asking a successful person to be a relationship coach over a girl who dumped you or a girl who flaked on you says one thing about your life. You have nothing meaningful going on. At all.

Harsh? Probably. True? Absolutely.

Here is a good proxy for when you should seriously worry about game. *If you're on track to be worth $1M+ by 30 and you're unhappy with your sex life, you can now ask for game advice.* Otherwise, get to work on something more meaningful.

2) You will be happier if you live your life honestly

If you are constantly putting on an act, you're going to be stressed. Yes cultural decline is real and most women you meet will be sluts who have hooked up with 20+ men on tinder. Ignore them.

You should know what type of life you want to live and that will naturally attract the type of girl you want as well. Going to the clubs, getting blacked out and stumbling around as your buddy asks you to pick him up with other "hot chicks" is about as appealing as 45 shots of 151.

If you live your life as you actually want to live it, you're going to attract different types of women and male friends. The law of attraction is absolutely true. Start approaching women as you live the life you actually envisioned and a lot of your unhappiness will fade away.

3) Holding men and women to the same standards is ludicrous

If you are dating an attractive woman who is your opposite, holding her to the same standards as you will not work. Period. Double standard? So what. It is simply true. No attractive woman is going to put herself through the same amount of pain as you, which is why she is there to be a supporter and cheerleader.

Besides, she is not going to respect you in the first place if she thinks you're her equal or lesser.

Click here for a review of the basic ground rules.

4) People have no emotional control

During our catch up we did have a chance to meet some quality people. Even then, one thing stood out… When it comes to money people have no emotional control. We didn't realize it but this short post can change a person's life if they simply practice the simple steps outlined.

Successful people, men and women who make $1M+ per year were actually concerned about "timing the market". This is exactly how people lose their life savings. After you personally watch a few investments go both north and south (30%+) you should be able to stomach the volatility. Yet our email got blown up after a 5-7% correction. In addition, it was a hot topic of discussion.

Sadly there is nothing to discuss. Just dollar cost average and move on. As stated over and over again, 99% of people won't be able to do this.

5) Talent is wasted everyday

With the ugly realizations out of the way, here is a mixed realization. There are a lot of talented people out there who are simply refusing to tap into their potential.

Lets step up to the plate with two examples:

Example 1

Twenties Mentor – This blog concept should be netting 6 figures. How do we know? The demand for this type of mentoring program would be through the roof if the author could simply do the heavy lifting instead of regurgitating a few select manosphere posts/ideas. Don't get us wrong, we're happy for a few clicks here and there but the bigger issue is the lost potential. Lets write this out again.

Twenties mentor is a 6 figure opportunity that is being half-assed.

It is being half assed because the author, whomever he is, is not addressing the niche appropriately. How so? Check out the starting video.

In short the author states he "wants to be the best at fitness, women, starting a business". Wonderful. Why isn't the blog taking up any traction? Easy. There is no action.

How should the blog be improved? Choose one action step and go down that path quickly. Write 2,000+ word posts every single day.

Based on the video, the author currently lacks certainty. Therefore… we would suggest the following series: "How to become a great speaker". Take classes, record your voice, show proof of effort and see how your readers respond to your new videos. We guarantee it will be interesting. **Take what people in their 20s are afraid of and show them real time it is achievable.** The #1 fear is the public speaking.

Is the author going to continue half assing the blog? If he does, then it better be a hobby because it certainly won't garner readership with regurgitation/summaries of the blogs he reads. Take out the machete and go down your own path.

To reiterate, **you can make 6 figures** off of that blog concept if done correctly.

Example 2

Kidstrangelove – The author of this blog has the reverse issue of twenties mentor (opinion). While twenties mentor is unwilling to get out and pave the trail (so far), kidstrangelove appears to be an engineer who is uninterested in the limelight. It took him all of 6 seconds to create manosphere.com which is a blog aggrigator that helps every single author it tracks.

The author is able to quickly cut through media BS and synthesize data (like any good engineer!). But… He's not putting much effort into building a brand off of his technology know how. The potential is certainly there.

6) The USA has everything you need

No the USA is not perfect and there are a lot of issues (kangaroo courts, fat acceptance and otherwise) yet if you look hard enough you can find the diamonds in the rough. Once you do, you'll bask in the glory of having your cake and eating it too. After traveling to enough international destinations you will find that you're trading one headache for another.

In short you're trading cultural dating headaches for business/trade headaches.

You can choose headache number two and make all of your income online or you can keep headache number one and simply adjust your lifestyle to find the girls that fit your needs. One thing is for sure, complaining won't do anything.

7) Intelligent 3rd party observations lead to immediate results

If you are spending time with an intelligent person on Topic X, it's wise to put them in a situation to give you feedback on that topic. As an example, if you're a great salesman but are in the room with an even greater salesman… You should show him a video of your latest presentation.

In less than 30 minutes you'll find multiple tweaks to improve your situation. Net cost? Practically nothing.

In short, the largest room in the world is always the room for improvement.

8) #GamerGate

Still do not understand what this is truly about. But if you're looking for some LULz simply follow Mike's twitter. In short, they are barking up the wrong tree since he doesn't have a boss to report to. *Popcorn*

****

A Basic Post on Minimum Leverage and Several Announcements

A Basic Post on Minimum Leverage and Several Announcements

When it comes to leverage there appears to be two camps: no leverage and a ton of leverage. This is simplifying things, but if you talk to rich people they typically talk about leverage positively or they got wealthy without leverage buying lots of assets with cash (significant business cash flow). Another interesting item here is we've noticed that people with a large sales background – constantly talking a big game since it's their career – use more leverage. On the other side. Those with a technology background or another industry with high cash flow lean towards a de-leveraged approach. Naturally, there is a middle ground here between zero leverage (decreasing your long-term net worth) and over leveraged (buying tons of cars on credit)

The Problem With No Debt: While you can still get rich without debt, the major issue is that you're decreasing your long-term net-worth. If you receive a million dollars with a low interest rate of 2-3% and cannot figure out a way to generate value… You're simply not trying hard enough. Realistically, to receive the extremely low interest rate in the first place, you would need a high income (allowing you to obtain preferential treatment). While there is some truth to avoiding "the top of the market", at extremely low interest rates, you should be able to weather any storm over a 20-30 year time frame.

If you want a rule of thumb we'd recommend calculating the "spread" and multiplying this over a 15 year time frame. For example, if you were able to get a 2.5% interest rate and your long-term annualized return was closer to 6% this would be a 3.5% spread. While you can certainly deduct the interest from your taxes (mortgage situation for example), this rough math means you're growing your net worth by an additional 3.5% per year (on the amount you borrowed). If we play this out over time on our $1 million dollar example, it would result in an incremental $35,000 per year. ($60K-$25K = $35K)

In year 1 and year 2 not much of this is a big deal. An extra ~$3,000 a month won't sound like much. But. If we reinvest that same amount of incremental money then you're looking at a significant change in cash flow. While $35,000 per year times 20 years would be $700,000… the return is actually much much higher. To keep the numbers "less risky" we assume you can earn 4% on the $35,000 per year.

So after 20 years what does this mean? It means you've generated $1,042,000 not $700,000 over a 20 year span. *This is how people get rich using other people's money.* If you want a good rule of thumb, every twenty years assume that you're going to recoup the entire loan amount. This is an extremely simplistic way to think about the number but also helps explain why zero debt does not make sense for a long-term investor. If your return versus the interest rate is 3.5% or higher… you're essentially losing out on that money (notice we didn't say risk free as everything has risk even treasuries).

The Problem With too Much Debt: On the other side of the equation is where you run into payment issues. If this is ever the case and you're "concerned" about making a monthly payment or quarterly payment… it's time to de-lever. Or more importantly. It is best to avoid getting into this situation in the first place. Unlike the other section, this situation is dire as you could be forced to sell assets to make payments (see people in credit card debt). In fact, this is similar to buying a car on credit as you're levering up into a guaranteed loss.

Using the same $1 million dollar loan example, this is only a good idea if you're 100% certain that you'll be able to make the $25,000 a year monthly payments. This is not a large amount of money relative to the loan size (assumes you're a high income earning individual). But. You better not rely on a single source of income when you decide to lever up with a large sum of money. If you're missing any of the payments the game is no longer fun. Why? Well if you're forced to sell items to pay the interest it probably means your cash flow statement blew up. That's the downside of debt. When it goes in the other direction there is significant pain and suffering.

The Minimum Leverage: The above is pretty basic knowledge, so the more interesting question is a minimum leverage amount. Notice we said leverage amount and not "leverage ratio" since this is more of a personal finance item than it is a company specific item. If your business could blow up any second, leverage is likely not in the playbook (while recurring revenue businesses can take on more risk). So. From a personal finance perspective? *We'd look at your passive income as the best determinant for your debt load.*

Facing the facts here, unless you're levering up to flip houses and it's part of your actual business, you're really just trying to juice your returns over a 20 year time frame. This means you're looking for extremely low interest rates and for a medium risk asset that will unlikely decline over a long period (stocks after a recession, housing after a recession, so on and so forth). To make sure you're always able to hit the interest rate payment, *simply match your passive income.*

Continuing with the same example from above, if you have an interest payment of $25,000 per year, this would require passive income of around $25,000 per year. While this sounds like quite a bit of money, we'll leave it up to the reader to decide what classifies as passive income as there are multiple forms (passive and semi-passive). If you're bright enough to have found this blog and make good money, you're likely sitting on two streams of income where you could easily classify stream two as "passive income" since you could start up a third one if one of them didn't work anymore.

Currently, you can get near-risk free returns of around 3%, this would mean that with $1M in investable assets you should actually have $1M in debt. Why? Well with $1M generating $30,000 a year… it's highly unlikely that you'll miss those interest payments of $25,000 per year. If you're unable to pay for your own food, water and shelter by yourself in a worst case scenario… we doubt the person would make it to a million bucks in the first place. This is less of a jab at regular people and more of a confidence booster for the future rich people!

Does This Always Work? Of course not. Sometimes you'll be forced to make tough decisions on leverage. Looking at markets in general, you want to have some broad views of when you're rejiggering your exposure. We've already made our opinions clear from 2012 till the end of 2018 there was nothing to do but buy stocks as we were still working out of a recession. At current time frames, we're just not as interested and are not *adding*. This is a significant change since you're not dumping stocks and "unloading all of your exposure" instead you're de-risking by tossing more money into cash. Why? Well if you toss more money into cash and have more accessible money, the interest rate you will get typically improves (everyone wants to know how much liquid money you have M1)

The other important concept here is that there is no way to time the bottom at all. While we're sure a few people will hit the exact bottom and a few people liquidated all of their stocks in the first week of October of 2018… No one needs to be a hero to get rich. What is more important is getting the broad trendline correct. We know that most bull markets last about a decade and up to around 12-13 years. We know that real estate and stocks should go up mid-single digits over a 20-year frame, so on and so forth.

Putting these two broad items together what you want to do is have enough cash on the books to *allow* you to buy the bottom. When de-leveraging occurs and people unwind their positions the last thing that people have is *cash*. So you'll be in a fortunate position to do just that. Borrow money near the bottom. As a final rule of thumb when you hear that we're officially in a recession, we suggest looking at your debt load and increasing it. Then you just need to play the waiting game.

Side Note and Important Announcement: First, we've officially decided to write a final product to complete the trilogy… it will be on effective spending. Being brutally honest, it has not been easy as 1) there are no real books on this topic as they are all typically about frugality and 2) we want to cover everything as maximizing your "status" over time is an important art. Second, we'll go back to posting regularly here (likely more frequently for the next month or two) to make up for the pause over the past couple weeks. Third, we'll drop the introduction/outline well ahead of the launch of the book. This is because it will likely take a good amount of time to do it properly and will need some feedback. It will expand from not just "when you're rich" but when you're lower on the economic totem pole all the way up to $20K/month or so… After that it becomes too personal (for many reasons to be explained). Fourth, to cap it all off. One frustrating part about doing all of the work is that many people don't bother to read important sections. So there will be a surprise section in the book to reward people that actually take the time to read it.

****

A Castle in the Jungle

A Castle in the Jungle

You're dropped into the middle of a jungle. No contacts. No resources. The immediate reaction is to find a source of water to survive. You quickly take to a perch near a river and realize you need food as well. You observe the wild life taking notes and quickly devour anything edible in sight based on your observations. You may live another day.

A few days pass and you catch wind of edible fish in the river. You don't know how to fish. You create a slew of fishing mechanisms, a sharp stick and a woven net seem the most promising. While you didn't catch anything with your last twenty concoctions, you pay it no mind. You haven't failed yet, you only found twenty ways to do it incorrectly. **You'll find a way since there is no other option.**

A week passes by and you wake up early one morning to see a fish consuming a worm. It clicks. You re-wrap your net to accommodate a few worms. You chug several extra cups of water before you go to sleep for the night. This causes you to wake up just before sunrise and wait with your worm laced trap.

You fail thirty times in a row, you fail more times than you have fishing gear but the thirty first one gets caught in your trap. The fish tastes significantly better than all of the food you consumed previously. Maybe it is because you prefer fish, or maybe it is because it took you several days of effort to obtain the fish. **A wise man will bet on the latter.**

You establish a solid routine of fishing, building out your home by the river and venturing further downstream searching for human life. One day you stumble upon a tribe of men. You startle them. With minimal viable ways to communicate you quickly offer up some freshly caught fish to the group. You leave your home upstream. You pick up the language. You adjust.

With a significant amount of trust established from your simple skills in catching fish the head of the tribe asks you to take over more roles within the group. You immediately accept. You are given the task of building a castle.

Five months pass and you have personally built the foundation for the castle. The tribe leader is quite happy but believes more can be done. Instead of asking for resources you turn back to the basics from your initial inauguration. You seek out to make friends. Recruiting several members to contribute a few hours of work per day. In just a few short months you have a four bedrooms of the castle completed. The tribe leader returns from a long excursion and is shocked at the change and work that has been done. You are given a team to manage for the completion of the project.

Ten years pass by.

You are now one of four men who live next to the king of the castle. You are no longer tasked with physical work, the tribe has many young eager and strong men to complete such requests. A change has occurred. You are now taking questions and are fed, clothed and sheltered due to your opinions. After all, anyone who can move from a river bank to the kings quarters should have valuable suggestions. You work long hours answering questions ranging from catching fish to building a team and establishing relationships across various sub groups within the growing tribe. You speak to every member of the tribe on an annual basis.

Another five years pass and the king has fallen ill. The king will now choose one of four men to be his successor… each of whom has a comparable skill set. After a long rest the king steps out to make his decision. **The decision was certainly made long before this night.** As each candidate is praised for his efforts the crowd is anxiously waiting the decision. A twinge of fear spreads over the crowd when the other candidates are mentioned. You are asked to be the successor. The crowd erupts.

In your own head you don't register the praise but instead are reminded of the first fish you caught on the river bank.

(pause)

What is the point of this story?

It is how you should approach life:

1) When you are young, you are trying and failing over and over again searching for a solution. You put in the work, you are inefficient at first due to minimal guidance and inexperience. *The only way to gain experience is through effort.*
2) You copy success around you, even if you are surrounded by animals with no human contact they are a source of information. *Everyone you meet will be a source of at least one piece of useful information*
3) You adjust to achieve results, it is not pleasant to wake up before dawn to catch a fish but it does not matter if it is pleasant or not, *what matters is if you wish to capture a fish.*
4) By the time you are independent and standing on your own feet, you should expand your network, if this means swimming downstream, so be it. *A man with just three real friends is a man of great value. A man with hundreds is wealthy.*
5) When you meet a new group of superior men the last thing on your mind should be competition. Contribute what you can to be near superior men. *Even if you could burn down the entire tribe, you would be left with ash.*
6) When offered new responsibility you jump at the chance. No one grows by staying in the same position. *You deliver results on an individual basis making it much easier for you to create a team in the future.*
7) As your tasks continue to grow, you make many friends. What makes a castle strong is not the walls but the relationships within the community. *Without their trust they will not work for you.*
8) As you age your physical skillet declines, however the skills you developed when young and energetic should make your thoughts more valuable than your muscles. You are not financially independent until people will pay a handsome sum for your opinion, *now you are a walking business*.
9) At the top of the food chain, leadership qualities begin to trump experience. Anyone who can make it near the top of the food chain will have a plethora of life experience, *but only a small percentage of those men can develop healthy relationships as well.*
10) Throughout your life, the greatest amount of happiness you feel will directly relate to the hours you put in to achieve your goals. If you have a life theme of improvement, your happiness can increase each and every year. This is why you should catch your first fish early in life, *train your brain into the mindset it needs to succeed forever.*
Lets assume you've transgressed a few laws within this story. Maybe you don't see the connection between work and happiness, *maybe you're spending your time trying to take down a castle someone has built in stead of building your own* and maybe you are not infiltrating the right tribes at this time. No matter. Instead we will leave you with the following Chinese Proverb.

"The best time to plant a tree was 20 years ago. The second best time is now."

****

A Day In The Life

Below is an outline of how to efficiently run your life at the mid-level in high finance. It assumes you'll be working in the realm of 60 hours a week and you want to maximize… sex and money.

7:15am: Alarm goes off. Check email do 10 push ups, shave, shower and change.

7:35am: You walk out the door with your pre-packed food for breakfast and lunch. Yesterday you set up a news article to go out, anything interesting to send to your team. They assume you are in the office but really you're on your way to work. Notably, the 25 minute time difference is enough for them to avoid checking in on you, if you show up 10 minutes before people may try and compete with you.

7:50am: You arrive roughly 10 minutes before everyone else and toss food in the fridge. Grab breakfast and eat while taking supplements you need such as fish oil and milk thistle for the massive alcohol binges and begin your day.

8:00am: If you're a banker this involves meandering around waiting for the staffing meeting where you're going to be assigned to check some analyst/associate's work and twiddle your thumbs looking at offering memorandums. If you work in a market centric job, hedge fund or otherwise you're going to be checking out futures markets, trying to find a catalyst in your space and working on long-term projects. The next four hours involves daily work that we've outlined previously. Update models, write notes, do pitch books, attend conference calls and read as much news as possible.

11:30am: Head out to "lunch" and go solo. At this point you don't need to go to group lunches if you're established, in two words? Day Game. You already packed your lunch so you walk down to Times Square with food in hand and open up the first 3 girls you see with "Hey where is a good seafood spot around here". ***Go direct*** after 2 minutes and say "Honestly I don't care about seafood I actually work just over here and thought you were ***kind of*** cute so we should hang out sometime". Get at least 3 approaches in over the next 20-25minutes. Depending on looks you can get 1/6 numbers or so, no problem.

12:00pm: Eat lunch back in the office while doing moderate work. At this point most people now leave for lunch, while they are out grabbing lunch use this time to practice a new language, type up the next post for your blog, read up on investment ideas or simply read a book. A good trick for reading a book is to get PDF copies as well, forward them over and have your fingers hovering over windows and D so you can flip down all your screens while your background shows a fake excel spread sheet.

1:00pm: From now until you leave the office at 6pm or so you're going to focus on automating as many tasks as possible for work, get ahead on projects and set them up for distribution. Finish all work 2 days ahead and deliver them roughly ½ a day ahead of plan. ***Always*** ***Lower expectations, higher than expected results***.

4:00pm: Search out a good interesting article to send to the team and send it out for distribution some time the next morning, begin texting a few girls you're currently seeing and catch up on your current date pipeline. As soon as you can, leave work for the gym. Leave some work items near by so people believe you are going to come back. Start texting girls in your pipeline, see if any will come through relatively easily.

6:30pm: When you head off for the gym, turn on any sort of music to get you back into spitting game mode. You're going to talk to at least 3 people while at the gym. You should be friends with the gym rats or staff at minimum. Between sets you can send out text messages and continue racking up dates for the week or weekend. Keep building rapport with the cutest girl you can find in the gym and go for dates/numbers after roughly 3 days.

8:15pm: Swing by the office for protein shake, supplements and all other necessary items.

8:40pm: Walk into your apartment and head straight for the fridge. Chop up juicing material and food for the morning. Throw items into a bag and throw some food in that needs to be microwaved such as baked potatoes and set it up for 7 minutes and 30 seconds. You now have 7 minutes and 30 seconds to shower (you do not have girly long hair).

9:10pm: You walk out of the shower, beeper on the microwave goes off. You pack the rest of your food up and juice. Clean everything up and throw your mason jar in the freezer.

9:30pm: Set alarm clock, you drink a warm glass of milk. Not to be a two year old but because it releases melatonin, you can also take that if you wish. You have 1 hour to read, learn a language or add value to someone else's life.

10:30pm: Sleep.

Notes:

- No TV or checking media or Facebook. If their opinion actually matters you'd have their cell phone number.
- The 1 day a week you do not work out, you can substitute for a nap and go out on a weeknight for learning a new fun activity (dancing, art, bartending etc.)
- Your iPad/Kindle can be an asset, ***do not browse through the web, you have a computer at work***
- Juicing is done 2 days a week as you have a set of mason jars, more free time
- You will also get days where you get burned by work, make this your new rest day for both juicing and lifting weights, never allow 2 days in a row to break your routine
- No time to complain about life or what you don't have because you're busy consuming good information and improving yourself, success is inevitable
- 8:30-10:30pm can also be set up for friends with benefits, mix and match

Conclusion: During a working day alone, you'll approach and talk to at least 4 women. This does not include your weekends and your weeknight out for fun. You'll be perceived as hard working at your job at minimum come bonus time, this puts you in an okay position at worst. You'll consume good information, books, languages and zero clicks on "Yahoo News" or "Fox News". The last thing to remember is always being happy at work because people have a difficult time giving more work to someone they already like as a person**.** Psychologically harder to screw over someone you like as a person, even if their work is just "okay".

****

A Day In the Life: Hedge Fund Associate Edition

A Day In the Life: Hedge Fund Associate Edition

Intro

We've previously outlined a day in the life of someone working in high finance (and someone not), however… we have received requests for similar overviews that provide more depth for specific roles within Wall Street as a whole.

This will detail such a "day in the life" for someone working as a hedge fund associate with an investment banking background. The focus here will be on job responsibilities, as opposed to any particular associated lifestyle habits.

Here is the typical answer to the question: *"there is no such thing as a typical day"*

While this is somewhat true outside of morning / evening routines, no day is the same as the next. That said, within the course of any given week or month there are a finite number of tasks that you will perform on any given day.

As such, instead of providing a detailed single day (maybe example), this post will outline: 1) Routine / rough outline and 2) Typical Activities

Routine

Wake up early (highly recommended) – This will differ depending on which coast you are on and when the market your hedge fund operates in opens, but for an Equity Long / Short associate working in NYC, for example, this is typically around 5:30-6am. For those operating in less liquid markets this could be later, while for those on the west coast this will be much earlier.

Workout: Most people work out either first thing in the morning or immediately after work depending on preferences and how feasible it is to squeeze one in first thing (i.e., if you have to be in the office by 4am then you're probably going to wait until after the market closes before hitting the gym). Many funds also have gyms and trainers on site, so it's also possible to do it in the middle of the day if your schedule permits.

The Commute: Some choose to take a short commute to work where you will typically catch up on news / market data / economic indicators on your phone and read/respond to any overnight emails that came through.

Day Outline: Once you get in at the start of the day you setup, check email, get coffee, get breakfast (many funds provide catering for most meals), etc. and begin to plan your day.

Sleep / End of Day: As stated, your hours will vary depending on fund and location, but rest assured you are not going to keep your banking hours – you are paid to think, you are no longer paid to process. With this in mind it's in the fund's interest to keep you well rested and healthy. Days don't tend to be more than 12 hours long, so save the occasional all-nighter for time sensitive material. A lot of your work can also be done from home if logistics permit.

Typical Activities

Now that we've gone over the outline, from here out, your day could be filled with any number of the following:

1) Working on New investments / Investment Memos: The primary focus of what you are doing at a hedge fund is researching and evaluating investments. Much of your day to day will involve different ways of getting information that you can use in order to do so. Once you've done your diligence on a potential new holding and come up with a thesis, you will typically pitch it to your PM either on the fly or in a regular (weekly or monthly) strategy meeting. Sometimes this means an email outlining the most relevant points about the investment, while other times it means a full blown investment memo ranging anywhere from 5-30 pages (depending on the complexity and level of detail necessary to understand the investment). They will typically have the same structure as the case study you beasted when you first got the job, only with more depth and more focus on what is relevant (as opposed to just background information that is easy to pull up on CapIQ or Bloomberg).

2) Source and Structure Deals: For funds where the focus is on less liquid assets or private / semi-private deals, you may need to work on structuring the terms. In addition, large individual investments where your fund or a group including your fund is negotiating with a company directly may be an issue as well. Similar to banking, this involves modeling potential deal scenarios, putting together update presentations, coordinating with lawyers and other funds to negotiate and arrange terms, etc.

3) Working on Investment Updates: For current holdings, you will need to provide updates for any events that may have a large impact on the investment itself. This can include items that may require a full thesis update (ex. legal judgment, big earnings miss, anything that would significantly impact the thesis to necessitate re-evaluating the investment) a short memo (ex. quarterly and annual earnings updates, smaller news items that still affect thesis somewhat), or just an email (ex. earnings previews, market moves).

4) Work on Marketing Materials: Depending on the size and resources of your fund you may put together marketing materials to pitch to potential new investors, as well as materials sent to existing clients such as quarterly letters, annual meetings, performance updates, and other presentations and analyses about the fund's performance (vs. benchmarks, alpha / beta, sharpe ratio, etc.) and strategy (see Howard Marks).

5) Backoffice Support: Similar to marketing materials, your involvement here will depend on your fund, but you may also need to coordinate the activities of the fund as it pertains to backoffice functions such as compliance and accounting.

Calls / Meetings:

1) Strategy Meetings: Most funds have weekly or monthly strategy meetings led by the PM in which fund performance is reviewed, investment updates are provided, and potential new ideas are discussed (this is usually when you present your investment memo). However, meetings are often held for special situations and time sensitive issues which can't wait until the monthly meeting. More regular update meetings may also be common (i.e., Monday Morning Meetings).

2) Conference Calls (i.e., earnings calls, investor days, etc.): This is typically for any current holdings. However… This can also be done for potential investments on your "Watch List" – i.e., companies that you are keeping an eye on or developing a thesis for in your downtime. It can also be for ideas you've diligenced in the past. But your firm passed. You continue to track it in the case that they become available at a more attractive price, etc.

3) Diligence Calls: While your own personal network can be helpful for diligence, more specific insight is needed for individual investments you are evaluating. This is where other sources of information, such as expert networks, come in. Most funds use a service like GLG to arrange informational calls related to investments they are looking at seriously. These calls are with industry experts, former employees, employees of competitors, or anyone who may be knowledgeable about the space you are looking at. These calls can be anywhere from 30mins to an hour long. Other sources of information can include finding people on LinkedIn (yes, seriously), your own personal network, talking to sell-side analysts and rating agencies. In short? Anyone who can provide you with relevant information.

4) Calls / Meetings with Management: There are clear benefits to talking to management teams on a one on one basis (if you can). This give you time to ask them about their strategy and anything else they may be able to disclose regarding their thinking and the company itself.

5) Talking to Other Funds: This is where effective networking comes into play. If you are looking at an attractive investment then in all likelihood you are not going to be the only one looking at it. Whether from business school, undergrad, your IBD analyst class, or anywhere else, it helps to have a large network of people at other funds to talk to. You can speak directly with multiple people on various topics such as 1) current holdings that they are also knowledgeable about 2) new investments you are evaluating that they are either looking at, already hold, or have held in the past and 3) what new ideas they are thinking about – many hedge funds want to remain secretive lest someone else capitalize before they do, but there are often cases where it wouldn't hurt if XYZ fund knows what you are looking at if it means they can give you insight (and vice versa).

Other Fun Stuff:

1) Reading: In addition to calls and meetings, the biggest part of analyzing the investment will involve reading as much as you can about it. In particular, you are looking for things that other may overlook (i.e., always check the footnotes). This can include filings, research reports, news articles, industry reports, emails, etc – anything you can get your hands on that will help give you a better investment decision. You also want to stay on top of any industry news / market data / economic indicators relevant to the fund as a whole – specific holdings, or anything that may present a new investment opportunity to look into.

2) Dealing with Lawyers: If you've ever uploaded a dataroom before (you have if you have worked in banking) then you will know what this entails… Those 300-page legal documents have to be read by someone and while lawyers will handle much of this work, specific issues may arise and you may be responsible for this. This is more relevant if you are on the fixed income side, as almost any investment you will evaluate will necessitate reading over an associated credit agreement in order to 1) know the credit terms (rate, length, covenants, etc.) and 2) peculiarities. There are also cases where you are investing in industries (airlines come to mind) or situations where a legal decision is a significant factor.

3) Modeling: There is a saying that in investment banking, modeling is the most interesting part of the job, while at a hedge fund it's the least interesting part. **This is true.** Modeling itself is often a methodical process once you have the basics down. You are more interested in what the model tells you and how it relates to your thesis than how good of an excel ninja you can prove yourself to be at this point.

Some notes to clarify… Modeling at a hedge fund is more similar to equity research than it is to banking – while you do create a new model for each new investment it can be put into a simple template if you are consistently looking at the same kind of company. If you are at a more generalist fund then this will be less common, but still relevant depending on how many asset classes are under your purview. Further, much of the modeling you do is updating existing models based on new information (earnings announcements, relevant news, legal decisions, changes in the market, etc.). You may also need to model the fund's portfolio itself in order to provide performance updates and inform marketing and LP materials.

4) Creative Research: On top of reading and diligence calls, which are to be expected for pretty much every opportunity you are looking at, other investments may involve doing more creative research. This can include the following: 1) diligence trips to the company you are evaluating to "kick the tires", 2) meeting with management, 3) calling every Walgreens in the tri-state area to analyze their inventory on a particular SKU etc. There are many ways that you can go about obtaining material public information. We could try to list them all here or you could read Bill Ackman's HLF presentation to get an idea of what we mean. *(See page 270 for a particularly interesting example)*

5) Conferences: Most of the bulge brackets will hold annual or semi-annual conferences for just about every industry and asset class they handle. These are often in NYC, but can also be in places where the weather is more "agreeable" such as Arizona, Florida, Nevada, California and others.

The conferences are held by banks in order to strengthen their relationships with their clients. They organize information sessions and company presentations where you can obtain information on the Company directly from management. The conferences also serve as an opportunity to network with other investors and pick their brains for ideas (similar to the calls mentioned above).

To reiterate, how frequently (if at all) you do any of the above will depend entirely on your particular fund, with some obviously being more "typical" than others. However, this should provide a basic overview of what its like working at a hedge fund…

Well what are you waiting for? Start blasting those emails we know you don't want to stay in investment banking for long!

****

A Day in the Life of a Loser

A Day in the Life of a Loser

7:45am: Alarm clock does off. (Snooze)

7:50am: Alarm clock goes off again (Snooze)

7:55am: Alarm clock goes off, hits snooze button and finally gets out of bed to change. 8:00 hits and the alarm clock goes off again because he keeps his clock next to his bed so he doesn't have to stand up to get to the desk.

8:20am: Just got out of the shower and is now running **10 minutes late** see above.

8:30am: Gets into his car. "Oh my god I can't believe this traffic I don't think i'll be able to make it to Starbucks!"

8:55am: "Well I've got about 5 minutes i know the Barrista I have been trying to hit on for the last five years knows my drink I should be okay." Gets his drink, pays $4 and heads to work.

9:03am: Arrives at work. The three minute delta is no big deal because no one cares about his work anyway.

9:05am – 10:15am: Reads a bunch of important news articles on "Yahoo" and "Shine" about dating and lifting weights. Ignores the fact that the articles are written by overweight 40 year old women.

10:15am: "All corporations are gross so I better check my paystub to make sure I am still getting paid!". Logs into overdrawn checking account. "Yep still making $10 an hour"

11:00am: It's getting close to lunch. "Hmm that girl over 7 cubes is really cute, I haven't talked to her in person for the last two years but its probably makes sense to ask her out to lunch out of the blue". Messages girl 7 cubes over through internal message system. Her response "Hey sorry I don't think so i have other plans".

11:30am: It's lunch break time. No time to pack lunch because he was **wayyyyy** too busy this morning. Goes out to Chipotle to buy lunch where for some reason CNN is playing in the background. It's about Wall Street. "Oh my god those dirty corporate bankers are taking all of my money with no work ethic whatsoever, I could 'EASILY' do their job any day of the week."

11:45am: Sits down to eat his Chicken burrito (may as well save 50 cents right?), he eats lunch with his *friends*. Over the next 45 minutes they refresh their Facebook, Twitter, Instagram and Pinterest accounts 75 times checking out that "cute girl" from when they were back in high school. Living in the past.

12:30pm: Arrives back at his desk. Goes onto Doostang, Indeed and other job search boards realizing he has similar qualifications for multiple jobs that pay $10K higher on an annual basis. Does not send in resume. Begins doing work for the first time in the day.

1:30pm: Gets email from admins in the office. "Company Happy Hour Today!". Jumps for joy! "Oh man i can't wait I love happy hour we get drinks for like $2 and maybe that cute girl i just messaged will tell me she likes me!!!!!! Continues to do some minimal work.

3:00pm: Does minimal work. Reads a few fitness articles on "cross fit". Doesn't realize all of the people on cross fit look awful and the program is tailored for women. Also realizes he signed up for the gym but has not gone for the last three years and likely looks like exhibit 3.

5:00pm: Well at least he got some work done between 12:30 and 5:00pm. It's time for happy hour! I can't go to the gym today because maybe that girl likes me!

5:30pm: Arrives at happy hour. Cute girl does not show up. The ball game is on, March Madness. "Oh my god man i can't believe people think XYZ team is going to win, that's not possible, Number 33 averages 26.72364617176525 points per game and 6.28363345 rebounds. No way the other team wins man, I bet you, I bet you whatever you want man." His boss turns to him and says okay I'll bet you $10. "Nah man I don't bet money on stuff man, lets just make it a friendly bet." Boss looks at him, squints "sure".

8:00pm: **His** team lost. Of course he has never played a sport before in his life. Now the conversation is turning *philosophical* "Man yeah, i can't believe those sports players get paid so much its dumb they shouldn't be paid more than doctors they should be paid much less". His friend slightly nods his head, his boss already left the building. A man in a suit is standing behind them and asks "If he's overpaid why do people pay so much to watch the games?". Neither of them have an answer.

9:00pm: On his way home he remembers that there were over 20 attractive women at the bar who he did not speak to. Man that guy in the suit was a real jerk. He was probably some uptight Wall Street guy I'm going to **fight him** the next time something like that happens.

10:00pm: Finally goes to bed with an extensive hangover and a slightly lighter bank account. "Man I wish i had time… I wish I had time".

A Detailed Look at Financial Institutions Group (FIG)

A Detailed Look at Financial Institutions Group (FIG)

We are testing a detailed look at sectors within Wall Street. Today the focus is on FIG. If you have no interest in the working of FIG or investing in FIG, we suggest you run for the door. However… If this is of interest to you, take a seat, read and take notes! You'll be able to get an edge on your competition by knowing all of the key metrics to look for and going in with a handful of skills on day one… Just remember you're going to do investment banking for period of time as you transition to creating your own online business.

Introduction

To build on what we learned from modeling Apple, we're doing a test run on detailed articles by sector to introduce and explain certain industry silos in more detail. First up is the Financial Institutions Group, or "FIG", which includes: Banks, Insurance Companies, Asset Managers, Diversified Financial Companies (Credit card companies and the like), Intermediaries / Securities Firms / Other Financial Companies (Custodial Banks, Exchanges, Brokers, Financial Technology, etc.)

This post will lay out a framework for understand FIG companies, starting with banks. It will do so by exploring the business model and typical operating and valuation metrics important for each major FIG subsector, in particular how they are different from other companies. Like Energy and Real Estate, FIG is a slightly different beast from your typical EBITDA / cash flow driven companies ("Widget" companies) because the balance sheet drives the income statement, and not the other way around. The assets of FIG companies (loans, investments, cash and securities, etc.) are what generates revenue for them, in the form of interest and investment income.

Basically, FIG companies "borrow money" (i.e., source capital) cheaply and then "lend money" (invest that capital) expensively. Much (though not all) of their income is generated by the spread between those two rates of return. Additionally, because of the sources of some of their capital (largely individual consumers), there is strict regulation surrounding what kind of assets FIG companies can and cannot hold on their balance sheet, and in what quantities.

There are a multitude of additional complexities involved with FIG companies which will not be covered here, but this should help to provide a basic understanding of how FIG companies operate and function and how people think about them. Lets go ahead and start with banks

Banks

How Do Banks Make Money? *Net Interest Income (50-75% of revenues).* The interest they receive on their interest-earning assets (loans), less the cost of: The interest they pay on their interest-bearing liabilities (deposits) The cost of bad loans (mortgages they foreclose on)… Banks hold deposits, for which they pay little interest, and use them to make loans, for which they earn as much interest as they can. They also have to eat the cost of loans that default, how much of which is dependent on the quality of said loans and what collateral (if any) is associated with them.

Besides just deposits, banks can also fund their lending activities using wholesale funding from other financial institutions, the government (i.e., the Fed), and the capital markets. Together, these comprise a bank's **interest-bearing liabilities**. Equity contributions are also a source of capital, though it is usually fairly limited because of how banks deliver value to shareholders and the capital requirements associated with how they maintain their balance sheets.

The investments banks "**interest-earning assets**" are primarily composed of loans (mortgages, commercial financings, construction loans, etc.), but can also include investments in other sources (securities, proprietary PE-type investments, stocks and bonds, etc.) depending on a bank's capital position.

The reason that interest expense is included "above" the top line (in net revenues) is because interest expense for a bank is analogous to COGS for a widget company. The uses of the liabilities drive bank interest expenses are fungible between being operational and being a traditional source of financing since again, their assets are their capital.

Non-interest income (25-50% of revenues): Mostly composed of fees, but can include other fun stuff as well. Banks charge fees for pretty much anything they can get away with – likely the best know examples are investment banks charging advisory fees and commercial banks charging lending and deposit fees (think ATM fees and the like).

Besides fees, other common sources of non-interest income include: **Principal Transactions**– for certain sources of their capital, banks are not limited solely to fixed income able to make principal investments which are slightly more risky – merchant banking, for example.; **Asset Management** – Detailed further below, but also a fee – on the assets being managed; **Credit cards** – Besides the loans associated with the card, banks also use them to generate interchange fees (essentially a transaction fee – the reason so many delis in the city don't take AmEx is because their interchange fees are much higher than other issuers); Some investment income not included in interest income (typically from principal transactions); Anything else that doesn't involve interest income.

Income Statement and Profitability Ratios

Income Statement: Now, taking the above and walking through the rest of the Income Statement, we have the following (explanations below):

Interest Income

Less: Interest Expense

= Net Interest Income

Add: Non-interest Income

= Total Revenues

Less: **Non-interest Expense**
= Pre-Tax, Pre-Provision Earnings

Less: **Credit Loss Provisions**

= EBT

Less: Taxes

= Net Income

Definitions:

Non-interest Expense – Essentially SG&A. Includes compensation expense, technology and equipment, marketing and sales, etc.

Credit Loss Provisions – Banks have to assume that some portion of their loans are going to default. In anticipation of that, they set aside a certain amount of capital each period to match what they estimate the losses will be for the loans they originated.

This is charged against the I/S in the period during which the loan is originated – i.e., not when the loans actually default (if they default).

The capital they set aside and charge against their revenues goes to a reserve fund (a contra asset) on the B/S called **Loan Loss Reserves** – discussed below.

Key Profitability Ratios:

Net Interest Margin (NIM) – Net Interest Income / Average Earning Assets

– Higher is better

– How effectively bank is using assets to generate income

Efficiency Ratio = Non-Interest Expense / Net Revenues

– Lower is better

– Measure of operational efficiency

Return on Average Assets (ROAA) = Net Income / Avg. Assets

– Higher is better

– How effectively bank is using assets to generate income

Return on Average Common Equity (ROAE) = Net Income / Avg. Common Equity

– Higher is better

– Ability to generate returns to investors in its common stock

Loan Loss Reserves and Asset Quality

Loan Loss Reserves

As mentioned above, banks set aside a provision each period based on the loans they originated in that period. This goes to a contra asset called Loan Loss Reserves, which is basically an “emergency fund” for when loans go bad and the bank has to cover the cost of default.

Where it gets tricky is that a loan can be behind on payments and not be considered a default. The process of disposing of bad loans therefore involves the following steps: 1) Loan is made; 2) Borrower stops repaying loan; 3) Up until 90 days past due, the bank accrues the interest on the loan as if it will eventually be paid back.; 4) After 90 days past due, the loan goes to nonaccrual (they stop assuming they will get paid back any interest) and is considered a **Non-performing Loan (NPL); 5)** The NPL is appraised (based on the value of the collateral and any money the borrower can repay) and the expected loss from the loan is charged against the reserves (the **Net Charge-offs, or NCO**); 6) After the loan is foreclosed, any collateral is sold, and any recaptured principal is added back to the reserve as **Recoveries**. In the case of mortgages or real-estate loans, the collateral is called **Other Real Estate Owned (OREO) –** basically all the houses the bank has repossessed that they haven’t been able to sell yet.

Each period, the reserve calculation is as follows:

Loan Loss Reserve, BOP

– NCO

+ Recoveries

+ Credit Loss Provision Expense (from I/S)

= Loan Loss Reserves, EOP

Asset Quality Ratios

A banks asset quality is determined by what portion of their earning assets are not performing – i.e., not paying up. A bank with a lower portion of NPLs and **Non-performing Assets (NPAs)** (any earning asset that isn’t earning, whether due to default or non-payment) is going to perform better, so banks want to minimize these kinds of loans while also making sure they have enough reserves to cover the loss potentially associate with them.

NPLs / Loans and NPAs / (Loans + OREO)

– Lower is better

– Reflect the portion of assets not earning money

NCOs / Avg. Loans

– Lower is Better

– Amount of loan losses caused by customers default and lack of collateral

Loan Loss Reserves / Total Loans

– Higher is better, but too high means a bank could have money used for reserves that could be put to better use

– Indicates adequacy of size of reserves

Capital Adequacy and Regulation: To reiterate, a bank wants as many interest earning assets as possible… and it wants to earn as much interest on those assets as possible…. The problem is that, generally, loans with higher interest rates are also loans with higher risk profiles. Since the deposit base utilized by banks is one of the foundations of the financial system, there are all sorts of capital requirements regarding what a bank can and cannot use different types of capital for. Taken to an extreme, if a bank took everyone's deposits and lost them all betting on red, then a lot of people would be SOL (the FDIC only covers up to $250k). Regulators don't want that to happen, so they put in rules saying "You can't bet people's money on red, because that's too risky, but you can invest this money in treasuries or something we think is safe".

To determine if a bank has enough capital to handle a "worst-case scenario" (think stress tests), banks use a variety of capital ratios to determine how solvent they really are and how big the risk that they lose everybody's money is. The numerator of these ratios is some definition of what a bank's "safe" capital (sources of funding) is, which is divided into tiers of decreasing safety thusly:

Tier I (Tangible Common Equity (TCE) – Equity less goodwill and intangibles; Preferred Stock; Trust Preferred Securities (TRUPS) – A hybrid security primarily used by banks)

Tier II (Loan Loss Reserves; Subordinated Debt)

While the denominator is some representation of a banks total assets (i.e., loans and other investments):

Tangible Assets (TA) – Total assets less goodwill and intangibles (i.e., assets that could be reasonably recovered in bankruptcy)

Average Tangible Assets (ATA) – Average TA over a given period

Risk-Weighted Assets (RWA) – Total assets, where each asset class is weighted based on it's level of risk. The risk-weightings for cash, for example, is 0%, since cash is "risk free". Most government securities are weighted at 20% ,since they are "kind of safe", while commercial loans and ABS / MBS are weighted 100% of their value, and can be rated higher than 100% if they are below investment grade (BB).

Capital Adequacy Ratios

Tangible Capital – Simple, conservative approach to evaluating bank solvency

Tangible Equity Ratio = (a+b) / TA

Tangible Common Equity Ratio (TCE) = a / TA, essentially tells you the amount of losses a bank can take before shareholders equity goes to zero

Regulatory Ratios – Used by bank regulators to capture the difference in risk between asset classes

Tier 1 Common Capital = a / RWA

Tier 1 Risk-Based Capital = (a + b + c) / RWA

Tier 1 Leverage = (a + b + c) / ATA

Total Risk-Based Capital = (a + b + c + d + e) / RWA

Valuation: As opposed to industrial companies and due to the nature of their business, banks are valued based on cash flows. to shareholders only (in contrast to cash flows to shareholders and debt holders), as debt funding is directly correlated to the bank's assets and its profitability. Banks tend to trade primarily based on Tangible Book Value (book value that would be available to shareholders in bankruptcy) and Earnings (P/TBV and P/E). **1) P/E** – Because of the capital adequacy concerns mentioned above, banks are only able to dividend a limited amount of their earnings each period to equity holders, since they may have to retain some portion of their earnings in order to improve and/or maintain their capital position. Higher multiples are driven by higher quality (i.e., consistent) earnings; **2) P/TBV** – A representation of how many income producing assets a bank has. Higher multiples are driven by higher ROTCE ratios. **3) DCFs –** While DCFs are rarely used to value banks, they can be applied to an estimation of future dividends (assuming a constant capital ratio) though this method is heavily dependent on cash flow and growth assumptions.

Insurance Companies

How Insurers Make Money? This can be broken down into two ways again:

Underwriting Income
The premium payments they receive, less:
The claims payouts they make
The operational costs associated with generating the policies that pay those claims

Investment Income
Money they make by investing the cash they receive from premiums before they have to pay out claims

Most of their income typically comes from investments. Insurers can and do make money from their insurance operations, but they usually price their products competitively so that they receive as many premiums as possible. Sometimes this means that they break even (or even come out negative) on a given insurance product because if they price it any more expensively then a competitor will capture that premium.

Premiums are analogous to a bank's deposit base – they represent cash with almost no cost-of-capital (or even negative cost of capital if an insurer is able to turn an operating profit) that insurers can invest for themselves (hence why Warren Buffet loves insurance so much). They want the investment income they can make on the cash they have lying around while it's waiting to be paid out for policies.

Life vs. P&C

The insurance industry is broadly divided into two categories: Life Insurance, and Property & Casualty (P&C) Insurance (i.e. car / house / medical insurance – anything that isn't life insurance).

The reason for the distinction is because of the nature of the payout periods for life insurance vs. other kinds – life policies, by definition, last longer than any other type of insurance a consumer may purchase. Therefore, once they sell a policy, they know with reasonable certainty that they have the capital they get from those premiums for a fairly long amount of time, allowing them to make conservative, long-term investments that will generate more investment income than ones with lower time horizons.

P&C insurers, on the other hand, have much shorter policies and payout periods. As such, in addition to investment income, they tend to rely slightly more on the income they can generate from their actual underwriting operations because they're churning through policies.

Accounting Quirks

The total value of a given insurance policy is not static. The revenue and expenses associated with a policy (both historical and projected) can change over multiple periods. As such, there are a lot of accounting quirks associated with how insurers report their financials, mostly to do with how to reconcile the timing mismatch and estimates informing their underwriting profit. There are a boatload of variables that can affect how a policy is valued.

Example to demonstrate:

Let's say you have a 3 year renters insurance policy, which you paid entirely up front. The insurer now has your cash in its hand, which it can use to invest, but it doesn't actually "earn" the money for years 2 and 3 until years 2 and 3 happen, so what's the fairest way to recognize it? And what about the associated investment income?

Then, let's say halfway through year 2, you get robbed and they have to pay out the full value of your claim. The recognized claim expenses associated with the policy to that point had actually been nil, but the reported expenses had been estimated (based on actuarial statistics). Now the insurer has to take this actual expense amount (the claim payout) and spread it out over the 3 years, including retroactively updating the recognized year 1 expense amount.

Then on top of that it turns out the salesman who sold the claim had a clause in his contract that he would lose his unvested bonus if a certain amount of his policy sales resulted in claims, so now the commission expense associated with the policy also has to retroactively change for year 1 and the estimate for commission expense may have to be lowered for year 3.

You also have the investment income / losses, which include both realized and unrealized interest income, dividends, capital gains and losses, etc, and all the fun accounting rules that get associated with them.

Add to all this the fact that most insurers also take out their own insurance policies (called re-insurance) in order to hedge / manage their overall risk, so if your policy was reinsured it was likely ceded, or "given" to another insurer, who is actually the one now responsible for paying you (though indirectly).

Oh, and don't forget the taxes associated with all of the above.

As a result of these complexities, a lot of understanding insurers comes down to understanding the accounting rules associated with them.

To oversimplify, there are basically three kinds of accounting insurers use:

– GAAP / IFRS – Traditional accounting required by the SEC. This focuses on trying to what an insurer "earned" in a given period so that shareholders can see that the business is healthy

– Statutory – Accounting required by state insurance regulators (insurers are primarily regulated at the state level). This focuses on the cash insurers actually receive from premiums and pay out as claims so that regulators know that an insurer will have enough cash to cover their required payouts in the future. It also informs the rules surrounding when insurers are allowed to issue dividends to their shareholders (similar to bank capital regulation)Associated with Statutory accounting is what is called **Statutory Capital & Surplus (C&S)** – similar to shareholder's equity, but with some adjustments. C&S is used by regulators to determine the maximum amount of dividends that an insurer can pay out to shareholders. The differences are basically that the income or earnings added to C&S each period are closer to actual cash earnings than in GAAP. Examples of specific differences include: Bonds are generally recorded at amortized cost (vs. as securities); Acquisition costs (cost of new and renewal policies) are charged as incurred and not "as earned"; Realized capital gains/losses resulting from changes in interest rates are deferred and amortized over the life of the associated security

– Embedded Value (EV) – While not required disclosure, EV accounting is used by life insurers as a way of determining the intrinsic value of all the policies on their books. If XYZ insurance company suddenly decides to stop doing business , then their existing policies they have would still generate premium revenue and have claims to pay for many years into the future. EV tries to estimate what the implied value of these policies would be.

Income Statement and Profitability Ratios

Basic Income Statement

Direct Premiums

Add: Assumed Premiums

= Gross Premiums

Less: Ceded Premiums

= Net Premiums

Insurers will report both Gross and Earned premiums for each of the above, the difference being that Gross Premiums represent the premiums expected to be received over the full life of a given policy, while Earned Premiums represent, predictably, the value of the premiums from a policy that an insurer actually earned over a given period based on the contracted length of the policy.

Net Premiums Earned

Add: **Interest & Investment Income**

= Total Revenue

Less: **Losses and Loss Adjustment Expenses (LAE) Incurred**

Less: **Commissions**

Less: **Underwriting Expenses**

Less: Other SG&A Expenses

= Operating Income

Less: Interest

= Pretax Income

Less: Taxes

= Net Income

For statutory accounting purposes, net income is slightly different:

Pretax Income
Less: **Increases (Decreases) in Deferred Acquisition Costs (DAC)**

= Statutory Pretax Income

Less: Taxes

= Statutory Net Income

Definitions

Direct Premiums = Policies the insurance company wrote themselves

Assumed Premiums = Blocks of policies the insurer took from another insurance company (in order to provide reinsurance)

Ceded Premiums = Blocks of policies the insurer gave to another insurance company (in order to get them re-insured)

Interest & Investment Income – Similar to interest income for banks, though there is no associated interest expense in the top line

Losses and LAE = The claims the insurer actually had to pay out in a period, along with any associated adjustments to previously paid out claims

Commissions = Commissions paid for the policies generated in the period

Underwriting Expenses = Expenses associated with actually implementing the policies they have – office

Deferred Acquisition Costs (DAC) = DAC is an asset on the balance sheet that represents the expenses associated with acquiring (generating or purchasing) new policies that have been paid but not yet been incurred (since per GAAP rules they must be spread over the life of the policy). Change in DAC represents a non-cash item on the income statement, so Statutory Net Income adjusts for it in order to get a picture of what actual cash earnings are

Unearned Premium Reserve (B/S Item): Similar to a bank's loan loss reserves (though not a contra asset), insurers create a reserve for premiums insurers they up front on multi-year policies. They create a liability called an that increases when they receive upfront premium payments and decreases when over time as they actually earn the said premiums.

Ratios

Retention Ratio = NWP / GWP

– Tells how much reinsurance an insurer relies on to balance their risks

Weighted Investment Returns = Interest and Investment Income / Total Value of All Cash and Investments

– Higher is better

– Tells if an insurer is putting its money to good use

Loss & LAE Ratio = Losses & LAE Expense / NEP

– Lower is better

– Ranges between 50 and 75% for P&C

Expense Ratio = Total Expenses (Commissions + Underwriting Expense) / NEP

– Lower is better

– Typically around 25%

Combined Ratio = Loss Ratio + Expense Ratio

– Lower is better

– Typically 90-110%. Under 90 is unusual

– Underwriting margin is 1 – Combined Ratio

Reserves Ratio = (GWP or NWP) / Reserves

– Lower is safer

– Typically around 150%

Solvency Ratio = C&S / NWP

– Higher is safer

– Usually around 70%, minimum of 10-20% depending on regulator

Risk Based Capital (RBC) Ratio = Total Adjusted Capital (TAC) / RBC

– NAIC regulatory ratio, similar to bank solvency ratios

– TAC = Statutory surplus

– RBC is calculated in a similar way to RWA for banks, with different weightings given for their various investments and other assets

– Above 200% is good, anything below 150% is bad. Under 70% requires state regulators to take control unless is corrected in 90 days.

Valuation: Valuing insurers is slightly different for Life vs. P&C insurers. Both generate investing income, so valuation based on balance sheet (including ROE and ROA) is important in the same way it is for banks. Because P&C insurers generate more of their income from underwriting, their valuation is also informed more by their operational performance. **Ratios Both:** (P/BV or P/ TBV – Higher for higher ROE; P / GWP or P/ NWP – Higher for higher premiums growth); **For P&C:** (P/E – Higher for higher quality earnings); **For Life:** (P/Embedded Value – Higher for higher ROEV)… DCFs are also possible for insurers in a similar way to banks – they can be valued based on their expected future dividends assuming constant capital requirements.

Other FIG Sub Sectors (Yes we likely missed a few here)

Diversified or Specialty Finance: These include FinCos (payday lenders, etc.), "Non-Bank" Credit Card Companies (Visa / AmEx / MC), Mortgage REITS, Business Development Companies (BDCs), and agency (GSEs). The main source of revenue for both banks and specialty finance companies is net interest spread earned on loans and leases, with the funding model as the primary differentiator. Whereas banks primarily extend loans by expanding credit through fractional reserve banking, i.e. "deposit funding", specialty finance companies must secure its loanable funds in the capital markets

Deposit funding is a unique legal privilege granted to banks, but comes with significant regulatory strings attached limiting the potential scope of banks' lending activities Hence, there is a need for specialty finance companies to deliver credit products that do not fit well within a bank regulatory construct Specialty finance companies also compete directly with banks in certain areas. Diversified financials are valued in the same way that banks are.

Asset Management: Asset managers include both traditional long-only firms, like Franklin or Fidelity, and alternative asset managers like KKR or Fortress. Working on Wall Street, you should be familiar with the asset management business model. They invest (and hopefully make) money for people (or endowments, insurance companies, etc.) in return for a fee. Broadly, there are two kinds of fees asset managers can take: **1) Management Fees** – This is a % of the total AUM, and is paid regardless of performance; **2) Performance Fees** – this is a % of the returns generated by the asset manager, with fees usually assessed on any performance above a given benchmark or high water mark

Because of this, one of the most important metrics for asset managers is their AUM, and how quickly it is growing (or shrinking). AUM can grow (shrink) in 3 ways: 1) Investment gains or losses; 2) Organic Flows = Money given to or taken out of an asset manager by their clients; 3) Acquired Flows = AUM acquired from another asset manager

The net organic flows of an asset manager or highly predictive of it's market value, with higher flows obviously being better.

Besides AUM and flows, however, asset managers are valued and treated similarly to other EBITDA companies, so we won't go into more depth here.

Securities: Finally, there is "all the rest" – other financial firms that don't fall into the categories outlined above. These are primarily in the securities industry, and are valued and analyzed in the same way as Widget companies. Examples of securities companies include: Brokers (online and retail); Boutique investment banks or advisory firms; Exchanges; Execution Services Firms; Financial Technology / Software Companies; Market Data Providers; Financial Processors

****

A Detailed Look at Technology Media and Telecom (TMT) – Part 1 of 2

A Detailed Look at Technology Media and Telecom (TMT) – Part 1 of 2

Given the positive response to our post on FIG, we are starting our TMT overview. Part 1 will cover Semiconductors, Telecom, Hardware and Internet. The second piece will cover Networking, Software and other technology.

Introduction

Technology Media and Telecom (TMT) is an interesting space particularly for those that enjoy seeing valuations that can range from "WTF was that" (internet) to a classic DCF model (older technology companies). With that in mind, it is best to break the sector into smaller sub-segments to understand how and why certain companies obtain higher multiples than others…. While there are hundreds of ways to break down the sector, we'll go with the following subsectors: 1) Semiconductors, 2) Telecom, 3) Hardware, 4) Internet, 5) Networking, 6) Software and 7) other components.

Before we dive into each subsector, we should note that technology focuses less on various equations (which FIG relies on heavily as you can see from our previous post) so don't be surprised if you don't see a lot of calculations. With that said… what are the key points to understanding tech?

1) Total Addressable Market (TAM): For each company you need to understand how big the opportunity is. It can be as simple as knowing how many Laptops and Desktops are shipped world wide to as large as "how many internet users are there on the planet". Using this same example, the PC market (desktops and notebooks only) could be a ~$200 billion revenue opportunity with total PC shipments of roughly 320 million… In comparison? If you look for the Internet, you can get to a TAM of $14 trillion… We don't have to explain why everyone fights about a firm's Total Addressable Market, it matters… a LOT. Now you understand why bankers fight tooth and nail over positioning a company within a specific sector/comparable group in Technology.

2) Growth rates: In lock step with the above point, you also want to know if the TAMis growing or shrinking. Piggy backing on the same example above you would quickly understand that it would be better to have exposure to Internet for growth because users continue to increase while the number of desktops and notebooks are flat to down as people move to their mobile phones and tablets. If the PC market suddenly sees innovation and the TAM is expected to grow to $300+ billion, you can bet anything that multiples will expand for companies with PC exposure (HPQ as an example). Similarly, if the number of internet users suddenly doubles for a specific company, say Facebook doubles its user base, get ready to see the stock move up as well.

3) A Real Technology Lead: This is where the engineers and techies step in.Lets say everything checks out so far, you have a product in a sector that is growing and has a large TAM… Now the rubber meets the road. **Is this product differentiated?** You should pound that question into your head after you've done a great job looking at parts 1 and 2. If you have a product that can be easily copied by a larger competitor because you have no Intellectual Property well… you are screwed (half-joke tone).

Side Note for Tech Nerds: Differentiation is vague. We're using Intellectual Property as the example since it is the easiest to relate to but it can mean a lot of things. It can also mean they have an extremely large install base and were a great first mover (think WhatsApp /SnapChat/ Uber).

We're not going to use this post as a time to debate the valuation of any of these since they do have specific technologies associated with them, but to give you an idea WhatsApp was able to process 27 BILLION messages in a single day with JUST 55 employees. You'd have to be a tech nerd to understand how crazy this is because the stick rate on low-end international phones has to be sky high.

Tangent – remember that differentiation/technology lead matters a lot and just because you see a high price tag doesn't mean it was always a bad deal (remember Google acquiring YouTube?). In addition, we strongly doubt anyone reading this is smarter than Mark Zuck in terms of understanding tech, that **includes** the authors of this post, so if you see an expensive acquisition try to understand the technology before jumping to any conclusions.

Valuation: We'll go into specific valuations for each subsector but the main ones you should know if someone asked you inside an elevator are as follows: 1) EV/Sales for companies with high growth and no profits yet – think companies you would take public, 2) P/E – main benchmark valuation methodology for medium to larger more establish companies, 3) FCF multiples, for large cap tech, think IBM/MSFT/AAPL/ORCL etc of the world 4) EV/EBITDA usually for internet based companies once they are relatively well established and 5) DCF: for the large cap high cash flow names.

With the introduction out of the way go ahead and jump to your sector of interest and take a glace.

Semiconductors (INTC, AMD, NVDA, ARMH, BRCM, TXN)

Semiconductors can be explained in many different ways, however, to boil it all down semis are the integrated circuits which act as the critical electronic components needed in system designs. Semis can serve in various functions from microprocessors, to memory, to analog, to logic to discretes and sensors. In general, semis account for ~30-35% of the BOM in electronic systems (think servers, smartphones, computers) etc. The total market was just over $300bil in 2013 with growth generally pegged to WW GDP growth.

What Matters in the space? i) Inventory Cycles – the space has traditionally been traded off of inventory cycles, mimicking ~6:2 ratio of builds to subsequent correction. Investors want to own through the early build quarters (6) and sell through the late build-early correcting quarters (2). ii) Return of FCF: The growth phase is transitioning into a more mature era, and slower unit demand is leading to excess capacity and broader industry underutilization, which we expect to persist through 2016. Given this backdrop, lower capital investments are needed as today's capacity is sufficient to meet demand. Consequently, we are likely to see greater FCF generation in the industry with companies endorsing shareholder-friendly capital-allocation strategies.

iii) Newer technologies: Rising technical standards (i.e. LTE) are demanding greater complexities out of solutions where system design is increasingly challenged. Semi companies that are solving these problems are poised to benefit from both a rising unit and ASP perspective – a trend (upwards unit and ASP slope) that is most appealing to semi investors looking for revenue growth.

Main Industries to understand from a high level.

Computing: In 2014 the market is estimated at $100 billion, -9% Y/Y accounting for 32% of total semiconductor revenues. Impacted companies: Intel, Marvell, Micron, SanDisk, Texas Instruments, NVIDIA and Broadcom.

Consumer: In 2014 market will be ~$55 billion, +5% Y/Y, accounting for 17.5% of total semiconductor revenues. In general, the Consumer market benefited from rising content trends, including more wireless connectivity ("the internet of things", TVs, household appliances), higher penetration of general consumer electronics in emerging markets, mix-shift to faster internal processing (embedded SoCs) and rising touch-enabled devices across multiple platforms. Impacted companies: Broadcom, Marvell, Cypress, Freescale, Texas Instruments, Analog Devices.

*Semiconductor Wireless:*In 2014 the market is ~$75 billion, +9% Y/Y accounting for 25% of total semiconductor revenues. While the growth in handsets and tablets are slowing at the high end, the market is seeing considerable uptake in the mid-range and lower end, which have become increasingly feature-rich.

*Semiconductor Wired:*In 2014 the market will be ~$15 billion, +2% Y/Y accounting for 4.5% of total semiconductor revenues. Within the data center, 100GE adoption is beginning to materially ramp as Ethernet content also benefitted from growth trends. Other components that are slated to benefit are network and multi-core processors.

*Auto:*In 2014 the market is $25+ billion, +31% Y/Y, accounting for 9.0% of total semiconductor revenues. The Automotive market stands to benefit from higher units (industry expectations +4% Y/Y) as well as semiconductor content. In 2014, total unit growth is expected to be ~4% growing to 85 million driven by increasing wealth in emerging markets. The content increases are largely due to 'infotainment' and safety systems which are benefitting analog ICs and MCUs.

Top Themes:

Theme #1: Enterprise Data: NAND Use to Broaden into Higher Value Applications

Theme #2: The Rise of Sector FCF

Theme #3: RF Integration

Valuation: Traditionally, the semiconductor industry has valued the space off price-to-earnings (P/E) multiples and EV/EBITDA multiples, as operating profits were always paramount in evaluating the effectiveness of on-going operations. This valuation method was prudent given the growth nature of the industry. However, the growth phase is transitioning into a more mature era, and slower unit demand (particularly in trailing edge) is leading to excess capacity and broader industry underutilization, which should persist through 2016. Given this backdrop, lower capital investments are needed as today's capacity is sufficient to meet demand. Consequently, we are likely to see greater FCF generation in the industry with companies endorsing shareholder-friendly capital-allocation strategies. Through this dynamic we should see five main characteristics unfold: i) lower capex as a % of sales; ii) rising industry FCF/share; iii) semiconductor leadership in FCF growth within the S&P500 sectors; iv) increasing emphasis to drive FCF vs. EPS; and v) rising P/FCF multiples across the industry, where the sector is trading at about six turns below the S&P500.

Financial Statement Dynamics: For semiconductor companies, the three most important criteria to follow are those impacting revenues, gross margins and CapEx cycles.

Revenues: As previously stated, industry revenue is generally pegged with GDP, and perhaps up to 5% on a forward basis. Revenues are impacted by ASPs (on average ~$0.45/component), units shipped (which may include distribution sell-through), mix-shift impacts (which affects ASPs) and product cycles. Mix shifts could be impacted by a move to higher technology standards (think 3G to LTE), increasing integration (think an integrated baseband + applications processors in mobile) or increasing software functionality (think GPU processing into big-data and cloud applications). Regarding product cycles, it is important to take into account seasonality which could lead to greater than expected volatility in the revenue line (think AAPL iPhone and Samsung Galaxy s4 ramps).

Gross Margins: Industry gross margins are ~45-50% range. In addition to revenues (see above), the moving parts of the gross margins are wafer costs, depreciation costs (GAAP basis), and cost efficiencies (think integration). In addition, foreign exchange may play a role if costs are overseas.

CapEx: Semi companies are either operate their own fabs (think Intel, Texas Instruments, and Samsung) or fab-less (majority of industry). A fab is where a semi company will design and fabricate its own integrated circuits. The cost of new fabs range from $2-$10bil (where costs are recognized using SL depreciation, usually over 10years). Thus CapEx cycles are important in assessing FCFs. The major foundries in the industry are TSMC, Global Foundries, UMC and IBM.

Telecom (T, VZ, AMX)

This space is on the borderline of technology as well but we'll include a short summary of the space for high level educational purposes. Everyone on these boards is familiar with the major telecom companies who make up the space IE: AT&T, Sprint, America Movil etc. The reason we consider it on the "border" is when most people think of tech they think of IBM/AAPL/MSFT etc, not major CAPEX intensive companies like T/VZ. We did not want to bucket this space under networking (CSCO, JNPR etc.) as it would be confusing and incorrect.

Main Items to Understand: The answer here is quite clear. You want to know how many post paid and prepaid adds a company is acquiring. Naturally, post paid adds are more important. What you would like to see is – AT&T for example – adding multiple post paid subscribers (recurring monthly revenue) and to a lesser extent seeing the Company sell a few of the cheaper junk prepaid phones to help with cash flows a tad.

Quick Sub Segment: Keeping it simple here again, there are two main segments to look at Wireless/Wireline. You can pull up a recent filing by T to pull the majority of the information necessary to understand the two sectors. In short wireless is going to be your phone plan (could include tablet plan – if you're talking about gigs of data purchased instead of WiFi only) and wireline is going to be your TV/Internet subscription.

Top Numbers to Know:

*Smartphones:*Roughly 1 billion smartphones in 2013/2014 This is expected to grow in the at ~20%

*Tablets:*Looking at 200M+ units (annual) as tablets replace PCs in the corporate/consumer world ("cannibalize" is the term they use) arguably. Arguably growth in the 20%+ range

Internet Users: About 2.5-3.0 billion

Financial Statement Dynamics: For the first time we're going to lead with a DCF/dividend valuation method and not have it as a joke comment. In general a DCF/dividend model can be used as part of the valuation because we are talking about enormous carriers that will unlikely go bankrupt and have been established for a multitude of years. Assuming user/subscription growth is solid, looking for 1) DCF on FCF, 2) EBITDA multiples, and 3) P/E Mutiples

Hardware

Many of you will be familiar with the hardware names (HPQ, AAPL, IBM etc.). In this space your larger players are essentially selling a hardware product such as an iPhone, Server or PC and layering on software/services to keep you coming back for more and generating recurring revenue (emphasis on operating systems such as iOS/Android etc.). Notice we are already mixing software with hardware causing a bit of confusion… but lets focus on the hardware side of the business and what you should know.

What Matters in the space? As noted, at the top of the post the focus is going to be on growth and a technology lead. In this case you can start with 1) growth which will be related to how many units or "volume" of the product you can sell [simplistically this would be iPhone units for a company like AAPL], 2) TAM expansion [another simplistic example would be how the smartphone market will grow in the future] and 3) hardware focuses a lot on margins, because higher margins will be a proof point that their technology is leading edge.

Before moving on, to expand on the last point, think of it like this. If Company A has 10% operating margins but Company B has 40% operating margins and they sell the exact same product and the exact same unit volume… There must be some sort of technological/operational edge because they are charging a much higher price than Company A. So in short, margins are eyed keenly in the hardware space, hence all the news articles speculating on gross margins at IBM, AAPL's iPhone/iPad and all of the Build Of Materials or "BOM" break downs you see on technology blogs.

Main Industries to understand from a high level, with example companies in brackets

*PCs [HPQ, Lenovo]:*As stated above, you're looking at a ~320M unit shipment industry with revenue of $200B (annual). As a rule of thumb the space is expected to be flat to slightly down as tablets become more and more widely deployed

Servers [IBM/HPQ]: You're looking at ~9-10M units with total revenue in the $50B+ range (annual). This space is also seeing contraction/flat unit expectations as it has matured. A signal? IBM's exit of its x86 business.

*Smartphones [AAPL/BBRY/Samsung]:*Lots of growth here. Depending on how you slice the market (again remember TAM slicing is important) you are looking at 1+ billion units and revenue of $250B+ (annual). More importantly? This is expected to grow in the future with expectations for annual unit growth in the 20%+ range

*Tablets [AAPL/MSFT/Samsung]:*Again growth here. You guys are familiar with the major players, to give the jist $50B+ revs, looking at 200M+ units (annual). As tablets replace PCs in the corporate/consumer world ("cannibalize" is the term they use) arguably Tablets will be the biggest growth item within the "PC space". Notably, we have only included desktops and notebooks in the first bullet as PCs to highlight the difference. Arguably growth in the 20%+ range

*Storage [EMC/ORCL/Hitachi – Private]:*Here is where we get more tech focused and don't want to explain the difference between Network Attached Storage (NAS) and Storage Area Networks (SAN)… Have we confused you yet? Essentially all the stuff you create, all the words on this screen, the nudes you send on SnapChat are all eventually screen "shotted" and saved somewhere. IE – Storage. This is put into a data center and industry analysts try to analyze both 1) how much data is stored in terms of Terabytes and 2) how much revenue will be generated from the purchase of storage items. These numbers are honestly mind boggling, you're looking at ~40+ Zettabytes of storage by 2020 in a ~$25 billion market. Again don't want to get into the technicals because this space is highly confusing for a beginner but improvements to storage "efficiency" ie how much can be stored on a single device offsets a lot of the growth, so call it low to mid single digit long term growth.

Notably, we could include more subsectors here, for example… by splitting the phone market into smart phones and low end cheaper phones without internet access. We could also begin breaking up each segment, such as business only PC sales (ie: how you're reading this post) versus consumer PC sales (ie: how you watch stuff that is blocked on your computer at work) to show growth rates in an enterprise versus the regular consumer/retail market. For an overview of hardware, the above units should be just fine.

Valuation: For the hardware sector you're looking at the same metrics we outlined for tech in general, however you should be more familiar with 1) P/E metrics both on a GAAP and non-GAAP basis, 2) DCF for Large Cap hardware, 3) Sum of the Parts and 4) EV/Sales for growth hardware.

P/E: This is self explanatory, however the point is earnings growth is eyed a bit more in the space as companies are expected to grow EPS faster than sales (assuming we're talking about larger companies)

DCF: Again focused on large cap tech, as your EPS becomes larger, companies look for quality earnings. As a rule of thumb GAAP net income growth should begin to mirror FCF growth, so a DCF becomes more viable at this point.

Sum of the Parts: As you can see, many of these hardware companies will inevitably have software and services as line items. Sticking with Apple again, their iTunes would be an example of non-hardware related sales which should be valued differently from the sale of the actual hardware item (ie: it can be considered more of a software or services line item). Here you're valuing each piece with a different multiple, add them up and see if it reflects the Company as a whole.

EV/Sales: When you have no profits and you're operating at a loss… You better grow like a weed. This is where EV/sales becomes crucial. The idea is that if your company is growing at 50 or even 100%+ that you have a major technology lead, a major company could then become fearful of you and buy your entire company. This is where you see the "wtf multiples" come into play and sales multiples are much more common for companies that are going public (TWTR as a clear example).

Financial Statement Dynamics: For hardware, as noted above you'll usually see revenue breakouts by segment. This is called a "bottoms up analysis" where you look at each segment and give a detailed look at how it is going to grow in the future. Sticking with AAPL since it is going to be easy for readers to understand, you would model out revenue for iPhones and iPads differently and you would also have specific unit volume estimates for iPhones and iPads as well, since they will unlikely grow at the same growth rate over the next 12-24 months.

In addition, if you think of a Company like IBM, you would have to look at the margin structure by business line as well. Considering that the server sales (hardware) would have lower margins due to cost associated with it, but their software product line would naturally have significantly higher margins. So an alternative way to model would be Revenue and Margins by segment, to build up to a consolidated corporate gross/operating margin line item.

Finally, from a balance sheet and cash flow perspective. Since it takes a lot of cash to manage inventories of all of these products and new machinery needs to be made to test and develop new products, CAPEX (cash flow) and Inventory (balance sheet) changes are eyed.

Internet

This is far and away the easiest sector to understand in terms of what a company does and what the value proposition is. Negatively? It is also quite difficult to value as growth rates can climb or sink at a moments notice. This is the Ferrari of Tech, high risk high reward. If you want to take a look at some disasters look no further than GRPN or ZNGA… A turnaround? FB… Wild success? OPEN, recently acquired.

Since the space is growing at rapid rates lets go ahead and look at the high level trends that people need to be aware of:

More Users, More Money: Roughly 2.5-3.0B internet users on a global basis. This is going to benefit the space as more users means more revenue. This is relatively simple to understand and industry analysts attempt to size the total internet business which leads to numbers in the trillions of dollars ($4T+)

Move to Mobile: Simply put, people are interacting more with their mobile devices than they are with legacy desktops and notebooks. This moves in lock step with the above sector analysis on hardware, the growth is in tablets and smartphones. Therefore? Investors/bankers are looking at what percentage of revenue companies generate from mobile sales versus desktop/notebook. So if you're looking to sell your company, or take it public, you should have a clear explanation of a mobile strategy to help monetize your company. This will help you understand how a company like Facebook sees its valuation move up as mobile is a higher % of revenue and help you understand why Uber receives such a high multiple (all mobile revenue).

E-Commerce: Here is a space that can mix a bit with consumer bankers/investors as well. If your company sells products both online and in retail stores, the different businesses may need slightly different valuations. A good example of a clear internet e-commerce business? Gilt. We all remember Zappos as well (acquired by Amazon). This is incredibly simple, but as sizing preferences are established people will shop more online instead of at retail stores (doesn't take a genius to figure out how that will help margins!).

Social: More and more people are purchasing based on the preferences of their friends. IE: if your two best friends all buy XYZ product you're much more likely to buy it on their recommendation. Enter… Facebook, twitter, etc. This space is also seeing a lot of the issues talked about above come into play (move to mobile, people looking for increases in users etc.). A long post on Facebook is already up so no need to go further, you can check it out here.

High Level Numbers: Since this space is growing rapidly, the numbers are more difficult to pin down when you compare it to the other technology sectors (hardware, semis, components, etc.) but lets go ahead and write down some back of the envelope numbers: **Internet Users:** about 2.5-3.0 billion; **Internet Value:** $4-8 trillion (obscure high level, McKinsey values the internet at ~$8 trillion – 2011 data); **Total Internet Advertising Market:** ~$50B+ annual; **Mobile Payment Market:** $70B+ annual; **Online Gaming Market**: $30B+ annual

Valuation: Here is where the fun begins… Valuing internet stocks. Since a lot of these hyper growth companies are going to be driven by users and many don't turn a profit you can look at 1) Sales growth, 2) User Growth, 3) EBITDA metrics, 4) P/Es and 5) FCF. As you move to larger and larger companies you would go to valuation metrics 3-5 (google as an example) but many of these companies do not have high (or negative) earnings so sales becomes the primary metrics along with user growth. No need to take a deeper look here since we'll be debating for days on the most important metric for each stock.

Financial Statement Dynamics: The long story short here is Growth. You're tracking more metrics that will impact the top line such as MAUs (Monthly Average Users) and use the user growth rate as a leading indicator for future revenue growth.

Conclusion so far? If you want to have a solid career in tech, of the four items listed above you're likely best off in internet as it stands today. Yes there is going to be debate about what sector to join but essentially you want to join a sector where there is a lot of growth. Internet and Software would be the two biggest ones. We'll cover software in part 2.

****

A Detailed Look at Technology Media and Telecom (TMT) – Part 2 of 2

A Detailed Look at Technology Media and Telecom (TMT) – Part 2 of 2

We're wrapping up our discussions on technology from a Wall Street perspective. Part 1 covered internet, hardware, telecom and semiconductors… Part 2 is going to cover 5) networking, 6) software, and 7) Other Tech to touch on all the remaining topics.

Networking

Networking is valued in a similar fashion to hardware. When you think of networking the biggest player that should jump out for your average person is Cisco Systems – the $130B networking giant.

As you can imagine there are a lot of mature product categories in this space and when you hear the word mature it usually means slower growth, less deals and more maintenance work and tuck-in acquisitions.

Positively, there are still some bright spots in networking and this post would not be doing the space justice without mentioning some of the hotter pieces of networking IE: Palo Alto Networks for example. So lets go ahead and break down, in simple bullets, what networking comprises of starting with CSCO since it has the vast majority of the product lines.

Switching – Essentially fixed, modular and storage expected to be flat to slightly up on a y/y basis in the future. Think closer to IT spend

Routing Products – you're all familiar with routers both on corporate environments and in your home for internet/TV connections – similar growth expectations at IT spend flat to slightly up

Service Provider Video –cable access, connected devices, essentially as video becomes the medium of choice this space will grow. Expected to be up mid singles annually

Collaboration – unified communications

Data Center – Growth. As expected by the name, anything related to additional sales into the growing data center space – expect 10-20% here (debatable)

Security – Self explanatory, helping keep enemies out of the network, flattish last year in 2013 but should grow at least mid single digits

Wireless –older legacy products call it IT spend growth

What should you move toward? With this backdrop it is clear the space does have some similarities to hardware in that a lot of the areas are mature but… there are some bright spots. The growth rates alone should point you to the bright spots Security, Data Center and Service Provider Video

Security (PANW): "According to IDC, the worldwide enterprise network security market, defined as IDC's Network Security market and Web Security market, is estimated to be $10.0 billion in 2012 and is projected to grow to $13.4 billion by 2016." – pulled directly from PANW IPO filing.

*Data Center (ANET): "*Nearly all consumer applications today are delivered as cloud services. Enterprise applications are rapidly moving to the cloud as well, since cloud services are easier and more cost effective to deploy, scale and operate than traditional applications. Internet leaders like Amazon, eBay, Facebook, Google, Microsoft and Yahoo! pioneered the development of large-scale cloud data centers in order to meet the growing demands of their users, including business customers. These U.S.-based Internet leaders increased their capital spending from $8.9 billion in 2010 to $19.4 billion in 2013, representing a 29.6% compound annual growth rate." – pulled directly from IPO filing

Video Services (CSCO): Keeping it simple and referring back to CSCO since there is nothing public that we would refer to for a specific sizing number (feel free to chime in if you know of a pure play here). Service provider video: 4%-6% y/y growth in the future.

Valuation: For the networking sector you're looking at the same metrics we outlined for hardware, this is a copy paste job below but good for reference if you're interviewing for a networking slot and want to print this out. You should be more familiar with 1) P/E metrics both on a GAAP and non-GAAP basis, 2) DCF for Large Cap hardware, 3) Sum of the Parts and 4) EV/Sales for growth hardware.

P/E: This is self explanatory, however the point is earnings growth is eyed a bit more in the space as companies are expected to grow EPS faster than sales (assuming we're talking about larger companies)

DCF: Again focused on large cap tech, as your EPS becomes larger, companies look for quality earnings. As a rule of thumb GAAP net income growth should begin to mirror FCF growth, so a DCF becomes more viable at this point.

Sum of the Parts: As you can see, many of these networking companies will inevitably have multiple business lines. Ideally you will value each sub-segment separately to come up with a fair valuation. Growth rates and margin profile will determine the appropriate multiple.

EV/Sales: When you have no profits and you're operating at a loss… You better grow like a weed. This is where EV/sales becomes crucial. The idea is that if your company is growing at 50 or even 100%+ that you have a major technology lead, a major company could then become fearful of you and buy your entire company.

Software

This is going to take the bulk of part two, because similar to internet, it is the "hot space" in the Tech industry. Before jumping in it's probably a good idea to explain in layman's terms why the space is coveted. The best example we can use is a subscription based model.

Basic Software Business Model: Everyone knows Netflix and Hulu (internet not software). These business models are attractive because individual *consumers* purchase a subscription or access to content that has a fixed/flat cost base. What this means is there are limited costs of good sold so you have higher gross margins and this flow through the financial model. The more users you get, the better since the content you're selling doesn't change in price and you simply need to scale.

How does this relate to Software? Well to put it simplistically a successful software company has this on an **Enterprise** level. Meaning your recurring revenue is coming from companies not consumers.

Using a simple example, you buy software from Microsoft for your company… Now this software has recurring annual license / subscription revenue and your software company now makes a huge margin as they sign up more and more enterprise companies on your software. Again the gross margins here are high because the software is a code and this flows through and your main overhead is essentially R&D (ie: the guys you hire to make the new codes)

Now we can go ahead and take this a step further and explain that enterprise users for major software companies also pay for services (be it maintenance or essentially trouble shooting) but the crux of the matter is that extremely valuable software can be scaled quickly, deliver value to an enterprise immediately and give the software company a "long tail" of future revenue assuming they sign an enterprise up for a 2-3+ year agreement.

What Type of Companies Fall into this Space?

You can find hundreds of ways to splice the space "Platform as a Service" (PaaS), "Software as a Service" (SaaS), "Big Data Analytics" (BDA), "Virtualization" (Desktops/Servers), "Cloud Based Companies" (don't get us started on anything that falls under the cloud).

Instead of going through and trying to bucket exactly where all these companies and segments fall we'll look at the big level trends and name a few players who touch on each space.

Virtualization (VMW/CTXS/MSFT): This was a bit hotter back in the 2009-2010 time frame when server virtualization was ramping up to speed. For those that are unaware of what virtualization means, in layman's terms, it essentially *allows a server to perform multiple tasks.* Previously a single server would be dedicated to just *one* application or task, but now with **Server Virtualization** you can install software and divide the physical server into multiple *virtual* environments.

Moving forward, the next phase is the move to desktop virtualization. Again to put this in layman's terms what this means is your desktop will now be more secure as it is linked up to a bunch of storage/servers inside a data center. The best form of explanation is as follows:

Non-Virtualized Situation

1) Joe has his laptop stolen

2) Joe reports the laptop stolen to his IT administrator

3) Joe has to explain all items on his desktop/accessible in order to make sure no confidential information is breached

4) Thief tries to steal information in the mean time

Virtualized Situation

1) Joe has his laptop stolen

2) Joe reports the laptop stolen to his IT administrator

3) Due to desktop virtualization and working off servers + storage all the IT guy does is cut off 100% of all access and shut down the computer for life

4) Thief gets nothing because zero information is on the drive, he simply picks up the cheap hardware product that no longer has information on it

There is much more to this, but with the two examples of server and desktop virtualization it should give good reason to see the value.

Business Model: Now in this space you're looking at around 10-12% long-term revenue growth, gross margins of 85%+ and operating margins in the 30% range. To avoid getting into the weeds too much, the big debates in this space are as follows: 1) what happens when all servers are virtualized and we have finally converted all physical servers to virtual servers?, 2) how much will it really cost to convert all desktops/notebooks to a virtualized environment? 3) Which company will have the best overall solution for the enterprise.

Big Data Analytics (SPLK, DATA and Pivotal a division of EMC)

This space is currently *hot* ie: many are talking about it and the valuations here are getting quite rich as people are looking for the best of breed in Big Data Analytics.

What is big Data Analytics? In short, it is essentially the ability to take a slew of information about a topic and make a decision as to what the information means in real time… And to do this in seconds not minutes hours or days. From a college student perspective think about it like this, big data analytics is trying to come up with a thesis paper… full and complete in less than 3-4 seconds! Okay that was a bit extreme… But that really is the idea.

As a real time example, lets say you *Joe Target School* walk into a local clothing store. With all the information you have given out in the past 1) your previous purchases, 2) your facebook posts, 3) your emails – which Google is free to read and 4) your history with the store…. They will immediately try to sell you the product you're looking for. Now… Take this a step further… They are looking to do this on a geographic basis as well. If you own the same clothing store in Austin Texas versus Spokane Washington, the clothing store will reorganize the entire store to match the buying preferences of the community as a whole.

Business Model: In this space you're looking at hyper growth of up to 50%+!!! In addition you're looking at gross margins of 85%+. Notably, operating margins are generally negative, IE: these companies are *losing money* because they are reinvesting in R&D to make sure they have the best analytics software and in addition are searching for ways to obtain more sales (marketing and sales expenses). Most of our tech savvy readers already know this is how high growth new software companies work, negative operating margins as you build a book of recurring revenue then you should scale appropriately and see the profits flow in at a later date.

Cloud Based Companies (CRM, WDAY)

Now we're getting into the cross over and broad topics in software. Cloud based companies can be literally any software company that primarily functions on applications for the Cloud or "Platform Three". A company that uses internet based computing to give a service/product is going to be considered cloud. As you can see this opens up a large large large can of worms in terms of what can be considered a cloud based company. Certainly a software company that has all of its revenue derived from the cloud would count… but deciding if you include a security company as cloud is difficult (looking at you FireEye).

If you wanted to look at one company and say this is a large "cloud" based play, then a good place to start would certainly be salesforce.com (CRM). Even on a $1.2B+ quarterly revenue run rate, the company is growing at 30%+. This is a tall task for any company. The Company operates in 4 segments sales cloud, service cloud, marketing cloud, salesforce1 platform.

Again putting this into simple terms, think of CRM's business model as access to proprietary software/applications through the internet. Simple as that. Using CRM as the leading example a *service cloud* would be creating and tracking calls and the ability to prioritize importance (through internet medium), *sales cloud* would allow collaboration in tracking and helping close a client/business lead and again escalating to different members as they near purchasing, *marketing cloud* allows customers to bring in outside data and integrate into their customer profile to help analyze and later sell more products in the future.

Business Model: Would like to reiterate that many companies can be considered cloud, but if we're speaking towards large scale growth (like a CRM) you're looking at ~30%+ growth this year and 20%+ over the medium term (call it 3-5 years). The Gross margin profile in this space is slightly lower than a pure software company but you're looking at 75%+. In addition, sales and marketing expenses are higher given the larger support and services piece of the business model, but you're looking at 10%+ op margins.

Software as a Service… For those that work in technology investment banking… you'll know why this was listed last… It is simply because you can technically call CRM/MKTO/Netsuite/Workday and other companies mentioned within this write up as… "Software as a Service" companies.

Since we don't want to go over every single company that is considered SaaS which would take a post in itself, we would recommend this short article that simply talks about high level valuation of SaaS Companies:

http://www.scalevp.com/a-valuation-framework-for-saas-companies

Valuation: Here's the basics for Software Companies, if you're talking about larger firms such as a CRM a Free Cash Flow multiple may work along with a DCF. When you're talking about high growth companies (see losing money) then you're forced up the income statement and you're looking at Sales multiples. If you're not using any of those four metrics then you're likely moving to a P/E metric and lastly a EBITDA metric…. Software is a huge space, we missed out on a lot here and didn't even scratch the surface (examples RHT/LOGM/LPSN etc etc.) and the fact that there are so many large companies lets you know that there will be a lot of IPOs/consolidation in the future. That's always music to a banker's ear.

Want to reiterate here, unlike Internet which can be more or less understood when looking at the business model at a glance, Software has a lot of overlaps and can be difficult to "position" particularly for a pitch or comp sheet. When push comes to shove you're going to have to understand how your banker thinks about splicing up the space and how to spin your company into the right "buzz word" areas such as cloud and big data analytics. As a quick note, a smart way to justify your comps/valuations is to stack up like for like growth rates and margin profiles regardless of it being a XYZ software play instead of a ZYX software play. Long story short software can have a full 10+ pager in seconds

Other *Tech*

Here we are going to attempt to tie in all the loose ends that could be considered technology. As an example you can use 1) manufacturing, 2) distributors and what we'll deem 3) electromagnetic devices as "Technology"

For those that work in industrials you see how we begin to blur the lines between "technology" and "industrials". As an example if a company creates the components within the technology device (think the nuts and bolts connecting everything inside a server or a laptop) is this considered "technology" or is this considered "Industrials". Without debating how to splice the group we can name a few types of industries that could be considered tech but could also fall into the lap of a few different industries person.

Main Industries that can qualify as *Tech*

Media/Gaming (CBS, GA, SINA, FOXA): Okay… fair we should have another section on this, since it is calledTechnology **Media** and Telecom… However the issue is the space is generally fragmented (gaming) or quite consolidated (media).

Looking at gaming, upstart gaming companies are quickly scooped up by one of the larger companies such as GA. In this case, when interviewing for a media/gaming based position you should expect to work on a LOT of 1) small sell-side M&A transactions or 2) advising a large gaming company on a lot of small M&A transactions.

Now if your focus is more on media you're going to be referring to CBS and we would refer back to telecom based valuations for simplicity: focus in on 1) entertainment vs cable revenue growth, 2) subscriber growth 3) Contract renewals with operators such as DirectTV, Cable Vision etc., 4) capital allocation policy – dividend changes and 5) Free Cash Flow. In short, refer back to valuations for "mature technology" since the big names are unlikely to trade on sales multiples gives the growth rates.

Distributors/Value Added Resellers (VARs) – [TECD, AVT]: These companies essentially buy products, warehouse them and resell them. Lets say you're a small company and can't afford a massive sales team like the big technology companies. You reach out to distributors/VARs to help sell your product. They generally provide some technical support as well.

[Note: *technically* distributors and VARs should be slightly separate as a VAR is supposed to provide additional features or services at all times before reselling, but we're just making this easier to clump together]

Manufacturing [Hon Hai, FLEX, Catcher]: All these severs, computers and phones being made someone has to put this stuff together right? Simply put, the job of technology manufacturing is to find ways to efficiently pump out those billions and billions of SmartPhones, laptops, printers, Servers etc. You see this in the news quite a bit with China wage laws and all the other associated manufacturing issues brought up by main stream media.

Electromagnetic Devices [GLW, TEL, BDC]: Lumping a LOT of categories in here, but think about it like this… all of the "stuff" inside. The antennas, the batteries, the sensor for your fingerprint scanner, the control that notices you have turned your iPad up and then back to the side to view a movie etc. All of this "stuff" is going to be technology in some cases. You could also call it "industrials" simply put the guts of the technology product.

Valuation: For this space we're really looking for P/E and FCF. For the extremely large companies that create the guts of the products you can have a sum of the parts for the different businesses (since they command different margins) but we're going to avoid extreme detail and stick with P/Es and FCF.

The bigger idea when thinking about valuation for these types of companies is this… They are heavily influenced by the macroeconomic climate. This makes sense. They are trying to sell anything and everything to everyone, or trying to create anything and everything. So if the macro economy suddenly improves their revenue numbers jump and if the macro were to suddenly decline, they would quickly fire all of their employees making all of these products.

Financial Statement Dynamics: Since these companies are creating large volumes it would be clear that inventories need to be monitored. Here is where you can look at working capital swings as proper management of capital is going to impact your FCF.

Finally, this group of "other" tech companies are generally prone to charge offs or one time restructuring as they resize their businesses on a relatively frequent basis to adjust for the macro climate. This should be taken into account when one looks at their performance over a specific time period, IE: a full bull and bear market should give a much more reasonable idea for how the company operates (positive or negative). Can they manage a down turn? Can they take advantage of an upswing? Etc.

Concluding Remarks: At this point we're burned out with the typing. We have ~20 pages written now on Tech and ~10 pages written on FIG. The big issue? We hardly scratched the surface! Media should be talked about more, same with software, internet and a few other segments mentioned on here. That said the combined pieces should provide more than enough of an overview for someone interested in either sector…. Good luck and as always 1) do your own research, 2) remember to network and learn about each group so you know what *type* of companies you'll be working with since growth technology and mature technology companies are certainly valued differently and 3) finally… never, never, never tell a banker he is in a mature industry, always be up beat and pretend you think there is a lot of *opportunity* in the space even if you know the segment is mature.

A Guide on How to Spot Rich People

A Guide on How to Spot Rich People

Welcome to a post designed for people trying to "network" and for gold diggers (God Bless them). We're not exactly sure how this information will be used but it doesn't matter to us. The post can be used to triangulate liars, people who are sandbagging and of course the "richest guy in the room". Before we begin, we have to give the standard disclaimer. Most rich people have odd quirks. This means you have to build a mosaic from the items below. One single item is not a good indicator of wealth (although we will highlight the most obvious ones) and many people break these rules. But. If you use the mosaic approach, you'll be right the vast majority of the time (85%+ or so).

Levels of "Rich": This is going to be a one to five scale. We're using this so we can help explain the ranking system. Number 1 will be the lowest and represents a person who is completely dead broke, homeless, massive amounts of debt or worse. Number 2 will be people who are in credit card debt and struggle to get by living paycheck to paycheck. Number 3 will be your standard middle of the road person saving a few thousand dollars to ten thousand dollars a year (yes a wide range since most fit here). Number 4 will be your first "pretty rich guy" who is a millionaire but isn't able to buy anything over the top like a Lamborghini, Mansion or $100K+ watch. Number 5 is the "ultra rich" area, can afford practically anything and you're looking at someone who is already worth 9 figures or could easily get there in the next 5-10 years. In short, these levels are essentially a "doubling" of buying power.

Levels of Rich Clothing Edition

The below tweet and photo is the summary but we'll also explain why. There is a psychological reason for the tiers to look like this.

> Levels of rich (clothing edition)
> 1) Broke: tattered clothing
> 2) Poor: doesnt fit but clean
> 3) Break even: "name brands" low end, (ex. Michael Kors plastered)
> 4) Middle class: Brooks brothers
> 5) Rich: custom clothes or hoodies in tech
> 6) ultra rich: jeans, t-shirt, $100K+ watch
>
> — Wall Street Playboys (@WallStPlayboys) September 7, 2018

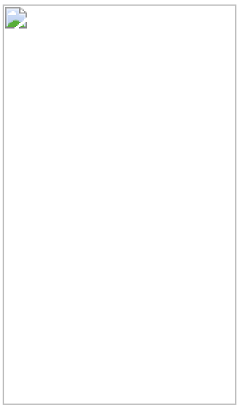
Wealth Level 1: This won't surprise anyone. People with tattered clothing, poor hygiene and a focus on second hand clothing are usually in a bad place economically. We're not going to burn time talking about why they are here or what to do about it since we really don't know. What we do know is that older tattered clothing that is likely not washed as well = no money. Tough to argue this one.

Wealth Level 2: One of the easiest ways to tell if someone is in level 2 but not in level 3 is the fit of their clothing. It's a small nuance but tells you quite a bit. When you're able to buy the same low-mid level brands but there is something "off" about either the fit or the color schemes they choose relative to their skin color… this is usually the sign. A great example is a lot of horizontal striped clothing or long-sleeve clothing where the arms are baggy. You're more likely to see this in Tier 3 level cities in the USA and less likely to see it in Tier 1-2 cities since they eventually assimilate based on how other people dress.

Wealth Level 3: The vast majority end up in this category and it's quite a wide range. This is where people buy clothing that fits and have a splattering of random "brand name" items. Good examples are guys wearing Brooks Brothers clothing or wearing Ferragamo shoes. We get it though. It would make rational sense to think that people wearing Ferragamo's or that $10,000 submariner Rolex are rich. We'll take the under on those bets every day. Why? Usually it's just a guy who makes $100-200K a year who spends on a few choice items but isn't really rich. They feel the need to impress.

Wealth Level 4: Here come the tell-tale signs. If a guy is wearing those brand name items *and* has a suit and shirt that are custom made, it is wise to re-calculate expectations. Why? Everything is matching. If someone has a few "random" choice items this isn't enough for displayed wealth. The watch could be a gift, the shoes could be his Christmas present to himself. A custom made suit (custom made clothing in general) is almost never a gift. Combine this with a guy who seems relaxed all the time and some other choice items (could be a watch value of $2,500-$30,000 and shoes valued at $500-700) and you're likely at level 4 wealth (millionaire). This again isn't perfect science but the difference should be clear. Custom items are not cheap since no one would know a person's exact measurements. As a side note, be careful if you're in the technology sphere because none of these rules apply and the guys who are rich usually wear hoodies and other low key items. An Asian or White male wearing a hoodie in tech could very well be rich (ver rich). But. This is just one strange situation.

Wealth Level 5: Welcome to the ultra-wealthy club. As usual in this club there is no exact outfit but more of a "most common" outfit. In this case it is a t-shirt jeans and a really, really, expensive watch such as a Patek or Richard Millie. It could certainly be a different watch like a Rolex or Audemars Piguet, but, the key is that the price tag has to register near $100K (rough range of $75-150K). We don't know why this is the case but it is a good item to be aware of. You won't see any low 7 figure guys sporting these types of watches since they are too far out of the price bands (unless it's another insane gift situation). For fun see Exhibit A (RM watch) below… his website is here



Levels of Rich Word Choice and Speaking

There are numerous studies on this topic and we're sure some of our assumptions here will be wrong. It's a mosaic approach where you look for all of the items in each section here.

Wealth Level 1 and 2: Unlike the other category there are only three real tiers here. At the lower levels you'll notice the following: 1) constant belief that any topic is about them, 2) they will refer to people dying as "he's with god now" or some similar statement with religious/spiritual undertone, 3) easy to anger and constantly giving out opinions despite lack of knowledge and 4) high amounts of vulgarity. We don't need to spend a lot of time here since most people will know if someone is in this area quickly. Their responses to questions will also be quite slow.

Wealth Level 3: Here is the vast majority of the general population (as usual). Common items here are: 1) passive aggressive behavior with commentary *and* belief that others are passive aggressive, 2) they will refer to people dying as "he passed away" –notice that somehow relates to #1 – odd coincidence in wording, 3) generally a lot more cynical, since they are moderately successful they always look for signs of "how someone is getting something out of the deal" this translates to more sarcasm and 4) constantly stating they were "better in the past" at any activity since it helps save face in any particular social situation. A few of these probably sting for people constantly surrounded by middle class people, but you'll notice it more and more now that you've read this paragraph. Most never make it out of this section.

Wealth Level 4 and 5: Welcome to the low stress arena. We know the level 5 guys are still way above the level 4 guys. And. It's damn near impossible to tell the difference in most situations. Why? If two couples walk into a high end restaurant and one couple spends $600 and the other $700… if one is worth 10x the other… you won't be able to see any difference. Funny how that works. After you get to a certain level it becomes near impossible. Anyway. Here are the common items: 1) they only talk about money if asked about it and are generally upbeat on the topic and excited. This creates a vibe where most people think rich people are "money obsessed"… they aren't. They are just excited to talk about it if forced to because they have a positive relationship with money, 2) they will refer to people dying as "he died", much more to the point, 3) very difficult to anger and rarely have any emotional outbursts, anything that happens is either good and they are excited or something bad happens and they shrug it off as if nothing happened, 4) wide ranging vocabulary, unless they are talking to audiences then they purposely dumb it down (7th grade reading level for sales and 3rd grade language for broad audience), in rich people events they'll use more complex words. Oh one small one we notice but likely just a coincidence, rich people tend to have a strange lisp/pitch issue. Not sure why but lots of rich people have a strange pitch when it comes to using certain letters/words that are extremely unique. We're still flushing that one out. Oh and by the way, most rich people do speak directly despite regular people saying they are "nice and elaborate". They are only nice and elaborate when they know they are speaking to a regular person so they keep their image up, if you try to give elaborate emails to a rich guy he'll delete them. Try it yourself if you feel like cold email networking (those life stories will not get responses)!

Levels of Rich: Home Edition

This is probably self-explanatory but many people put way too much emphasis on home and value of the individual. Many individuals and families live in situations where the primary residence is a huge chunk of the net worth.

Wealth Level 1 and 2: Low quality housing. It is no surprise that people in this category typically live with multiple other people (usually more than just one) and don't live in the best parts of town. It's pretty difficult to enjoy life in these situations since people don't want to go to these areas and the quality of the facilities is usually lower.

Wealth Level 3: As usual the middle class comes in once again. There are usually two different camps. People in cities will have a wide range of living in studios or even two bedrooms assuming it's a nice one in a prime location with another working professional. This certainly sounds crazy to people who live in more suburban areas where the middle class lives in basic homes/apartments in the low $100Ks value. For this level instead of assuming the person is rich or broke, think about the cost of living, location and the lifestyle the area affords. In suburban areas, cars are needed… this means the lifestyle is less location dependent.

Wealth Level 4: We'll take a break from level 5 since there is usually a big difference. In level 4 the person may live in a basic place or they might live in a high end place. There really is no real way to know. If you find someone lives in a basic one bedroom apartment in SoHo (Manhattan) the guy might actually be loaded (or he is somewhere between level 3 and 4). The reason for this is his spending style. While one guy might enjoy spending more time alone (higher end place) the person with a basic but nice apartment might spend $10K+ a month on having fun. This is an interesting arena to us since the range is so wide. You could be talking to a guy worth millions or a guy who is still on his way. Tough call and why we're leaving this here to be aware of.

Wealth Level 5: Here is the rub. If the person is in a high end place but *still* travels a ton, it is difficult to say this person is in level 4 anymore. Why? Well the costs would pile up. In the fourth level of wealth you have some barriers (you can't choose the super nice place and to go out a ton so you choose one of the two)… In the final level there are no real barriers. If push came to shove here, you can tell if the person is in the final area if his home is worth more than $3-4 million dollars or so. This is because there are limited deductions on mortgages going up that high which then means the person is probably loaded. If it's a $1M place, the guy could be in level 3/4/5 around $2-3M is 4/5 and then north of that is likely level 5 wealth. The main point here is that real estate is displayed wealth but never gives the whole picture since you can always downsize to leave more money for discretionary spending.

Levels of Rich Going Out Edition

Level 1 and 2: As usual we have such a small amount of information on this segment since we're dislocated but you can assume this level is in the minority. No real time to go out. If they go out, they are drinking cheap items, alcohol and other partying is done indoors or outdoors (literal sense) not inside standard bars/clubs unless it is extremely cheap.

Level 3: Ah yes. Being able to tell the regular guys from the rich guys is quite the art and we'd argue that even the gold diggers have trouble learning this scene! That's right, it is that hard to tell. There are many situations where a guy can get table service but pay nothing (maybe he knows the owner and he is personally not rich). There are many situations where the guy is also just a promoter (see completely broke and short lifespan that ends in a spectacular decline at age 40). There are many situations where the guy only has 1-2 drinks but is loaded to the gills! Well… That's why you're on this paragraph. Lets start with tables:

Tables: Before assuming the guy has money because he has a table you have to do a quick check. Figure out if the guy is just connected. Figure out if they are only ordering basic drinks (vodka with mixers is the most common level 3 bottle order). Then of course the natural "does this seem like a normal event" tell, where they are "antsy" to get the night started or not (the less excited they are the more likely they are rich). So there you have the basic level three tells: 1) if promoter or hooked up – ignore not legitimate, 2) if they are excited – likely a group event and they are not comfortable, 3) look at the type of alcohol ordered, it will always be a lot more basic since they don't want to break the budget or anger the person hooking them up!

Regular Bars: Since drinks won't really break the bank at $8-20, it's harder to tell again. Until… you see consistency. This is where the east coast women seem to have the west coast ones beat out. They are sharper. If they see the same guy at the beach with a nice car in the club/bar… they *will* remember. Also. They recognize guys as regulars in specific high-end joints. So your basic tell for a regular person is that they don't really have consistency. They can absolutely afford to hit the same clubs and bars but there is no real ability to continue this over long periods of time.

Level 4: Here you get into the rich area (the place everyone wants to be). The people in this region are usually recognized in multiple areas. Not just one city. This sounds like a fairy tale but it is reality for a lot of people. If you meet someone and he's recognized in two different cities in nice areas, you've essentially seen his cards already. He's well off. This type of person will bounce around quickly and never worry about the money. Typically paying more in cash because it's faster and if he doesn't like the "vibe" he can get out of the place without having to sit next to the register for 5-10 minutes wasting valuable time. If the guy is with a group at a table he's usually disinterested either engaging with the group or simply relaxed (no major emotional swing since it's just another day)

Level 5: Here you've entered obvious signs of wealth. These guys do not show up to any clubs alone, they show up with multiple girls or some sort of entourage. They are not there to meet anyone since they already have their group and have no problem dropping money on any type of alcohol (champagne, high-end anything etc.). Naturally, since they are not there to meet anyone… the girls show up. Funny enough after writing this out we now realize why it's difficult for most people to tell the difference. The guys showing up with a "group" in level 3 look very similar to the guys that are truly rich. The difference though is that the guys who are actually rich are not going to show up with people their own age, practically never happens and the girls are always several years younger 5-10 as a basic range (bonus, the watches and clothing from above can also help fill out the picture).

Levels of Rich Travel Edition

Level 1 and 2: As we write more in this post we realize how dis-located we really are since we have trouble naming exact items in this category. This is probably because it is extremely clear. If the person is always forced to take public transportation and has long commutes then they are not in good shape. Traveling outside of the country is just not in the cards since it is much more expensive and time consuming.

Level 3: As usual the vast majority fall into this category. This usually consists of a few domestic vacations and one international vacation. Or some mix of the price points combined. It can also include some sort of hobby such as ski trips/fishing trips and other somewhat costly extreme adventures. In general, we're putting a wide range in here because it doesn't really tell you much. A vacation to Hawaii or Western Europe is probably the most common. The same stuff every single time with the same Instagram photos of toes/feet on the beach. Nothing special just an attempt at attention grabbing.

Level 4: The interesting level begins where the person travels quite a bit. Now remember, we're assuming here that the person likes to travel. Many rich people stay in the same areas and simply frequent country clubs, but, if the person likes to travel this type of life will be a dead giveaway. The first one is status. If the guy has a status level that is at the top tier in any airline he is probably a millionaire at least. The clearer sign is the frequency of visits that are *not* work related. Work related travel doesn't get factored in since there is no cash outflow. If the person does north of 10 trips a year then he's certainly in this group. He'll probably have a few locations he simply loves which leads to "being recognized" in multiple higher end locations in different cities (see going out edition)

Level 5: Now of course if a guy has a Jet or Helicopter he's in this category. For those that don't have these obvious glaring items, the next one is frequency of business class travel. Be careful here. If a guy flies economy here and there it does *not* mean he is in level 4. He could be saving time which is worth a TON more than sitting in a nicer seat. If there is only one direct flight and it's economy he'll buy this every time over the connecting business class flight. Your average person thinks that he'll choose the business class trip but that's why they are average in the first place (they don't understand the value of time and have never seen a big paycheck in their lives). Anyway. If around 80% of his trips are in biz class he's likely in this category. The only exception is if the business class tickets are always short flights to the same destinations, in that case they could be a lot of upgrades and somewhat related to work which doesn't signal much.

Levels of Rich Time Edition

Level 1 and 2: Everything is essentially the same. In this area each day is similar to the last since the habits are practically set in stone. If you were to go and follow a person in category two for example, he would be doing the same thing next month as he was doing the prior month some 99% of the time. They are unable to tell you what they did last week or last month since it is essentially the same (their lives don't' change). A good way to tell if they are in this group is the classic "what did you do last year" and they can't really give much for highlights.

Level 3: Pretty standard tells here, the most common is the belief that there is a "time for money exchange". That's probably the biggest sign, a devoted relationship between time and money. There is also some deep obsession with age and net worth as if getting older should equate to more money (doesn't make any sense). The good news is that this group is generally easy to spot once they explain their relationship with time. They'll have some sort of schedule that is slightly more flexible than level 2 and they have 2-4 special events that will highlight a year for them. The rest of the year is essentially a blur since each year is a baby step up the socioeconomic ladder (10-20% savings a year).

Level 4: This is where it gets fun. There is no real relationship between time and money in this group since they are typically *less* busy. You'd think they would still be killing themselves to get extra money but there is a strange void here. You're either in Level 3, working like a dog to get into level 4 or you're in level 5 where you're so valuable that your schedule is filled in seconds! Not sure why this happens but it's hard to deny particularly if you have lived it. People in this group have a *de-coupled* belief between time and money, they also have much more control of their lives. The most common example we can give is a top rated sales person or an affiliate marketing professional. They make around a million a year, +/- $200K or so and yet they don't seem to work a ton or be on call constantly. This is called deep rooted relationships. It's tough to explain it if someone hasn't seen it or experienced it but once you do it'll stand out like a sore thumb. Very low stress levels, high flexibility but an oddly lower amount of demand compared to the ultra-rich or the middle class.

Level 5: Two types: 1) still working hard which means no free time because they are pushing for hundreds of millions or more and 2) those that hit their huge numbers and have quite literally no commitments. This is quite an odd set up since the guy who hit his numbers will operate similarly to the level 4 guy, the difference is that the level 4 guy will always have certain times in a month where he suddenly drops off and needs to work hard for a few days. The ultra-rich person quite literally never *needs* to do anything. The stereotypical level 5 person is the one the masses hope is true for all rich people (as you see it's no where near accurate), constantly grinding. This is because he's trying to reach some larger goal and wants to push every single lever he can to get that exit multiple!

Bonus: Levels of Rich Car Edition

You'd think there would be a solid relationship between the car and wealth… But we haven't seen a really good correlation. The extremes are the only ones that really stand out. If someone has a *new* high end car like a Lamborghini then they are rich (used older ones are questionable and in some cases could fall all the way down to level 3/4 range!). Also. If we look at the bottom barrel with cars, you can see the person doesn't have money (level 2). This would be a car that is so old that it is worth more money selling it in pieces (or a basic fender bender would result in a cash payout since the repairs are more expensive than the car!). You'd think that the classic BMW or Audi shows that someone is well off… all we'd say is please visit Miami or Texas. Lots of people get into the upper middle level of car ownership without having any serious amount of money. Funny enough, people still equate cars with wealth. It's more likely that a guy in level 4 wealth drives a brand new Honda civic (but flies first class) versus a guy driving a BMW and flying economy (despite both equating to the same amount of cost). Once again… the opposite is true, a "known" item for wealth isn't accurate.

Conclusion

Somehow this casual post turned into 6 pages. Seriously. Six pages. It's interesting how easy it is to compartmentalize people once you've seen it enough. It is also interesting that the only way to really see these items play out is by getting to the top. This is probably because an outsider from the know can only see what is in front of them, if they were able to read people they wouldn't be middle class for long in the first place (logically this makes sense). We'll leave it up to the reader to remember these basic guidelines and see if they can do the calculations in the back of their head quickly in social situations. And. Remember… the truly rich never really have to pay for anything (funny how that works!). *Spoiler: if forced to choose on the fastest way to determine wealth go with 1) watch, 2) most expensive real estate asset and 3) amount spent on services. If they aren't a watch person the money will flow into 2 and 3 anyway.*

> Levels of rich
> 1) broke – buy on credit negative worth
> 2) ok – pay all items no debt
> 3) better off – everyone assumes you will pay their tab becuase you are well off
> 4) rich – company covers most your bills
> 5) really rich – you never pay becuase you're paid to show up
>
> — Wall Street Playboys (@WallStPlayboys) September 6, 2018

Q&A Announcement: we'll hold the next Q&A on Friday September 21. As usual only paid purchasers will be allowed to ask a question.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality … You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by **Clicking Here.**

A Laundry List of Basic Mistakes We Have Made in the Past

A Laundry List of Basic Mistakes We Have Made in the Past

It's unclear if the mistakes we've made will be applicable to everyone. In fact, some of the mistakes may be the right move for some people. That said, we'll start with bigger mistakes we've made since the chances of these items being "good decisions" are quite low. Then we'll move onto the smaller scale mistakes. While we did avoid the biggest errors: high debt, single form of income and legal marriage at a young age, there are still many mistakes that we would reverse (if we could turn back the clock).

Introduction

First on Regret: Overall, every single person you meet could have done something better to maximize their potential. While we don't worry about these mistakes, it is simply reality. Think about it like this, if you never learned from a mistake then it means you wouldn't be able to go back in time and improve your current life. This of course is impossible.

The good news is that smart risk adjusted decisions should lead to a high quality life. Maybe you could have done things better but if you avoid the disasters (big mistakes), it won't move the needle that much. Regret to us means you made a mistake that was large enough to not enjoy your current life. We're not in that camp.

Second on The Past and Future: Generally, if someone didn't make a major mistake they won't long for the past. We wouldn't go back in time and redo everything. This is because there is a lot of luck and timing involved as well. If we could go back in time with our current knowledge, then of course we'd take it (you would simply do the same things but undo obvious old mistakes). This is why hindsight is 20/20. With this in mind, we don't have any interest in re-doing all of the work we did in the past. The future is a lot brighter because the correct life decisions over the past couple of decades makes the next several decades easy to live. In short, we're not writing this post to complain about the past (we would not redo it) instead we're writing it to see if these mistakes are being made by anyone else.

Third on Major Mistakes: To wrap the introduction up, we wouldn't classify any of the mistakes we made as "life changing". That is because most life changing mistakes are avoidable in nature (except for extreme examples of bad luck: getting hit by a bus, natural disaster etc.). We've already mentioned the major mistakes but we'll go ahead and restate them. The first is debt: anything that cannot be paid back within a year is a high level of debt (particularly if the debt was supposed to increase your income). The only exception would be a rental property. The second is a single form of income: by having a single form of income you're not diversified. If you lose the single form it could set you back many years since compounding is brutal if it works against you. The Third item is legal marriage: we don't talk about dating or anything like that anymore since it's essentially something that can be learned in 2 years. What we do emphasize is never creating a legal contract because all of the effort you put in could be cut in half for no reason (out of your control). If you follow these three items alone you'll be at the middle of the pack without much effort at all. Simply avoiding the major traps.

Laundry List of Changes: Personal Life, Personal Finance, Health, Business

Personal Life #1: Grasping to Mediocre Talent: We've done this several times. When you find something you're reasonably good at, you think it could be your calling. The problem is recognizing when to move on. If we could go back in time we would have thrown a LOT more spaghetti at the wall to figure out where our talents were. This is a mistake since you lose valuable time investing in a skill where you're only going to be in the top 20% or so. Nothing to sneeze at but nothing to be extremely proud of.

We get questions about this "talent" and it's quite easy to summarize. *How much time does it take for you to excel?* The general framework is 1) people must tell you you're good without fishing for complements – no friends and family don't count, 2) you must get into the 2nd or 3rd standard deviation without working long hours – this is relative and more art than science and 3) the distance between you and your competitors should *lengthen* every single year that goes by for the first 5-7 years or so. The last one is something we figured out at the end (unfortunately). If you're creating more and more distance between you and the competition, you're basically near top-tier. After a few years into the task, you've already thinned the crowd to decently talented people. So if you're getting further and further away from them every year after that, you've found your skill.

Personal Life #2 – Giving Out Second Chances: Smiling and nodding is the best strategy to avoid giving out free second chances while leaving the door open. If someone has failed to deliver on a promise do not expect them to do you right the next time. If you've worked with them 10 times and one time there was an error, this was likely due to chance/law of large numbers. If the first task is immediately a mess and they go against what they said they would do (or made some new rules as well), go ahead and back out. There is nothing wrong with moving on and you're going to save yourself a lot of time as well. If someone was willing to try and pull the blinders down on the first go around, it's likely someone who will do the same in the future.

On a positive note, yes in rare instances 0.1% of the time, (okay, okay, 0.0001%), people do change. Instead of being the person who helps them get on the right track, just leave the door open if they do change several years later. This way you're not the one actively involved in fixing their problems for them. Let them figure it out themselves or have someone else help them along the way. Life is extremely short and it's just not a good use of your time. There are many people who are honest and upstanding people to work with, don't try to make lemonade out of a lemon when you can just go out and find something better.

Personal Finance #1 – Focusing on Returns Not Cash Flow: We got lucky. The majority of our investments over the past couple of decades have been more illiquid and less cash flow oriented. This is because we didn't want to be heavily involved in real estate. Not smart. We realized the main reason why real estate professionals make up the vast majority of millionaires is because of cash flow. Cash flow is more important than the return profile when you're younger since you need money to invest. The more money you have coming in gives you a chance to take on more risk. So on and so forth.

We got lucky because the returns ended up being similar. We recognize this as a mistake since it wouldn't be good advice for someone in their 20s/30s today. While we wouldn't go down the real estate path, we would be buying and flipping many websites. Websites offer monthly, bi-monthly and sometimes daily/weekly cash flow. This is typically inconsistent but is a lot better than a non-cash flowing asset that gives you the same return. Our strategy of buying non-cash flowing assets with excess money didn't make much sense. It would have been easier to focus on buying nothing but cash flowing assets until we were we'll into financial independence territory. Then move to non-cash flowing assets. *Unless it's earning money while you sleep, try to avoid it as an income stream*. Assets that earn money in your sleep are: Real estate, websites, subscription income, dividend paying stocks and any employee who earns less than they generate for you. That last one sounds insane. But. Why would a company hire you unless you generated more than you were being paid?

Personal Finance #2 – Not Tracking Finances Properly: While you shouldn't have time to check your net worth on a daily basis (creating an obsession) it is foolish to track everything in an excel sheet. Excel sheets don't tell the whole story since you'll have investments that may have management fees (like a mutual fund), you'll have assets that go up a lot of in value that should be de-emphaisized later. And. You'll have assets that go down a lot in certain years that you should re-invest into to buy lower and rebalance your allocation. We didn't do a good job of tracking asset mix and it is going to take another 1-2 years to finally get the mix to make sense. Let's think about that for a second. Despite serious planning and thinking for many years, it will still take another 1-2 years to rebalance. This is not a good use of time.

For those that are serious about developing multiple streams of income and a high net worth, we can recommend **Personal Capital.** The Company offers *free* software tools with the following four key features: 1) ability to *avoid losing money* by tracking all fees associated with an investment product allowing you to choose the best possible fund for your future, 2) portfolio analysis where your risk profile is stacked up against your current age and retirement goals, 3) in addition to these free tools, you can also track your net worth and path to becoming a millionaire and 4) when you hit $100K in networth you'll receive a free one time consultation with an investment professional at Personal Capital. After linking up all of your accounts you'll be able to sit back and watch as your net worth goes up and your fees remain minimal over the next several years. We strongly believe that Personal Capital is the premier personal finance software tool when compared to its competitors such as Mint.

Personal Finance #3 – Using Minimal Leverage: Leverage is a good and bad thing. If you have a long time horizon and high cash flows, you can take advantage of leverage. We made a mistake of being too risk averse to leverage. Keeping it well below optimal. Imagine having a rental property that is 80% paid off and appreciated by 15% or so. It doesn't make sense to keep the leverage at just 20% of the value especially if you have a 2 year lease locked in. When thinking about leverage, it is smarter to delete all of your active income and see if you can make payments on your total debt load. You'll be surprised to find that you can take on a bit more leverage since it is unlikely that all of your income streams go to zero. A good rule of thumb (if investing long-term), you can have your annual payments = to your passive income excluding the asset. This means that dividends, bonds, etc. should offset your mortgage payments. Which of course means all of your rental checks are going straight into the bank. Being blunt here, this is probably too risk averse as well. But. We don't have any interest in taking on material risk anymore (personal decision making)

Health #1 – Not Taking Nutrition Seriously: When you're young, you can consume practically anything. The most classic items are cheap carbohydrates: pizza, ramen noodles, lots of rice, candy bars, fast food etc. Your body is able to consume these items and see no major impact (when you're young). This leads to the belief that food is just a way to get rid of the "hunger" feeling. Completely wrong.

Around your mid-20s to early 30s you'll see a dramatic change in your body. You'll feel worse when you consume unhealthy foods. Your skin will become more dry, prone to acne and pale. Instead of having a glowing/healthy skin color it will look matted and broken down. This leads to a large amount of damage to your internal body. Healing from the inside out takes a lot more time and is not easy to reverse.

The answer is clear. Your body does not react to food based purely on calories. While it is true you could eat 3 candy bars a day and lose weight, your body will be in terrible shape after a week of that type of torture. Just look at the experiments run on people who eat fast food consistently. They break down. Taking your diet seriously should begin as soon as you are living alone (low 20s at latest).

Health #2 – Giving up Intense Cardio: If you've played any sport at a high level, you know that touch (coordination/accuracy) and cardio go away first. While you don't need to play a sport that has a ton of coordination involved, deleting anaerobic activity *is pretty close to a death sentence*. Yes, we're taking it to an extreme to emphasize how important it is.

If you don't do any sort of high intensity training: sprints, sprints on a bike, jumping exercises etc… You're going to be in quite a bit of pain. This doesn't show up instantly and is more of a slow erosion over time. Where does it show up? *In your sleep.* If you feel groggy in the morning it is typically because of lower oxygen intake (breathing out of mouth) and lower blood flow (no movement). Both of these are caused by low anaerobic activity.

Going to the gym is what every average guy does. It's just not enough. You want to have a body that is used to various types of movement from regular strength (weights) to anaerobic (sprints) to endurance (swimming). Most people fall into the trap (including us) of focusing on body composition. Sure you look a lot better but you want to feel 100% as well. Giving up intense cardio probably causes you to lose 1 hour of productive work per day. We wish we were exaggerating but it seems to be reality. *Note: when you get to your mid-30s stretching becomes a dangerous item to neglect. We luckily avoided this one but we're leaving this note here in case someone reads it and realizes that they have not been stretching for several years. No stretching = severe injury.*

Business #1 – Get the A- Not the A+ unless you own Equity: There is no reason to go above and beyond unless the results are going to accrue to you. This is seen most in the work environment. Trying to be the #1 person is unlikely a good use of time. Using Wall Street as an example, if you're in the "top bucket" you're going to make roughly the same as the #1 ranked person in your class. Maybe you're off by a few percentage points. This really doesn't matter because the #1 guy has a much higher bar to keep up with AND he is going to be forced to work more (everyone wants the guy on his team). The only exception (getting an A+) is if you're in a revenue generating role and have nothing else to work on (unlikely).

A- work is not good enough if you own Equity (your own business). This is because you obtain all of the benefits. The A+ worker in a corporate environment is almost always the "highest operating margin employee" this means the extra few thousand he is paid is more than offset by the revenue he generates. Otherwise he wouldn't be so loved, would he?

Put these two together and you'll realize that it is better to be "liked" but not extremely liked in any corporate setting. This gives you a lot more time to build your own stake in something that flows directly to your bottom line. A+ work is only necessary if it is going to benefit the person who matters: you! You should only be motivated to do A+ work if you see the benefit of said work.

Business #2 – Small Money Matters if It Doesn't Take Time: Should never sell tiny websites. Well, it depends but the point is pretty simple. If you have an extremely small website that makes $500 a month, you should not laugh at it. If it makes $500 a month but requires a lot of time to run, then you should dump it. The key here is how much effort are you really putting in? If you have an old website that makes a few hundred dollars a month but spend 15 minutes a month on it… *keep it.*

Just because a website wasn't a success doesn't mean it was a failure. There is definitely a middle ground and the middle ground is determined by time. We've sold quite a few websites that we considered failures. Making between $300-600 a month. We should have kept them. They are still up and running today and probably make the exact same amount of money. That was many years ago! All of that money could have been sent into a bank account without doing anything. In fact, if you have 20 "failed" websites, that would be $6,000-12,000 a month… with minimal work. This is a simple reminder to see if you can automate any "failed" project you have. If you can reduce the time to practically zero, you should keep it until it goes into the red (could last several years in the green).

Business #3 – Trying to Sell to a New Market: Yes everything is sales. And. No, sales are not equal. We wrote last post that it is better to sell to the masses since you learn basic communication skills with a wider audience that allows you to improve your social life as well. That said, if you know how to sell to the elite, there is no need to change gears. While this is a high level view, it makes absolutely no sense to try and change your target group.

Assume that you have a solid business that targets women in their 30s-50s. Now you want to start a second idea. Is it better to try and target men in the same bracket or a different set of women? Trick question. Neither. You're better off finding another product to sell to the same age group! This is because you've already figure out how to tap into the sales funnel for that group. This is also why you find that specific affiliate marketers sell to certain niche's. Gambling websites do not hit the same group as cosmetics. Diet does not target the same group as Lead Gen. While there are some specific instances where they do overlap, it is much smarter to stay with your core competency.

This is also why we are quite impressed by people who succeed in various types of businesses. Most can only tackle 1-2 industries or target audience (not throwing shade, one industry is *more* than enough). That said, targeting multiple at the same time takes a lot of skill. Also. We've noticed that this is typically where people blow their money. They succeed in one area then try to expand in an unrelated area… only to fail and lose a large amount of money. While we did lose a good amount of money trying an endeavor that was unrelated to a core business, it didn't break the bank. We've learned our lesson and hope that anyone reading this will be sure to max out their core competency before moving on. Remember, if you know where your talent is, you need to maximize it before moving on to more risky ventures. Targeting a completely new group of people is a big risk.

We're sure we have missed a lot more (will add as they come in) but if there are any other mistakes to avoid please leave them in the comments!

****

A New Lifestyle After Financial Independence

A New Lifestyle After Financial Independence

Inflating your lifestyle is a lot of fun if you can do it in a consistent way. We'd say this is easier to keep on track if you have multiple hobbies that require physical effort versus cognitive effort. That is the one item we see in common between people who are able to keep a flatter spending pattern. Think about the number of people you know who are healthy and fit, they generally spend more time doing physical activities which cost significantly less. If a person's only skill is making money, this typically leads to a lot of lifestyle inflation as their entire personal well-being is tied to money. They view income and net worth as their identity. This leads to a needy personality. Luckily, you're here so if you've successfully executed with Efficiency, you'll recognize our timelines. We're going to show a good example of how to use your time once you're rich.

1) Focus on the Business Income: As of 2018, you're still going to pay a lot of taxes if you make more money. The good news? Any business (large or small) will pay less in taxes. Why? Well you have a lot more deductions, you can expense numerous items from rent to food to internet bills. This means your effective tax rate is significantly lower with this income relative to anyone making good money with a standard W-2 (practically no deductions in sight). While we're sure there are a few ways to make business taxes higher, we'd argue that there are too many ways to reduce the effective tax rate. Changing it from an LLC to an S Corp, moving states, employing a relative etc. All of these things can reduce the "effective" tax you're paying. As you can see we view any cash flow savings as a "reduction in tax" since it decreases the operating income line.

With this in mind, it means that all of your actual time during the day should be spent increasing your business income. Remember, this is only the time you're dedicating to work. If you're still in the classic W-2 and S-corp income class, it means you should give up on the W-2 side. It won't give you a good ROI and it increases your risk (tied to someone else's decision making). Don't bother doubling down on the W-2 as you're essentially going down the rat race where you have to expend an exorbitant amount of time playing some internal politics games as well.

2) Spend Half of After Tax Gains: Every month your income will be volatile. Anyone who has succeeded knows the one benefit of a W-2 is the consistent flat check. It is predictable and boring which is good for cash flow and bad for building net worth. With this is mind, we'd say spending at least half of your incremental after tax gains is easy and safe. If your income goes up by $2,000 in a month, you can spend another $1,000 and invest the rest. If for some reason you have a bad month, and you're -$1,000 from your usual income, unfortunately you don't get to spend any more money and have to cut back! This up and down will help you avoid the big recurring expenses in life: unsustainable mortgages, unsustainable luxury goods and other recurring monthly payments. Keep it simple and give yourself a variable monthly expense line, this will increase your flexibility. It isn't fun cutting back costs when you hit a rough month, but it sure is better than increasing stress in your life.

3) Ramp Up Physical Activity: Once you start marching into your 30s, *fitness becomes a status symbol*. Unsurprisingly, all those long hours you spent in the gym pay off when you're older. Being in tip-top physical shape past 35 is going to make you stand out like a sore thumb. Most people give up everything to be well off (looking terrible by this age), making you a stand-out person. If you've kept your body fat low and didn't develop the classic protruding stomach you'll be well ahead of everyone.

Luckily it doesn't stop there. If you've kept your diet in check you'll also have healthy skin, a full head of hair and vision that hasn't deteriorated (go ahead and get Lasik if you need it!). Being in shape with terrible looking skin (lots of stress lines) will negate a lot of the benefits of being in shape so you'll pay special attention here. If you're looking to adjust your skin tone, we'd do research on the products women use given that they take it a lot more seriously (try to reduce wrinkles at any cost).

4) Spend a Ton of Time Socializing: At this point, there is no reason to be bored. You're going to have a lot of free time and the money to spend on activities. Some people enjoy building massive empires ($100M+ annual revenue businesses) and others don't see a need for it. Surprisingly we're in the latter camp as we've seen how much work it takes to get to $100M+ in annual revenue (it is an enormous headache). We're not going to say that it is "bad" to try and become a billionaire, all we're doing is highlighting the choices we'd suggest considering. Imagine being financially set with all the free time to do whatever you like versus being "time poor" and having all the money in the world. We've always viewed money as a tool to get what we would like and that was free time to enjoy the rewards.

At the end of the day, we're all animals and having a good set of people to talk to is going to add a lot of activity to your typical week. The one problem is that you'll need a diverse set of people. Ideally you'll have a few people younger than you that you're helping for fun (because you think they are nice people), a large chunk of people your age and a handful 5-10 years older than you. This will take a long time to develop given that you still want to increase your income for the fun of it. After about 2 years you should be set in terms of your social circle with minimal need to branch out aggressively.

5) On and Off Effort: The last strategy to utilize is the "on and off" work schedule. This means you work extremely hard for one week, then do nothing the next week. Similar to training in the gym, apply the same concept to work. You'll push extremely hard and then take your foot off the gas the next week. This creates a nice ebb and flow where you're still engaged mentally but you're not killing yourself constantly like you did in your 20s. Unsurprisingly, you end up being incredibly efficient with your time with this schedule. When you're busy there is a natural ticking time bomb going off in your head so you crank out the hours intelligently.

A Work Day

Wake up around 8am: Instead of looking at emails first thing in the morning, you should go ahead and eat something healthy (fruit, eggs, nuts, meat). These items are better consumed in the morning (exact opposite of the standard cereal breakfast) and take a walk. We'd say 15-20 minutes of walking while listening to music or anything meditative would be a good choice. Spend another 15 minutes showering and getting changed.

9am Work Begins: At this point, you should be ready to go. We're vague about "getting changed" since you may work in your pajamas for all we know (working online). The good news is that you're now mentally engaged to work. By allowing your body to wake up naturally, you won't be responding to emails with a flurry of typos. Crank out the basic email clutter that comes in around this time and move on to the next task.

One Focus Item: If it takes 3 hours or 8 hours, we'd then focus on one single item to get done. You won't do anything else but eat and drink until the task is done. This creates a good habit of intense focus. Even if it will take you a full week to get done, you'll crank out all of the hours in a similar manner. You'll work straight through with brute force (focus). We've never believed in the idea of "working taking a break and coming back", there really is no difference. In college you likely did the same thing, cramming last second for the exam. This is a situation that forces you to get into a state of flow. Meaning you're more likely to get quality results by cramming as all your focus is on a single task. Similar to athlete sprinting.

Mini Tasks: Alternatively, if you have two small tasks, then it is perfectly fine to break up the day. We'd guess that more of your tasks will be big projects. That said, if there are small projects here and there, we would go down that road. Do one task to completion, take a break and have lunch with friends (not employees/co-workers) and then come back to do the second task.

Shut Down at 9pm: We have a hard cut off, there is no need for more than 12 hours in a day anymore after you have made it. We'd guess most of your work days will last between 6 and 9 hours. Given that you're likely a work-a-holic if you made it to financial independence by ~30 years of age, having a hard stop is important. Your body won't enjoy more than 12 hours in a day so there is no point in doing it. Oh and by the way, no more red-eye flights. Those are officially over! Unless you're absolutely forced to, try to take the "Chairman flight" meaning flights that are coast to coast in the middle of the day so you don't have to adjust your body clock.

Reading/Wrapping Up: Work days should be extremely difficult, simply working, eating, drinking and that is it. You'll cut off at 12 hours so you still have time to go to the gym and read for an hour before sleeping. This cut off allows you more than enough time to do both and you can even shut off your cell phone on the heavy work days.

An Off Day

Wake up Around 8am: Wake up time is unchanged since we want to keep the same daily schedule. Jumping around does not help you as you're forced to adjust your body clock over and over again. Go ahead and wake up at the same time. The one item we would add is an additional 10-15 minutes of stretching after your walk in the morning.

Run a Reverse Day: The benefit of free time is being able to go "off schedule". Going to the gym at 1-4 pm is ideal as you'll miss all of the people who go at lunch and all the 9-5 workers. You also have free reign with equipment access. Before you had this luxury you'll distinctly remember how crowded every single facility was. This is similar to a morning commute. If you had this in the past, those days are also over as you can move around when the traffic is low (ideally walking or taking a subway, no need to take an Uber black if it's going to be slower anyway).

Sunlight: Another major benefit of free days is the ability to soak up more of the day. It is much better for your body to be out during the day. Humans were not built to live inside concrete building staring at a computer screen while the sun is shining outside. So take the time to go outside when it is hot out and eat lunch/exercise outside as well. Vitamin D deficiency is a serious issue for people with white collar jobs and there is no excuse for you to be in this camp anymore!

Intermittent Fasting and Dieting: Another good "life hack" is to put your intermittent fasting and high quality diet days on the off weeks. Since you won't have a lot of cognitive work (typically causes people to eat more), you'll be able to utilize some will power and keep the diet 100% clean and your appetite in check. We know that many of our readers are in their 20s with metabolisms that are through the roof… the problem is that this slows down later on. We believed the same thing many years ago and eventually it does slow down. The good news is that in shape people will have a significantly lower rate of decline.

Conclusion: There you have it, if you're not interested in becoming a billionaire and are financially set that is how we'd structure a typical day/month. You'll make sure the following items are checked: 1) your income is still growing each year, 2) your fitness levels are at peak levels with no exception – age adjusted of course, 3) your social circle no longer centers around one industry, 4) you oscillate on and off weeks to give yourself some stress combined with off weeks and 5) structure a "reverse day" which gives you the ability to take advantage of the best parts of each day (avoiding the crowds). Remember, money was just a tool to live a better life. No point in being rich if your life is just as stressful as it was before!

****

A Series of Life Changing Events

A Series of Life Changing Events

For some reason the holiday season always causes us to think about major life changing events and significant milestones. There are a few things that change the way you think about life. Most of them involve mental shifts and some simply come out of the blue. If you don't experience some of them, you'll never know what you're missing out on and if you do experience them it's not possible to replicate the feeling/change in beliefs in the future. Don't bother chasing the high of getting rich with drugs/alcohol for example. Celebrities are Exhibit A for how it all ends. That said we'll outline some of the big ones.

Escaping Near Poverty: Hopefully you didn't have to experience this. There is a certain level of stress that causes premature aging. Worrying about bills, the rent and even food is not healthy at all. While many claim that it's impossible to make socio-economic moves in the United States, we firmly disagree. It isn't easy but it is 100% possible for people who really want to make a jump.

While we don't have experience with the bottom 15% of the economy, starting at the bottom 25% is enough to never forget. Once you jump into the upper middle (top 20%) your stress levels go down to the point that you see it on your face in the mirror. You stopped aging. We can only imagine how this feels if you started in the bottom 10%.

Mathematically speaking, the average reader here is going to be starting somewhere in the center and the real inflection will occur when they break into the top 5%. If you break into the top 5%, you know it is only a matter of time before you become a one per-center for at least 5-8 years of your life. People begin to treat you differently and the following occurs: 1) you will almost certainly buy some stuff you said you would never buy, 2) you appreciate several things that you never understood – for example spa services and resort experiences and 3) you have a harder and harder time relating to your prior socio-economic class.

As a fun fact, the people who make it to the top 5% never end up buying material things for long periods of time. If they were really poor to start they will do a few dumb things (fast car or fancy watch) and then never really repeat it. Also. The ones who really hit it big \$5-10M are harder to read. They either grew up in a rich family and were used to the fancy items or decided to say "f-it" and blend in with the materialistic crowd. Mathematically speaking, unless you find out through the grapevine that someone is ultra rich (\$10M+)… If they are rocking tons of material things, they grew up upper middle class in the first place. Nothing wrong with it, just a simple observation. Oh they also take the most photos too, unsure why that is the case.

The long story short? A smart person who makes it up the ladder has no interest in moving backward. Zero. The amount of failures it took to get there and the expended effort is too large. Their standard dopamine levels are now naturally higher as well. Don't let the "money doesn't buy happiness" people fool you. It definitely decelerates (moving from \$50K to \$150K a year is huge, while moving from \$500K to \$600K isn't really relevant), but it helps a ton as you work your way to the top 20% and then to the top 5%.

A Complete Failure: While the positive part is what everyone likes to talk about, if you push the boundaries long enough you will have an epic failure. Epic failure means you gave 130% of your effort and didn't get anything. Except for the taste of crow.

From what we have seen, these typically occur in standard time frames. Generally? In your early 20s and later on in your mid-40s or so. The first failure is due to the learning curve. You quickly learn that passion is for losers and no one cares about your "interest" in the industry/activity. If you're not good at it… life gives you nothing but Ls. Loss after loss after loss. You learn that your best isn't always good enough.

The second major failure is due to hubris and optimism. If you're successful, you believe you have the experience to swing for the fences. This doesn't end well from what we've seen. There is a strange ebb and flow to success where it goes up through about late 30s, goes flat to down and then many people ramp back up later in life (mid 50s). Unsure why this is. One fun implied message here… if you're already rich by age 30, swing that bat as hard as you can between 33-37. It seems to be the sweet spot. Does it guarantee success? No. Also it forces you to get rich early enough (30) to have a chance to swing hard at mid-30s.

Similar to a rubber band, the harder the fall is (earlier in your life) the bigger the snap back is. The catch? Over time the rubber band becomes weaker (just like your muscles) and would break if you put too much pressure on it over a long period of time. The point of all of this is that you want to take as much pain as possible up front while your body and mind will actually get better (not break).

A Health Scare: When you're in your 20s… You're invincible. Seriously. As many of you know we keep a basic personal journal (no we're not religious about it and no it's not long, 100-200 words is more than enough). Looking back the writing style was certainly weaker and the length was far too long. That said, it's hard to believe how much your body can take at that age.

An example of someone who is 22? You can honestly do the following: 1) wake up go to work for 12-16 hours – including your side business, 2) somehow have energy for the gym, 3) sleep and repeat 5 days in a row, 4) decide to go out and "rage" extremely hard until 3am, 5) have no hangover the next day and work out!, 6) set up a few dates during the week and 7) go back to working 60+ hours a week.

This is not sustainable at all. Not even close to realistic by the time you're 35+. If you decide to have kids, you end up doing something similar (in terms of work ethic) yet 99% of adults end up gaining a ton of weight and aging rapidly due to the sustained pressure to work constantly.

Notice… We've talked about running on all cylinders and somehow tied it to adults having kids. Why? Well they are heavily correlated. You continue to think you're 20 years old until you hit your 30s. Then your body starts to age a bit and you have a serious injury or health issue. This causes you to reflect and many people end up having kids after this event. You realize you're not invincible and life is eventually going to end. As usual we don't give opinions on having kids as we've seen happy people in both camps. But. We're pointing this out now. If you haven't noticed it in the past, you'll notice it now.

Making Money in Your Sleep: We wrote a few tweets on this but it is honestly life changing. People laugh at your first "sleep based income". It could be a \$500 dividend payment or a \$500/month income stream from some poorly monetized internet project you were working on. You will never feel the same once you get the first check.

Why? You visibly see the compounding if you're smart. If you were smart enough to build a small income stream that generates some money while doing nothing… You'll be working extremely hard despite the income stream. This causes your savings *rate* to inflect without becoming a frugal monk.

Do some quick math and say you're spending \$5,000 a month. If you generate an extra \$500 a month. This means you're saving another 10%! That is not a joke. 10% of net income is a higher savings rate than the average american and you're not even trying yet.

We're not sure why it feels different but it just does. The main thing that occurs… your brain no longer believes that you have to add hours to make more money! It will never reverse after this shift in mentality. No matter what you do, people always think in terms of "time exchanged for money". Once you have a money making machine in front of you… There is no turning back.

Significant Loss of Friends: If you think the friends you made in college will be around in 10 years we've got some bad news for you. Unless you were incredibly unsuccessful or incredibly lucky… You won't know any of those people anymore. Why? Well the chances that 10 people in a group make it are slim.

If you attempt to hang onto the past all you are doing is dragging your net worth down. People joke about the saying "give me the five people you talk to most and i'll tell you who you are"… but its 100% true. If you continue to hang out with people who are not going in the same direction, *you are losing time spent with people who are*.

What happens? Your relationships with people who didn't make it deteriorate at rapid speeds. As we've said before. No matter how talented you are, anyone in your age band will think they are better than you. This is just a stone cold fact of life. It begins with *"You changed man"* and *"Don't you think you're making people feel different"*. Of course you changed, you didn't work like a dog to remain in the same place. Also. It is not your fault if they are insecure as long as you're not blabbing about money in front of them. *Note: even if you never talk about money in front of them (ever) or mention your work (ever) this will still happen anyway.*

So how does this shake out? Ultra rich people end up having a few people they trust (call it five people) then a ton of rich acquaintances. There is potential to make money with the acquaintances but the few people who have known you for 10+ years are in a different playing field entirely.

Death in Immediate Family: These types of events really put life into perspective. Sometimes they are actually not incredibly sad. For example if you have a relative who lived to age 90 and really saw/did everything they wanted while dying peacefully, that's not incredibly damaging. We would classify these deaths as "safe" deaths.

The ones that are impactful typically involve: 1) a sudden accident that kills someone, 2) a sudden health event that leads to death, 3) a sudden overdose or extreme situation and 4) suicide/self inflicted death. All four of these are completely different and impact the psychology of the person closest to the event. Ideally, you never experience any of those four but once you see it… This changes your actions almost immediately.

While this is depressing, we'll end on a social note. If someone tells you that someone "passed away" they are usually middle class. If someone says someone "died" they are usually rich as they went straight to the point. And. If someone says they "are with god now" or "went heaven" they are likely from a poorer background. This is something you learn if you've seen the three major economic buckets (started from the poorer background and worked up to well off/wealthy).

Life Turnarounds: We'll end on one last life changing event, a positive note of course. Which is witnessing a life turnaround of either a family member or someone you have known for a long period of time. These are extremely hard to describe as you're forced to realize that anyone can fix their lives. You're beyond excited to see it happen and unsurprisingly you're one of the only people to reach out with a congratulatory phone call.

The other thing this does? It forces you to work harder and actually improve your life at a much faster pace. As a rule of thumb, people who really turn their lives around do a large amount of the heavy lifting without help. So. The image and real life "anchor" is stuck in your brain forever. You essentially get an energy boost from someone else.

With that said we hope you enjoy the end of the year and don't do anything foolish like waste money on overrated New Years Eve parties. Since we put the emotional roller coaster in here, if you have specific positive life changing events that most people go through we'd love to hear it!

****

A Shopping List for Christmas in September and Q&A Announcement

A Shopping List for Christmas in September and Q&A Announcement

Now that we're two months into the global pandemic, it's time to turn our focus to *buying* items at a discount. Notice, we've used the word "items" since you may be interested in purchasing things that will depreciate in value (such as a car) which acts a lot more like a liability than an asset (IE. vast majority go down in value over time). The last couple of months we've spent more time focused on keeping cash flows up. The past two months were critical as you were hit with a golden opportunity to not only make more money through online revenues but keep costs at near zero since everything was shut down anyway. Now, we're in step 1 of the transition phase: purchasing all the stuff you need and even the stuff you want.

Cars (1-2 months): You probably don't need one… but if you do? It is time to start researching. Again. This assumes you need one and this will not be the case for many people who read this blog. The reason is pretty obvious… many Americans will purchase a new car with debt. If the car was purchased with debt and the person is laid off, this is one of the first things that will go. You'll see the same thing happen to homes as well.

More importantly, many Americans own two cars (sometimes more). With unemployment at 20%+ in the United States, the chances that both a mother and father are employed is on the decline. It's a sad state and it is also realistic to assume that many of these households will be forced to sell a car (or both). The potential "offset" is more people living away from a city center (driving up car demand). That said, we'd bet that work from home adjustments would structurally decrease commuting anyway (IE. cars sales will be down). Looking at the automotive SAAR data, -20% is the initial starting point in terms of car sales.

With the grim part out of the way lets look at a simple step by step to finding the right places with the right deals: 1) first find the area with the worst credit rating. You can simply google and find the states with low credit ratings and that is typically a good starting point for where the pain begins. Low credit rating is a simple filter for inability to pay debt. 2) after this we enter "more art than science" as you target the city within that particular state that has a more "materialistic feel to it". An obvious example would be Los Angeles in California and Miami in Florida. Generally speaking, nicer cars are purchased so other people look and say "oh man that guy is rich look at him!". High-end car sales are not about performance, they are bought for attention. The performance aspect is just a way to justify the purchase without looking insecure. As we've said millions of times, if you can target an insecurity (looks – weightloss for example) you're going to get rich in a hurry. And. 3) the last item to flush out is the inventory situation. You want to find the car (in that particular area) that is overbought and popular. Every city has its own culture. That said, each city usually has a type of luxury car that is common. You want to focus on that one as the common luxury car has the highest number of defaults (of course!). There is no doubt in our minds that some luxury sales will actually go up and certain specific cars won't be on sale due to limited supply (Also… the person who bought the unique items are more likely to be rich and not debt loaded).

This wouldn't be a WSPs blog post without exact cars in the text. So we'd suggest going for cars with a typical $80-100K price tag (real luxury but not quite the lambos/Ferraris). The 911 Porsche is a good starting point. These will likely see the steepest discounts when the real white collar layoffs begin. The second area we'd look? The classic "i'm over spending for my middle class income" – this usually results in mustangs, BMWs and corvettes.

Quick pause. We realize the writing above was more run-on than usual. This is due to excitement so you should really look into these cars in about a month or two!

Homes (3-5 months): It is still early. While more and more homes are entering into forbearance, the real estate game is a "long unwind". It takes about 120 days before the home is taken away from someone (as usual there are ways to delay the inevitable, but, we like to keep things simple around here). If we take a look at the timeline, the first month of pain was really March and then April. So we know the deals won't really show up in the first two months. People are busy trying to get their personal lives in order, calculating what they can and cannot keep… so on and so forth. Combine this with unemployment benefits (higher than usual) and a $1,200 stimulus check for many and you get some extra time.

As a rough estimate this would put us out into around August/September. Why? Well we can assume that the unemployment benefits + some savings (hopefully) and stimulus will lead to a delay in many foreclosures. The above is not meant to be an exact figure but more of an estimate. Highly unlikely that it is an exact 120 days from the beginning of the pandemic and it is also unlikely that unemployment benefits help a lot of people after 6 months or so (don't forget, these benefits also go away eventually).

With the rough timeline out of the way, you now have to decide on your real estate strategy. You either 1) buy your own place in a centrally located area you love or 2) you decide to target rental properties. This seems obvious but the strategies are completely different. If you're looking to buy your own place, this is likely a *bigger* gamble. Why? Well, the world is going to change and you have to correctly choose the right cities to live in.

For fun, we'd bet on the major cities with good weather beating out the ones with bad weather. A simple filter, sure, but it also makes sense from a logical perspective. If people begin to work remotely and commuting becomes less common, then the value of weather goes up. Who wants to live in a major city with terrible weather and a declining population? Sounds like a Gothem type scenario. The second idea is clearer, find the levered up states (just google search credit scores by city… again) and you'll get a good starting point. This usually leads you to middle class areas that are seeing significant wage compression.

Both strategies have a high chance of working and you've got an approximate 6-9 month window to strike. That's a rough estimate and it could be a bit longer (12-months) but unlikely lasts much longer than that. So assume that by September of 2020 to September of 2021 there will be an "official bottom". No one times the exact bottom and no one times the exact top so don't beat yourself up over that. Instead, you should look at the *rate of recovery* of the city you bought in. If you go down the single purchase track (you're buying your own place)… you better be right since the amount of money you're putting up is likely higher. If you choose the rental track, you have a little bit more diversity since you're probably buying 2-3 of them in various areas (areas being defined by type of person the market targets in a particular state/city).

Now for the fun part, we'd be looking at the following places: Summerlin/Vegas (Nevada), Dallas/Austin (Texas), Denver (Colorado), Los Angeles (California) and New York City (New York). As you can see the strategies are completely different. Also, you should assume that the major cities (LA, NYC) will see a bottom *later* than the tier 2 cities. Why? The major cities typically have more rich people that will strike first and fast since they're less worried about near-term returns. This keeps the supply off the market for the short term. The tier 2 cities will likely see faster action (people have less cash/liquid savings) and move to nearby suburbs from the major city. For example, if people usually live in Dallas/Austin, they will move 10 miles out or so (lower the cost) and vacancies pick up in the city center. So there you have it, high level strategy along with exact areas of interest.

Commercial Real Estate (6-12 months): Here is where the big money is. The problem? There is no way to earn big time money without big risks. That's how life works. Commercial real estate is going to feel some extreme amounts of pain. Twitter already stated that their employees can work from home "forever".

Going forward, more and more companies are going to look at their workforce and realize that 10% were doing a ton of work and 20% were doing practically nothing and some of them don't even need to be employed anymore (IE. who needs a conference organizer if conferences are illegal?). Without mass gatherings for what appears to be a year or longer… you'll see a large reduction in the need for commercial spaces. Why? Well less jobs = less foot traffic at the city = less revenue for people with leases (coffee shops, sandwich shops etc.) = unable to pay rent = vacant spaces = default since the building had leverage. Hopefully the prior sentence was clear but if not, follow the flow of money in your own city and it should be quite clear.

Why is this going to take a while? Good old corporate politics! No one wants to be the first Company to fire people during a global pandemic. Doesn't look good (you know PR stuff). Also? This allows the big players to drive the smaller players out of business. If you can survive a 2-year downturn, then you try to make your competitors do the same thing. They bleed and bleed and bleed until they go under.

Fast forward a bit and this would result in head count reductions when the market begins to open up. No reason to have those small satellite offices when you can simply log into a computer at home. These positions won't be "layoffs" they will be redundancies where the position is no longer available in the future. Software will take over the VAST majority of all tasks. At this point, a savvy young entrepreneur can create businesses making millions in profits with only one person and a few outsourced items (software does all the basic tasks).

Most of our readers are sharp so they have already figured out what areas will be hit the most: cities with heavy technology exposure. San Francisco/San Jose are likely impacted. Texas and Nevada are hit due to oil and casinos going down. And. Miami will likely take a big hit due to large declines in hospitality.

The most compelling, again our own guess, is a tech focused city like San Francisco, San Jose, Austin, Boston and Seattle. Those cities generally have more tech jobs (we're sure we missed a few) and will be the most open to a work from home environment.

Taking another pause… yes we realize we're taking an opposite stance from Google. We've been wrong about things in the past but our guess is that the team at Google is talking their own book. They bought a lot of real estate recently and likely don't want to see the value collapse. We have no idea how "social distancing" will work in an office. All of the sinks, kitchens, elevators etc. are going to be shared anyway. Perhaps we're missing something but it just doesn't seem efficient or effective at all to have 6-10 feet distancing within the same floor or building if all the items are being touched by 10-100+ people (door knobs being obvious examples).

To wrap this up, you have to wait quite a while for these deals to become attractive. Two clear reasons: 1) companies can hold on for a lot longer than a levered up individual and 2) you have to be extremely careful about what you're buying. These projects cost large amounts of money and can have a large number of investors as well.

Rare Collectables (6-12 months): Right now, Michael Jordan rookie cards are selling well due to the "Last Dance". This isn't surprising as he has a massive brand and following. While we wouldn't recommend buying those during a hype period, you should take a look at collectables in about 6-12 months. People will begin to sell them to shore up some cash. This is already occurring with rare art collections. We're not sure if any of our readers are interested in these things (could be a waste of time) but it's an area worth exploring. In a worst case scenario, you can buy a few items that are likely to go up in value long-term and then liquidate once the economy is in a stable condition.

For those with limited knowledge of a particular collectable (comic books, stamps, rare coins, paintings etc.)… We'd go ahead and choose one that has been around for more than 30 years or so. This will decrease the likelihood of choosing the wrong area of focus. For fun, you'd be shocked at how much money people pay for rare comics. In fact, this might be a good area to start as you're less likely to be emotionally attached to them and can flip them for a profit.

Find the high quality items that have appreciated consistently over long periods of time and purchase those items in 6-12 months when individuals panic sell them (yes it will happen, even for obscure collectables like comics and stamps).

For fun we'll go ahead and recommend the items that have lasted quite a bit of time. We'd look at rare coins, rare baseball cards, rare stamps and rare comics. That gives a different strategy for everyone and choose the one you care the least about (no emotional attachment). If you get attached to it, you won't sell it on the rebound.

Final Shopping List Items: Now for the funny money stuff. If you're just looking to get good deals on some stuff you've wanted we'd look at all companies with heavy retail/commercial leases in place. This is not a fun task. Go through 10-K filings for major public companies in retail for example. Then find the ones with a lot of real estate. These companies will be the most desperate, most likely to go under and most likely to have significant discounts. You can repeat this for any item you're looking to *consume*. The key word here is consume. If you need new suits, go through the financials of your favorite brands and you'll know which website to track. If you're looking for used cars, keep track of those resale market postings and rental companies going out of business. If you're looking to upgrade your apartment or home, track all the appliance companies and construction companies that are hurting. They will all give you the best deal since they'll need the cash flow.

Q&A Announcement: Our Next Q&A will be held on Friday May 22nd. As usual this is only available for purchasers of one of our products.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending. **We hold Q&As 1-2x a month for purchasers only.**

Looking forward to September.

****

Diet Advice for a Busy Professional

Nowadays, in order to get ahead you are practically required to work 60 hours a week. Working 40 hours a week and complaining about money is simply not acceptable. While you should always work smart, the best way to get ahead is to pay your dues early… in your 20's.

With that said here is how you should look at an efficient diet that will allow you to have a cheat day on a bi-weekly basis, allow you to lift and at the same time avoid breaking your budget.

Breakfast:

Everyone tries to eat cereal or oatmeal for breakfast…. *Since everyone else does this you know it is the wrong move.* What is the right move? High protein and fruit or nuts. This is significantly better than a carb overload which will cause you eat more throughout the day.

Breakfast #1: Buy a pound of frozen berries and thaw it out with a scoop of protein mixer. In addition grab a banana on your way to work.

Breakfast #2: 2-3 brown eggs with chopped tomatoes and spinach, no bread. In addition a side of mixed fruit. For mixed fruit you can buy pre-made mixes, frozen mixes or stick with something simple such as grapes.

Last Second Breakfast #3: If you have literally no time, only 2 minutes. Grab a protein shaker and throw two scoops in and have 2 bananas on your way out the door (or grab a bag of mixed nuts). If you have an extra 30 seconds you can throw a green mix into your protein shake.

Lunch:

More likely than not, if you're cranking long hours you'll be forced to eat out for lunch. If your morning is light you can pack a lunch but you'll usually end up spending at least ~$10 a day on a meal if you're unable to take lunch breaks (you won't get one if you work on Wall Street). Usually lunch time is a better time to take in carbohydrates so you can increase the intake here.

Lunch #1: Brown rice with chicken and vegetables. If you're hungrier than usual you can add a lentil or vegetable soup.

Lunch #2: Salmon, vegetables and a side pasta salad. If you take fishoil supplements, you won't need the capsules if you're eating ~6oz of salmon in a day.

Heavy Lunch #3: Spaghetti with meatballs and a side salad. This meal is high calorie so a heavy workout session (legs) will usually follow.

Dinner:

~$20-25 on the Company's dime! Back in the day meal expenses were much higher, but if you're traveling you can spend even more! Long story short, most people end up buying unhealthy food… Needless to say, everyone else is doing it so do the reverse. Your dinner expense should be spent on getting the highest quality food possible.

Dinner #1: The best bang for your buck is going to be at a whole foods, if there is one near by, you can expense a healthy green juice, vegetables, chicken/beef/fish and be well on your way to a high quality meal.

Dinner #2: Assuming someone in your firm ruined the Company's dinner policy by forcing you to go to qualified restaurants, you can shoot for healthier dinner options such as Sushi with brown rice, miso soup and a seaweed side salad.

Dinner #3: Another decent last second meal will be heavier, going with a half baked chicken, vegetables and sticking to a regular baked potato (usually the other options are packed with unhealthy fats you want no part of).

Supplements:

Another question we continue to get is what exactly are you taking for supplements and what exactly are you juicing. The answer is relatively simple, if you're juicing 4-5 days a week you can avoid the vast majority of supplements.

The two supplements we recommend are fish oil and vitamin D. Fish oil is used on a semi regular basis 4 capsules per day 3-4 days a week (none if fish is consumed) and Vitamin D is a great one to take daily since you're likely missing a lot of normal sunlight.

From a juicing perspective, we recommend ~20oz a day 4-5 days a week. Of course you can drink more but here are some good items to throw into a Juice: Kale, Carrots, Cucumbers, Celery, Pears, Apples, Lemons and Limes. As a rule of thumb simply toss in as many vegetables as possible and only use the fruit to make sure it does not taste like AIDS.

Snacks:

This deserves its own section as many people will have "good diets" but they are unable to lose or gain weight as they would like. If you are on the thinner side here are great items to keep at your desk: Mixed Nuts, Raisins, dried fruit and bananas. If you are on the heavier side you should keep the following: protein mix (increase protein intake to satiate your hunger), mixed berries frozen or raw and vegetable mixes such as celery and carrots without using ranch dip, replace ranch with low fat dressing.

Keeping these items at your desk will force you to eat healthier throughout the day. If you end up eating candy bars as filler foods, you simply wasted your entire day.

Diet over Weights:

One last piece of commentary that we would add is that your diet will impact your physique much more than lifting weights. If you're constantly eating processed food and hit the gym you'll notice minimal gains, lower abdominal belly fat and brain fog when doing work. If you take your diet seriously your body will respond positively.

The Bottom Line:

Ideally you have read all the highlights here and are now thinking "These people are health freaks", this is simply false. Health freaks generally stress about what they eat on a daily basis and are constantly counting calories, both *counting calories and stressing are a waste of time.*

We simply provided a few meal outlines but the best way to think about it is in the five bullets listed here: 1) Protein in the morning; 2) Carbohydrates in the afternoon, 3) 20 oz of juice when possible; 4) vitamin D and fishoil, 5) nearby snacks that fit your body type.

That is the TL;DR version and we hope it helped.

****

Adapt or Die – Some Things Won't Be Like the Past

Adapt or Die – Some Things Won't Be Like the Past

If you look at social media, a lot of unsuccessful people have one thing in common: they long for the past. They use arguments such as "I did not evolve to live in a home, we're supposed to live in the wild look for berries, hunt and chill the rest of the day". This type of attitude doesn't work since the clock on your phone will continue to move forward. Humans do not live below a bunch of trees/shrubs since we were smart enough to solve that problem and are currently solving bigger and bigger problems every single year. Therefore we can outline several "evolutionary" problems that are no longer useful in the 2020s.

Tribalism: Tribalism has slowly died. While there is something to be said about being loyal to your own country, the idea of needing peer acceptance is laughable at best. Unless you were born with a silver spoon, the chances are higher that the surrounding people should be ignored. Take any middle class area and you'll find that they are generally behind the times when it comes to technology, medical advances and even social interactions (the way kids socialize has changed dramatically over the last 20 years)

As usual, there are always exceptions. If you are somehow surrounded by winners, then tribalism can help you. We'd wager the chances are extremely low for anyone below the age of 25 reading this website right now.

A good balance is having your current peer group consider you "weird/different". You've gone too far if you're a hermit with zero friends and no ability to interact with the average American. Over time, you'll eventually develop a peer group that is similar in beliefs and moving in the same trajectory. In addition, we're moving to more and more autonomy over the coming decades. Recommended book on this topic is "The Sovereign Individual"

Avoiding Zero Sum Beliefs: This is another one that has been engrained over many years. The belief is that someone else's success somehow negatively impacts your life. This simply isn't true. If your friend ends up making $100K or $500K or $10M it does not impact you in a negative way. Not in the slightest.

Back 100 years ago, competition was a life or death affair. Nowadays, someone can get rich selling pastries, software, shoes, computer parts etc. *and it will not impact your ability to succeed.* Zero sum mentality is only the right view if you're watching a direct competitor in your line of work/business. So. Remember that the success of anyone else in a different industry is a good thing (you are friends/acquaintances).

In fact, we could make an argument that zero sum beliefs hurt your ability to become successful. Why? Well every successful person notices who is happy vs. unhappy to see them succeed. Since 90%+ are unhappy to see them succeed they will remember the ones who were thrilled. They stand out like sore thumbs. Recommended book on this topic is "How to Win Friends and Influence People"

Increasing Status By Dragging Down: Status games are still alive and well. We would estimate that less than 1% of the population is completely immune to status games. That said, remember that dragging a person down to increase your own status usually leads to long-term reputational damage. So don't go out of your way to drag someone down. You're better off improving your own position and worth vs. creating new long-term enemies. As usual there is one exception. You're already getting screwed by someone. In that case you go down kicking, screaming and fighting until the bitter end. You just don't look to *create* those situations.

Creating status is *relatively* easy, the problem is that the solution isn't fun "work extremely hard for a long period of time". No one likes that answer so when we say "easy" we mean "easy" for someone who realizes how life works/operates.

As a note, individuals will eventually be able to tell that you have made it in life. Do not do anything to burst their ego and appear to be "lower" than them at all times. This isn't a game worth playing in social situations. If you lower their status, their ego bursts and they will go out of their way to waste your time. Recommended book on this topic is "48 Laws of Power" the section on not outshining the master. If you surpass… you must cut off all contact immediately and move onto the next stage of life. *As a general rule, you want to lower your status if you're around a group of men that you've never heard of (chances they are lower status) and if you're around women raise it as high as possible without using your words to prove it (dress well, pay with cash, have zero worries/tension)*.

The Digital Economy: This is clear as day from where we are sitting. The newer generation spends more time in front of a screen (computer, phone, tablet) relative to being outdoors. For anyone over 35-40 or so reading this blog, it seems insane. Anyone over 40 remembers life without the internet and a large amount of being a kid consisted of outdoor activities. This is changing.

With this in mind, you should be able to understand the following on a basic level: 1) build an email distribution list, 2) ways to monetize social media platforms, 3) how to operate a server, 4) how to build a basic website, 5) how to use both a Mac and Windows computer – set up a Mac to have both, 6) how to use digital currencies and basic smart contracts, 7) the evolution of video games and what kids are using as their main forms of entertainment, 8) products used by e-celebs to improve their photos, 9) how to use VMware/Citrix and 10) basic changes to taxes across countries as part of your income will likely come from the digital economy in 10-20 years (the last one appears to come out of the blue, but is important if you earn money remotely).

The big and final one is caused by the recent pandemic. Now… You can hire anyone in the world. So middle management layers will be under attack from every single angle. Why build a middle layer when you can have a full organization do an entire task without the overhead **AND** the ability to fire them and switch within milliseconds. We don't have a great single source for the Digital Economy, instead we would read up on the following: Virtual Reality, Augmented Reality, Bitcoin and Other Crypto Currencies.

Robotics Removes Many Manual Tasks: This won't really take off in the next few years as timelines are always aggressive. That said, things like building homes and other manual tasks will be done by robots in the future while drones will also help deliver items (think amazon delivery by robots).

While this doesn't appear to be relevant, it is. Back 50 years ago being strong and fast was an extremely important attribute (as it related to being a male). Even now, you don't need to be strong or fast to be successful, you need to have high amounts of processing power/speed. If you want to be rich in the 2020s/2030s having high processing power and intelligence is significantly more valuable than being a body builder (yes we still recommend you stay in shape, but the point should be clear, intelligence is more valuable going forward).

Therefore? You want to put yourself in a position where you're telling the robots what to do. The last thing you want to do is compete directly with the robots, since you'll lose. Robots work 24/7/365 don't get tired and do not complain at all. This is not a fair competition for you. Instead, you want to be the person on the other side of the screen, telling/training/helping the robot make sure it is operating correctly.

Assets Become More Valuable: This is more theoretical. While we have high confidence in the prior paragraphs, if there is a transition to robotics assets should do extremely well. Imagine making billions of bottles of coca-cola with zero operating costs! Sure it won't be zero (CAPEX spend needs to be there for the robots) but when all variable overhead (humans) goes away, this improves results. Besides, a human is 1,000x more likely to steal from you compared to a trained and monitored robot trapped inside a facility.

What does this mean for you? It means this is the right time to focus on asset accumulation. It doesn't matter what it is (we already gave our big three tech/healthcare/crypto). All that matters if you focus on being an "accumulator" of assets for the next few years. Ownership in anything that uses robotics/high tech should do well as it reduces costs dramatically.

On a final note, this is actually good timing for you as well. If you're making good money, we wouldn't recommend showing it at this time. The socio-economic divide has escalated rapidly. In fact, Luxury home sales are up 42%… That is an insane figure. So you can see that the divide between the rich and poor got a lot bigger this year. So? Adapt to the situation. Accumulate assets, wait for the economy to normalize and socio-economic stability to return. At that point you can go back to flexing on the gram if you feel like it.

Follow the Trend: What is the major trend? Well we can all agree that remote work to some extent will stay. Look at home prices in San Francisco, they are falling along with rents. Technology companies: Twitter, DropBox, Google and more are allowing their employees to work remote.

This simply emphasizes the need for a Digital Economy. If people need to be at home during "work hours" cooler talk will be replaced by video game breaks. Office gossip will be replaced by VR meetings. Homes will become a lot more advanced with new amenities we couldn't even imagine 10-years ago. For fun, if we could find a popular video game where each "match" lasted 10 minutes or less and was highly addictive we'd invest tons of money into it. Why? It fills the water cooler break perfectly.

While remote work is the obvious trend we'll go ahead and list a few other ones that we expect to be big outside the ones mentioned above: 1) rare-earth minerals and electric vehicles as mentioned in prior posts, 2) space travel/exploration/space vacations, 3) technology used to improve the physical environment from cleaning water to air pollution, 4) privacy as individuals will want to regain control against an overly invasive corporation/big brother entity, 5) life extension technology and ways to incorporate technology into our physical bodies and 6) popularization of digital scarcity – after all the digital economy needs a way to "flex" so a rare digital item will be seen as "cool" just like a Patek in the physical world.

Conclusion – Forget the Past: Generally speaking, you want to forget the past. You can remember the lessons, but, hoping the hands of time will go backward is simply foolish. Instead, you want to live with a balance of both the present and future. Enjoy your life today and prepare for tomorrow. Yesterday was just a bad dream. It should be a bad dream because your life is better today and will be better 10 years from now as well.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life. **We hold Q&As 1x a month for purchasers only.**

Adjusting Your Net Worth and Preparing for Downturns

Adjusting Your Net Worth and Preparing for Downturns

The last time we saw a real recession was 2008-2009. Over the past 10 years we've been in a perpetual bull market with nothing but upside (so it seems). 2011 was one of the rockier years during the bull run, but it persisted with double digit returns on a consistent basis. Looking back, the prior recessions occurred every ~5-7 years on average: 2008, 2001, 1990, 1980-1981, 1973 etc. There is no logical way to see forever growth in any economy so we should be aware of a potential down turn (relatively soon). Here we're going to highlight portfolio management ideas along with age related opinions on how to manage a pull back. We covered building a recession proof life for older readers in a prior post.

Age Related Allocation

Young 22-26: In this younger bracket, you actually don't care about recessions! That is right, your only goal is to keep your cash flows high. Unless you were lucky enough to already make it (skip to the net worth related allocation) you're simply trying to stay employed. Financially responsible young adults will be able to put away anywhere from 20-40% of their annual income into savings. They don't live glamorous lives a lot of the time (until they've made it) so they can easily weather a storm. Even if you're at the high end of this range and you have 1.6x years of living expenses saved (40% * 4), you're still able to sustain a 50% cut and end up at over 1 year of living expenses.

In general, the rule of thumb is to keep at least 1 significant cash flow item up and running. If you're able to do this you're going to survive and spend all of your additional time building that second form of income. Once the second form comes in and the economy improves, your income will sky rocket and you'll triple the amount of money you're putting away in a year (or more). So remember, if you're young, recessions should be less meaningful to you. Just do everything in your power to create cash flow (career or businesses, either work since you're young.

Young-ish 27-33: At this point, emotional stability should be quite difficult. This means a recession will certainly hurt your net worth. There is no way to continuously grow your net worth through a recession every single year for the rest of your life. At age 30-33 your net worth is high enough that it would be almost impossible to see an increase without selling assets (your business or another item that has appreciated materially). This is essentially the last "battle" you'll face. Surviving one recession when your net worth is high leads you to an immense amount of wealth later on. It just isn't fun.

Run the math on this. If you only had $100K, you would have seen your net worth roughly triple from the bottom of the recession to today based on boring S&P 500 returns. This means the survival of a recession will be enormous for you. If you have ~$1M and you're able to weather the storm of the next recession… you can see a clear path to at least $2M and more likely $4-5M just on S&P returns and your regular income! Think of this as the final battle before seeing a blue sky scenario. After you're through a downturn (seeing your net worth likely come down 20-30%), you'll be in a great position to get rich over the following 5-7 years.

Age of Relaxation 34-40: At this point you're set, you're not really worried about making a billion dollars and you're more worried about enjoying your life (maximizing utility). With this in mind, if you've already survived at least one recession during your high income earning phase you probably want to adjust your portfolio a little bit. This means you're going to weight more into boring items like bonds and CDs because you only want to see a ~15% or so decline in your net worth. It's not going to be easy to make up for a 50% or even 25% reduction in net worth so it's better to limit the downside. Similar to age 27-33, there is just no way to see forever increasing net worth, but there is a way to mitigate the downside quite a bit.

The second way to think about this is risk tolerance. If you've already settled into a lifestyle that can sustain a 50% decrease, then you can be much more risk on. For example… If financial independence only represents 30% of your net worth, having a large exposure to higher risk assets isn't a problem. Just remember that you'll never dip into the money you need to continue with financial independence. You've already won the "money game" so no need to replay that one.

Age 40+: At this point no one is going to listen to advice/opinions anyway! That said for fun we'll simply say that the person in this position shouldn't risk anything that would hurt his own family. If you have kids (or don't, none of our business), you shouldn't put their futures at risk due to a high risk tolerance. Other people are relying on you and it is better to make sure that box is checked before looking at bigger, riskier assets.

As a side note, an interesting thing about people in their 40s is that they seem pretty "set" in their minds financially. There are really two groups: 1) people obsessed with making more – their identity and 2) people who are set and looking for lifestyle design. We are very heavily in favor of item 2 since the chances of being remembered on a historical basis are one out of one trillion or so (we don't even know the inventor of the refrigerator or toothpaste for example). At this age it's best to just agree with people since they won't change their minds and they will fall into one of these camps.

Net Worth Related Allocation

$0-100K: The one benefit of being on the low-end? No worries! That's right. You shouldn't even bother with portfolio management because you should be focused on earning much more money. Earning money will increase this number even if the market goes down 60% over night. By finding a way to earn $50-100K extra per year, you've already made up for the entire decline and didn't need to worry about the news, product cycles, earnings cycles and balancing a book.

$100-300K: At these levels you're really focused on investing all of your money into another income stream. This means you shouldn't be interested in investing yet again. Instead you're interested in *"building".* Instead of looking at opportunities to invest money, we would look for opportunities to buy an actual asset. This would mean an online business (of course!) or a fixer-upper home (if you're going the real estate route). Essentially, when you're in this range, you're not earning enough to move ahead so you have to find an asset that can give you "forced returns". Forced returns means you can put a lot of sweat equity into the project and force the returns higher (a business and real estate offer this).

$300-$800K: This is a very strange ball park range. Essentially you have enough money to do damage with investing (if you doubled $500K you're a millionaire). But. You also unlikely have a high income. You need to increase your income a bit more and make sure you can cross the low seven figure range before really making it to financial independence. We'd argue that $500K isn't enough to be independent because a $500K portfolio that goes down 50% is not going to support anyone for very long.

In this ball-park range we would say you're forced into online business. Unless you already have a real estate portfolio, you're not going to find an easier way to increase your income. Why? Time constraints. Working online means you can work while in a cab, on a flight, at home or in an office (hint hint!). We'd be doubling down online until you can get cash flow numbers up another $60-90K. It sounds small but it would be enough. At these levels you'll likely have a lot of deductions, ability to reduce taxes and the incremental $5.0-7.5K a month will cover the vast majority of your living expenses. Your regular income outside of the online business would flow 100% to the bottom line.

Financially Independent: Once we start talking about numbers in the million dollar plus range, the majority would call this "financially independent". Sure you still have to do something for money (just because you will be bored otherwise) but you're not taking it seriously. Our rule of thumb here is to "protect the principal". As soon as you have 25x the amount of money you need to live in a year (25 annual living expenses) this should be thrown into very low risk items. Majority bonds, CDs and a small amount of boring dividend stocks. You'll probably clip around 4% and this is just enough to live if things really hit the fan. The rest of your money isn't material and we're sticking with this strategy. *Under no circumstances do you ever dip into principal associated with your financial independence hurdle.*

Net Worth In a Recession

No 401K: We got a lot of negative feedback when we stated that your 401K should not count towards your net worth. We continue to believe this since it will help offset any declines in a recession. As a basic example if you have $1 million and then $300K in a retirement account, the real number is around $1.15 million since it would cost you 50% to take out the retirement account money. The good news? If you're conservative you never counted the 401K money in the calculation in the first place.

By never including the number, you're able to have an extra emergency buffer in a downside scenario. We have always used this as a tactic to avoid inflating a net worth number. The tax rate is unknown so strip it out and get the real number before calling yourself "set".

Adjust Down Based on Upticks: If you've never seen a recession we would say net worth should be deducted by 25%. Another way to do this is to discount your total net worth as you move along. As an example, since we know each recession occurs every 5-7 years or so, we can just use a 5% haircut at all times. If you have a $1M net worth, that would be $750K if you're 5+ years into a bull market. If you are in a recession the net worth number really is $1M. This causes you to become a lot more realistic about the real net worth.

Every single year the market is up, at the end of the year, take 5% off the total number and that is the real net worth. If you go into a recession with a $1M net worth but mentally believe you have $750K… when it drops to $750K you won't be rattled. Once you make it out you can then adjust back to normal (no discount) which reflects your true net worth. This is a very solid strategy for people in the later years since retiring and seeing a recession would be the worst possible set up imaginable. (this happened to a lot of people in 2008!).

10% Rule: The last item to keep in mind is the 10% rule. This is applicable to people who are above the age of 30 or so. You want to have 10% of your net worth in boring cash. Simplistically you move up from 2% and each year the market is up you increase this by a point or two. This helps offset the downside of a recession. Running the numbers, if you have 25x annual living expenses this means you have 2.5 years sitting in cash. This will allow you to weather a material recession and if it lasts longer than 2.5 years… well the world has a lot bigger problems and other people are suffering much more than you are.

Paper Napkin Calculations: For fun we'll highlight a few numbers we use to give an idea of what type of portfolio you'll want. 1) If you're under $250K or so, it just doesn't matter and you should be focused on building more streams – real estate or online, 2) If you're above $500K you're switching to online business and you're just barely low enough that you can own stocks + real estate and weather the downturns, 3) at $1M you should begin diversifying quite a bit because a 50% decline at $1M would be difficult to make up (it would require ~$750K in gross income just to get back to $1M), 4) to be more conservative, adjust your net-worth down by 5% every single year the stock market is up, 5) take 25x your annual living expenses and this is essentially the amount that you don't want to gamble with once you make it (the rest will be risk on – our style, or risk averse depending on your personality).

AMC, GameStop and Nokia – Why it is a Huge Deal

[AMC, GameStop and Nokia – Why it is a Huge Deal]

Say what you will about the valuations, the banning of Wall Street Bets is beyond ridiculous. While we don't think any of these companies are worth their current market cap… that is not the point of this post (at the end we'll explain why). Instead, we'll walk through what exactly is happening and why we're pro Reddit and against the "coincidental" banning of Wall Street Bets.

Fundamental View: People complain that there is no "fundamental reason" why GameStop is soaring. We'd argue there *IS* a fundamental view. The fundamental reason is Melvin Capital shorted 100%+ of the stock. This in turn created an opportunity for them to be short squeezed into oblivion. That sounds like a lot of financial chatter for anyone who doesn't understand what a float is or what shares are. So we'll dumb it down even more.

The stock market is a market. This means that normal companies have say "100 shares" to trade. Think of it like apples. If you have millions of apples being traded every single day they will eventually meet a price point of say $0.25 per apple. This is healthy.

Now a new person comes in and we'll call him Melvin. Melvin decides to sell every single apple on the market leaving the available apple market of just 100 apples. Melvin will sell all apples at any price. This creates a strange scenario. Since Melvin is saying all apples are worthless now the remaining 100 apples determine the "current price".

A bunch of individuals around the world create a forum to buy apples (Wall Street Bets). They then realize they can make a TON of money by simply buying the 100 apples from one another at an ever increasing price. This is normally a prisoners dilemma game because who would buy 100 apples knowing Melvin is just going to sell it. Well… If you all work together, we know how prisoners dilemma works. If everyone agrees to just bid up the apples… the only person who gets screwed is Mr. Melvin!

That is a rudimentary example of what happened. *By shorting the entire company, there were only a few shares to trade. Smart retail investors then slammed the stock, buying it rapidly with small sums of money sending the price to the moon.*

Now who is to blame here? Apparently according to our society, it is Wall Street Bets. The view on this side of the web is it is Melvin's fault. If you short 100% of a company which is legal, you put yourself up for a short squeeze which is entirely fair/reasonable. If they want to prevent this type of price action, then there should be rules that state only 50-60% of a Company can be sold short (we're making it up). There is no logical reason to blame Wall Street Bets.

No It Is Not Insider Trading: Wall Street funds have idea dinners. These are events where the 10-15 biggest managers all meet and drink wine. They decide which "stocks" are the best buys and all go into them. How is this any different from a bunch of retail investors seeing a short squeeze opportunity? It isn't different at all. If 15 major fund managers with $10B+ each can dump into a stock due to a private conversation, how come retail investors can't do it in a public conversation. At least the public conversation is honest.

In fact this is extremely intelligent "fundamental *market* analysis". If you realize a fund can be short squeezed to the tune of $10B+… Why wouldn't you squeeze them. They put themselves at massive risk (with client money no less) and deserve to be punished for levering up and shorting the stock (excessive greed).

Onto the Future: Right now shutting down these types of market moves is possible due to circuit breakers and centralized exchanges/servers. What happens where the servers are all decentralized and the market is on-chain 24/7/365? At that point there will be no circuit breakers and the market will move prices organically. It also reduces the use of leverage. Who in their right mind would lever up heavily in a 24/7/365 market? No one intelligent. So, the long-term future of decentralized exchanges is high.

Millions of people learned how this game is played and it's going to come back at some point. Maybe it dies down for a day, a month, a year… But the playbook is now out there. If a hedge fund is foolish enough to put themselves in that type of position, they will get burned again and again and again. This is great as firms should not be levering up 5-10x with customer money to short every single share of a single stock without any repercussions.

On that note this was a huge day for decentralization. Several people on our twitter commentary actually understand it. They will be rich. Filthy rich. The ones that do not, might get lucky and time the next pump. And. The real money goes to the same old people. The visionaries who understand the long-term consequences and invest in the right disruptive technologies/industries.

Q&A still set for Friday. Enjoy the fireworks in the meantime!

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life. **We hold Q&As 1x a month for purchasers only.**

American Cults and Subjects that Stir Up Emotion

[American Cults and Subjects that Stir Up Emotion]

For fun we're going to outline some extremely emotional topics where you're better off avoiding discussions. If you want to polarize an audience to grow your social media platform, then you should certainly take a side on these topics. We bring them up once in a while just to stir the pot but at the end of the day, in any sort of meeting or real discussion, try to avoid the topics. Unless you've known the person for 10-years and they are not a client (IE. you won't lose money) try to avoid these topics. People are extremely attached to their views and won't listen to the other side. Even if the can readily open Microsoft excel and find the answer in less than five minutes. Time to jump in the ring!

Housing: There are actually two cults now: the "you must buy" and the "you must be a renter for life" cults. Neither of these are accurate but you'll figure out where someone stands very quickly on the topic if you ask them about their living situation. In short, we think it is smarter to go ahead and remain a renter unless 1) you are over ~30 years old and 2) you are going to stay in the city for at least 10-years. These two items prevent you from losing out on money making opportunities (location) and also allow you to build equity if you love a specific city and plan on living there for a long time.

At the end of the day, you want to limit your housing expenses even if you can afford a bigger home or apartment. Why? Well the only three real expense lines are 1) housing, 2) taxes and 3) food/water/utilities. If your housing expense is 10% of your monthly income (renter or owner), it really doesn't matter if you decide to rent or own. Why? Well it's unlikely your expenses are significant beyond this payment. People who don't understand how compounding works, will say "I don't want to live in a car!" when in reality they should be thinking of ways to earn more money. If you were to earn a large amount, say $20,000 a month… This idea makes logical sense. By living in a basic place (one bedroom or studio) for just a year or two… You'll be able to buy a better place outright due to the savings you incur in just 18-24 months. It's really that simple. Rent or own is less relevant, what matters is how much you're throwing into it.

The only real common mistake when it comes to housing (beyond the math above) is when people attempt to buy the "maximum house" they can afford. This rarely works out. Why? If you're buying the maximum you can afford, much more of your payments go to interest and not principal (dollar basis) and any sort of downturn in the housing market (didn't buy the bottom or mid-cycle) and your math gets ugly very quickly. The usual miscalculation here is the state tax expenses. While you do get to deduct a lot of costs when you own a home, the taxes, insurance and maintenance all add up. Over time, you're essentially putting too many eggs into the real estate market. There is a reason why millionaires are defined by net worth excluding their home (many are "house rich" but cash poor).

Doctors and Lawyers: Since you were a kid, doctors and lawyers were supposedly the best professions. Unfortunately, if you were to actually run the math you'd realize these are not good professions for getting rich. Your average guy with no experience will always point out the top 5% of the people in the group (people who start their own medical businesses or lawyers who make partner) and completely ignore the other 80%+ that are not doing well relative to debt load and savings. People really believe that making $300-350K a year pre-tax in a high cost city (NYC/SF/LA) is a lot of money when a 2-bedroom apartment would cost you $1.5M+ or at least $5.5-6.0K in rent alone. While we would go ahead and put the numbers here, well just link to our blogging friend Financial Samurai instead who did this already. We already ran the math here a million times as well, but no matter what the math says… people will still inevitably make terrible financial decisions. Day in. Day out.

Pausing for a second, there is nothing wrong with doing the professions if you actually want to do them. Saying you'll get rich is just not true though. Everyone has access to a wealth manager, just talk to 2-3 people in this industry and you'll find the same tired old answer. The most common rich people are 1) small business and 2) real estate. After that you're looking at Wall Street/Technology since the two industries allow for high saving rates beginning at age 21 or so. People have access to the facts without any serious effort (30 minutes of contacting people) and yet the belief is engrained in american society.

Sports: This is really the best. As usual when you follow the emotion you can make money. Overly logical people think you can't earn money gambling. Lucky for you they are totally wrong. They are correct that the average person will fail. But. There are many many bookies who lose millions of dollars to "sharps" which run algorithms that win 60%+ of the time. With a math background you could create your own algorithm that legitimately wins and then you're basically running around looking for accounts (you'll get banned for being a perpetual winner and need other people to bet on your behalf… *Ring a bell for another similar industry anyone?*). Anyway. Sports get so emotional that you can even find ways to guarantee winnings through arbitrage (one book offering different lines from another).

The second way to do it is the good old fashioned hobby way to do it. Actually be good at one of them. For fun we troll twitter with extremes but the reality is that we'd define good as anyone who competed at a decent College (leave it open ended as the worst private D3 school likely doesn't count). High school is not legitimate as anyone can make the team and if your team won a state title then you likely played in college as well. Neither here nor there. There are sports like boxing where you know the "edge" will go to the A side of the card and there are nuances to match ups in any sport where the stats won't line up appropriately. Most people who bet here and earn money do it as a hobby (not emotionally attached to the players) and make mid 5-figures a year. Nothing terrible, nothing amazing. Just a fun way to make the event more exciting (sure beats movies and TV shows when you're sitting in an ice bath recovering from a hard workout).

Fitness and Diet Cults: This market never seems to die. The routines are well known and people still find ways to put a spin on it. Fast for 16 hours instead of 15 hours. Cross fit (the injury Olympics). Plant based gluten free vegan tacos… So on and so forth. No one likes the real answer since it's too basic. Only eat healthy foods, drink a lot of water and work out 4-5 days a week (hard, where you're sweating and sore/tired the next day). If you decide to tell someone this they will more than likely tell you how their "special routine" is the best on the planet. Then you ask them for their performance numbers and they have their tail between their legs screaming that you're "mean"… Sigh.

Anyway, the best way to avoid these topics is to simply avoid these discussions. Don't join fitness forums. Avoid new fads and stick to the basics. "Does this make sense". That's the best way to see if a fad will hold up. Training at max potential every day (cross fit)… does that make sense? No. Eating only meat and zero carbs for life does this make sense? No. Eating healthy and working out hard with a few rest days between without counting every single calorie? Yes. Pretty simple logic. This will then allow you to pick up some new routines as you learn about a few different specialized muscle workouts for your body type. Doesn't get any easier than that.

Superstition Cults: This is a growing phenomenon. Didn't realize how emotional people get about them but there are people who will battle to death about their specific "skills" related to astrology and your birthday (other such things like this). While great if it works, we stop when people claim they can predict the future but make $150K a year. This makes no sense at all. While it's perfectly natural to be a mis superstitious (we are as well), we're not going to take life advice from someone who hasn't accomplished anything just because he gets a few predictions correct. If the guy was actually that accurate he'd be very rich. And. If he's really rich, then we'll go ahead and listen.

Feel free to do what you please as it relates to superstition. Ours is a lot easier. Avoid unlucky people. Attach to lucky people. Don't think about it on a daily basis. Pretty simple. So if you know person A always seems to have things go his way, stay close to that person. If person B always seems to get screwed over at the very last second, it's best to avoid them. This will naturally cause your relationships to skew towards people with better luck who will naturally be better off in life. Besides, it's better to be lucky than smart.

Recent Minimalism Cult: Did a big number on the minimalist cult with our fashion posts. If you're worth $100M and drive a Ferrari, no one should care. If you're worth $1M and drive a Ferrari there is a problem. Really is that simple. People think that every single person with nice things is a "loser with personality problem who can't get laid", in our experience this isn't the case. Just like any bar/club there is always an exception. Ask it a different way. If you had to bet your life on getting lucky on a Saturday night, would you really choose to drive up in a Honda Civic or an Aston Martin? Would you really choose to wear no watch or brand new Patek and custom fitted clothing. Everyone knows the real answer they just aren't being honest about it. The only significant exception here is probably if you're under 25 where the easiest answer is to just go on Spring Break in Mexico where you basically have to be autistic to fail.

The whole idea of living a basic life is very cool when you're young. It prevents you from spending on meaningless things like splitting bottle service with a bunch of people. But. At some point, you have to ask what the point of making money was. If you really only want to live on $30-40K a year you probably shouldn't even read this blog (in fact we don't know why anyone would read this blog if they didn't want to be rich). You want to scale your spending with something that is sustainable long-term. No one in their right mind would wake up, have $10M hit their bank account and say "I'm just going to eat lentils and bike around the city for the next 50 years". That's so boring it hurts. As usual, we'll be reasonable here and say to lean on the side of conservatism when increasing spending. And. You don't want to become a boring guy after getting rich… Otherwise what was the point?

Dating Complainers: As soon as we saw this form we had to stop answering questions about it forever. There are really people who say that it's hard to date women in New York, Miami or Los Angeles (highest concentration of attractive women in the USA). What are they really saying? They are not of high value. The only thing that needs to be said about dating is that women will go for the best man in the group since she wants the best she can get. Men on the other hand go for the best looking woman. Surprise, surprise, neither sex is doing anything illogical here. The only thing people should be worried about is if the city has enough attractive women. Why? We'll if you actually have your life together: in shape, rich, good amount of free time… You would be at the top of the pack. Makes logical sense then that the only people who complain about the three best cities are not at the top of the pack, not even close. (for fun to be in the top 1% of income it's somewhere around $450K… So you don't even need to get there since around the top 10-20% of men do well in the dating category).

Assuming you make it, which many reading will, you'll eventually go down the private party route. This is because it's a natural filter for everyone involved. The girls who show up know that everyone there is at least well off and the guys don't have to worry about unattractive women showing up and interviewing them in front of their better looking friend. Sure you'll still go out and party here and there. But. The preference will shift to events where everyone knows the people are not complete losers. While it's still fun to go out and meet random people, it's kind of sad to imagine a guy trying the same old tactics as a 27 year old.

Company Man Cult: These are much more common on the coasts, but there are still people who talk about prestige and take pride in working for some major Company. It doesn't make any sense. 99.99999% of people are replaceable in a Company and the only reason that Company is hiring someone is so everyone on top can make more money. Tell this to a "career man/woman" and you'll immediately kill the social interaction (we've tried for fun and it gets ugly very quickly). While it's sad to see, it's also impressive. The Company has made the employees legitimately feel like they are part of something bigger and important… When all they are doing is making someone else richer. Nothing wrong with working at the best possible company you can get into on day one… But being proud of wearing that sweater vest and lap top bag? Quite insane.

The most interesting thing about the Company man is that you know he is easily brainwashed. You can actually tell what they will believe in after 5-10 minutes so you can adjust your positions on the fly if you need to establish rapport with him/her (hopefully a her if you're in a new social situation). The downside of this is that you're not going to change their view on this stuff. They are *sold*. Entirely sold on their decision. Instead of trying to get them to see the light, you're better off making them feel smart/special. When it comes to making money, telling someone they made a bad choice is equivalent to telling someone they are ugly and gross as soon as you say hello.

Debt: There are many people who don't believe in any type of debt. This is an interesting topic as there are many wealthy people who get rich with zero personal leverage. It's rare, but it happens. The problem is that this type of thinking is far too risk averse. Without any sort of leverage at any point in time, mathematically their net worth is lower than it should be. By way of example, if someone gives you a loan at just 2% and you can't figure out a way to make more than 2%… you're in a lot of trouble.

This creates two camps of people: 1) never use debt and 2) people who got rich off of a lot of leverage – typically real estate people. We're somewhere in the middle. The easiest way to figure out how much leverage you can take is based on your passive income. Once that gets to say $100,000 a year, that means you can take your annual interest payment up to $100,000 in a maximum scenario. It's unlikely you'll do that as it implies $2.5M worth of debt, but you certainly shouldn't be debt free if your investment returns can beat the standard 4% rate on the debt.

So if you're running a finance blog, you can quickly cause debate with the classic "how much leverage is too much" question. There is never an answer here but you'll quickly see how cult like both camps are. Guys who took out massive loans on homes at the bottom of the market (under 10% down payments) will say the debt free people are foolish. Meanwhile the debt free person might have all his money tied up into some high risk high reward biotechnology stock that could be a $0 or up 10,000%. Hence the natural debate.

Gambling: Ah yes leaving the best for last. Gambling. There are many people who can consistently make money gambling. This is not in roulette or black jack but in sports/poker. Any time the "line" is set by humans, you know there is an opportunity.

So people who are not familiar with statistics or arbitrage will complain and say it's not a way to make money. But. It is. Just ask them basic questions about sharps and algorithms and see if they actually know what they are talking about. 100/100 times they will not know what they are talking about. And. There are also people with significant sports knowledge that can make money with their knowledge of the sport. On that note, we're loaded up on Canelo for the weekend fight.

Just remember, when you talk about gambling it's actually a good way to weed out boring people from fun ones. At minimum if someone doesn't have $5,000 to bet on a game once and a while (entertainment) they are either 1) broke or 2) too boring to hang out with. No one can stand the guy who never gambles in his life, it shows he's never willing to make irrational decisions once in a while. Essentially a robot.

****

Analysis Paralysis: Damaging Your Net Worth and Future

Analysis Paralysis: Damaging Your Net Worth and Future

We've been writing too much. The blog grew far too quickly and we're receiving low quality questions that are being deleted at lightning speeds. Not a good sign. While many of the questions appear to be good from the perspective of the reader, they fall under the same umbrella: **Analysis Paralysis.** This is a function of asking questions when: 1) they have no other options, 2) are not even in the situation they are describing and 3) are looking for a short cut to making money. All of these questions go straight into spam.

1) Examples of Low Quality Analysis Questions

2) How to Avoid Paralysis with the 90/10 Rule

3) Most People Shouldn't Read This Blog

4) Why You Should Think in Terms of a 2-4 Year Plan

5) You Will Only Succeed When You Have Specific Differentiation

"Analysis Paralysis. Over-analyzing or over thinking a situation so that a decision or action is never taken."

Examples of Low Quality Analysis Questions

This is going to be an extremely easy section to write. We are simply going to pull terrible questions from the spam section and show why the person either 1) didn't bother to do low level research or 2) is trapped in his own mind thinking of scenarios that do not exist.

Will Investment Banking be Automated? Anyone who thinks this is an imbecile. Plain and simple. Investment banking has ***nothing to do with trading stocks or investing.*** It has to do with transactions. You are a salesman. Unless you believe that interpersonal relationships will be automated (they won't) then investment banking is going to stay for a long time.

When you buy a home, you hire a real estate agent. When you sell a company you hire an investment banker to negotiate the sale/purchase. Reiteration. It is a sales position and unrelated to "picking stocks"… a common term used by regular people.

This is an example of a terrible question. The reader doesn't even know what investment banking is. The information is free and if they cannot find out how the business works with a Google search… they certainly won't survive in the hyper competitive industry.

Should I Take XYZ Job? If it is a job and not a career the answer is always no. The only time you take a job is is if you are forced to *or* it can be leveraged into an actual career in the future. Secondly, if you don't have anything else on the table… You cannot ask this question. Without multiple job/career offers there is no point in having a discussion anyway. Nothing has happened! This is a waste of brain cells since the decision was made for you already. If you need income and have no other offers… You have to say yes. If you are concurrently interviewing with other firms, the answer is to delay acceptance.

In short, this question is wasting valuable brain cells. If you only have one option, you're forced into saying yes.

What Are My Chances of Making $X? We don't know. No one knows. If you cared about maximizing your chances you would simply try your best out of the gate and see what happens. This does not mean you spam everyone you know for career/business opportunities. It means you do the requisite research (about 1 month) then present the "best you" at the time to hundreds of firms.

This question is typically asked by people who have taken no action. If you did the research on what you're trying to accomplish you would already know how to best represent yourself. If you know how to best approach the situation… All you have to do is try at that point.

What is More Important Game/Looks/Money/Status? Another terrible question that we constantly delete. There is no saving these types of people. The best you can do is hold one item *constant* and try to make observations based on your personal experience.

It is simply silly. An extremely good looking person or a person with a position of extremely high status (DJ, promoter, professional sports player etc.) does not need as much "game" or as much "money" to compete. This is not even worth talking about. The goal is to maximize your potential. Not argue with broke people on the internet who can't even make $100K+/year.

The more important question is this: how do you maximize all four? That's what this blog is about when it comes to life advice.

In short:

1) Looks improve until at least 35 as long as you stay in shape (learn basic fashion, hit the gym)

2) You have more energy in your 20s. If your looks are going to improve the obvious answer is to focus on money and status.

3) Now that you're focusing on money and status which skills are the most valuable? Easy. Sales and networking. Sales and networking = same thing as "game" which is just sales. (You selling yourself)

4) Put it all together. You work on sales and networking. This improves your career and business. This also improves your general social skills with women. This leads to a bigger social circle (status) and leads to more money (leveraging your time). Now you're in your 30s and you're worth over $1M and don't have to worry about anything.

Alternatively. You can do what everyone else does. Try to maintain their college circle of friends (temporary status) and get drunk 3 days a week. Work a dead end job that pays a salary until 30. Look around as their college girlfriends all go for guys 4-10 years older than they are (usually around the age of 25-26). Spend their mid-thirties chasing money while the smart guys relax and have fun.

Takeaways: This is probably the most negative section we have written in over 3 months. It needed to be done. These questions are simply terrible. Expecting to get ahead of the pack by doing what everyone else is doing… simply won't work. Build the framework of how life works and weight your time appropriately. If you do this correctly you're going to be flying down the runway like a drag car racer. If you do it incorrectly, you'll be watching in the stadium.

How to Avoid Paralysis with the 90/10 Rule

Now we're onto the more positive and fun items. As we stated at the beginning, we have been writing too much. Why? We're getting overtaken by questions from people looking for "hand holding". The best way to avoid the hand holding trap is to simply find a way to improve yourself.

Most people focus on the gym as their bread and butter way to start improving. This is not the right move (not surprising since it's what everyone says to do first!). Being in shape is like brushing your teeth. It is not something to brag about or even consider as an accomplishment. Use this as a strong filter for being surrounded by guys who won't go anywhere in their lives.

Your first course of action? *Find a high income by leveraging your intelligence.*

How do you find your skills? Try at least 10 different types of career paths until you hit the jackpot. You'll know you're generally good at it when 1) other people tell you you're good and 2) you find the work to be 80% enjoyable (~20% of every single industry is dealing with nonsense)

Wall Street Example: Lets say you are reading this for Wall Street information. Based on your peer group, you want to go into investment banking. Is this really the right move? We don't know you, so we can't answer yes or no. What is the point of investment banking? It is to develop long standing relationships, learn how to sell and think strategically. It is not about creating excel sheets all day. That is the mundane portion of the job that you will eventually outsource when you begin generating revenue for the firm.

Situation 1: Lets say you're working an investment banking internship but find that your short term interpersonal skills *significantly* outweigh your ability to look at a landscape slide and find M&A targets. The answer is obvious. *Go into institutional sales instead.* Why? If you're not able to correctly understand a landscape and the subsequent strategic plays, over the long-term you're not going to make a great investment banker. You will likely make a great institutional salesman and you will still clear well over $500K a year in short order (early 30s).

Situation 2: During your same internship you realize that you're quite good at predicting which M&A deals will fall apart or get bid up. Congrats. You should probably go into investment banking for 2 years and immediately *jump into a Merger Arb Hedge Fund.* Why? Even though your skills are good in terms of analyzing deals, if you're able to synthesize the transaction quickly there is *much* more money in the merger arb field than there is as an investment banker. Practice what you preach and jump in year two.

We could go on and on about this (if you're better at understanding how to run a book you're better off at a L/S hedge fund or in Equity Research etc.). The point is the same. If you're reading this blog for information on Wall Street you should do the much more important task of finding what section you should work in first. This is going to pay back millions of dollars versus the $250K a typical associate will make. Spend 90% of your time finding your skills, spend 10% of your time looking at what niche you should jump into .

Business Example: Many of our readers have triangulated how much money we're making online (yes we deleted your comments!). The bigger issue is this. Seeing numbers from someone else *has nothing to do with what you are currently building.*

We get other terrible questions such as "when should I buy traffic" where the answer is always the same "now and see if it works". We have no idea where a person is in terms of their company so it creates more wasted time. You should spend 1 month doing basic research then… **try before you ask.**

Paid Traffic: Using the above question as a piggy back, you should always try to buy traffic first. This means you do all of the necessary research, target your niche and start out with a few thousand dollars in spending. You're never going to "know" if it will work from day one. This is simply not possible (hence the word risk). Once you have tried at least 2-3 times you can start asking questions about the next steps.

Good questions include: 1) did you target the right group at the right time of day?, 2) did you go through the correct traffic avenue?, 3) were your copy writing skills up to par?, 4) did you choose the right distribution avenue to maximize margins?, 5) were you being outbid due to a traffic arbitrage by a competitor?

Until you have at least *tried* to buy traffic, there is no point in asking any questions in the first place.

Takeaways: Keeping the section short and sweet. The point is simple. Try everything after you have done the necessary research (research takes ~1 month). Simply find trusted sources (never mainstream) and then go with your gut and logic. Once you're rolling it should be a simple game of making tweaks and focusing 90% of your time on doing versus learning

Most People Shouldn't Read This Blog

This blog is not meant for most people. The harsh reality is that 50%+ of our current readership probably shouldn't even read this blog. Why? This blog is niche. Focused on life advice for people involved in business sales and Wall Street. That is it. If you're not operating a profitable business (draw the line at $200K+) and you're not working on Wall Street (draw the line at $200K+) the information here is not going to be helpful unless that's the career and business path you want.

If someone is reading this blog along with 3-4 other blogs on a weekly basis, they should probably shut this one down forever. We don't need the traffic since the blog is set up to have product recommendations offset hosting costs. If we wanted to increase traffic we would have "joined forces" (power rangers comment from one of the readers who shouldn't read our blog) with other bloggers. Of course we didn't.

Why are we recommending that over half our readership leave and never come back?

See *"Analysis Paralysis"* again. While it's great to see readership grow, it is not fair to recommend reading a site that is not going to give information tailored to their interests.

If you're obtaining information from more than 2-3 sources on a weekly basis you're already losing steam. You should only have one *maybe* two blogs that you read on a once per month rotation. Otherwise you're going to read a muddled mess of ideas and beliefs that won't help you at all.

Finally, an online resource is probably worth 5% compared to an in person resource. You're going to make a lot more money and a lot more friends by having a real social network instead of a fake social network on the internet. How do we know? Look at the lives of the online social network. The lives of people who live primarily on social media, forums etc. ***never improve*.** If you're the same person this year as you were last year. That's a dead giveaway to shut down resources.

Takeaways: Avoid Analysis Paralysis by reading at *maximum* twice per month. Do this online with a few select resources (we're drawing the line at two). No more than 35 minutes of your time should be spent reading online resources on a month to month basis.

Why You Should Think in Terms of a 2-4 Year Plan

All of the advice here really ties in together. If you're spending 90% of your time taking action then you're not going to have much time to loiter around on the internet. This will cause you to think on your feet and problem solve without going to internet websites or forums to find the "perfect" solution. You only visit online resources when solving a legitimate specific problem that you are running into.

The crux of 2-4 year plans is simple. **Think backward.**

Lets say your goal is to increase your net worth by $240K. That is a sizable chunk of money and is going to require a lot of work if you're new. Do your best to think backward to the savings rate and your income growth.

In a linear fashion you need to put away $80K per year. Knowing that income is non-linear, you're probably looking at something closer to $30K, $70K, $140K. Why is this important? It is important because $30K on a glance looks like an extremely easy hurdle. Instead of worrying about how you're going to get to $140K in year three… you know that you need to throw **at least** $30K into the bank in year one to have a fighting chance in a performance based role.

Performance based income generating $30K is going to give you an idea of what works and what doesn't. You're going to learn basic tricks without even reading a book. You'll learn through experience that phone calls 4+ with the same client have next to no chance of converting relative to phone calls two and three. You adjust your game plan. The next year you're spending more time chasing down *quicker* sales than "long-term sales" since you learned in year one that phone calls 3 and 4 are a waste of time.

Quick pause.

Now you can do the basic math to see why going from $30K to $70K is no longer a huge hurdle. You spent 2x as much time (calling over 4 times) to generate $30K in extra savings/net worth. Knowing that calls 3 and 4 are worthless ***you have cut your working hours in half.***

Since you intend on increasing your income, you're going to chase more leads up until phone call number two. A doubling of income is certainly on the horizon.

Alternatively, from a career perspective… you should think in the same fashion.

Is a 10-20% uptick in compensation worth the risk of destroying long-term relationships? The answer is generally no. The only time you jump ship is for a 40-50% change, not a 10-20% change. If you're in good standing with a firm and you're leaving for 10-20% you've blown yourself up.

Takeaways: To boil the examples down: 1) businesses should be managed mentally from a year to year basis upfront instead of a 10 year plan because there is minimal history to suggest trends and 2) careers should be managed from a medium-term perspective since everyone else is jumping ship for 10-20% moves on a 1 year time horizon. In short, 1 year plans and 5-10 years plans simply don't work.

You Will Only Succeed When You Have Specific Differentiation

Ah, yes. The final reason why "Analysis Paralysis" is ruining your net worth and future. The **only** way to increase your income materially is to ***have a competitive advantage.***

We get a lot of emails asking what "exactly" we're doing (all deleted) and for specific "resource tips" (all deleted). The answer is always the same. We recommend very few products and all of them are good. Beyond that, the only resource tip we can give is to make mistakes.

No one in their right mind is going to give away trade secrets or any form of creative competitive advantage. You don't build up a company or a career over 10+ years just to hand it to someone else who has contributed $0 to your bottom line. It simply doesn't work that way.

How does it actually work? It works like this.

You pick up a few resources on the topic you are interested in (Sales, Wall Street etc.). You learn the basics on what to *avoid*. Avoidance is the only thing a resource has to offer you for free. It will prevent you from making bone headed mistakes that will cost you materially down the line. It is equivalent to learning how to swing a golf club correctly. After that… It is up to you (90/10 again!).

You can ask for a review of your golf swing once every month or so when you're seeing minimal improvements. But. No one is actually going to swing the club for you. Once you're good at swinging the club, you find nuanced strokes that work better for you in specific situations. That is where you go from decent to good.

A business and a career are both the same.

You avoid the blow up mistakes (incorrect company formation, incorrect politics, incorrect beliefs on what drives revenue) then you search for differentiation. So long as someone can copy you verbatim, you're already behind the game!

Takeaways: You will gain traction once you find legitimate differentiation. This usually takes several years and you're not going to learn differentiation from any book, seminar or website. You learn it the hard way (by doing). This website is set up in a similar fashion. We now provide detailed explanations of why you do XYZ instead of ZYX. It is up to the reader to decide if it makes sense or not.

Concluding Remarks

Keeping it short as this post was written during a long international flight and likely has many typos. Below are the bullets

– Do not ask questions based on fake scenarios. This is a waste of time and your brain cells can be put to better use by improving your current scenarios instead of imaginary analysis

– If you do not have options you do not have questions. This is similar to negotiations. If you don't have a competing bid there is no reason for them to move up to your ask.

– Hate to say it. But. Based on analytics, most people shouldn't be reading this blog. It is a niche website and if you're reading this blog along with blogs that are unrelated to it, you're probably best reading the unrelated websites. There is too much conflicting information to draw up a good mosaic for yourself.

(on a more positive side note, reading comments from Stealthy1Percenter, REGuy and Recent Graduate, should help decide if this place is good for you. If you disagree with these three, you're better off leaving since we agree with these three contributors the most)

– Instead of thinking deep into the future (what most people do) think **backward.** Create the game plan and think backward to today and let the flow of improvement carry you forward.

– You will gain traction once you are differentiated. When people begin copying you or trying to copy you… You've won. In addition, if people cannot figure you out… You've also won. You've transcended their sphere of logic or "their world view". On that note back to 90/10 and we'll decrease our post count from once a week to once every 10-14 days or so (barring special events).

****

Annual Health Ideas Update and Q&A Announcement

Annual Health Ideas Update and Q&A Announcement

Once a year we like to add some items we've learned particularly as age related issues begin to work into the equation. One of the main items that continues to worsen is flexibility, hair and skin. This is due to natural attrition but you can still look 5-10 years younger by changing your routine/diet over the course of a year. Some of these items may not apply so simply book mark the page for the future.

Skin: For some reason this area seems to decline rapidly without attention. This won't apply until you're at least in your 30s. Here are some quick things to remember: 1) caffeine does a lot of damage if not kept in check, 2) water consumption should be higher than the daily recommended amount if you're exercising regularly, 3) blood flow is extremely important to keep all of your organs in check, 4) dehydration shows up a lot more on your mouth/lips acting as a warning sign and 5) if you've got enough money, dysport/botox can be used in the 30s age range to prevent long-term wear and tear.

Starting with caffeine, if you have had a rough year (2020 was certainly rough in terms of work), you're likely overloading your response system. This means you should cut it out entirely and remain off of it for at least 2-3 weeks. The process is quite painful if you were we really running full throttle.

You can expect the following improvement timeline: 1) your muscles start to hurt quite a bit making it harder to exercise, 2) you may get some headaches, 3) your tongue/mouth will "ask your body" for caffeine so you'll be forced to replace this with decaf options or a bunch of water and 4) in the end you'll know you're off of it when you have no interest in caffeine and you notice a slight glow to your skin. As a note, some people see no real side effects and others only see one or two of them. Either way, your skin will show the difference.

Water consumption is quite easy. You simply need to buy a 64 ounce carton/container and drink at least 2-3 of them per day. Note, this is in addition to the standard green juices that you should be drinking (wheat grass shots, celery/kale mixes etc.). The only thing you really need to do is add around 16-24 ounces of water consumption (more than usual). We've stated this before, but if you're tired of the taste, sparking water is a great option. Lemon/Lime flavored are usually the cleanest.

Blood flow is one we haven't covered here and is surprisingly important. We had no idea that this actually declines with age. If you take a shower in the morning or add a basic bath once or twice a week you'll notice that your body "wakes up". There is another product out there that helps encourage blood flow and reduces heart attack risk: Wax Matrix Niacin. There does not appear to be a lot of long-term effects from supplementing with wax matrix niacin so we're sticking with it. Similar to HRT and other PED related items, the information is always going to be a bit mixed. The only downside? Sometimes you may experience a "flush" where your face turns pink/red and feels hot for a few minutes (not more than 5). Which is likely due to… You guessed it, good blood flow.

Your lips and internal organs are going to show a lot more signs of dehydration. If you look up common issues for people in their 40s, you'll notice that people are encouraged to get colonoscopys… Now why? Answer seems to be related to dehydration as well. If you're dehydrated your internal organs, just like your skin are not as smooth/fluid. You should get tested (no matter what in your 40s), but you can do a lot of work to prevent dehydration (ie. watch your lips.). If your lips are chapped constantly it means your internal organs are also dehydrated. In addition? These issues are also apparently related to eczema, ie. people who have skin rashes/issues are usually the same people who don't drink enough water and consume a lot of caffeine/uppers.

The last one is for your back pocket. If you're serious about getting rich you'll be a multi millionaire (minimum a millionaire) in your 30s. This is also the time frame to look into dysport/botox. Feel free to laugh but there is a reason why wealthy celebrities/public figures look better than average people (hint it's due to additional treatments such as dysport/botox). The trick here is to bite the bullet early. As soon as you see signs of worry lines you should look into it at minimum.

Muscle Flexibility and Injuries: Ah yes, the flexibility issues continue. You'll need to invest into equipment to prevent further issues: 1) NormaTec has a great line of products for leg massages, 2) FleetFeet also has a good range of massage guns and 3) you can pick up foam rollers and electrical pulse massages for a few dollars.

Starting with equipment, as a good "rule of thumb" the first thing to go is your maximum force. This would mean your ability to jump extremely high (vertical jump or running jump). This means your first purchase should be the NormaTec product combined with regular ice baths. After this you're looking at reduction in general wear and tear. There is a reason why knees end up hurting for a lot of people in their 30s/40s (wear and tear). This means you should think about the surface you spend your time on. It is not wise to run on dry sand, the mud or play a significant amount of sports on concrete. These three items put significant pressure on your tendons, hence the high probability of achilles issues in your 30s/40s.

As a final note, one of the major issues with these adjustments is remembering them. It is not easy to go from “never using a product” to using it daily. Therefore, you should put the items in an area where they are hard to forget. If you spend your time working on your desk, you want to convert to a laptop. Work on your laptop while laying in a bed or on a lengthy couch. Then it is extremely easy to remember, just put the massager on before you begin working on your laptop.

Hair Loss and Color: There isn’t much you can do here beyond some basic preventative measures. For example, if your family has a history of hair loss you’re better off shelling out the money for permanent hair replacement (cost of around $20K). On the color side of the equation, you can either dye your hair or you can try to reduce the number of white/gray hairs by increasing your consumption of anti-oxidants. In the end not much is going to prevent the steady color fade so you’re still better off with a combination of dye + hair replacement.

If you want an official view on this, it would be replacement + no hair dye. It just doesn’t make sense to have perfectly dark hair at age 50. There is certainly a gradient here (you can dye for 5-10 years), however, the long-term results in showing some grays (looks strange when someone has dark black hair and is 50-60 years old).

Some Health/Vitamin Note Updates: Beyond the major three items, there are some other things to be aware of. First, we’ve already stated that we think stress is the number one health killer in the world. We have zero proof of this and only go based on what we’ve seen and how the human body reacts to constant stress (there is a reason why poorer people look older – it is not fun to think about paying bills for decades at a time).

The second one is related to vitamin adjustments. If you have some recurring acne issues (cysts etc.) you may want to look into Vitamin A. Concentrated Vitamin A is something that is used for acne improvement. So taking a Vitamin A supplement (2x normal) would likely act as a preventative measure. Also. Vitamin B12 and Magnesium can help improve hair color loss and prevent degenerative skin disease as well.

A third one is not a serious issue and relates to reduction in ADH levels in the body with age. Usually this causes the body to spare less water (hence higher chances of dehydration in the body as you age). You can take a pituitary supplement (likely needs to be prescribed by a doctor) to improve ADH levels. It isn’t a big deal as older people are usually forced to wake up in the middle of the night to use the bathroom due to lower ADH levels. That said, if you want to have higher quality long-term sleep you’re better off with a pituitary supplement to reduce the probability of this occurring.

Small Note on Stress Reduction: If you’ve done well financially, we’ve noticed that most rich people have insufferable amounts of insecurities. We’re not sure why this is but we’d guess it is primarily due to their upbringing (lots of upper middle class people were born into rich families – not a surprise). So if you’d like to reduce your stress levels an easy way to do it is by getting rid of your ego.

We’re sure many of the people reading this believe this website is about big egos which is fine. The stress is the part that is concerning. It doesn’t matter if you have a BMW or a Lambo, there is always going to be someone else out there with more. So simply enjoy your life and don’t lever up to create more stress. While you “could” make a bigger return, it isn’t worth the risk once you’re rich. If someone attempts to drag you into the “BSD contest” simply say “you’re better than me at everything I agree” and they’ll fall apart on the spot.

With that said we’ll have a Q&A on Friday the 29th. It’ll focus on Health, Taxes and Investing. We’ll see if expanding the topic a bit reduces quality. All other questions will be deleted.

****

Anticipating Defaults and Bankruptcies – A Short Term Outlook

Anticipating Defaults and Bankruptcies – A Short Term Outlook

At this point, we have high conviction that we’ll see a wave of defaults/bankruptcies in early 2021. While we realize a lot of bankruptcies have been announced thus far, this does not account for the numerous people & entities that were not allowed to evict tenants. For example, if you had your occupancy rate drop from 90% to 55% in a single year, it is unlikely that you’re in great shape. In addition, you’re in even worse shape if the occupancy rate is “at 90%” but half of these tenants are not paying rent. You are still on the hook for the loan against the apartment complex (don’t even get us started on the leases for businesses).

Step One, the Defaults: As we’ve described in prior posts, allowing businesses such as restaurants and bars to operate at “25% capacity” results in more losses when compared to closing up shop and waiting until full capacity is allowed. The math is extremely simple as the establishment needs to run at 70-80% capacity at minimum to generate profits. Fixed costs are not going to change and the margins on food will remain suppressed due to competitive markets.

Therefore, as companies are allowed to evict tenants who are not paying rent, the debt burden will continue to rise. Why? Well the loans that were given to these businesses have to be paid back. Even if it is a 0% loan, there is a real chance that interest rates go negative (yes we’re serious). In that situation, they would be in even worse fiscal shape.

Lets go ahead and assume that interest rates stay low (slightly above zero) and you’re still stuck with a bill that needs to be paid back over the next 3-5 years. And. Run some simple math. If the interest free loan of 0% was used to cover 9 months (about the length of the pandemic) and you lost money the entire time, it means that you have to make up for 9+ months worth of losses. Who knows how much this is. What we do know is that there is a bare minimum number which is zero.

Take the zero scenario (remember it is much worse than this since they are losing money). If you didn’t make any money for 9 months it means that you have to pay back 3/4 a year worth of profits. If you open on January 1, 2021 with the exact same profit and loss profile, you will be in the red until October of 2021. This is because you have to pay back the entire loan amount! This is simply insane for most businesses as you didn’t lose 9 months… you really lost 18 months. If you were generating losses the entire year (extremely likely), then you really lost 24 months or 36 months at minimum. This means? Probably better to default.

If the above is too wordy, a simple rule of thumb would be “take the number of months the business could not run at full capacity, multiply by 2.0-3.0 and you get the total number of months they need to pay back the loan”. For example, if a business was locked down for 10 months, this means 20-30 months to recover from the pandemic *assuming* the business returns to normal immediately.

Step Two Solutions: As many of you are well aware, we have no interest in politics since they detract from the main concept of this blog: “You are responsible for your own success/failures”. As long as we don’t end up electing a benevolent dictator and turn into a socialist country like Cuba, we were going to be just fine regardless of who wins. In fact, if you understand the above you’ll realize that both the democrats and the republicans will be forced to make the same decision no matter what. What is that decision? Print more money/UBI/Helicopter money.

Why? Well there is no other solution in sight. If you want to try and kick start the economy again, you need to give people money to spend and these business that went under need to be “bailed out”. The problem here is that unlike the financial crisis in 2008 where it was primarily driven by one sector (housing) we have a crisis that is impacting 50%+ of the GDP (Technology, Healthcare, Grocery stores and a few other various businesses are the only ones that flourished).

Your other two options are not going to sit well: raise taxes and a wealth redistribution. If you want our long-term view, we think a wealth redistribution of some sort is inevitable (or a wealth distribution through UBI to the large numbers of structurally unemployed people). The fun part is that people do not think long-term. Even though we should be preparing for artificial intelligence and job losses, we’re not going to accept the long-term reality. This means what? It means they will choose the path of least resistance which is printing money.

As a fun note, notice that we don't mention a vaccine. We don't mention who is going to win (our public wager has been out there for three years already – Trump) and we don't even mention our expectations for a "recovery". All we care about is what we know. We know that there is no *silver bullet* or magic pill that is going to solve 9 straight months of losses due to a pandemic. The only solution that will sit well with the masses? Printing vast amounts of money. In the end, we know that businesses lost ungodly amounts of money, are levered up and have to repay these debts (or default).

Similar to the end of section one, if the above is too wordy… the government has to print money. Doesn't matter if it's a democrat, republican or some hybrid version of the two. If they don't help the businesses that they recently stomped on, the uproar would be unbearable. You don't want to see riots from the people who wanted to be left alone.

Step Three – Being Prepared: Take a big picture view. Is there a scenario in which retail out grows online sales now that we've taught a huge portion of the economy how to use Amazon, Netflix, Shopify etc.? Probably not. Is there a scenario where people spend less money on health care given our aging population and new interest in virus research? Probably not. Is there a scenario where people riot on the streets due to job loss, political turmoil and socio-economic unrest? Probably. If there a scenario where kids learn more online than they do during their old K-12 habits? Probably.

As usual, you're free to disagree with any of the questions we posed above. Instead of listening to a blog, it is always best to think for yourself. If you can't think for yourself you're already being swayed my media and celebrity personalities.

Now that we've got that out of the way, there are some easy near-term solutions for you. The first one is that you should re-stock up on any basics. With businesses boarding up heading into an election it is likely intelligent to stock up on all your basic needs again. We think it is unlikely that the chaos is uncontained, however, why should you expose yourself to this risk? Buy all the food, drinks and toiletries you need to survive at least a couple of weeks. This won't "cost" you any money as you need the items anyway. If your city has civil unrest you can stay inside and watch the show on TV.

The next near-term solution is to have assets in your hand that have some value. We've already explained the importance of crypto currency, gold, collectables and physical cash. We're not going to lecture anyone on the perfect allocation. That said, a good number to have in your head is "6 months of living expenses". This should be on the go. If you're a gold bug, maybe you have a 50/50 split of physical gold and physical cash. If you're a bitcoin HODLer, you may have 75% bitcoin and 25% cash. We don't know. You might even be a rare sports card collector with a stash worth $100,000+. Either way, you need to have some wealth stored in a way that makes it difficult (if not impossible) to confiscate.

The third near-term planning item is to write down an "exit plan" to lower your cost of living. We're serious on this one. The world is going to go through a lot of pain over the coming years so you need a way to reduce your costs if necessary. If you are bored during the holidays, we recommend looking at all your expenses and *income line items* and saying "what can i do in a worst case scenario". A worst case scenario can include: 1) moving to a low cost city or even country, 2) cancelling certain "wants" vs. needs and 3) changing the ways you make money. The third one is going to be painful for many people. If you are unfortunate enough to be laid off, you may have to trade your time for money for a period of time. The recovery phase is going to be quite difficult and when you do your worst case scenario planning, you have to keep income generation in mind. *"Always prepare for the worst and hope for the best"*

The fourth planning item is for people who have "made it". The risk profile in the market has changed dramatically. Valuations are back up (massively), interest rates are going to be at zero for three years and wealthy people got wealthier (internet, technology and anyone who can work from home while generating revenue has made a killing). This means a large amount of money is floating out there. This money needs to find a home and that home is likely "alternative assets". That's fancy for high risk items: starts ups, crypto, SPACs (all the rage) and anything else not called a stock/bond on day one (yes we realize SPACs are technically stocks, no need to point this out as the point is still the same). We may have to do an entire post on alternative assets (something we've been researching all year at this point) since it's the only asymmetric bet left at this juncture. If we can agree that there is a large amount of money floating around due to wealth disparity, that money needs to find a home and some of these alternative assets will likely catch a bid (meaning they increase in value 5x or 10x in a short period of time – 5 years or so).

The fifth and final item really ties this together. Chamath said it best when describing his investment philosophy (paraphrasing), "The biggest debate is if interest rates are -5% or +5% in the future… Knowing that, you want to be exposed to growth so it won't matter which one prevails". This is something we agree with and lines up with our view of alternative asset investing. There are very few areas of growth that *don't* have huge valuations (technology is high and you do need some exposure there). A company that appears "cheap" is cheap because it is on the decline which is exactly what you're trying to avoid.

If the above was too much, the tweet version is as follows: 1) stock up now ahead of election to reduce risk, 2) have "in-hand" net worth that is in excess of 6 months spending, 3) write down a serious plan B if things go south for your income streams, 4) look at alternative assets and 5) you need to optimize for growth… some argue this is a barbell strategy where you buy high-risk and extremely low risk only.

Step Four, the WSPs Prediction Part: This wouldn't be any fun without some real predictions that are over the next 6-12 months. We gave two up front that we can't see changing (printing and more defaults). This is an arithmetic thing and if someone has found a work-around we'd love to hear it.

The first prediction is that private equity firms are going to go down the work remote framework to juice returns. Pretty simple. Find a software company or any tech company that has a huge foot print. Go in there, buy it and then get rid of all the overhead. The business doesn't need to be amazing it needs to simply "chug along" at 0-2% growth. Why? Well look at the P&L. Most companies have at least 5-10% of total costs tied to fixed assets (this is actually low). So then you simply borrow money at 0-2% and collect the return by cutting cost. While it is true that many tech firms are asset light, headquarters, travel and other such items hit the P&L in a big way. Good night to retail companies with huge real estate footprints when valuations decline.

The second prediction is even more crypto noise. Square, PayPal, Microstrategy, DBS bank and Fidelity are all drops in the bucket. They are drops in the bucket because the rails are not made. Once the rails are made, it unlocks all of those users at once. It is one thing to announce that 350M users can now purchase crypto assets. It's a completely different animal when they can begin purchasing them. This won't occur until 2021 or so at scale. The beta edition for PayPal is "cute" but it doesn't really make a dent until the flows begin. Once the flows begin all bets are off.

The third prediction is a significant increase in both gambling and religion. We've talked about this in the past but it needs to be mentioned again. This isn't going to be a fun time for the vast majority of people. Therefore, they will likely turn to religion and gambling. They are related in the sense that they both offer hope. Gambling gives you a temporary high/jolt and religion is a back stop for people who need a community to lean on. We have nothing negative to say about either to make sure nothing gets mis-understood. We are making this statement as a prediction.

The fourth prediction is bigger household headcount. The easiest way to reduce costs is to reduce overhead. The easiest way to reduce overhead is to live with more people. It will be interesting to watch as independent individuals (men who can afford to live alone) will command a premium. This impacts the dating market (seriously it likely will) and will impact the maturity rate of many people in their 20s. If you never live alone, it reduces your ability to mature. Again. We have nothing against the strategy as tough times call for tough decisions. That said, consequences remain.

The fifth prediction we have is an *increase* in financial literacy. We can't believe we wrote that one out. While we don't expect the increase to be explosive, the recent decisions made by the government cannot be glossed over. People are starting to ask questions about taxes, why there is unlimited money printing and modern monetary theory. In times when unemployment is at 2-3% people are more interested in hooking up with their tinder date or going to the strip club (okay they are still more interested in that, just slightly less so).

The final part is more obvious: 1) more remote work, 2) people moving to lower tax locations, 3) less conferences more zoom meetings, 4) reduction in air travel relative to the past, 5) reduction in cruise travel relative to the past, 6) massive increase in video games, at home entertainment, 7) increase in home remodeling, 8) decrease in commercial real estate prices due to reduction in footprint for major companies, 9) increased interest in healthcare investment and 10) another shift forward for technology companies.

Some Concluding Thoughts: A good way to think about the future is to simply bet on innovation. Trying to bet on people, companies or processes that worked in the past is not a recipie for success. You want to look for things that will make life cheaper, more effective, more efficient and easy to use. Things do not need to be "easy to understand" as data centers, internet connections, and other technologies we use everyday are quite complex. They need to be easy to use. Follow this line of thinking and we're guessing you'll fall upon the same conclusions we have. If not, we're looking forward to the rebuttals in the comments section! Enjoy the weekend.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life. **We hold Q&As 1x a month for purchasers only.**

Apple Bottoms Up – Three Statement Model

Apple Final **<— click to download, you should be able to build this in 1-2 days and once you can… DO NOT bother spending a red cent on any other financial modeling courses. Feel free to update the quarters for actuals or use a different company, it does not matter.**

While we cannot give specific stock advice you can run through the numbers laid out here and get an idea of how to think about an investment in Apple. There are only tw o key points to look at when you consider investing in Apple. **Product Sales and Margins.** While the current spotlight stands on capital allocation policy ($3.05 quarterly dividend and $60B repurchase authorization) at the end of the day what matters for the Company is its long-term revenue and earnings growth.

Product Sales: Simply put, are Apple products becoming commoditized? Blackberry and Nokia have suffered similar fates where growth degrades as the product becomes similar across all brands. In addition, if the products are similar, the only thing that matters would is cost. To simplify the question, are Apple products still differentiated? If you believe so this is a positive if you believe that it is not then this leads to price competition… Which leads to point number two.

Margins: A commenter asked for a gross margin profile, this is actually quite a difficult exercise given the product categories, but should make for a decent discussion point.

iPod: This product line continues to decline as people purchase iPhones and iPads instead of iPods. However given that the product has no connection to subsidies and is likely becoming more and more commoditized, we can conservatively assume a 25% gross margin profile.

Mac: This product line also likely runs below corporate average due to the commoditization of PCs. In addition the latest Apple products have historically had yield issues (noted during Apple conference calls). We can place a 25% gross margin profile here.

iPhone: You can triangulate that this has company leading gross margins due to carrier subsidies. In addition the iPhone has lower component costs (screen is smaller). This is the most important product line to gross and operating margins. If we build a bottoms up model, you can assume a 45% margin profile.

iPad: Given commentary from Apple "Under corporate average margins", we can assume closer to 30% for the line. However, this product is driving year over year revenue growth. While this is a drag to the corporate profile it is a positive boost to point one – product sales.

iTunes, Software and Services: The truth is that all software should be labeled near 100% GMs but the model will be difficult to track with a 100% flow through. Instead we peg this at the 40% water mark that the investment community has been eying for the past several quarters.

Accessories: Similar to Mac's and iPods, the products here are likely cheap and run at low margins. Again the higher margin is coming from a software/subsidy perspective and reoccurring streams. So if we place a 30% margin here, it seems reasonable.

Conclusion: Interestingly, during the Mar-qtr the company stated margins for iPads were impacted by higher sales of the iPad Mini. If we deduce this means the margins for this product are a tad lower we can run the aforementioned numbers through the model and it balances. We'll have to wait until next quarter to see how this plays out but it should be interesting nonetheless.

****

Application of Logic to Improve Your Life

Application of Logic to Improve Your Life

In our post on how to obtain consistent happiness we tried to touch on "how to think". This is a broad topic and we only hit on a few items in the previous iteration. Given our interest in expanding our posts we're going to try and give our *ideas* on how to improve your thinking process. Namely, through the application of logic.

Overview:

1) Before Doing Something Ask "Does This Make Sense?"

2) Quick Numbers For Business Calculations

3) Quick Numbers for Personal Finance Calculations

4) Logic Says Success is Relative

5) Application of Logic to Recognize *Our* Weaknesses

<u>1) Before Doing Something Ask "Does This Make Sense?"</u>

This will save you a lot of headache. A lot. Before you begin steering your ship in a new direction, ask yourself if the direction "makes sense". Given our strong stance against the "manosphere" and against the "red pill" community we can use everything in the "sphere" to see how the vast majority of writers are losers.

Become a "Location Independent Businessman"! If your goal is to actually start a business, the worst possible move you can make is this: *"pack your bags, move to a third world country, teach English and start a company"*. This is the fastest way to realize that you're talking to someone who doesn't make a lot of money. The person did not have the necessary skills to earn a high income. How are we so "sure". Easy… Does this make sense?

If you are legitimately capable of becoming an entrepreneur then you are going to have *options*. This means that you likely have *career* offers from top tier institutions and firms. So, run the math. If you can obtain an engineering slot at a top tier silicon valley firm you're going to make $125-250K a year ***out the gate*.** If you were a top tier finance student and got an offer to work in investment banking, you're going to make ~$150K ***out the gate*.**

No sane person is going to say *"let me start a blog in a third world country with no experience and live off of $50K a year instead"*. Again. It does not make sense.

Nail in coffin. If you're truly brilliant and can start your own company without being trained at a top firm … You're still *not* going to leave the USA. You're going to do what all of the other big guys did. You start it in the States because that is where the network is. Facebook, Twitter, SnapChat, Uber, etc. etc. etc. are not in Cambodia for a reason. It is not because the founders are dumb.

In short: If you are talented and have options, there are too many opportunities in the states to cause a young 20 year old to pack his bags and leave for no good reason.

Girls Are Sluts but it is Hard to Get Laid: This is probably the funniest piece of the entire Complain-o-sphere. The claim is that women are not relationship material because they are sluts… Then… Claim that women are too hard to sleep with. Huh? This does not make any sense. How can you take advice from someone who has this type of logic?

Never in the history of mankind has "average" guy been able to obtain a "model" because he was simply a good man. This time never existed and never will.

It is either hard to get laid or it is not. Both cannot co-exist. We do not care which group you are in. If you're having trouble, improve yourself and find more girls to talk to. If you're doing well with women, the last thing you do is complain about them. If you're not attracted to the girl or her personality turns you off, then move on. It is not a big deal.

In short: Which group are you in. We don't care which one it is. Just don't claim to be part of both of them.

Women Abroad are Soooo Different! No. No they are not. We've been to over 35 countries now and while there are always nuances with each group of women… There is no real "difference". The only real difference is (gasp) your ***relative value*.**

Here is the basic learning curve. 1) Arrive, 2) realize you're getting higher quality women, 3) calculate how much more money you make relative to the median, 4) *decrease or increase* your spending to your relative purchasing power in the states, 5) figure out it is roughly the same!!!

Most people don't make the logical jump to points 4 and 5. They walk in with $2,500 a month and say *"wow I am getting girls here that I couldn't get back home with a $5,000 a month lifestyle!"*.

Then reality hits.

You're a bright guy so you find the median income. The median income is roughly $725/month in the city you're in while the median income is $3,500/month in the city you live in. Your relative purchasing power is 4x in the foreign country and only 1.43x in your current city! Surprise, surprise! Your lifestyle was significantly better on a relative basis so you did better.

If you really want to prove this out, you can test run the thesis. You simply decrease your spending **all the way down to the median.** If you live in Manhattan try to live a fun and exciting lifestyle with your $70K gross salary (~$4,300 net) per month. Hint. It won't be great. Then go to your third world country and spend the median income within that city… Hint. It won't be great.

In Short: While there are always nuances based on personalities, the same thesis applies in foreign countries as they do in the states. The girls you attract will always be a reflection of your total value. This makes sense.

2) Quick Numbers For Business Calculations

With the high level examples out of the way lets move onto some quick math. This is apparently a lost art as some people really believe "big bloggers" make $500K a year… Again. No. They do not.

5% Convert: On launch day your conversion rate for any product, this is an eBook, real product from a real business or otherwise, is going to be significantly higher than any other day. Of course, holiday season and special days will also sell well, launch day is the real big one and should be ignored. Going forward run the 5% rule (yes we realize it will range between 3-7% we're using 5 because this is quick math).

Take the total number of *recurring users* this means actual people. This does not mean page views, this does not mean sessions etc etc. **Only people matter.** Now here is the equation:

(Recurring Users) * (5%) * (Total dollar value of all products) = Income.

Roughly speaking, if you have 40,000 legitimate customers, 5% convert at $100 you're looking at $200K.

Here's the rub! **This is likely an inflated number.** Now that you have the rough number, work backward and it's probably 75% of this as pure profit (taxes other expense etc.). So you're looking at a rough number of $150K. Bracket this with 10% and you have a good idea of the actual income $135-165K.

Now that you have the rough math you can quickly figure out if someone is telling the truth or not regardless of claims.

In short: Learn basic internet math if you're going to buy products off the internet. We do not care if you sell scammy products or real ones (it is your life). Just know the numbers so you can be aware of the world around you. Hint. If the person sells something recurring, that's where the real money is.

Pro-tip, if the product costs $47 or more. Price ends with the number 7. 99.999% of the time it is junk. People will buy and they will also buy the $1,997 special consult promo items as well

3% Ad Convert: We used a somewhat vague term on the first calculation with "recurring users" which means that people viewed the website and *return*. IE: someone didn't read one item and leave forever. These are always the best customers because they clearly see the value in what you're doing. This is also why many companies have blogs that accompany their service (personalcapital as an example – not a recommendation, we haven't used it before, but it has a blog to accompany the product).

The second and ***much more important*** metric is paid traffic conversion. That is what separates real money from a smaller scale business. Paid traffic converts are where you make a lot of money. A lot.

If you can convert 3% of paid traffic into sales and you sell a legitimate product worth $100+ you're going to get rich fast, fast, fast. The reason why paid traffic is so important is simple. Your product is so good that it does not need to be "pre-sold" via trust over long periods of time.

This is exactly why athletes, musicians and celebrities are paid so much to endorse XYZ products and why many affiliate marketers are being sued for impersonating celebs. **A great sale is a quick one to a stranger.** Enough of the explaining…

If you're running a biz and you see a 3% conversion rate on your paid ads… We have one word for you. **Spend.** Spend all of the money you have. Take out loans, liquidate all of your easily sell-able assets and keep spending till it dries up. Once it dries up, turn off the hose and go to the bank.

So here's the quick math to see how healthy the business is: 3% convert on paid ad + $100 price point = healthy. So if you see a business consistently advertising on extremely high traffic website (yahoo finance for example) that company is doing very, very, very, well. Don't worry, the affiliate selling it is also doing quite well himself.

In Short: Unless a business is selling aggressively on paid ads in high traffic mega websites, it is not generating a large amount of income. If you are ever in the position to sell a good product at $100+ on 3% conversions, spend until the money dries up.

3) Quick Numbers for Personal Finance Calculations

Strong personal finance knowledge will set you free from regular people. It really will. If you know the math between income, living expenses and compounding you're going to avoid severe financial pitfalls. While the link we provided is a basic list post, we're going to add quick calculations that will not only improve your personal life but also improve your social life.

The Magic of 80%: Most people lie *up* meaning that they will say they make $100K a year when they really make $80K a year or so. Naturally, we recommend you do the opposite.

Here is what you do if the topic of money comes up with "regular people" (you will deal with regular people consistently due to the law of large numbers). They will incessantly prod you with how much you actually make so the best way to trap them is as follows: 1) talk about your minimalist lifestyle and complain about some mundane payment – "cellphone bill" usually works, 2) after complaining about your fake cell phone bill "problem", ask if they have reception problems at their *home*.

They will usually respond by giving you a little bit of detail about where they live. Once you have this you can now give them your "number".

Take the neighborhood. Assume they live in a 1 bedroom. Take that number… multiply it by 3 (after tax money), gross up to the total annual income. **Boom.** That is how much you "make".

If rent is $2K a month, this means $6K net/month, this is $72K/year, this means ~$115K a year gross.

Too much math? Here is the quickest version!

Monthly Rent of Person * 50

It really is that simple. We've found that if you claim to make ~80% of what the other person makes he won't feel insecure and won't prod you for any business advice or otherwise. The calculation will get you to ~$100K a year when he likely makes $115-130K gross! You've avoided the topic smoothly.

In short: Regular people are always insecure and even if they are secure there is no point in testing the waters. Say you make 80% of what they make and move on. The best way to do this is to simply multiple rent by 50, say that is your gross income and be sure to "complain" about taxes, a mundane bill or otherwise.

A Year Per Month: If you really want to step on the gas with regards to your financial future, start calculating your net worth by years of living expenses saved. If you are young and in the 22-25 bracket this is likely low… between 0 and 1.

Everyone has different levels of risk. But. If you're reading this blog you likely don't mind the truth so your lifestyle has a lot more flexibility when compared to your typical schlub.

Every year you have saved = one month of your future life.

While the 4% rule sounds good, it is derived by the personal finance crowd which is primarily a bunch of liars and scammers. You're a smart person so you realize that retirement is a scam and don't want to become a boring type A person with no friends, no girls, no personality and no meaningful life experiences.

This means you're going to shoot for **12x your annual spending.** Once you get there, you can now spend like mad (if you want). If you have 12 years in savings there is no reason to accumulate 100 years of expenses since you won't live that long anyway. Accumulate 12 years and begin doubling down on life experiences.

But this is risky! Of course it is. That said, if you have $1.2M saved (using $100K as the marker), then we are certain you will be able to earn $50K a year in another profession.

4% times $1.2M = $48K + $50K = $98K… Roughly a wash.

In Short: A single year of savings is going to give you a month of time for the **rest of your life!!!** Get to twelve and you can continue working hard on your actual passions/businesses while ratcheting up the expenses with nothing to worry about.

4) Logic Says Success is Relative

Take any success a person has is a field and double it. That is going to be successful in their eyes. This can be applied to any field. If someone makes $50K a year, they will be impressed by $100K. If someone has a "notch count" of 10, they will be impressed by anything over 20. If someone played division 3 football, they will be impressed by a division 1 athlete. So on and so forth.

Knowing this rule of thumb, you can quickly look at audiences to determine if they are groups of people you want to associate with. We've already made several association mistakes (we ain't perfect and will fix this over time) but at the end of the day, you can judge the audience by their relative standards.

Some quick ones to go through:

What type of person is impressed by $100K a year? $50K or less.

What type of person complains about a girl's standards? Likely a schlub.

What type of person worries about politics? Unsuccessful people blaming the "system"

What type of person is impressed by photos on a computer screen? Can't do math, is an idiot.

What type of person gets angry over words on a computer screen… "attacks"? Privileged.

In short: Find a person's "hero" and divide by two. That is the audience. Do you want to be a part of that audience? If so, stay. If not, leave.

5) Application of Logic to Recognize *Our* Weaknesses

The word *our* is highlighted because the authors of this blog have clear weaknesses. Everyone has a weakness. If someone cannot call out a legitimate personal weakness they are untrustworthy individuals.

Use logic to recognize weaknesses, limit them and improve upon them.

Motivational non-sense will do the reverse. They try to inspire people who are not inspired: "be all you can be!" "get pumped up!" "get after it!", "everything is a limiting belief!"… Only a loser would respond to this because it implies the person **needs a "push to get started" and is okay with someone talking down to him.** As if you haven't been going 100% since day one. Degenerates respond to insults.

Instead. Focus on *acknowledging* weaknesses as you improve upon your *primary* talents.

Acknowledging Weaknesses: This is the best word to describe the process. Acknowledgement implies acceptance. Since weaknesses would result in horrible "headline copy writing" we'll use this blog as an example.

We're a Bunch of Narcissists: This is evident in the existence of the blog alone. Anyone who wants to spread their message far and wide is going to have some level of narcissism that is *above average* to say the least. It is better to acknowledge this as a piece of our personality and take the good with the bad. The good is that narcissism leads to solid speaking skills and aggression. The bad is that it leads to arrogance, self importance and lack of empathy.

We're Not Empathetic: Building off of the previous section, we have very, very, very little empathy. Your girlfriend dumps you. You give us the story in 5 minutes. After that, if you say another word about it… We're just going to laugh. This is not very "nice" but it is the reality. This is a function of life experience as well. But. At the end of the day, unless it is something serious such as death (real health issues) or prison (loss of time) we're not going to care much. The end. <– Couldn't even write a paragraph with a drop of empathy.

We're Not Interested in a Stranger's Opinion: This is why we don't read more than 2-4 blog posts a month (max). Unless we know the person in real life, we have no interest in reading anything they have to say. The only way to really break through and get us to listen to anything is by providing 1) actionable advice or 2) giving enough detail for us to figure out if the person is legitimate. **That is the only way we will ever read or listen.** Once we have done the due diligence, we add the person to the "radar screen" and try to pluck items up here and there. If we do our diligence and realize the person is simply mediocre… we ignore them. Lets make this crystal clear. We do not care who other people associate with. If person A has useful information and person B is his friend… It does not mean we care about person B. In fact, we probably don't care at all. If you have a business partner with a friend who is a drug addicted lunatic, you don't need to talk to the friend.

We Get Annoyed Over Investing: We will never do legitimate securities analysis on this blog. That will never happen. We already had two interactions over investing that were down right stupid and dangerous and we're going to make that the last two interactions for 2015. Last year we had 10 interactions, this year is two and hopefully next year will be zero. The reason why we get annoyed is simple. **Just dollar cost average into VOO (not our advice, stolen directly from Warren Buffet) and go back to building income to get your net worth above $1M by thirty.** If it is good enough for Warren Buffet's family, it is good enough for everyone. People can't even explain what a futures contract is but they want to invest in individual stocks with a net worth under a million. Atrocious. Embarrassing. Irresponsible. Stupid. Lazy. Gambling. Uninformed. Hell. The tone in the paragraph has already gotten annoyed and we're going to delete any investing questions off of this blog. The good news is that we're overdue for another sector overview which is the best way to inform without getting ridiculous comments from broke retail investors.

In Short: We have many clear and obvious weaknesses (even more from a personal basis). Now you know why this blog exists. If we can tolerate annoying emails from retail investors about stock picks and avoid extreme narcissism by forcing ourselves to give back (ie: free advice for Wall Street entrance), help people who are down and make acquaintances with strangers… We're *limiting* those weaknesses by doing this as a hobby.

Pro-tip, if you have similar bad qualities, surround yourself with 1) people who are better than you and 2) people who constantly talk about "investing" so you can practice your smile, nod and ignore skills.

Finding Primary Talents: There are clear strengths here as well. Namely 1) direct communication which makes it near impossible to misinterpret, 2) ability to distinguish haters from critics – haters are all deleted and 3) ability to showcase a wider range of tones depending on the mood we're in.

Instead of making this section about us (like the weaknesses piece) we'll flip it around and help *you* find your primary talents.

Physical: This is where we would start if you're a teenager. Are you an explosive athlete, an endurance athlete, an in-between athlete, a precision type athlete? We don't know. It is your job to find out.

Once you find your talents, see if you can obtain a scholarship in that activity and leverage it to get into an elite university (Hint: many elite educational schools don't have great sports teams in every field). If you find that you're not talented enough to make it worth your while… then go and pluck out an explosive athlete (football, basketball, sprinting). Befriend them and get basic training advice. That's your new routine with perfect form all set in stone. For free.

Analytical: While physical is the easiest to determine, analytical is the most important one. What is your brain good at? Yes that is a terribly phrased question. But. It makes sense. What do you have a knack for? There are only three real analytical skills to be learned: 1) intent, 2) numerics and 3) synthesis. If your skills are primarily intent and numerics… You're going to be a great investment banker. If you're heavier on numerics and synthetic you're going to a hedge fund (heavier synthesis) or becoming an engineer (heavier numerics). If you're heavy on intent and synthesis you're going to be a great salesman.

*We realize we have tried to summarize a full post in three items: intent, numerics and synthesis. Without elongating the post, ask yourself where your primary skill is. Do you whip through software code like it is a comic strip? Numeric. Can you quickly figure out if someone really wants to buy an item? Intent. Do you have a deep memory bank that is constantly used to solve large scale issues? Synthesis.

Art: Some people really have this down. If you need an example of someone that does not have this down look not further than this blog! You can clearly see that we do *not* have a knack for writing. This blog is mediocre at best, likely in the bottom 25th percentile to be honest. No surprise that we don't write for a living.

But.

If you can write, draw, act, sing, play or design at a level that is in the top 5% or so in the USA… You're going to be rolling in the 7 figure range sooner than later. Finally, we're obviously not the right people to judge your artistic skills. We wish we could give you advice on art but that would be downright dishonest. The only true measure is approval from an elite person (they tell you you're good), we hear the Julliard School is quite elite.

In Short: There are three groups of primary talents: physical, analytical and artistic. Try a slew of different tasks for a few hours a week when you're young. Once you find the one that you're truly going to excel at… Step on the gas and never look back.

Concluding Remarks

We finally came up with a decent phrase for the views of this blog.

"Optimistic Reality"

This blog likely comes off as harsh and downright cynical at times with splashes of over the top entertainment in the form of videos and pictures. It's really just a balance. Cynical people are awful, depressing, type A people (usually an atheist as well!). Unrealistic people are also awful, "you can do anything in the world!". So the best explanation is *optimistic reality.*

If you can run 100 meters in 12.0 seconds in peak physical condition at the age of 18… You're not going to be an elite 100 meter sprinter. Ever. You're slow relative to the elite. That said, to say that you "can't run faster than 12.0 seconds" is incorrect. There is a major difference there. Saying you're not going to beat guys running in the 10s is simply correct. Saying you cannot run in the 11 second range is incorrect.

There is always room for improvement. Use *logic* to focus that effort in the right area. It is up to you to find the area in which you will do well. We don't know where your talents are, that task is in your hands.

****

Approved Products

We use and recommend all of the products listed below. Given the focus around earning money/investing we start with money related products and work down to resources for learning sales, staying healthy and keeping a malleable belief system.

Money Related Products

Name Cheap: Affiliate marketers, product websites and personal websites all need a domain. Even if you're not serious about earning money online (we disagree) at least create your own consulting practice to have a way to make money 24/7/365. This would be produced by "owning your name" online (FirstLast.com). Our recommendation is quite simple, you should *have at least two websites*: 1) your consulting website with your name and 2) your product based website. How to make a living online is covered in Efficiency and if you meet anyone in the industry (affiliates/product website owners) practically all of them own their names online.

Blue Host: We have gotten several requests on where to obtain hosting and we can recommend Blue Host as a starter resource for an internet business. As you're well aware, we prefer product based websites instead of content based websites given the lower volume of visits needed to generate a living income (lower hosting costs as well).

How to Get Rich: This is the greatest book ever written on becoming rich. It does not offer emotional advice such as "think positively and grow rich". Instead it provides a solid outline for how the real world works. You'll get an understanding for scale, recurring income and how to raise funds for your company. Just "thinking" about becoming rich doesn't work. If it did everyone would be a multi-millionaire because everyone thinks & dreams about becoming rich.

Zig Ziglar's Secrets of Closing the Sale: If you're hoping to get rich in the future, learning how to sell is critical for success. This means you'll never lose valuable time by learning how to sell. If you're going to learn how to sell you may as well start with some of the best sales advice out there and Zig Ziglar offers just that.

Ca$hvertising: Once you've learned how to sell in person, the next step is learning the basics of online sales. For anyone hoping to become location independent you'll need a businesss… Yes you guessed it… That operates on the internet. The first step is learning how to sell from an emotional level and the second step is being able to transfer this level of emotion through words on the internet.

The Intelligent Investor: This is the premier book for learning how to invest. Warren Buffet now tells everyone to dollar cost average into as many ETFs as possible so he can create market dislocations and invest heavily into single individual stocks. If you're interested in overall securities analysis this should be the first book in hundreds that you'll read. Until then you can simply dollar cost average into S&P 500 ETFs offered by Vanguard (Example: Ticker VOO).

Life Related Products

Chlorella: If you don't have time to make a healthy juice or eat a lot of vegetables on the road, chlorella will do this just for you. In addition, it can also be used to prevent hangovers from a long night out, simply take a table spoon, mix it in water and chug before sleeping. Chlorella is an essential dietary supplement and hangover prevention item.

Protein Powder: We try to keep things as natural as possible over here and prefer products that are as close to "real life" as possible. This means we drink protein that is from a natural source (egg whites). While there is likely a minimal difference between natural and unnatural, when it comes to your health, it just isn't worth the risk.

A Guide to the Good Life: When you're first getting started in your journey to get rich it feels like the weight of the world is on your shoulders. Instead if we focus on what we can control and ignore things that are completely out of our control (negative comments from others for example) we'll be psychologically set up to succeed.

A Guide to Rational Living: For people who are suffering from anxiety or depression, this is another product similar to practicing stoicism that will make your life significantly more calm. You'll find that many things that upset people on a daily basis are needless. Finally, we recommend taking up meditation as well once reading through both the guide to the good life and the guide to rational living

International carry on bag: We travel quite a bit still and having a solid international carry on bag is essential to quick travel. You'll whip through security using your clear pass (or TSA Pre Check) followed by a rapid boarding process. Having something durable that can fit on all airplanes will save you several hours of time.

Wall Street Related Products

Investment Banking: Valuation, LBOs, and Mergers and Acquisitions: This book offers everything you need to know about getting started on Wall Street. You won't need to take a fancy modeling course because there will be templates on the job. Instead you can learn the basics from your house without paying a ton of money and get started well ahead of your peers.

More Money Than God: This provides a fantastic overview of the hedge fund industry. You'll walk through the glory days of the 90s in addition to the eventual declines in 2007-2009. Hedge funds provide various different roles in making markets as efficient as possible (also giving various rates of return for differing risk profiles) and this will provide a broad overview for you.

Barbarians at the Gate: For those interested in Private Equity as a long-term career, Barbarians at the gate provides an overview of the leveraged buyout of RJR Nabisco. This is one of the most famous transactions in history which includes a bidding war and large amounts of debt (leverage) to try and profit off of a

$24 billion dollar transaction.

Q&A is CLOSED

Q&A is closed thanks!!! Shorter than usual but questions were a lot better!!!

****

Are You a Time Waster?

[Are You a Time Waster?]

Time is the most important asset you have. Period.

If you believe in God, that is perfectly fine, just don't believe you have a second life because you may lose the one you're living right now. If you are 25 or 50 years old, you're closer to death after reading the end of this sentence.

Don't waste time.

Types of Time Wasters

These people make up 90%+ of the population. They have no niche knowledge and are unable to provide an intelligent or different perspective to any conversation. How do you know? They haven't taken the time to build a skill-set. Instead they consistently look for immediate results **without learning the process behind it.**

No, you are not going to know a lot about everything (and you shouldn't because a jack of all trades is broke). BUT. You should have a deep understanding of at least 3-5 subjects before you even bother asking for solutions to a specific topic.

Since we like examples here are some classic time wasters.

Too Lazy for Search Engines: If you didn't even bother searching for 30 minutes to an hour for the answer, you may as well tell the world you're a fool. Most answers are easily found after two or three clicks on Google. If you know someone who asks questions that can be answered in 10 minutes by a Google search, delete their contact information immediately. What that person is telling you is that he believes his time is more valuable than yours. **This should be taken as an enormous insult.**

The Time Just Flies By: Unless someone is complementing you on how gracefully you age, under no circumstances should you be living the same life in the current year as you were in the previous year. **No exceptions.** Lets repeat that. **Under no circumstances is year 1 going to be the same as year 2.** It is simply not acceptable behavior.

If anyone tries to tell you this is too difficult, immediately spit out the following ideas: learn a new sport, create a second source of income, teach a new person how to pick up women, take a book challenge and see how many you can read in a month, learn a dance, learn an instrument, learn an art, volunteer, gain 10 lbs of muscle, lose 10 lbs of fat, learn a language, hike up Mt. Everest, etc. Again if you run into someone who is exactly the same as he was a year ago, simply move on.

No Killer Instinct: This is a preference and many will disagree. There is nothing worse than being surrounded by someone without a killer instinct. You can smell it. They are generally passive aggressive because they aren't confident enough to put their foot down on a belief.

Long Winded Nonsense: We like twitter. Why? If used appropriately you can succinctly get a message across without wasting 700 words full of tripe. At a certain point in time you should become a **clear communicator.** You can generally tell the age of the person writing by the length of their emails, **the longer it is the younger they are.**

Unless there is a reason for specific detail, keep it simple.

As an example? Lets go back to the interview. If asked about *why you?*… you better be quick to show value since your first impression is going to be more important to the decision factor than you think. If they are asking you to explain *in detail* how a financial model works, you better sit down and write out all the high level items and build down to the nitty gritty as the interviewer drills down to the takeaway.

The Procrastinator: This person is either young or lazy. Not sure which one but procrastinators are usually in one of these two camps, the young ones are learning how to avoid this trap and the rest are far beyond repair. In short, if it is going to improve your life financially, physically or intellectually and you're not doing it immediately you've got no one to blame but the man in the mirror. It's your life to waste.

Summary Action Steps: For those that believe the above was long-winded nonsense 1) search for the answer yourself until you have knowledge to payback, 2) you should see ***dramatic***year-over-year improvements in your life or you've wasted the year, 3) avoid those without a killer instinct – typically passive aggressive, 4) learn to be a concise communicator unless it is an in-depth explanation, 5) if something is going to improve your life financially, physically or intellectually you're only ruining your own life by not making the jump.

"Most people die at 25 and aren't buried until they're 75" – Benjamin Franklin

Don't let this be you.

*** For those that have followed the blog religiously, you're going to be in for a surprise in 2015. We've come up with a solution. Expect change.***

****

Are You Counting the Wrong Days?

Most people have a terrible habit. We count the wrong days. We like to remember the first time we got laid, the first time we bench pressed 200lbs, the first time we got a sizable bonus check. These days are not important.

"We are what we repeatedly do. Excellence, therefore, is not an act, but a habit" – Aristotle

Since we are approaching a New Year soon lets create a new habit. ***Start counting the days that matter. The ones where you go through extreme pain and hardship.*** We all have similar goals, get better looking girls, make more money, get in better shape, etc. Instead of tracking our progress by remembering a milestone, track your progress based on what you gave up.

For those of you that work on Wall Street, the days you're going to count include the days where you suffer from the banker twitch. Your eyes lose control, you have not slept for 48 hours and you're overdosing on cocaine, yerba mate, adderall and Lord knows what else. Instead of quitting or complaining ***you get work done.*** Not only do you get everything done, you still go to the gym and work out for 30 minutes or you do pushups underneath your desk. Not to mention that you use all your meal allowance to buy healthy food because you know that repetition is the key to excellence. To top it off, when everything settles down, you continue to show up with a positive attitude every day… ***Maybe this guy deserves a promotion.***

If you want to get those coveted "six pack abs", instead of taking body fat measurements of your stomach or doing a few crunches every day (which do not help much), how about you count the cumulative hours you spent working out in the gym? Anyone can go into the gym after New Years running on a higher level of dopamine and adrenaline to "make a change this year"… Why weren't you in the gym New Years Eve? Why weren't you in the gym on your birthday? Why weren't you at the gym on Saint Patricks Day? ***Those are the days that matter.*** It sounds cheesy and lame, but real success is built when no one is looking. If you take a break when everyone else is taking a break… be prepared to end up just like everyone else. ***Average.***

Everyone remembers the first time they got laid, purposely going out to try and pick up a girl. What seems to be forgotten is all the work that lead up to that successful pull. You talked to 10, 20, 40, 100, 200+ girls. All a distant memory. Instead start counting the number of times you talked to an 8 or a 9. ***Did you let an 8 walk by and not say anything? Bad Move.*** Start counting the days where you open every single 8+ you see regardless of the situation. If you want to get better looking girls, you're going to go back to work.

Finally, the biggest hurdle for men… money. Everyone wants more, but what are you giving up to get it? Are you wasting your time doing a job that pays near minimum wage when you could be working on a new cash flow… yesterday? Are you hoping for a raise or a bonus instead of spending every second you can trying to add value to your company? ***If you add up the days you worked yourself to death, you'll find a direct correlation to your income.*** Don't get us wrong, you may have to go through months or even years before you see that correlation pick up, but when it does you won't regret it.

With that said, review your 2012 correctly. How many counted? ***How about today.***

****

Are You Really Maximizing Your Time?

This is an impromptu post after reading a few more emails come in. The big theme is this.. ***"Are you really using your time?"***

Today was a day that counted.

To explain here's the breakdown of the day:

1:00am: Flight lands late due to flight delays. This day is going to be full of hell no doubt, snow… not that kind of snow, but real snow is always a disaster.

2:00am: Arrive at the hotel and immediately go take a cat nap and send the suit to the cleaners. No time to shower because I haven't hit the gym yet.

5:00am: Alarm clock goes off. Let the games begin. B-line it for the gym, do some lunges and jump rope to warm up and begin squats. 35 minutes elapse. My brain is waking up. 45 minutes have now elapsed, after doing ***fifteen*** reps of one legged squats, my legs are beginning to shake and I feel like I just drank 7 bottles of Ciroc and redbull. Wired. Start walking down the stairs and I collapse, this is going to be good.

6:00-6:30am: Within 30 minutes the quick scramble begins. Suit is delivered, shower, shave, change, check emails, breakfast is already delivered to my room which is consumed in 5 minutes, brush teeth and grab my tablet because I have to meet with ***120 clients today.***

6:37am: Always Google maps your hotel to the first meeting so you don't have to bother with cabs, walk to the meeting and start popping halls and drinking yerba mate, its going to be one of those days. Meeting, meeting, cab, meeting, cab (phone call in cab), meeting.

10:30am: In a word, shit-show. Acquisition while in a meeting. During the meeting I pull down a few models and populate a back of the envelope calculation to explain numbers because it should be coming up during the next few meetings. Yep. Multiple questions on a deal where I'm unable to listen to the CC.

12:00pm: Head to airport, need to make it for a dinner meeting in another city 1 hour away, the cab ride is awful as I attempt to download the partial CC on the way and answer phone calls and emails as well.

1:00pm: Things are cooling down, as people know the flight leaves in 30 minutes. Time to day game. I shut off my black berry and start opening up girls in the only sushi spot in the airport since all of the other food is undoubtedly disgusting. No sex is going to occur but this city is on the "to visit list" after the warm responses.

1:40pm: Flight takes off and I'm working on some items now that i've got wifi and an hour to burn. I notice an overweight woman next to me in biz class and decide that her three different comments on how she doesn't have enough "me time" to get healthier is enough to send a message. I take the "warm almonds" and return them, take a frozen juice from the airport and set it on the recliner. I then rep out 50 pushups and sit down to read again. ***She doesn't talk for the rest of the flight.***

3:00pm: Slight delays, my brain is tired, I could pop some mod-alert but instead opt to begin writing one of our upcoming articles.

3:30-4:00pm: Time to get back into work mode, start rehearsing for another meeting where there will be a lot of questions to be answered. This should be fun, more importantly I spot another cute girl. "I like your shirt, you're looking pretty cute today what's your name?", "Umm I have a boyfriend, head turn". Funny thing is as we walk down to corral she sees I'm getting picked up and quickly figures out what I do for a liviing… Her face says it all, girls can be caddy 99.9% of the time. These of course are girls that are not worth the investment anyway. Too costly.

4:30pm: Arrive for the meeting, of course the jetlag is messing all of these time zones up but no matter. Meeting goes fine, everyone begins drinking and I fake alcohol consumption by drinking sparkling water. Two hours of hanging out with some rich guys, yeah most of them are fat, but you can't win them all.

6:30pm: Cab to catch a flight home.

7:00-9:00pm: Usual transit, reading books instead of work the day looks like its pretty much done. Read some emails from readers of this blog as well and respond accordingly.

9:30pm: It's finally time to head home. Ah you know what, who cares I'm going to the gym to finish up my workout that got cut short.

10:30pm: 20 hours of work, sweating like I just got out of a pool work out. This day has been busier than a mosquito in a nudist colony.

11:00pm: Time to head off to bed on the 21st hour. You know what I'm still feeling good maybe I should write an impromptu blog post on how to keep going? Yeah. That sounds like a great idea.

Conclusion: As a final statement this is not supposed to be some sort of bragging or "humble brag" about work ethic, it is simply a mindset that is unbreakable. Don't bother with trying to save a few bucks on ebay at work where your 9-5 jive is really a 3 hour a day work shift. Instead start forcing yourself to constantly switch and optimize. If you're not doing something that's making you more money, getting you more motivated, getting you out of your comfort zone or getting you healthier, wealthier or more free time for 90%+ of your day, ***you don't deserve to succeed.***

It's tough out there. Make your days count.

****

Ask Your Crypto Related Questions

The title says it all! We are making final touches this weekend on the book and given the volatility we have no doubt many people have many questions. All of the good questions will be added to the book. No crypto isn't dead. Thanks!!!

Attempt at Valuing Time Over 2 Decades and Q&A Announcement

Attempt at Valuing Time Over 2 Decades and Q&A Announcement

There is no real way to quantify the value of time so we're going to attempt it right here. As we've stated many times in the past, health is by far the most important thing in life as the loss of health makes you 1) lose time and 2) lose money. Since time is more valuable than money, you actually suffer a huge loss as your time evaporates and health issues usually come at a severe financial cost. Lately, we've been focusing a bit more on paying attention to your body (massage therapy, diet etc.) and this is due to the natural slowdown past age 30-35 or so. Mathematically speaking, you've got a solid 30 years or so where life is at peak performance (age 20 to 50, where 20 is more energy specific and 50 is more freedom and money specific).

Value of Each Decade: One of the main themes around here is that if you give up a solid 3-5 years of your life (typically only takes 3 years), by the time you're around 25-27 you're so far ahead of the game that each decade gets better. So far, this has continued to be the case. The downside is when you look back in time and ask yourself "would I be able to do all that work in my mid 30s", the ugly truth is a resounding no. No. We're not saying "to give up" if you haven't made it yet. All we're doing is pointing out a simple fact of life, energy levels decline from your 20s to your mid-30s to your 40s etc. Instead of pondering about how to adjust for this we're going to write it out here from actual experience.

Early 20s: This is where quantity over quality pays off without question. Everyone in their early 20s is drunk. They are partying in some way and going nowhere as they spend their entire paycheck every month. The funny thing is that their productivity at work doesn't even take a hit as a person this young can easily party 3-4 nights a week without any hit to productivity. This is due to the value of youth. The reason why people say "youth is wasted on the young" is because that level of energy can be used to learn and produce hundreds of things at the same time with no real impact to the physical body. People like to "claim" your health is ruined by working long hours but the reality is partying or working hard leads to the same thing… literally no impact to your future health. Trying to do either of these things (working 80 hours a week) or partying late into the night extremely drunk 4 nights a week at age 35? Not going to be a pretty outcome.

Quantity over quality applies to practically everything here. It isn't difficult to recall the ability to drink lower quality liquor and not even recognizing the difference between the "good stuff" and the "cheap stuff". This is because your body is able to process everything from pasta to junk food to bad alcohol. Use this to your advantage. You can work extremely hard and still go out a 1-2x a week without severely impacting your future. A great set up. Try every single type of venture that comes to your mind, to rattle off a few here we go: 1) affiliate marketing, 2) a cheap brick and mortar, 3) a fixer upper real estate deal, 4) a fitness coaching idea and 5) absolute worst case scenario, a second job. In the end throwing a bunch of spaghetti at the wall and seeing what sticks is a good strategy here.

Time Value: Luckily, we maintain basic journals every single day. After over 20 years of data, we've noticed that it was possible to sleep ~6-7 hours a day and work 9-12 hours a day (one rest day) without feeling fatigued at all. When you hit your mid 30s, this just isn't possible. Before jumping there we can run a quick calculation. 10 hours of "real focused work" per day is 60 hours a week. Then you add an additional 2 hours a day of "basic work" essentially grunt work that needs to be done, and *you're looking at 72 hours of productivity per week* for anyone in the 18-25 years old age bracket. Reading the underlined part of sentence will make anyone over the age of 40 certainly feel tired and remember "wow this really was the amount of work in the past"

Mid-20s: Once you reach your mid-20s there is a slight change. Instead of working 72 hours productively, you're likely in the 60-65 range. The interesting thing is there is no change to output, *you're simply much more efficient with your time*. After trying hundreds of ideas, angles and projects, you have a much better idea of what won't work and what will work… This allows you to reduce the number of hours spent due to decision making alone. Again. The actual productivity is just as high, the difference is that you're getting more leverage from the hours you're spending.

One of the major reasons why making it early pays off is that you know what you're good at. Many people do the math and say if you make a million dollars by 30… by the time you're 50 you'll be worth $8 million alone just on compound interest. This is the lazy way to think about it though. If you're able to get to over $1M by 30 it means you are earning a *high* income. All you have to do is maintain that level of income and you're going to be so far past $10M the first $1M will look miniscule in comparison. So. By your mid-20s we can say that your hours go down by around 6-8 per week and your energy levels are about the same (if not better). This means the extra time should be spent on 1) staying in tip-top shape to decrease physical decline and 2) building up your second, third or fourth income streams. Both of these items will allow you to elongate your earnings potential.

The real difference here is by your mid 20s you should already know what you're good at and what you're better off outsourcing. If someone doesn't know what they are good at by this age they either didn't attempt enough tasks or spent their time latching onto the success of another person. The second one is more common and dangerous than it sounds, by being in a role where someone supports a winner, they get a lot of benefits from the rising tide but don't develop individualistic skills as they are simply following a chain of commands. Not your problem (hopefully!). Simply spend your 60-65 hours a week on the things you're good at and keep scaling.

A small side benefit here is that your social life gets a lot better. The extra ~8 hours a week is a full day out if you want it. The second big benefit is that you begin to look like an "adult". Until you're 25 or so, you physically look like a teenager (for the vast majority of the population). So you fill out your frame, have more time to go out and if you don't feel like it, have more time to read and learn (reading decreases once the money really comes in). In short, your social life gets better, hours go down and you don't actually feel any real changes physically. One thing to note, you will notice the difference between good and bad quality foods/drinks. This certainly changes and is your first hint to make sure your diet is "dialed in".

Late-20s, Early 30s: At this point, the numbers should be working in you favor. The income generated by your investments and the income generated by your current Company/Career should lead to significant cash flow. The only issue is that you're going to be bored working less than 40-55 hours per week. We've seen many people hit their "number" in their early 30s… quit… only to come back working for 30% less since they got off the grind too early. While some people are ready to call it quits we'd wager that it's a bad move until you're at least 35-40 years of age. If you really hate what you're doing, we'd say to take a longer than normal vacation. This will be a good reminder that you're not ready to call it quits as you won't have anything to do besides party (which isn't all that fun 24/7/365).

We've got some bad news here in this age range. Somewhere around here you see a reduction in your "recovery time". This is noticed both at the gym and the times you go out to drink more than you probably should. The soreness from the gym no longer lasts 24 hours but between 48-72 hours if you really went hard. Similarly, the alcohol consumed is no longer out of the system within 12-16 hours but instead lasts 24-48 hours killing productivity for at least one day. The answer will be clear from day one, drink less and stretch/sleep more. Both of these two items will increase your recovery time and allow you to physically work out at similar levels to when you were in your mid-20s.

Since many of our readers are around this transition period here are several ways to get "over" the hump and make sure the declines are not felt: 1) chlorella and pedialyte for rehydration and recovery before sleeping after going out for drinks, 2) penciling in a massage 2x a month to get rid of any flexibility issues and improve recovery, 3) ice baths and icy hot for recovery and loosening up muscles, 4) switch from heavy grains like white rice to quinoa and more legumes and 5) consistent green juices – spinach, kale, etc. As a bonus, you can also reduce your calorie intake by consuming foods with high nutrients and low calories: berries and wheat grass while cucumbers can be used to make your body feel full while simply adding more water. To cap it all off, make sure your blood work says you have a healthy amount of all the major vitamins.

Before moving on here, around this age it no longer makes sense to crank out 60-70 hours a week. In fact, the *quality* of those hours worked will be low. This is a fantastic way to think about this age bracket. You should no longer be looking at quantity based approaches and should be 100% quality based. Your income streams should be high quality versus time spent, your workouts should be high quality but lower in frequency. And. Your food and drinks should also follow this same trend. If asked for a single word to describe this transition it would be **Quality**.

Mid-30s: This is where the energy declines are felt. Instead of working long hours, you should transition into being an "on call worker". This means you have to focus for short periods of time instead of prolonged focus. If the game was played correctly, you'll know exactly what to do and have the clearest path from A to B. The downside here is that you certainly see the decline in your ability to stay "on".

To explain this, back when you're 25 or so, you could hold extreme focus for 3-5 hours at a time and not feel exhausted at the end. In fact, you could hold extreme focus for around 8 hours a day or so and it won't make your day to day activities harder. Try to do this at age 35 and you'll be forced to cancel appointments. This means it is still "possible" but when you focus for long periods of time you do not feel 100%. You'll need to sleep, relax, and avoid cognitive work. The main transition in this phase is what we'll call "cognitive fatigue". Even if you've kept your body in tip top shape, this happens. For anyone who has made it, they will also notice this lines up with their experience as it relates to entertainment. You'll consume a few hours of mindless entertainment between ages 35-45 because it is something that forces you to relax. (Side note: this is not a change from prior advice, if you're not rich you certainly shouldn't be watching TV or doing any mindless entertainment, this is simply how rich people operate once they are older).

Day time activities also jump up significantly in this general age range. This is because losing large amount of sleep staying up late only prolongs the recovery period for your body. There is a reason why cities near the beach cost more (they are a lot more fun during the day). Also. In this age frame you shouldn't be stuck in an office and have more control over your schedule. So you're able to enjoy the day without impacting your bottom line.

Late 30s to early 40s: There is one thread that seems to keep coming back at this age, some new obsession with food/drinks. If the person is single or married it really doesn't matter. Both groups seem to shift to a focus on food and drinks as their form of entertainment. The ones that do it right are the ones that still look muscular. This is due to increased focus on energy levels. You're looking at another ~5 hour degradation to intense focus per week. Unless you're on special "enhancements" which we'll cover in our upcoming lifestyle/spending book (due out end of year).

The great news about this age range is that you still look very good assuming you didn't develop any serious health issues. Also. By this time you've likely had at least one serious health issue (a broken bone, tendon damage etc.). This will emphasize the importance of what is going in your body and how your body reacts to specific supplements. Seeing a professional dermatologist is essential as well to prolong your youthful look (we'd recommend going to serious professionals before turning 35 as it pays to prevent the issue earlier in time).

Evaluating the Time: After the entire overview it's time to go ahead and assign value to each year of your life. Meaning, by definitions above, since you had *more* energy in your 20s a lot of those hours can be devoted to making money. By contrast, by the time you're 40, the amount of "good hours left" in your life is moving down. People can say what they like but it's the truth, energy levels decline and the value of your time should only go up (since you're closer to death than before).

To attempt to take a mathematical approach to this, we'll go ahead and assume you're working 250 days a year. This means each day is worth at minimum $400 from day one (250*400 = $100,000) at age 21. By the time you're 30 this number should be closer to $1,000 a day at minimum (250*400 = $250,000) and finally by 40 it should be another double as well $2,000 a day a minimum (250*$2,000 = $500,000). Now before we math this out, lets emphasize that *earning is not linear.* You will be working in *event* based income also known as performance based work. This likely means that several of your years will be significantly higher than $250K-$500K.

The math is quite simple though, if we take the above numbers and combine it with the idea that your ability to work goes down, it means that a year of effort at age 21-25 is worth roughly 5x that at age 40. Thinking this through it means that every 1 year wasted in the 20-24 age is equivalent to wasting 5 years straight at forty. Compounding is brutal when it works against you. Assuming that you're healthy and in amazing physical shape, maybe we can reduce this math a bit but not much more than 3 years. Essentially a single year wasted when they should be invested is worth a minimum of 3x in the future. Remember this rough metric when deciding to kill yourself working long hours at age 35-45… the return better be sky high.

Before closing it up, we'll have a Q&A on Friday April 19 with the same format as usual. Also. As stated here it will likely take until the end of the year to finish up our lifestyle/spending book which will include how to use performance enhancing items (hint, don't do what everyone else does and use them when you're only 20).

****

Attention to Detial Is Overrated

Welcome to The Street: Every single day you work on Wall Street you develop an obsessive compulsive disorder for formatting errors, grammar errors, periods at the ends of bullets… etc. You start to become that Psycho VP or that "Managing Associate" you have always hated since day one. It is a slow process. You don't notice it until one day it happens.

It happened to me. It will happen to you.

The event: You walk into a restaurant ordering up some sort of sushi so you can pretend you're living a healthy lifestyle on the company's dime (ignoring dem dere 100+ hour work weeks mind you) and you see it…

A typo on the menu.

You: "Man this place is hilarious there is a typo right here! I see it man you guys catch this?"

(the dinner group goes silent)

Them: "Dude you're looking for typos on a Menu at the sushi joint. Who are you [[insert psycho VP]])"

You: (place head in hands and realize you've succumbed… you would sob but they are really just eye drops from the previous all nighter)

You're about to jump off the 27th floor of the building (of course that one slightly more prestigious bank is on the 29th floor) and if you are lucky you come to an important realization. You realize attention to detail otherwise known as ATD also known as OCD and depression **doesn't really matter that much.**

You know what matters? **The Art of the Ghetto.**

The Ghetto: You're laughing at this thinking that it can't be serious… but it will save your career many times. You know what separates that middle tier analyst/associate from the Top Tier? The ability to ghetto a model, ghetto a presentation or ghetto last second changes and make them appear correct! As you know perception is reality on Wall Street.

For those that have not had their first fire drill… take out your iPad Mini Retina display with flappybird installed and jot down the following bullets:

Excel with the White Cell… Ghetto: So your client wants a "quick edit" to the model we all know this means you have to respond in 4.767189 seconds or else your VP is going to be pissed. You can quickly ghetto the model by using white font in the excel spread sheet to run calculations. Insert the quick change and flip it to the VP for review… give them a print out… meanwhile over in your cube you are secretly correcting the documents during review time.

Cardboard Box Ghetto: Oh so your client wants to quickly hide pieces of the presentation. Open that Power Point presentation and do the following "Alt + I + X" followed by "Right Click + R + T". This process can also be called "Alt-R-IT" (say that last one out loud as a single word).

Now you have a moving box to cover up any last second issues on the page. IE: move this shady text box around to cover up both errors and parts of the presentation by bringing it to the front. Don't forget to hold down CTRL+Shift to make sure you're moving the box perfectly horizontal or vertically. Repeat the process of "turning the document quickly" and secretly fixing it on your end.

Pro Tip PDF versions usually move the box up and to the right slightly so make sure when you cover up some ridiculous formatting error like an extra $ sign in the top left of the chart that you adjust the 0.001 inches to make it work. This may just be a dated hardware issue so find out the issues with your computer in advance.

Gang Line Ghetto… Word: Similar to the text box white ghetto the biggest SOB in the world is the border issues on a word document/presentation made in word.

FML.

Get used to clicking Alt + I + P + A… and we are not talking about IPA beers here man. You can grab any sort of quick line to make it seem like you were a good peon and correctly messed with each border appropriately. Slot them all in and proceed as usual (fixing it on the DL while in review process).

Fire Drill Gentrification: Well we'll probably catch some heat for the phrase gentrification but remember we're trying to clean up all the ghetto we made before the turn comes in.

– For excel your smooth move is F5 go to special select objects … Delete. We all know that was some serious ghetto you just pulled off

– In addition, if you had a lot of white cell secrets in there… highlight the trick cells (usually on the right side of the model) and go back to F5 go to special … select constants

– For word documents select one of your objects and click TAB to get to the fake ones

– For Powerpoint you can simply drag and grab… a rare time when using a mouse usually doesn't matter too much

The After Math: One day you eventually get promoted and you are one of those VPs correcting the work. You're gonna catch some ghetto in one of those presentations.

You: "Dude this is a text box and white cell man can you fix this before the next presentation we're gonna reuse this a lot"

Disgruntled Analyst: "Ahh okay ya sorry about that, just thought the presentation was done"

You: "I know good work on the speed but… we need to make sure all the files are clean in case there are edits"

Disgruntled Analyst (seems to be upset with you)

You: **I'm not being mean… I'm living the dream"**

****** How about you Star Analysts and Associates? What are your secret ghettos?***

****

Avoid Initial People Management Mistakes

[Avoid Initial People Management Mistakes]

Eventually you're going to be put into a position where you're forced to manage people. That's right. Dealing with employees in some form. This is the worst part of life in general (not an exaggeration) as people are driven by emotion, ego and a myriad of other non-revenue generating factors. With the bleak beginning, we can move onto the good news. If you simply focus on aligning incentives you'll be off to a good start.

Why Managing People is the Worst: Before beginning, we'll warn you that everyone you meet will immediately assume you're a bad manager. That's right. People who have never managed people in their lives and people who will unlikely ever get to that point believe they know if you're "good or bad" at it. We wish we were joking but we're not. In fact, if you show this article to anyone they will immediately react in the exact same fashion "this makes no sense they just suck!" The reality is that managing people is the part that actually "sucks". You're now in charge of someone else's livelihood (paying for their bills, family etc.). On top of that they think they are smarter than you and think you're "out to screw them". It's insane but this is the starting point.

The ramp period is generally the worst part. You have to find out what type of skills the person has without bursting their ego. We'll use a sports analogy as it should hit home. If you tell a 40 year old guy that is 5' 7" all and a tad overweight that you don't think he can dunk a basketball, he'll agree and won't be offended. After all, this is easy to confirm and validate. Now here comes the "fun" part. Tell him that he can't write a sales memo or can't make a good power point presentation and he'll flip out. Why? Everyone thinks they are smart and if you tell them they can't do something that requires thinking, their insecurity will go parabolic. Remember this paragraph and engrave the words in stone. During the "ramp" period, you have to put the person into a myriad of tasks to figure out where his skills are. If you assign him a task before you know that he'll be good at it… he'll be personally insulted when moved to a different task. *Do not give anyone direct responsibility until you're certain that they will do a good job.*

The last one that explains why managing people is the worst is this: *they overvalue their contribution*. Generally speaking, people over estimate their worth. It is crazy since the job market is pretty open. If the person was really worth 20% more, how come they can't get another job offer? This is pretty clean logic and yet you'll get hit up for more money over and over and over again. If someone is doing a good job certainly pay them over market. But. If a mediocre person continues to ask for something, begin ignoring them. Unsurprisingly, the ones you're paying the most are usually the ones who don't "ask" for anything and come in with a new offer and a resignation that you have to match.

Two Easy Ways to Start: Hopefully the above already reduced your interest in managing a large team (good!). Their incentives are already different. If they are paid an hourly wage, the performance of the firm doesn't matter to them. But. If you're the owner, the performance of the firm matters a ton to you. It's time to close the gap.

The easiest way to close the gap is by hiring people who had bad managers and by figuring out a way to give them large amounts of autonomy. The first one is more of an art that will be developed over time. If you've never had to read people before, this is something you can ignore for now. Just keep it in the back of your mind. If someone had a terrible manager before, that's the main reason they left. No one quits a decent paying job, they quit bad management/work environments.

The second one is where you can control a lot of the work flow. If you're able to correctly identify where a person has a "competitive advantage" this naturally leads itself to more autonomy. Most people would actually take a pay cut if it meant that they could work in full autonomy. Absolutely no one likes a micro manager who stares over their shoulder all day. This should be music to your ears. Find the tasks where you trust them 100%. This also protects their ego. If you have to constantly "fix or edit" their work, their ego takes a hit. They believe everything they do is perfect (a part of the human condition).

Incentive Alignment: There are two things you're looking for, a person to help save you time and a person to help your net income go up (more than the amount you're paying them of course, otherwise you'd go out of business). While this is what you're looking for the employee/worker is not looking for this. They are looking for the least amount of work for the most amount of money and a sense of "purpose". If someone is simply lazy you can't hire them and you're looking to align incentives by adding a "purpose" to their life. It sounds crazy. But. People will really work hard if they feel that they are needed/providing some sort of value. The value does not need to be high, the way they feel is more important than that. This is why criticism never works and you're better off managing with carrots instead of sticks.

While we've painted a picture of an ideal hire, someone who is good and incentivized by something illogical (a sense of meaning or purpose), this is not always going to be the case. The key items that people care about are: 1) money, 2) feeling of importance, 3) autonomy, 4) stability and 5) risk

<u>*Money:*</u> This one is quite simple, if someone is really looking for money you want to put them in performance roles so your incentives are entirely aligned. Sales for example. Hiring a money hungry person for an administrative position (or back office) is just going to lead to headaches. You don't want to pay top dollar for things that are "qualitative". You want to pay top dollar for things that are quantitative.

<u>*Feeling of Importance:*</u> As mentioned earlier this is the best hire in general. The money hungry person is only the better hire if they are *good* at their revenue generating role. Other than that, the person with the big ego and need to feel good is the best hire. All you need to do is make them feel important and they might even work for less since you're such a good manager (seriously this happens A LOT more than you'd think). This reduces turnover, reduces the chances they look for a new position and increases morale in general.

<u>*Autonomy:*</u> While covered above, this is a bit separate as Autonomy means different things for different people. For some it means that they get to work from home and don't interact with co-workers. For others they want to be in an office but don't want to be micro-managed. And. For the extremely talented, it means they don't want instructions just a "direction to run in". If you find people who are actually able to produce with basic directions (XYZ is needed), you're probably going to give them equity in the future. In fact, there are only two people who really end up getting competing offers and moving up in any company: the fully autonomous person and the money hungry performer.

<u>*Stability:*</u> No one works well when they are under a lot of stress. As another fun rule of thumb, anyone you hire will do 50% better in under a month. Why? They are nervous because they are human. Many say it's because they need to adapt to the new tools/tasks but it's really a function of being nervous/new. This is a general concept you'll hear thrown around an office environment. The need to feel "stability" since they are likely paying bills, may have a family and other obligations. So if you figure out that a person is in this camp (unable to perform under stress camp), you pay higher salaries and lower bonuses. This is the calling card of the typical "risk free" person. No interest in risk.

<u>*Risk:*</u> This naturally leads us to the Risk person. You're *much* more likely to find this person when you look for a new worker. Why? Well unless you're already managing a 100+ person Company, the chances are you're a pretty new and small company. These individuals are only motivated by "upside" and don't care much for the salary. The answer is Equity. And. Ideally with a performance component. Large companies use options but this could also be done for smaller companies.

Congrats! Now you have the basic framework for making a hire. You have to figure out which one of the basic five they are in and adjust your strategy. The funniest thing about this entire endeavor is that the average person still thinks management with the "stick" is the right way to operate. It never works. People who are happy to see you every day will work harder for you, potentially work for less and deliver better results. If you ignore all of the items above but simply avoid yelling at people and criticizing consistently, we'd wager you'll still do better than 90% of people when they look to build a team.

Not So Fast on the Hire: Started out with the bad, moved to the solution (positive), now we move back to the realities of life. <u>*Under no circumstances do you hire people you don't need.*</u> Cannot do a post on people management without the harsh truth… You want to hire the least amount of people as possible. Contracting, outsourcing, software tools, etc. Use every single possible thing you can think of to improve efficiency. Until you're *losing* profits with 100% certainty do you hire someone. Notice that you need to be certain that the person will free up your time to make more money. That's a good rule of thumb to be aware of. Hiring too early will cause you to lose cash and it just isn't worth it to scale extremely fast unless you're trying to get to $100M+ in net worth.

Basic ideas for avoiding a human hire. Virtual help, this comes in the form of assistants and software tools that automatically do mundane tasks. It should take about 90% less time to "check" something versus manually doing the task. Outsourcing tasks that are not critical. This means you find someone who works on short contract cycles. Much better to simply write a check vs. the whole negotiations, health care, etc. Combine both! Hire someone to come up with a tool to fix part of your process. Depending on your industry we have no doubt that there are many many more.

Structuring the Process: Now that you've got the big three: why hiring is the worst, how to focus on the big picture and ways to avoid hiring in the first place, it's time to conclude with creating consistency. The best way to create consistency is to have a plan B in place before the new hire shows up and to keep a pulse on their personal interests.

Have a Plan B: At the end of the day, no one is going to care more than you do about the success of your venture. Don't believe the lies. Every interviewer is going to say they are hard working, smart and love the Company. It's all a mirage. No one can possibly care more than you do if you're serious about making more money. If other people do care more than you do it's probably time to sell it anyway. Therefore you must have a Plan B. A plan B means you have multiple ways to generate "value" out of the person. If you hire them for task A only to find that they can't do it, you'd be out of luck. So you're looking for someone who can fill two different roles in an ideal situation. To wrap it up, you want to create a trial period for most employees so you can let them go without legal headache within a short period (call it a few months). This is becoming more and more common.

Personal Interests: As a rule of thumb, people in their 20s are more interested in learning, people in their 30s want to see career growth and people in their 40s want to be managers/respected. The last one is complicated since people in their 40s usually hit a plateau, don't generate much more revenue/value but want to see higher incomes and status. To make matters worse they typically have families and only a heartless person would enjoy firing anyone in that situation. As a fun framework, you want to outsource projects to people in their 40s, these individuals usually had strong careers, made their money and decided to become their own boss so to speak. Quality usually high. People in their 20s shouldn't be trusted with serious outsource work as they don't know how to work with minimal guidelines. And. To wrap it up people in their 30s usually catch on to new trends as they synthesize their work experience with life experience. Good age range for idea generation. Before getting lambasted in the comments this is just a summary for the "general population". There are many exceptions to the rule and we're not focused on that since it is statistically unimportant.

So put it together. Since people in their 20s want to learn, you can move them around fast to see what they are good at. This benefits you and it feels like learning to the employee. People in their 30s want to see career progress so you should be certain about their skills. If they don't have the talent to scale up, they'll leave on their own as they see they are not being moved up. Tasks for people in their 40s should be outsourced unless they are part of the select few who have too much talent to ignore.

If you think the above is brutal, we remind everyone to read the greatest book ever written "How to Get Rich" – Felix Dennis who states the following: *"Youth is a further factor. By the time talent is in its mid-to-late forties or early fifties, it will have become very very expensive. Young talent can be found and underpaid for a short while, providing the work is challenging enough. Then it will be paid at the market rate. Talent is indispensable, although it is always replaceable. Just remember the simple rules concerning talent : identify it, hire it, nurture it, reward it, protect it. And, when the time comes, fire it."*

On that note the book has been read so many times we've even picked up some of the writing mannerisms. And. For example. Sign of good things to come. Hopefully excludes the throat cancer part.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality … You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by **Clicking Here**.

Avoid Thinking Like Regular People

Avoid Thinking Like Regular People

While introverts are not always the greatest people to bring to high energy night clubs, introverts have a much higher likelihood of being independent thinkers. It sounds like an oxymoron. But. It is 100% possible to become an independent thinker by using processes that force you to think for yourself. We see numerous people on the internet who cannot think for themselves they either 1) use the mainstream to "educate" them, 2) find a few people they think are smart and regurgitate their opinions or 3) read a bunch of information but unable to apply it resulting in memorization… which isn't learning. Generally speaking, extroverted people fall into trap number two while introverted people are more likely to fall into trap number three. The first group would never read this blog so we'll go ahead and kill that off first.

Step 1 – Mainstream Avoidance: There is no way to insulate yourself from the entire mainstream media or mainstream trends. At the end of the day it is natural to have some hobbies or interests that are popular with the masses. We're public with our interest in boxing and basketball as both a hobby and a way to make money pretty consistently. Until we got rich we didn't watch any real movies or mainstream entertainment and now that there is a ton of free time we watch them once and a while. The funny thing about going through those two phases (watching none of it for several years then watching it once in a while) is that you can see how blatantly fake special effects and acting is.

Back to the point. Mainstream media and mainstream entertainment are the two items to avoid until you can think critically for yourself. One of the clear reasons we chose to watch sports as a hobby is that there is no real political motivation there. Unless you go down the rabbit hole of watching interviews and post game recaps (not sure who does that) watching and analyzing a live sport is neutral (no narrative). Since you're reading this blog the chances that you sit around watching TV and movies is hopefully quite low. A maximum of 2 hours a week is about right if you haven't made it yet. Thinking back, during the busiest "ramp" years it should be zero hours naturally as you're too focused putting out fires everywhere and scaling your production.

Mainstream avoidance is solid general advice because of the audience it is serving. That's a good way determine if you should listen to the source. If the source is "the general population" it means the message has to be dumbed down to a point where nuance can not be communicated. Similarly, motivational speaking is the same, Michael Jordan, Steve Jobs, Albert Einstein and Tiger Woods do not attend motivational seminars. Motivational items are targeted at people who lack motivation (by definition) which is not a crowd you want to take advice from or be a part of.

Step 2 – Look for Sources: Since we want to create a post that forces you to think for yourself, we've only limited two groups: motivational nonsense and mainstream. At this point you're already ahead of the curve. Now the next part is to play a fun game *"Does this make sense*". Sounds easy but it isn't and this is how you'll end up creating your own thoughts. Just because something is said by a person you respect, you should still question it. There are people we follow who we think are smart from Cernovich to Naval. There is no chance they agree on everything and there is no chance we'd follow two different accounts that say the same stuff. That's the fastest way to create "Group Stink", where everyone agrees and the result is nothing (if the herd agrees there is no significant value left).

"Does This Make Sense" come up with your own structure. We'll emphasize that again. Come up with your own structure. We're happy to give ours a way as an example, so here we go: 1) where are the incentives, if the incentive is aligned for it to be true the likelihood increase significantly, 2) follow the insecurity, 97% of people don't even get to a million bucks and we'd say 99% of people don't get to a million dollars with their life in check – unhealthy, overbearing wife/girlfriend and 3) what are they trying to "get". These three are probably the foundation of our decision making. There is a lot of nuance but that's the big three if forced to make a rapid decision.

Incentives, Incentives, Incentives: The only way to get people to cooperate over extremely long periods of time is through incentives. This is an opinion but as you can see we beleive that to a high degree. Train a dog to only eat food when you say he's allowed to and he'll do it for a few minutes or maybe even hours… leave the dog there for longer periods of time and he'll break. At the end of the day, humans are the same, we're not special. If you're over the age of 25 we can all but guarantee you've had at least "wow she/he did that to him!" and if you look under the hood you'll see that incentives were not aligned for a long period of time.

The second piece of incentives is the "likelihood of being hurt". This is more art than science. Take white collar crime for example, generally speaking, the incentives are aligned for people to break the law in many cases. If someone has a chance to make $10M off of a questionable deal and they will only be under house arrest for a couple of years… they will probably do it. This is a lot more common than you'd think. Kids are arrested for drug possession (crack cocaine for example) and serve longer prison sentences than people who steal millions of dollars. Until a balance is made we're certain that these issues will not be resolved. Coming up with the right balance is definitely not within the scope of the blog. But. This will happen over and over and over again as new industries grow and die creating a similar situation consistently.

Follow the Insecurity: Even rich people are typically insecure. They got rich by giving up everything (their health and social skills for example), so it is extremely rare to find someone who is stable. When we use the phrase stable we mean that the person really isn't moved by anything passive aggressive or "words". They know it isn't true so it's entertainment.

While the rich usually have insecurities around women and their health, the vast vast majority are insecure about their place in society. So they do the following "root for the underdog" "find exceptions to the rule" and claim that visibly successful people are unhappy relative to them. Why? Well they have to come up with an excuse for being in their current position in life and must find "hope" that they'll make it. This is why people consistently claim that rich people are unhappy, it's an arbitrary measure that make them feel better about their current place in society.

What are they trying to "get": This doesn't refer to people. *Generally* people who are happy with everything in their life don't have role models. Instead this refers to a style of life. If someone is really "aiming" for a basic life outside of the USA, it usually means they know they can't make it in the USA. If someone is desperately trying to make an extra $500K a year while their health erodes, it usually means they think that money can fix their personal life problems. Look at what the person is trying to get and you'll find what they lack in life quite quickly. This is why our readers don't see us engage with people often, it's because we can tell in a single click "where they are" and then predict with high accuracy "where they will be" in a few years. Unsurprisingly, the ones we have engaged with the most have suddenly done well in life (including random anonymous accounts). Doesn't matter if the person is a public figure, where they are going can be figured out based on tweets alone with extremely high accuracy 90%+ (no we're not joking).

Step #3 – Find Proof Points: At this point you should be looking at various sources of both high and low quality. Consistently asking "does this make sense, do i want to be like this person" over and over again. Now you can build your own mosaic of ideas. Say you respect one person's ability to spot trends in investing for example… Maybe you don't listen to their fitness advice since they are out of shape. For another person they are in extremely good shape and even competed at a professional level… But… They are always strapped for cash. Finally, you find one person who is a solid 20 years older than you and you say "generally I want this persons life". Well you can now build a data set out of this. You get the broad picture of where to go "the life arc or life path" the person took. After that it's up to you to stay current on the micro level.

One way you see this play out in *reverse* order is when unsuccessful adults try to pass on advice to kids. While some of it may be decent it just isn't worth listening to. Many will feel attacked and upset by it… That's alright, this is supposed to be a post on thinking differently anyway. The adults mean well, they just didn't see the consequences of their actions over a 20 year period. And. What worked before may no longer work today. As a prime example, going to work in financial services was a great idea. If you have a child that is only 4 years old… Probably not the best advice (in fact probably terrible advice). Instead you want to move down the software/sales route to open the door to more options. Learning from mistakes just isn't good enough when making life changing decisions. You have to find people who saw "where the money pot was going". If they didn't see where the money pot was going 20 years ago, they are not going to see it today since age usually results in falling behind. In fact, we're starting to feel those consequences today as we lose interest in keeping up with every single industry that is out there.

Mosaic complete. Find results. You want to build rapport with people so you're going to 1) ask them for advice, 2) take the advice, 3) send them proof that you took their advice and it worked and then 4) send a thank you message to follow up. Prior to taking their advice you will not bother them or contact them. To cap all this off if you have absolutely no mosaic built you should "A/B" test this. You find two people for each category you're trying to learn about and see which guy gives you the best results. Make sure they don't know each other and are geographically spread far apart. The guy with the weaker actionable information is the guy you're going to drop.

Step #4 – See Green: Less than 4% of the human population will take the time to go through all three of the steps below. This is why we aren't worried about increased competition any time soon. They are too busy complaining about where they are in life.

Seeing green is a reference to the combination of yellow and blue. Essentially, you have to learn how to combine two different topics into one. If you can do this you're going to come up with different conclusions from the masses. ***The masses only see one side of a picture.*** This is also similar to how they play a game like chess, they only react or see one move at a time. This is because they don't have any niche knowledge, only have one trusted source (media or one guy they trust) and can't piece it all together.

For fun we can come up with a clear example. During the presidential election the only person that people could talk about was Trump. This was clear as day even if you were against him. Most assumed it was because he was being made fun of… but why would you pay attention to someone that is a "running tabloid joke". Tabloids only last a day. It made no sense. The average person only saw the laughing and joking part and ignored the amount of attention he was getting in general. This is similar to people who say they think "Kanye West" is a loser, but then proceed to talk about him every single time he does something. The same applies to the Kardashians and many other celebrities. If we only look at the initial reaction, we can't see what "caused" the event. Maintaining relevancy is NOT easy at all. In fact it is borderline impossible which is why many musicians are "one hit wonders", never figuring out the secret sauce to consistent hits.

Taking this to another example you can look at the marijuana/weed industry. While the masses tried to create weed shops and products the big money was made in buying land in Nevada and Washington since there was a clear "go" signal that it would be legalized. So over time the people who bought the stores are paying all of these land owners for several years (5, 10, 15 year leases). Also. They don't even care if the person succeeds. Someone else will take the land to grow the plants.

A conclusive sentence for this section is that ***"memorization isn't learning"***. That sentence hurts for all the book smart people who "know a lot of stuff" but don't have anything to show for it. At all. Doesn't matter if someone knows a lot of information, the magic happens in the execution. This is similar to sports yet again. You can teach someone how to make all the right movements, but it doesn't guarantee that they will execute them.

Step #5 – Create Consistency: This is a ***lifelong process*** you will eventually come up with differentiated thoughts, ideas and predictions. This is great. Want to know what's better than that? Being able to gain utility from all of them. You don't need to make money off of it. You could get information that saves you time, makes you healthier or improves your social life. It could be a wide range of items. The one key here is that you've successfully become an independent thinker when you come up with a conclusion and it makes people go "hmm i didn't think of it like that" **AND** it works!

That's the holy grail of this long process that we can all but guarantee 99% of people won't follow. Since there is no way to "teach" independent thought, we had to rename this to "avoiding regular thoughts". By avoiding the sources of data and information that are weak, you're forced to come up with different conclusions on your own. This is where the magic happens.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality … You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by **Clicking Here.**

Avoiding and Going After Tail Events

[Avoiding and Going After Tail Events]

How many airline CEOs thought they would generate practically zero dollars in revenue and lose billions of dollars in 2020? How many stock market experts could have predicted a massive decline in profits for practically every sector outside of technology, medical/bio-tech and grocery stores? Absolutely zero is the answer if we polled the United States on October of 2019 (we're not using December of 2019, since a snarky commenter will state that some deep state officials were privy to COVID-19 before December 31). The one benefit of this pandemic has been a return to "importance". Outside of financials, the pandemic shouldn't have rattled you if you had your priorities straight. Naturally most do not and realized (quickly) they were not living life in the correct direction.

A Good Time to Reflect: As the economy opens up over the next month or so, it would be wise to question your current set of decisions. If you were unhappy during the lockdown, ask serious questions about the "why". If it's because you were unable to get drunk with friends, that's not a good reason. If it's because you were losing money ask what you can do to be better prepared for one income stream going to zero. If it is because you were neglecting more important people in your life then it's time to switch up your priorities.

In fact, we'd say that this was the perfect time to hit the reset button. There is no better time to click reset than now. "Post Pandemic" gives you a perfect excuse to become a ghost to the negative influences in your life. When you're suddenly gone, you can claim "COVID-19" issues and no one will prod further. It is beautiful.

To give a clear example on this side of the pond… There is limited value to going out if you can invite people over instead. That is the main conclusion here. We're starting to side with people who throw house parties and privatize their social lives. It makes more sense as you get older since you've sifted through tons of people and already met the major set of winners in your social group. If new ones pop up you'll hear about them anyway. So the benefits of throwing social events at your home begin to outweigh the costs (clean up costs, organization etc). We're showing our age with this as no one in their 20s would agree (and they shouldn't).

Can't Control Everything: If there was a time to read about stoicism, the lock-down was certainly the time to do it. The next best time is now. While you can try to plan for rough time frames (a year to five years or so), predicting anything further than that is quite painful. As we've learned you cannot predict everything. You could get a life changing disease, you could get hit by a car walking across the street or you could randomly hit the jackpot with a hot hand at Vegas. Who knows.

What we do know is that you can focus on your reaction and decision making. You can decide to wake up early and get your major tasks done. You can decide what you eat every day. You can decide what you consume everyday (information). You can decide if you're going to exercise. You can decide who you spend your time with. So on and so forth. Since the lock-down allowed you to isolate for a month, this is the perfect time to write a list of the things you can actually control and throw away the uncontrollable items.

Another item we researched during the pandemic was "tail risk aversion". Since most people did not understand the idea of "fat tails" we decided to look into every fat fail issue we could reduce going forward without ruining or seriously impacting our lives. So here is a quick list below:

First example, do not put all your valuables in a single place. This does not refer to a portfolio (which is obvious) but also refers to items at your place of residence. A single point of failure results in total loss, so storing all your valuables in a single safe is not smart. If the safe is gone you're toast as well. You should have numerous areas within your home that hold different types of valuables. So if one goes down you don't suffer a total loss.

Second example, if you have a family you should never fly with your wife unless you are together with your kids. Why? If you fly together and the plane goes down your kids are the ones who lose everything. If they are over the age of 21 that's a different story. Fly on different flights to the same place, no change in price.

Third example, if you plan on purchasing a home it is smarter to purchase a home with a single story. You may laugh at this but older people, kids and even people in their 40s/50s could fall down the stairs and die. This seems like a joke to anyone under the age of 40 but is something to think about if you're investing/living in a place long-term. It reduces risk without any serious cost considerations in the USA.

Fourth example, gated communities provide more security than risk. This is obvious but some believe that living in a gated community leads to crime via targeting. This is only the case if you live in a poorly managed one. In an ideal situation you live in a gated community that is well managed so there are security cameras. The key here is consistent monitoring of the property. As the technology improves over time, you will deter the vast majority of crime since the perpetrators are traceable.

Fifth example, don't purposely go out to violent areas. This seems obvious but watching all the riots has really solidified this view for us. We find it laughable when people say *"you should do something about it"*. This is the same logic that Peace Corps and Teach for America types have. That is… they are fools. If you really want to make a difference we all know that starting a school, creating fund raisers and voting will cause more real change. Anyone who believes that they are "making a difference" by standing in the street for 2 hours while other people rob businesses… is fooling themselves. The people in the Peace Corps are being fooled in the same exact way. If you're talented you create a value additive business, hire people (so they can feed their families as well!) and then use that money for a greater good. Walking around with some good people, some bad people and some criminals is just a waste of time. Notice, we've made zero political statements here since it doesn't make sense on either side and we don't vote since the winner of any election doesn't change a winner's ability to win at life (as you can see, lots of winning!). Any mass gathering with rioting nearby is just a gamble on your life that is not worth taking.

Sixth example, stay out of cars when possible. Seriously. While this might contradict the housing argument it really doesn't. Up to date high rises are well built, are one story in nature and usually have multiple well maintained elevators. It's much more rare to see a high-rise suddenly collapse when compared to a car crash or an injury from falling down stairs. Again. Look at statistics. Even though people fear airplanes more than cars, that fear is rooted in irrational beliefs vs. facts. Cars are dangerous.

Seventh, think through natural disasters. There is always potential for natural disasters (hurricanes, earthquakes, tsunamis, tornados… etc.). You can't avoid them all. That said, you can certainly de-risk them without paying outrageous insurance premiums. An easy way to do this is to purchase in the "nice area" that is away from the major disaster (when possible). If a city has tsunami potential, you don't want the beach front property even if it's "cool". If a city has earthquakes, then you can learn about the major fault lines and simply go away from them. If a city has a volcano for some reason, then you simply map out the area with significant risk… and avoid.

Eighth, layers of protection for access to important information. We can use crypto as an example here since it's easy to understand. You don't want to have a piece of paper sitting in your desk that holds the keys to all of your money. If you lose that… you may be screwed forever if a criminal acquires it. Instead you want to have those keys spread across a few different locations and on top of that have a few different copies. For example, if your pass-phrase is 12 words, you have 6 pieces of engraved metal with six of the words on each of them. A smart reader will understand how this also prevents someone from grabbing one slab and running away.

Ninth, defend the 2nd amendment. Notice the difference between defending the 2nd amendment and owning a gun. You may not necessarily need one at this moment but you certainly want the option. If you already own one and read this blog chances are you've taken intelligent security precautions (making sure no one else can get a hold of it). This is an active item to keep in mind given what has taken place in the USA over the last few weeks. People are certainly unpredictable.

Tenth, the last one is a consistent choice – decreasing risk of the top 10 causes of death. The top ten are heart disease, tumors, accidents, respiratory disease, stroke, alzheimers, diabetes, the flu, kidney disease and cirrihosis (liver). As you can see, we've highlighted the major accidents that can be de-risked (staying out of cars, living in one story homes, not looking for trouble etc.). The other ones take minimal research. Seriously, if you can do the following, you're good: 1) clean diet, 2) grip strength training, 3) regular blood-work, 4) avoid alcoholism and 5) taking smart precautions around catching the flu and of course… COVID-19. Very few people do this type of basic research since you feel invincible till around your mid 30s. At that point you notice you're not as athletic/energetic/high-metabolism as you were in your 20s. We gave you the main ones above but please do your own reading. It is not well known that annual blood donations and grip strength can reduce your risk of heart related death by 80-90% (yes we're serious). The key of course is always the same: consistency. Most will do it for a couple months and give up, the winners make it a life long habit.

We're sure we missed a lot but we're reading more and more on this topic as it seems to be quite important. There is no reason to "stress" about these things, it is more about taking actions that are intelligent over a long time frame. Does it matter if you live in a one story house instead of two? Not really. Does it matter if you walk more vs. getting in a car? No not really. So on and so forth. Once the habit is engrained in your daily life, it is actually healthier for you. *Bonus: smart time to practice stealth wealth particularly as it relates to new people in the future. We've covered this topic hundreds of times.*

Wasted Mental Space: Many people spend hours and hours worried about things they cannot control. Not only that but they also worry about results for things that do not matter. *For example:* worrying about an airplane crashing. If you're already on the plane there is nothing you can do. So you have to teach your brain that this is reality. It is simply something you cannot control. *Another example:* worrying about the opinion of 97% of people. The vast majority are not that bright (a statistical fact). So trying to win them over is foolish and on top of that, worrying about their opinions = reduction in intelligent thought processes. Unfortunately, or fortunately, we've reduced the number of things we worry about to almost nothing (vast majority of issues are out of our control). So. This has led to a pretty calm mind. The majority spend countless hours living in a *stressed out* state of mind which impairs their decision making and reduces the length of their lives.

Active Positive Tail Events: The events of 2020 typically result in "risk aversion" thoughts. So we have to end on a positive note and highlight ways to take on risk that results in significant outperformance with little downside. Below is a short list.

First, Cryptocurrency investing. Even if you think it is worth $0 in the future it would be foolish to own $0. This is because the asymmetric nature of the investment is high. If you invest $1,000 and lose it all, your life is not going to change. If it goes up and really becomes digital gold, you're looking at $400,000 per coin (yes an insane figure but the point is clear).

Second, starting an online business. Even if you are risk averse you can go through the standard: time for money exchange -> selling other people's products -> selling your own product. The reason this is an asymmetric risk is the same… the max you can lose is a few thousand dollars if you have a skill based service to offer. As you learn how to earn online, a $50,000 investment will not be a lot of money (to you relative to net worth) and the upside is a million plus per year. *Important note: please do not read this and assume that crypto is better than an online business. It isn't even close, a business is better since the money is *recurring* and can last decades. An increase in prices for crypto is not only low probability but also inconsistent.*

Third, always selling/applying. Colleges, Jobs and Dating all apply to this one. There is quite literally no loss if you fail (okay the small application fee for college). Generally speaking, you should be selling/applying for something on a daily basis. The only exception is if you're wasting someone's time (IE. cold emailing/"networking" when you have nothing to offer). In that case you are wasting their time and burned a bridge. Assuming that you have something valuable to offer… go ahead and swing. Even if the chances are slim (under 5%) you don't lose anything.

Fourth, try to be in the middle of the pack -relative term. This seems counter intuitive at first since most people think they are the best and should always be "#1". Unfortunately, in the real world, you're going to find someone who is better than you at practically everything. So you want to consistently surround yourself by people who are making you better. If you surpass them, you constantly look for higher and higher levels. If you are the best person in the room at all times… you're *decreasing* your chances of making it to the next level. In order for you to move up in the world, you have to surround yourself with people who are ahead of you. This is similar to playing a sport, the only way to get better is to go up against people who are better than you.

Fifth, stay long the outliers. We've posted about Tesla before and sure there will be days where it is down quite a bit. That said, when you want to invest with low percentages of money, choosing the smartest people in the world is usually a good decision. Elon Musk is arguably the smartest person on the planet. Steve Jobs had a similar "aura" about him as he successfully turned Apple around. A good way to find these individuals is to follow the cults. People who are seen as "crazy" are usually geniuses if their background is riddled with low probability success stories. If someone is deemed "crazy" this is actually a great sign as most people can only think in binary ways (either he/she agrees or disagrees with me).

Concluding Remarks: Tail events are rare, under 2.5%. The key is to expose yourself to a bunch of the positive ones while simultaneously making decisions that decrease the risk of a negative tail event. If you look hard at tail events, you'll realize that you're missing out on hundreds per year. Most people avoid the positive tails as their egos get in the way (you will lose much more than you win since you're going after something with low probabilities). Over time, the math simply catches up to you and you'll benefit from a positive tail event.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life. **We hold Q&As 1-2x a month for purchasers only.**

Avoiding Big Mistakes in the New Economy

Avoiding Big Mistakes in the New Economy

Your average person is an expert in everything but doesn't have results. This seems to upset a lot of people as they know it's true based on their world view: dating, money, friends, fitness etc… Yet no results. As many of you know, the answer is to "smile, nod and agree". That said, we can go ahead and look at some logical conclusions based on the new economy (tech, healthcare and your future working environment). This will act as a bit of a crib sheet for the next 10 years or so.

Follow the Results: Look around. The people who made good money were in tech and online businesses. Even people with small social media profiles were able to make six figures without a significant change to their production. People with consumer based tech companies were up 5-10x… People with mission critical software were through the roof (not just revenue but valuation expansion as well). So on and so forth.

In fact, the numbers were so clear we didn't even bother doing a post on Wall Street compensation (which was actually up, about 4-8% y/y). Even in a record year on Wall Street, people didn't get paid much as the firms know that jobs are scarce *"the Company eats first"*. This is a secular declining industry so it's losing its luster over time (except M&A which continues to be unscathed).

Now take a step back and look at the bigger picture. Do not "invest in the dead cat". This means? When things get back to normal some brick and mortar businesses will thrive. Popular bars and clubs will certainly do fine. The problem? Why would you fight the bigger picture, which is remote work and decentralization (the last one is worthy of a book and is more than just crypto).

In conclusion, for the first section you should assume that people will work in a scattered fashion. There is no reason to start a high overhead business. Also. There is no reason to become educated on high-overhead activities since they won't generate high returns.

The New Education Process: Education needs to go through a transformational reform. Here is a big opportunity for someone with technical knowledge. Learning facts will not help you get ahead: google can do that for free. The new economy needs to learn how to operate in an entirely virtual manner. This means the following items are needed: 1) warehouses, 2) virtual assistants, 3) delivery services, 4) smaller private schools dedicated to skills, 5) copywriting copywriting copywriting, 6) graphic design, 7) software updates – living breathing code, 8) digital training schools – think esports camps similar to a regular sports camp and 9) individualized video education and entertainment

We've talked about a few of these before so for fun we'll go into more detail about a particular example: digital training schools.

This isn't something that's overly popular right now. There are a few out there such as esportscamps.com. That isn't enough to satisfy the long-term demand. The current generation will view the esports industry as a legitimate competitive field (at least the ones that have been paying attention). This means their kids will have an opportunity to learn skills related to shooting games, fighting games, MMORPG games and more (we're sure millions of other types of games will be created – especially as VR rolls out). If people are willing to watch twitch for millions of hours per year, you're aiming for the top 10% or so that are taking gaming seriously – as a potential career to make money on twitch or win tournaments.

Take a simple example like an MMORPG game or a war type game. Instead of creating extremely easy simulations (like playing the game from start to finish), you can create situational game play. For example practicing micro management on entry level fighters. This would not be comparable to a standard CPU as you can stack the game against the player and force them to micromanage the units/fleet. You can also change the terrain, the spacing and the damage levels of each character. Over the long-term, "fundamentals" will evolve just like any sport (correct way to shoot a ball or swing a golf club). You can create game situations and sell the packet as a set for training. On top of this? You can do virtual consulting for errors made and how to fix them (or create personalized tasks to fix them). As a final note here, some of these items exist generally. If you're up for the task you can emulate accuracy/player movement of certain professional or near professional level players to code in their play style.

Betting Against Degeneracy – Not Wise: It's an interesting concept but appears to be logical as well. Many say that investing in drug companies or degenerative platforms like Only Fans is bad. The reality? This is likely where a lot of money will be made. A. Lot.

Therefore you don't want to bet against degenerate enabling products. Before the choir comes in and says "You're helping the problem"… That is verifiably false. When you invest in a company the firm does not make any money. If you buy the S&P 500 for example, you're not giving the S&P 500 money. You are saying that you believe the S&P 500 will be worth more in the future. You'd be surprised at how many people believe that investing in a stock means you're "helping them". Again. You're not. An investor is simply saying he/she thinks the value will be higher in the future so they are willing to own part of the equity. (note: if you were the first check or part of a fund raise then you would be creating a new "problem")

Degenerate platforms will likely be normalized in 5-10 years. Take music for example. Back in the 50s/60s if you told adults that Nicki Minaj/Kim Kardashian would make porn/being a slut "Cool" they would have laughed in your face. And. Here we are. Similarly, in the future it will be entirely normal to see people in their 40s and 50s smoking marijuana and frequently using LSD/mushrooms etc. On a historical note, look at the tattoo industry. Before they became common, it was also associated with degeneracy.

Note, we realize that intelligent people can use these substances to their advantage. And. We also realize Americans have no self control so they will be abused anyway (luckily it's practically impossible to die from marijuana overdose).

Areas we would *not* bet against include: 1) escort/prostitution normalization such as only fans, 2) recreational drug use like marijuana, LSD and mushrooms and 3) the natural mental health issues caused by overdose of drugs and other degenerate activities. Similar to any growing industries there will be times where certain segments balloon in valuation and eventually bust due to exuberance. That said, the long-term view is that it will be up and to the right. Amazon, Netflix etc. all had days where the stock would be down 15-20% (even more), however, the trend was the same. It was just a buying opportunity.

Big Tax Mistake: With record amounts of printing (and more to come), your portfolio should become more liquid and easy to conceal. For example, you're better off buying that $700K place versus the $1M home as you will appear to be "lesser off" on paper. When taxes come in it is going to be a blanket belief based on obscure bench marks. If you don't believe this just look at the tax brackets we already have in the United States. Is $400K a year a top 1% person in Los Angeles? Does it make sense that he pays more in tax than the guy making $400K in Wyoming or Utah? It does not. This is just a simple way to enforce a tax and they will do the same based on what they can see on paper.

For fun we'll make some predictions, it wouldn't be fun without it. Our best guess is the targeted people will be $10M+ in net worth. We'd go ahead and guess that someone in the $1-5M net worth range will be entirely fine. When you go to $5-10M you may have to do some moving around… At $10M there will be some sort of impact (due to what you hold/own).

Assuming this is right (unlikely we hit it exactly) here are some ways to reduce your tax foot print. If you're at $10M+ you should go to your accountant/tax person. 1) for real estate you want to stay below $1M or so in terms of the value of the asset/home in an ideal situation. There are too many $1M homes on the coast and in Hawaii to justify a sudden spike in pricing there. Especially since the money printer pushed valuations up another 10% sending many homes in the 700-800 range closer to that $1M mark. 2) for stocks and bonds you're going to want to have two separate accounts. One can be your regular trading account and the other is going to be a roth/after tax "retirement" account. Within these accounts you want to try and keep them balanced. If you're already worth $4-5M it doesn't matter if you can click sell tomorrow since you likely have a high income anyway. 3) for digital assets/commodities, keep as much possible in physical form. This means physical bars of gold/silver, holding the actual keys to your crypto assets while keeping anything on a "hot" wallet at a minimum (no smartphones, no exchanges). You can have a few bucks here and there on there, but it's just for your own fun/entertainment if you're interested in trading them (or need to liquidate quickly). 4) take a hard look at assets that go up in value with limited liability/risk. This primarily refers to collectables. Instead of finding items that may or may not go up in value, just buy the best and most popular item and hold it for the long-term. To make a baseball example, a Mickey Mantle rookie card or an original version of the first Spiderman are unlikely going to die off (in terms of value). Before moving on here, avoid buying something you are actually in love with. You're better off owning something from a logical perspective and holding it for the long-term. This means you will be able to sell it in the future (mental game).

We'll use a $4M net worth individual to paint the picture. Anyone reading this blog (that takes it seriously) can reach a $4M net worth figure. If you are in this situation a good set up would be as follows: 1) $750K home, 2) $1.25M in individual trading account, 3) $1.25M in post tax retirement account and 4) $750K in alternative assets say you have $500K in crypto and $250K in rare collectables such as art/comics. Notice, we're against owning a bunch of rental properties going forward as we view them as easily taxable. If you already have them, feel free to keep them or sell them (as usual risk is relative to your view s of the future).

Decrease Your Potential Liability: This goes without saying but if you're well off do whatever you can to hide the amount of money you have. As a simple example, even if you can pay for your $750K home in cash, you're better off putting down $700K and taking out a $50K mortgage. Why? On the initial screen it will appear that you don't own the home, the bank does. No one will view an individual with a mortgage as rich (highly unlikely anyone screens mortgages across the entire USA).

Other ways to disguise your wealth is by spreading it across multiple assets. If you run two small companies or three, you can put assets into all three and they will appear to be less valuable. This is the beauty of online businesses. If you sell unrelated items, say a fitness company and a clothing company, they diversify your income and your verifiable net worth. Trust funds are also extremely helpful for tax purposes but if you're in this category the chances are 99/100 that you're already making the changes we listed above.

In terms of passing on inheritance when you die, there isn't much you can do. Our best guess is that the tax structures will change and will only impact the richest of the rich. For this we'd anticipate a change in tax for someone who is attempting to pass down around $50M+. These are simply guesses and unless you have kids, there is no reason to worry about it.

Summarizing the Changes: Back 20 or so years ago, if you went to a typical wealth management office you'd get the same answer: the clients are real estate, small business or in some cases Wall Street. In the future, call it 2040 or so, the answer will be a bit different: small internet business and technology. Those two areas are the future and there is no reason to fight the trend. While you'll always find exceptions to the rule, the trend is clear as day at this point.

The second major item here is that taxes and individual autonomy will increase. This just means more degeneracy for the individuals who lack self control and major profits for the individuals who take advantage of new tech. Not only that but the competition will be busy doing drugs and hanging out on Only Fans while you'll receive an education from the best and the brightest for a lower cost (say good bye to advice from unsuccessful people who haven't made it in life!).

Third is that you should take asset allocation more seriously from a visibility perspective. Visibility means easy to see and tax. Things that are hard to tax are physical (gold, art. collectibles), digital (crypto) and physical currency (fiat). Items that are easy to tax include transfers of wealth, real estate and W-2 income.

On that note, avoiding big mistakes is a surefire way to stay ahead in life. Just remember, the rules constantly evolve.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life. **We hold Q&As 1x a month for purchasers only.**

Avoiding the Pitfalls of the "Millionaire Life"

Avoiding the Pitfalls of the "Millionaire Life"

A lot of life requires avoiding potholes. Even after you become a millionaire you'll find that there are several hundred more potholes to avoid. If you're looking for proof of this look no further than your next trip to the airport. Take a good long look a the people flying in business/first class and you'll see a common theme. People are physically in bad shape and many of them look several years older than they actually are. Despite having money (it is rare to see the majority of people in first or business class on credit card churning), their bodies are already giving out on them. To make matters worse, this is only one pothole of many to avoid. We'll go ahead and outline them in groups from easiest to hardest to control.

Physical

Physical Health: A common thread amongst the out of shape? Typically, no athletic background at all. Since a lot of people enjoy talking on airplanes, you'll likely be forced into one of these brutal conversations (more than once). If you do, go ahead and poke around about their back story/history from a athletics perspective (it is never anything good). The ones that are in shape typically have one. Since there is no way to go back in time and develop a background (if one doesn't exist), we'd say having a real athletic activity after becoming rich is a requirement. Simply lifting weights isn't enough. One of the benefits of being a millionaire is more free time (if you've done this millionaire thing correctly) and penciling in a notable physical activity will add years to your life.

Internal Health (Diet): Another common one is an addiction to low quality food. One of the interesting things about food is the addictive properties. We believe sugar is more addictive than alcohol at this point since it seems like eating healthy is a sin these days. If you're under a lot of stress, many psychological studies say you're more likely to choose carbohydrates and sweets over vegetables. There are many solutions including: 1) eating when your workload is lowest and 2) restocking your refrigerator with high quality goods until your taste buds change. We'd say you'll "feel bad" after eating high amounts of sweets or carbs. At this point your body has changed and you can feel free to pick up a low quality food item every full moon or so.

No Style: This is another big one. Not sure why this is the case. If you want to find people with name brands that don't fit… Look no further than the rich! That's right. A large chunk of the population buys name brand items and yet they can't even wear them correctly. The one thing the $30,000/year millionaires in Miami have going for them? At least they dress correctly. Instead of debating how much should be spent on high quality clothing, we'll say this: at least get a tailor! If the clothing doesn't fit it was certainly a waste of money. As usual, feel free to blow as much money as you'd like as long as you don't blow through your financial independence nut (no point is hitting reset on that game again!).

Personal Life

Trapped in Guilt: We couldn't think of a better explanation for this phenomenon. You'll find many rich millionaires who refer to their wives as "the boss". You'll also find many millionaires that can't seem to unwind out of high recurring expenses such as a house that is too big or a car payment. We just don't get it. The only explanation we came up with is personal guilt. It has been drilled in our heads to do the "right thing" which typically means giving up your own personal well being and happiness for someone else (even if the someone else is adding no value to your life). This is a big trap that we see very few people escape from.

We've never gone through this trap but for fun we'll explain what we would do in this situation. It sill sound heartless but it is exactly what we would do. Step 1) is begin cutting it out immediately, cold turkey. There is no reason to keep someone in yoru life who is causing you personal financial stress when you've spent the last 10+ years becoming rich, Step 2) set stronger guidelines on the people who think you "owe them". If they are not happy with your lifestyle they are free to leave and Step 3) never refer to anyone as a "boss" again. If you're rich there should be a two way street where either party is allowed to leave immediately.

Lifestyle Inflation: Our basic rule of thumb is to invest more money each year as a percentage of after tax earnings. This has been the consistent theme until you're financially independent. Once that occurs, the game becomes "increasing your spending at a rate of your financial independence". This seems like a small increase until one understands compounding. If you're at $3 million dollars and feel fine at $10,000 a month (4% rule), then you'd keep this level flat for a year. Ideally, your net income and your investment gains (up to 10%) make up a large chunk and you're sitting closer to $3.6M the next year. Now your expenses go up 10% since the same rule allows you to spend $12,000 a month into perpetuity (In a few short years you'll unlikely be able to spend it all anyway). We would stay with this until you're older (40s) then you're probably spending much more since you'll ideally end with a $0 net worth upon death (assuming you didn't have kids).

Now with the positive actionable item out of the way… You can already guess it. Most people don't do this. From what we've seen they hit 30 or so and suddenly the spending start ratcheting up. This is due to the standard marriage and kids. The lifestyle inflation of trying to keep up with your new "peers" and many other issues. Luckily we do have one clean strategy that works. For at least one full year (after hitting financial independence) keep your spending level flat or down. That is right. Ideally it goes down so you realize that you were 100% happy with the amount you were spending in the first place. This will then give you a large buffer room in year two and beyond. People who suffer from lifestyle inflation never really make it to financial independence as they get stuck on a treadmill of recurring costs that were never necessary in the first place!

Needing to be Fed: This is borderline psychological but typically comes up in social situations. At all costs avoid the rich people who claim to "know everybody". This is by far the worst type of personal life flaw. Being well known and needing to be "fed" that their circle is important is beyond damaging and borderlines on psychosis. A good way to prevent obtaining this disease is by realizing that no one will be remembered in about 100 years. Unless your name is Albert Einstein or George Washington, there are maybe 10-20 people in our current generation that will be remembered in 100 years. The chances that it is anyone reading this blog is probably 0%.

Typically, people in this camp exhibit all the bad qualities we will mention in the entire post including: 1) materialism, 2) insecurity, 3) comparisons and 4) decline in physical health. Even if the person does have a lot of contacts, we'd say they are not worth the effort. They will waste a lot of your time since they need a lot of attention. Instead of keeping a soft touch relationship, just delete the contact and move on. Other people will have their energy drained by these leeches. Based on all our comments here you can see that we have no solution for these individuals (once the personal style is adopted). The good news is that 50% of rich people don't have this quality so you can simply delete them and move on to the other half.

Psychological

Comparisons, Passive Aggressive Behavior and Insecurity: This is probably the most common theme amongst the rich. They constantly compare themselves to the next guy who is constantly trying to throw passive aggressive comments in his direction. It's quite funny because if you're rich 1) why would you care about the opinions of some other guy and 2) if you're rich why would you waste time throwing passive aggressive comments to another guy. It really highlights how humans are monkeys. If we look at these interactions from a third person perspective they look like teenage girls arguing amongst each other. Everyone seems to be angling for the "higher status". Unfortunately, most people never understand that status is transferable. The same rich guy would lose his status in a different environment (singing competition, athletic competition etc.).

Luckily, if you're reading this blog you'll already see the pitfalls and avoid this trap in advance. If you're already in this trap it is almost impossible to escape (*In fact we've never seen anyone actually break out of it! Seriously not one!*). The person is trapped in their own anchored belief system. If you find people like this our response remains the same: smile, nod and agree. If a guy tries to throw you passive aggressive comments stick with the strategy or do the classic "agree and amplify" counter if a group is present. The passive aggressive behavior is just insecurity since they don't have much going on for them.

The Need to Be "Alpha" at All Times: This is the second layer of insecurity. The first one is practically unbreakable, the second one can be fixed over time (typically as the person ages). Remember, it is best to get rid of this before it begins. There are several well off people who "think" they can actually be good at anything they put their mind to. This is beyond crazy and is likely a psychological disorder. Unsurprisingly? The rich have this psychological disorder.

Now it is great if you have multiple talents. In fact we'd say it is highly likely that you'll be great (not good) at a handful of tasks. To expand this to "anything" is beyond crazy. We would say that it is unlikely anyone becomes #1 in their field at all. This is already step one in realizing how difficult such a task is. There can only be one richest person in the world, one gold medalist in any sport and one top record producer. Therefore, the chances of being the "alpha male" in every single environment is not possible. Pick the handful of items and give out honest praise for people who excel in tasks that you find difficult. It's nota bad thing to praise someone for being exceptional in a task that is difficult for you (psychologically healthy as well).

Need to Impress: This is the last one. While this may be seen as a contradiction we'll make it as clear as possible. You can certainly dress nice (spending some money to look good isn't bad), but there is a line between dressing nice and beginning to judge people for the exact brand they are wearing, assuming they look perfectly fine. Knowing the difference between the price of Gucci Loafers and Ferragamo's… Is taking it way too far (more common for women to know such details).

We use this as a good line to draw because any male wouldn't really know the difference between a $4,000 dress and a $1,000 dollar dress. In fact, we would probably fail a knowledge test on what bags, dresses and shoes cost the most. The reality is that the quality of the clothing matters (as long as the threads are of decent quality) the remaining items are largely prestige and other riff raff that no one really notices (except the snobs you never want to hang out with in the first place). So, as you ramp up your spending try to keep this in the back of your mind. Buying the item to gain attention for the brand is foolish. Buying the item to make sure you have a high quality suit/watch is perfectly fine. If someone needs to announce the brand… They've spent too much and just announced their own personal insecurity.

Concluding Remarks

If we were to write out a step by step process to making sure you avoid the pitfalls we'd say it flows as follows: 1) realization that there is always someone better than you so trying to be the best at everything is a game for fools, 2) avoid lifestyle inflation by figuring out what gives you the highest utility – it will never be the same for each individual, 3) find a balance between empathy and giving away things for free – as we've proven in the past numerous times, people simply don't value free items, 4) avoid physical decline since there is a steep hill to climb if this goes sour and 5) compare yourself to your own self a few years prior, what you view as a great life will unlikely align with many people if you're honest about what makes you happy… Oh and as a bonus… avoid people who exhibit the negative traits as the people you associate with will do their best to push their insecurities and passive aggressive behavior onto you.

****

Avoiding Psychological Pitfalls

Avoiding Psychological Pitfalls

After our most popular article of all time (due to several high quality people re-linking to it!), we thought it would be valuable to provide a rough framework for avoiding all the pitfalls that becoming "successful" can bring. These include: personality destruction, passive aggressive behavior, deterioration of health, loss of empathy, insecurity and increased stress despite being set for life. While it is certainly normal to be high strung when you're still trying to make it, there is no logical reason to remain in this state of consciousness when you have nothing else to worry about. The shift isn't easy and we doubt there is a "step-by-step" to avoid all the pitfalls. That said, we'll give it a try.

Personality Destruction: One of the odd items that successful people have in common is ruthless focus. This usually leads to too much attention into one item. We suffer from the same thing and once we get our heads stuck on something: trying to a contract, trying to get in contact with someone or trying to fix a problem with the online sales funnel… it is all but impossible to change gears. This still occurs even after you're financially well off because it is a habit that got you there in the first place. After all we'll always choose *Will over Skill*. If you go to the point of obsession you usually get what you want.

The flip side of this is enormously negative. Which is the actionable piece of this post. When you're already set, it is a lot smarter to move horizontally versus vertically. This means you want to expand the types of people you're talking to instead of digging further down the same rabbit hole you went down. This prevents group think, prevents you from hitting the stereotype of your industry and allows you to recognize your own tendencies. Many times, we've stopped and said "shouldn't push this anymore" and are happy to admit it. The same strategy that works in one industry is not going to work in another.

In case this is confusing we'll provide a concrete example. If you're used to hammering the phone/email to get in contact with a manufacturer for example… Try to avoid this same strategy in your every day life. A good example would be friends in completely different industries. It's a 100% different social dynamic and the guy/girl that constantly does this ends up being a thorn in their side (losing the relationship). A second example would be a sport that involves combat: Boxing/MMA etc. Similarly, the strategy would be 5x worse. If you continuously pepper people to fight/practice you'll end up getting laid out very quickly and regret using the same strategy for this environment.

As a final layer of security (to avoid becoming the dorky passive aggressive rich guy), you'll want to find a new hobby 1x a year. This does not mean you need to be "good at it". It means you should learn a new basic skill once a year. It could take two years (learning a language) or it could take a single year (becoming proficient in XYZ activity). This forces you to adapt to a different culture and environment and we have no doubt that someone who is proficient in 10+ items will have a differentiated contact list.

Passive Aggressive Behavior: This is the most common tactic for the rich, they give off their own insecurities by using this strategy. The first answer is to avoid these people at all times. You'll meet them daily, so try to spend the least amount of time as possible around them. There is no winning here. If you hang out with them you'll lose motivation because in the back of your head you'll think "wow I don't want to end up like this guy". By minimizing your exposure to them, you'll be able to reach financial independence without having to hear about how they invest $X thousand dollars or even $X million dollars into something you've never heard of (or care about).

Fortunately we do know a way to avoid adopting this behavior which is by praising people specifically. People you talk to on a daily basis should have at least 1-3 things where they are significantly better than you. This is a great thing and praising them for it (honestly) is going to keep your own ego in check. We do the same thing. There is no way we're going to "compete" with a tech guy in coding. No way we're going to "compete" with a top-tier club promoter in throwing a party. And. No way we're going to compete with a billionaire in terms of the value of his time. Being able to praise honestly solidifies relationships with people you want to keep around. To be clear… There is no need to constantly do this, simply acknowledge it once and a while and they'll appreciate the comment.

Deterioration of Health: This is a tough one. In your 20s, your health can take a hit without much long-term damage. We laugh when people say "investment banking will kill your health forever". There are always 1-3 people who over-do it in anything. Don't be this person. Also, look at the hundreds of thousands who have successfully made it up the chain and look great as of today. There are quite literally millions of people who had much harder lives from age 20-25 that are still alive and doing amazing at age 70-80.

Where is the line? We'll draw it at around 35. This seems to be around the time when professional athletes in high-twitch sports begin to see a notable slowdown. That's probably a good marker for when your body really cannot grind out 60-80 hours a week. By this age, having a system in place that optimizes your time will help you grow your net worth without killing your health. Ideally, you're getting paid to do everything and move around for free by the time you're 40, unlocking free time to focus on the 5% of items that actually matter. Assuming the big items continue to get done, we'd become more cautious when it comes to grinding out long hours. It just isn't worth the trade-off anymore. For fun we'll add a physical marker as well. When you find it much harder to stretch in the past (you'll notice it!), that is probably the time when you should focus a lot more on your health. Your body is messaging that wear and tear has finally kicked in. Take down the hours, increase flexibility and keep it at those levels before your joints/muscles get stiff.

Loss of Empathy: This is yet another common feature of success. In fact, many studies have shown that if you give a group of people the "money" idea, in the form of making them richer than a control group, they will see a dramatic drop off in empathy. They no longer care about the "other group". This is similar to rich people constantly believing they are above everyone else because they are rich. This is more of a psychological feature and is certainly solvable.

The solution is quite simple: find some people to help. We don't believe in giving anything away for free. All that does is make it less likely the person listens and less likely the person succeeds in the first place. A basic idea is finding someone who wants to succeed and having them help you do some mundane task in exchange for your time (organizing calendars, basic customer email etc). This makes the individual do actual work in exchange for information (also why many firms have low-paid internships). This is exactly why we have a free blog and a paid for book, if it's free, less people will actually do it. Defeating the purpose. To clarify. When we say "mundane task" we wouldn't have them do this for free, you pay them a basic wage for it and see if they can add value beyond that during his/her time there.

Insecurity: This is the most common feature and is likely due to too much concentration in one task. For what it is worth, we've found the most insecure people are only good at one thing. Typically that is their line of work. This is why they dislike any disruption or change to their industry (puts their entire identity at risk instantly). Insecure people don't have many skills beyond one (maybe two) things which makes it harder for them to have any internal happiness.

Luckily, it's quite easy to have a diversified skillset. It takes a lot of work but having a diversified set of skills will make anyone comfortable in their own skin. By branching out and trying to be "good" in several items, you'll find some that you excel in and several that are difficult. This is a good and humbling experience since it is unlikely that someone is able to be in the top 10% in every single task on the planet.

Increased Stress Despite Being Stressed: We have no idea how this is even possible but we see it all the time. Our belief is that it is because the person grew up with money. While a lot is said about being born poor (lower chance of successes) one of the benefits is the upside. If someone grew up with nothing and suddenly gets to financial independence, they are rarely stressed! We're not sure why this is but it is likely due to some sort of higher bar for "lifestyle costs". If someone grew up well off in the first place, their standard of living bar is so high already that getting back to that same level doesn't "feel" like success.

An interesting solution is to go out and travel more to lower quality countries. While counter intuitive, putting yourself in a situation where you see that life can be significantly harder will solve this issue. You may even solve two problems at once: Empathy and Stress. Knowing that you'll never have to worry about food, water, shelter and basic health care is going to be more than 99% of the world can ever say in the history of their lives. It should cause immediate relief and empathy for people who are in significantly worse situations with minimal ways to climb out.

Concluding Remarks: The main threads here are as follows: 1) creating a diversified set of skills, 2) avoiding a 100% dive into one category, 3) keeping a broader set of contacts than most in your industry, 4) recognition of others being more talented – ego destruction and 5) having a mental focus on keeping empathy high. If you're able to do this we think it is unlikely you'll have the major symptoms that many rich people suffer from. ***If you have additional ideas to avoid these pitfalls please drop them into the comments!***

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by **Clicking Here.**

BANKS ARE ZEROS – April 27, 2021 and the End of this Website

Thank you for all of the years! From Wall Street to Affiliate marketing to Ecommerce to DeGeneration. It has been an amazing decade and we would like to thank you so much for everything! All the laughs and all of the wonderful people we've met (particularly anon troll avatars on Twitter!)

That said… As we all know…. **BANKS ARE ZEROS**

Therefore, we are transitioning our entire platform to Substack. ***This website will no longer exist in 48 hours.*** Everything will be shut down and yes we do have a back up copy for everything so no need to panic (just give us some time to reorganize).

BANKS ARE ZEROS EVENT DETAILS: April 27, 2021 NYC Times Square, NASDAQ building (exactly in the photo on Twitter). 1) Exact address location will be reiterated on twitter and substack. 2) At ***4PM EST to 7PM EST we will BOOST the number of clowns appearing on signs*** and we will be throwing our meet up at that time (look for various clowns running around)

Clown Event – FREE US TOKEN:

Tier 1 (minimum 1 hour troll commitment): We have hundreds of free shirts that say BANKS ARE ZEROS with our logo. You get one for FREE for *simply showing up* unless we run out. In addition you will receive a specific amount of US Token a ***minimum* of $50** for simply showing up and wearing a mask and wearing a shirt that says BANKS ARE ZEROS. If you want to do something else and simply hold a sign that says BANKS ARE ZEROS we will **still pay you $50**. ***But please put a face covering on for Doxx issues and covid-19 rules.***

Tier 2 (minimum 1 hour troll commitment): You will have to show up to see this. While the $50 tier is simply for showing up and wearing any mask with the phrase BANKS ARE ZEROS on your shirt/holding a sign… the $100 tier is better. This one will be secretive for now but it does NOT require much more effort. Everyone who shows up for this will do something similar… Chocolate covered grass hoppers may or may not be involved! No you do not need to ever show your face, any mask works.

Tier 3 (Paid Clowns): We have clown volunteers and you will get an email from us now to pay for everything. Total free for all. Just show up with clown gear and completely masked up and you get the payment. We are emailing you now.

Tier 4: Clown Owners – The clown ad actually runs for *24 hours randomly though the day* (this is how the system works) and the clowns will receive a boost from **4-7pm (roughly) on April 27**. We submitted every clown equally at random including Clownman Sachs. We are setting up a website to *try* and *earn all of you re-occurring revenue through a decentralized platform (will be explained later)*. For now just get the message out there and recognize we're trying to make you part of the largest troll in history.

Summary: More exact details will be released on the **FREE substack.** There will be enough for HUNDREDS of participants so don't worry about too many clowns showing up, we want as many as humanly possible. **WEAR A MASK PLEASE. DO NOT DOX YOURSELF AND DO NOT DO ANY DAMAGE TO ANYONE OR ANY BUILDING**. This is a ***group troll.*** This website will self destruct in 48 hours and we have already backed it up so don't panic. Also *we are dumping 100% of profits from all book sales into this event so we're giving the entire thing back*. Gratis.

****

Basic Changes to Make America a Better Place

Basic Changes to Make America a Better Place

After a lot of back and forth on Twitter we thought it'd make sense to come up with some real solutions to real world problems. A lot of them are not "perfect" as no solution to large scale problems ever is. That said, we think there are some clear ways to improve the USA without causing significant negative impacts. In simple terms, we think it's better to "raise prices" in many areas to cause real change vs. hoping that people will change their behaviors with no economic impact.

Luxury Tax: This one seems like a no brainer. Singapore is the richest country in the world by Capita. They have many US dollar millionaires making it an unimpressive feat. This is due to a tax structure that makes a lot more logical sense. No. We're not even close to socialists (hard core capitalists). The difference is that you have to incentivize the capitalists to act more rationally.

If you go out to a restaurant with your friends/family it should not have a similar tax rate to the purchase of a Ferrari or a Rolex/Richard Millie watch. This seems like common sense but it isn't in the United States. To be clear, we have *nothing* against people "flexing" or "flossing". In fact, a luxury tax would make the items even rarer and you'd know that the person is really rich! This is the whole point of luxury items in the first place. Please do not attempt to tell us that someone is buying a $100,000 watch "just because". He knows it brings positive attention and is a status symbol which is completely fine.

So how would this work? Pretty simple really. You earmark certain dollar levels (say over $3,000 for a watch) and anything above this number results in escalating taxes. If you buy a $100,000 watch the tax could be 25% or something even higher/lower (we don't know all the statistics). This would apply across the board for various items: 1) ultra-high end shoes, 2) ultra-high-end cars and 3) ultra-high-end jewelry.

The best part about this tax is that the ultra-wealthy wouldn't even care. In fact, we'd prefer this system and we're not "ultra-wealthy" which we would deem as $50M+ net worth. If this system was in place we'd still buy a nice Rolex and nice shoes anyway and it would be great to know that other people with the same items were not "$30,000/year millionaires" like you see in Miami. Instead of being forced to develop a strong sense for who is actually rich it would be a bit easier this way (helps more than you'd think).

Variable Housing Tax: This is similar to the luxury tax. We don't think it makes sense to have your home taxed based on book value (when you bought it) and it also doesn't make sense that the annual tax rate on a basic home for a normal family is equal to one for a Mansion. Again, if you're ultra-rich, a tax rate on your property going from 1% to 3% is not going to matter at all. This would give some leeway to lower the tax rate on a standard apartment or home for the middle class.

While it may make sense to have various tax rates based on the country, we think the price of the properties would already adjust for this in the first place. For example, a home in downtown Manhattan is already going to be more expensive on a per footage basis than a home in Buffalo, New York. Since this would be the case regardless of square footage you could probably tie the change in tax rate to the overall property value assessed on a 3-year or 5-year basis. Instead of being forced to argue about the tax rate every year, you simply adjust every 3-5 years.

Similar to the prior comment on Luxury goods. No one "needs" a 10-room mansion with five swimming pools and a theatre. Now if you're rich enough to afford it, by all means buy it and live the dream! You're definitely not buying that mansion because a theatre is a necessary item to get by in life.

Lower the Income Tax: If we move to a luxury item tax, this gives wiggle room to lower the tax rate on items that are actually essential for living. We could reduce the tax rate on homes/apartments that are smaller. We could reduce the income tax rate on people across the board. We could reduce the percentage of your salary/income that goes to housing in general.

All of this would also allow you to save and invest more which also boosts the economy. Allows individuals to try that project they never had the money for. Allows individuals to actually purchase a basic home to gain equity over time. Forces individuals to really think about their purchases and their long-term investments.

Tipping at Restaurants: While the bar scene is set up in an ideal fashion (our opinion). The restaurant structure doesn't make a lot of sense. In a bar scene, paying cash and making friends with the servers is an easy way to build rapport. You know they are forced to pay a lot more in taxes if you pay with a credit card and you get to skip the "lines" when it is crowded. The situation in a high quality bar/club is actually fine. Our issue is focused primarily on restaurants where the performance/incentives don't make logical sense to us.

In a restaurant, why does the customer need to add 20% for tip when he doesn't know if that is actually the best server at the restaurant? Also. Why wouldn't the establishment just raise prices to reflect the "real price"? Instead we have a pretty simple solution.

When you pay your bill you should be given a basic slip. 1-5 rating. You give it a 5 if the service was great and a 1 if it was terrible. This should be automated and anonymous (use an iPad for example). At the end of the month the manager then divides the percentage split based on who is providing the best service.

Currently, if you leave a tip on a credit card, it gets split up (and taxed) amongst everyone in a lot of cases. So, if you change to this set up, the restaurant manager can also identify the best workers. Those workers are then quickly promoted to being managers… so on and so forth. This improves the service of the establishment, reduces turnover (top people get paid more) and everyone wins. To cap it off, if you do become friends with the good servers nothing prevents you from leaving cash as well.

The last reason why we prefer this idea is that a lot of cheap people don't even tip. Most servers quite literally survive off of the tips. Without tips, they can't pay their bills. This is not good and causes a lot of stress for the workers as well.

"Passive Income Tax": We are 100% against a wealth tax as it doesn't make sense from a logical perspective. Most ultra-wealthy are business owners and forcing them to sell their shares creates a terrible incentive structure. Would you want a CEO running a Company with a grand total of 0.001% ownership? Everyone knows that when a CEO sells his entire stake that there is something wrong 99% of the time.

So how do you fix this? Well you can simply increase the tax rate on passive income above a certain level. If you own $500M in Coca-Cola stock, the dividends paid out should be taxed a bit higher. Similarly, if you sell $500M you could change the capital gains tax to say 20% instead of 15%.

To be clear here, we're talking about extreme levels of wealth. Doing this at low levels (someone is only worth a few million) makes little to no sense. In fact, it really only makes sense at the extreme levels (say $500M+ net worth as mentioned above).

While this one needs more flushing out, it doesn't prevent someone from becoming a billionaire, they are still incentivized to work long hours and grow their Company. The idea of simply forcing someone to sell their assets is beyond ridiculous, kills incentives and prevents the talented person from innovating. Increasing the capital gains tax on say $100M+ of sales, would certainly make the person think about selling (forcing them to make the Company more successful to hit his higher net worth targets).

Healthcare Costs: This one is too complicated to answer in a single post. That said one extremely obvious example is variable health care costs based on how fit someone is. We're getting to a point where we can easily track if someone is healthy based on body mass, blood work and general lifestyle habits. With detailed fitness trackers, you could simply have a once a year "test" where a person needs to complete certain exercises to reduce their health care costs (both individual and employer). Having someone who is incredibly fit at age 30 paying the same as an obese person with a drinking habit, makes no sense to us.

This would also make the United States a healthier place. No one in their right mind could possibly say that is a bad thing. The 1% of the population with a strange health ailment will be exempt from this and the remaining 99% of the population would be part of this set up. Also, by doing this we could also have better information on health metrics to improve. This would increase life expectancy and force us to learn more about the greatest disease on earth: aging.

Global Warming, Food etc.: Yes we are grouping food and global warming into one category. Why? Well we can help solve both of them by introducing basic externalities. We don't know anything about global warming or the fast food industry. We do know fast food is terrible for your health and we do know that fossil fuels are potentially causing harm to the environment. To keep it simple we can assume that fossil fuels are a major issue.

Instead of ridiculous solutions such as "don't use plastic straws" there should be a factual cost to both using fossil fuels and buying unhealthy fast food. By introducing real costs (a tax) you could convert this money directly into a "stipend" that is only useful for purchasing healthy food.

The key here is the direct conversion. Instead of giving someone money, it is better to incentivize good choices. If you buy a candy bar, the price is higher than it should be and that spread goes into a fund that lowers the cost of healthy food directly. This would cause people to eat better food. Similarly, a tax on fossil fuel created items (like plastics), could be used to reduce the cost of electric vehicles.

One of the big items here is that it makes a lot more sense to create a "direct conversion" of the external cost. We're not fans of the "give everyone $1,000/month" strategy, as the likely result is increased purchases of drugs, alcohol and fast food. Instead, we should work toward a society that has a basic standard of living where food (healthy food) is as cheap as possible and a basic place to live is cheap as well.

College: This is a complete mess. While we think a smart 18-year old is not going to do something foolish (major in Ethnic Studies), the colleges should be forced to line up their cost with the results. For example, if your first position out of college pays $50,000/year this would be the amount of money you owe the University. Or some fraction say $35,000 in total. Similarly, if you end up being unemployed, you don't owe the University anything until you get your first job.

Now we are sure there are ways to game the system we laid out (someone gets minimum wage to start and signs an offer letter to start a year later), you could easily adjust this by saying the average of 3-years of income post-University. There are many solutions. The fact of the matter is… Right now the college is not responsible at all for your success. This makes little sense as you're paying for the opportunity to earn more in the future. If they didn't provide those tools, you shouldn't be paying them.

Conclusion: Generally, the ideas printed above are designed to "align incentives" and force people to make decisions that are better for them and society as a whole. We're not against flashy items (far from it) but we're against people buying them when they aren't even rich (doesn't make sense).By making these adjustments, people are pushed into smart long-term decisions and we don't have to do foolish things such as issue a wealth tax or hand people money that will immediately be spent on hard drugs.

Our Next Q&A will be held on January 18. We will focus the majority of it on the book launch, January 31 but you're free to ask other questions as well

****

Basic Guide to Understanding a Stock: Facebook Example

Assuming that you have access to no financial products such as FactSet, Bloomberg, CapitalIQ, Thomson or otherwise, we thought it would be helpful to give a step by step guide on how to ramp up on a new company from your home computer. Using FaceBook as an example, lets go ahead and start with the website you will visit the most when you start your job on Wall Street (be it investment banking, research or otherwise).

1) SEC Filings and Understanding the Story

The 424B: This is the best spot to start if you're looking for a long history on the company, grab the first equity raise (IPO) by simply going to this link:

http://www.sec.gov/edgar/searchedgar/companysearch.html

Type in FB for the ticker then enter 424 as your filing. Note, you can search for S-1 documents as well to get a longer history, however IPO price, total raise etc. will not be shown on the cover (page 1 where the banks are shown as well). The good news is you can likely get a few more quarters of back dated information by looking at older S-1's.

Prospectus Summary & The Offering: Here you will get a "snapshot" or quick view of the Company. Read the entire section. You should write down the key metrics they use to measure success (monthly users, daily users, reach, likes, comments, mobile vs. desktop views etc.). You'll get a good backdrop here and you can boil down some of the key high level themes. To save you some time the basics are: 1) User Growth, 2) Activity of Users, 3) Monetization of Users. You can take a deeper dive into any company and of course there is more to the story than the three simple points, but now you have a concise understanding of the main tenants of the story.

Once the story is laid out continue reading and you'll get an idea for how the company delivers value to its advertisers (reach, relevance, social context and engagement). More importantly as you read on you'll come across a section that summarizes the market opportunity "According to an IDC report dated August 2011, total worldwide advertising spending in 2010 was $588 billion". (Note: This is not the same for every single sector, take a look at Pfizer and you'll see the focus is quite different)

Next as you move to the tail-end of the section you get an idea for "risks to the story", in simple terms, things that could go wrong. Essentially the negatives would be 1) unable to monetize for advertisers, 2) stagnation in user engagement or user growth 3) privacy concerns and the usual speech on issues with being a public company. The section ends with a decent explanation of Zuck's controlling interest as well.

In summary when you are done with this section you should know 1) the key drivers for the Company, 2) the addressable market or opportunity for the Company, 3) the risks of owning the stock and 4) an idea of the ownership structure

Look Into Revenue Drivers: Now that you understand the basic story. You should search for measurements of these key themes within the filing. Simply put, you are looking for user activity and user growth numbers which should be provided in the filing. Go to the management's discussion and analysis (page 48 is where it really begins) and you see they take a deeper dive into these metrics. Now you can get all of this information into excel and begin tracking monthly average users (MAUs), daily average users (DAUs), mobile MAUs and engagement levels. (Note: Again this is not the same for all companies, for example if you were ramping up on Apple you would be breaking out line items (iPad, iPhone etc.) by revenue)

Once you have the metrics down, you can start tracking the performance by geography as well. Knowing that the USA is a much more saturated market it would be smart to track growth by geographies, see page 51 and begin tracking this on a go forward basis as well. You now have Average Revenue Per User or ARPU according to the document by region.

Look for Profits: Now that you have an idea of the Company's business model, top-line growth and revenue generation, it's time to see how you're making real cash from the security. Internet companies are generally valued off of EBITDA numbers, again this is different for each sector, some are simply valued off of sales numbers/revenue growth if they are profitless.

Jump to page 64 (quarterly breakouts) and you can now get an idea for the income statement results. Look for seasonality and profit margins (EBIT or operating income). Now that you've got an idea for the EBIT number on an annual basis, check the cash flow statement (page 66) and you've now got an idea for the EBITDA for the firm, $2B+ for 2011. Before you move on do a quick check on yahoo finance for next year estimates: Facebook Estimates

This also gives you a free glance at consensus estimates for Sales and EPS, so you can quickly calculate the sales and P/E multiples on both an LTM and Next Fiscal Year basis. (Note: It should be stressed that companies are valued differently, be sure to check if your industry is valued on alternative metrics such as P/BV, Free Cash Flow etc.)

Stop and Formulate the Elevator Pitch: At this point you should have decent working knowledge of the Company and likely have some good ideas on comparable companies as well (Linked-in and Google for example) and you can now come up with rough metrics for the firm and pitch the stock.

"Facebook is a ~$65B company that is looking to grow its revenue through increased advertising fees by driving both user growth and user engagement. If the company is unable to grow its user base or is unable to continue monetizing ad space the stock will likely suffer"

2) Build Out Your Model

Now that we know the story well, lets go ahead and build the financial model. To do this lets review the latest earnings print (8-K) to see what information we are working with on a quarterly basis. Before we begin, this is a technology stock so you see they give both GAAP and Non-GAAP numbers, generally speaking for technology you use Non-GAAP numbers because tech stocks have quite a bit of stock based compensation (SBC) expense. The 8-K currently does not breakdown revenue by segment within the IS but does give a slight breakout in the comments.

Facebook Earnings

Q1 2013 Highlights: With the basics out of the way, notice how the items we want to track are also disclosed on the 8-K. Daily active users (DAUs) were 665 million, Monthly Active Users (MAUs) were 1.11 billion; Mobile MAUs were 751 million. In addition the Company does give some breakout of revenue in the Q1 highlights (although exact numbers are not disclosed to the decimal point on the IS. Revenue from advertising was $1.25 billion, representing 85% of total revenue; Mobile advertising revenue represented approximately 30% of advertising revenue; Payments and other fees revenue was $213 million for the first quarter of 2013

In addition, note the other highlights in the most recent quarter: 1) Launched Facebook Home; 2) Instagram reached 100 million 3) Launched new advertising products such as Lookalike Audiences, Managed Custom Audiences, and Partner Categories 4) Partnered with Datalogix, Epsilon, Acxiom, and BlueKai 5) Enhanced ability to measure advertiser ROI through acquisition of Atlas Advertising Suite; 6) Appointed Susan D. Desmond-Hellmann, M.D., M.P.H., (UCSF), to the company's board of directors.

Revenue: With the basic first quarter out of the way go ahead and build out your three statement model (yes this will take some time), generally at least 5 years of data should be a good starting point. Now you can break out the revenue line item.

1) Notice Q4 has higher revenue followed by a dip in Q1 (seasonality, IE: Q4 generally has a higher net contribution to annual revenue than Q1, Q2 or Q3)

2) Continue to build out the geographic break out (not from the 8-K however disclosed in 10-Q filings so you can track regional ARPU numbers and other metrics, page 19 and 24).

Facebook 10-Q

3) While your financial model will simply have a revenue line, continue to track the 10-Q and 10-K filings and you will see that they disclose advertising and payment revenue (page 27).

4) Now break out the numbers we were told Mobile advertising was 30% of advertising revenue, we now know that Advertising revenue was $1.245 billion from the 10-Q so you can break out mobile versus desktop/notebook revenue by applying 30%*1.245B = $0.3735 billion in mobile advertising revenue $0.8715 billion in desktop/notebook

At this point, you have a general break out of revenue and have a top-line number to build out your financial model.

Expense: Read through the expense lines to understand how the items are being broken out starting with COGS which represents the operation of data centers, facility and server equipment, energy and bandwidth costs, support and maintenance costs, salaries, benefits, and SBC associated with such activities. This is followed by 1) R&D which is primarily salaries, benefits and SBC for employees in engineering; 2) Marketing and sales, sales support, marketing, business development, and customer service functions; 3) General and administrative salaries, benefits and SBC for executives as well as legal, finance, human resources, corporate communications and others. Run the numbers as a percentage of sales for now and go through the 8-K to find guidance and long-term plans.

To wrap things up and make sure you have tied all the loose ends on the financial statements, go through the quarterly company slide deck (some companies do not have any) and build out the additional numbers as you see fit. Here's the link to the deck.

Facebook Deck

You now have an idea for the expense structure on a historical basis and it is now time to turn to building out the future quarterly earnings

Build Out The Model: Finally, now that you have a large set of historical numbers to review and also have information broken out by segment you can start to build out a forward model. The easiest way to get a proxy for forward estimates would be to review the analyst consensus numbers as of now. You can simply check yahoo finance for that as mentioned from part of Step 1.

Facebook Estimates

To keep things simple set up a model that is in-line with consensus, then we can move on to part three where you come up with a differentiated approach. Attached is a more complicated financial model for Apple so you understand how to build a bottoms up model with a detailed breakout by revenue and even gross margins.

3) Coming up with a Differentiated Opinion

The final step is explaining how to come up with a differentiated opinion on the security, again this will vary by company and you'll have to adjust your process appropriately as no person or firm will view a single security in the exact same fashion. With your financial model in front of you it is time to start digging into management, valuation and sustainable long-term growth.

Management: A significant piece of valuation for securities is within the intangibles. One main intangible is the consistent execution and delivery of a strong management team. The main negotiators and sirens for the firm should deliver a clear message, set expectations appropriately and slightly exceed said expectations. For example if your company has the best operating margins and free cash flow for your industry, you will become an attractive security due to performance alone, however you must set the expectations appropriately. As an example, if you are promising 10% revenue growth in a space where 5% growth is average, you will not be given much credit for delivering 6% revenue growth as you are setting the bar much higher than your results. Even though 6% growth would see investor interest, it would be wise to set the bar at the average (5%) and execute slightly above (6%). This gives the company more credibility and investors will take note.

A good way to gauge the Company's ability to beat and raise, is to simply review guidance on historical conference calls which can be found in the investor relations section of most company websites

Going with the Facebook example, the management team is still relatively new so you can peg this as neutral to negative unless you have a differentiated opinion of Zuck & Co.

Clean Numbers: As many of you know the income statement can be manipulated quite easily so it is important to look for any accounting discrepancies that could explain a valuation divergence. An obvious but simple one would be comparing Non-GAAP numbers to GAAP numbers, a company that reports solely on a GAAP basis with no history of restructuring charges or other one time events will likely deserve a higher multiple (earnings basis).

Notably, Facebook is a standard Internet tech stock from a financials perspective, so it reports both GAAP/Non-GAAP numbers, most models you find will run with it on a Non-GAAP basis. With this in mind the multiples should be in-line with the peer group.

Glancing quickly through the filings there are no positive or negative moves from a financial statement perspective.

Differentiated Financial Model: Generally speaking, if the company reports guidance that is roughly in-line with actual results on a quarterly basis, consensus numbers will center around the mid-point and your estimates will reflect normal seasonality. Based on your new knowledge and opinion of the space (growth rates of users, demographic shifts, expected products and use cases for the firm etc.) you should have a differentiated financial model. This means your "real" expectations are likely above or below consensus numbers in a meaningful way. This differentiation in revenue growth and earnings power should drive some extra upside/downside to the current stock price.

Peer Group: Here is where many debates arise, by now you know if you approve of the management team and you have dialed in your expectations for the future financial performance so now it is time to decide what multiple the company (Facebook) deserves. You'll need to look at the comparables (LNKD, GOOG, BIDU etc.). Cutting to the chase in simple terms since this is a basic guide, the best bet is to look at your numbers and decide on the long-term revenue and EPS growth rates. This should then be compared to the peer group where a higher or lower multiple is warranted.

The Final Lap: At this point you're wrapping up and its time to take a stand on the stock, you have 1) an understanding for management, 2) a strong and differentiated financial model, 3) worked out possible valuation disconnects due to accounting changes, restructuring charges, charge offs or other wise and 4) understand where the Company should trade in your view..

With the grunt work out of the way the final step is coming up with a differentiated metric/opinion/view that the Street may not understand. This is general for a reason, because the final step is always the most difficult. Ask yourself the following questions now that the numbers and management team are out of the way, again focusing on Facebook as the example:

1) Will new products and services for Facebook be more margin accretive?

2) Is the total addressable market under/over estimated, why?

3) Is there a competitive monopolistic/duopolistic environment?

4) How could your current thesis be entirely wrong (write down all reasons)?

Notice the final step is open ended, given that this is a basic guide if you are able to go all the way up to the final step you will be in great shape for interviews and understanding the basics of finance when you hit the ground running. If you're able to impress with a non-consensus view then you'll be more than prepared for the future.

With all of that said if you have questions feel free to leave a comment.

****

Basic Guide to Valuation and Metrics By Sector

Valuation By Sector

Technology: In this space there are really two metrics that matter the most, sales growth and EPS growth. EV/Sales will be used if you are thinking about investing in growth companies (IPO valuations). To keep the post short if you're investing in large tech it is more about EV/EBITDA (cash flow) and P/E's, if you're investing in growth stocks it is more about year over year sales growth and EPS growth since many do not have positive earnings.

Metrics Basis: IT spend will help tech companies, GDP is usually a driver for IT spend, changes in products impact margins (software has higher margins for example) also you should track the cost of items going into each tech product (example: if the glass on the iPhone increases by 200% that will hurt Apple margins)

(Note: Software would be similar but it gets a higher multiple due to higher margins ie: gross margins are usually near 90%, this is why take out multiples for software companies would be higher than say a hardware company, better margins drive better multiples)

Consumer: This space is about sales growth, operating margin growth (look for earnings growth, P/E multiples) and returns on your assets. For the consumer segment you want to open stores with or without debt, get them cash flow positive, open more stores and repeat. So with this in mind ROA, ROE and margins become significant metrics to follow. Finally, you want to make sure your debt load is manageable.

Metrics Basis: Weather impacts consumer sales (warm weather means more people shopping), Sales/square foot is a good metric to follow (how efficient are your stores), monthly data comes out regarding sales for consumer companies and same store sales calls are also tracked religiously.

Auto/Transport: Auto: This space is also heavily focused on EBITDA and some will use metrics such as EBITDAP (the P stands for pension obligations which makes sense for a company like Ford). In addition, this space can utilize the DCF valuation as cash flow is much more predictable relative to a small medical technology stock. Transport: Similar to Auto, the focus is again on EBITDA or EBITDAR (the R stands for rent). Again this depends on the company but with a gun to your head stick with simple EBITDA metrics for both.

Metrics Basis: In this industry one key point of course is IHS Automotive data (Worldwide sales, European vs. North America etc.). In addition, when looking at the auto space one should look at the Seasonally Adjusted and Annualized Rate (referred to as the SAAR). Finally, one should remember Automotive is highly cyclical, recall the 2008 disaster so GDP growth is also a factor for auto sales.

Financials: Another large industry but key metrics here include book value, returns on assets and equity and of course loan ratios. Companies will trade on P/BV ratios and tangible book value per share will also be a key metric. The space is broad for example a REIT will see more focus on consistent dividends and of course interest rates while banks zero in on loan ratios and tangible book value and finally credit card companies track charge-offs and portfolios of loans.

Metrics: Needless to say, changes in interest rates impact bond prices and loans in general so this is always a key metric to watch. Credit companies will look for charge offs and as mentioned with REITs you are looking for stable book value and consistent dividend payments.

Medical: The medical space is tougher to value with simple metrics because if a product is approved and is a game changer (for example a cure for cancer) the stock will move triple digits within days. With that said a good way to value the firm is by valuing their product lines or using a sum of the parts analysis. If you believe product X is worth $5 per share and has a 50% chance of being approved then it would add $2.50 to your stock price. As you grow to a major medical company the DCF becomes more relevant.

Metrics: Available market is put in both metrics and valuation as the market you are attempting to penetrate will determine the value of your product, again if you can cure cancer you have addressed a major market with an extremely desirable and valuable solution. Beyond product approvals you are also looking for changes in governmental laws

Oil & Gas: In this space we again turn more to EBITDA metrics (or EBITDAX which excludes some differentiated tax issues) as we are dealing with large numbers and recurring income which allows for the use of a DCF as well. Finally for oil and gas you can use the Net Asset Value model (NAV) where you no longer assume perpetual growth and instead look at reserves moving to zero.

Metrics: Simplistically you are looking for large reserves and production of oil/gas or otherwise. In addition, changes in legislation and drilling rights/laws significantly impact your financial model. Finally, a large disaster (plants being destroyed etc.) can be major detriments to Oil and Gas.

****

Overview of the Consumer Sector

Overview of the Consumer Sector

We have not done a Wall Street specific post in a while so here it is. If you're looking for a different sector we have already covered the following: 1) Financial Institutions Group, 2) Technology Media and Telecom Part 1 and Technology Median and Telecom Part 2 and 3) Healthcare

Let get started.

Apparel Companies (ANF, GPS, GES, URBN)

For this sector we'll talk broadly. The metrics are easy to understand for most people and it should make for a quick read.

Same Store Sales/Comparable Store Sales: For apparel companies (and a plethora of other consumer companies as you'll see) you'll be tracking monthly sales metrics by store across all geographies. This data is available on a monthly basis. **Note same store sales figures are on a monthly basis so if you work in consumer IBD get ready for those early morning releases

Sales Floor Performance Metrics: This is another easy one to understand, you're looking for outperformance relative to peers on the following metrics: Sales per square foot, average sale/customer, costs/sq foot. The metrics are exactly as they sound, you're looking for sales and cost efficiency on a per store basis and by geography as well. The most common of the three mentioned above is of course Sales/Sq foot. Finally, if you want to get into the nitty gritty of each product line you can ask specific stock to sales ratios of key product launches at the company (stock to sales simply being how many items of the new product were sold are in stock and were sold over the last quarter/month/year)

Online Metrics: This is even easier to understand! Any website (including a retail online store) is simply looking to monetize its online customer base by tracking the following: Average sale per customer, conversion rates – number of page views to sell product X or number of products sold after clicking on XYZ advertisement and of course the mix of items being sold split by gender/age range and product line.

Production Efficiency: Assuming the company you're looking at does the manufacturing of all the items (shirts/sweaters/shoes etc.) you can get into more detail by tracking manufacturing efficiency. If you order say 10,000 pairs of shoes and you have to create 11,000 of them your efficiency is 91% (this 9% adjustment reflects manufacturing errors/quality control issues).

Geographic Roll Outs: For larger companies, particularly international expansion, we want to track store growth rates, margin profile by geo and open to close ratios (number of stores opened in geo X versus number that were forced to close). Without digging too much into the details here, many consumer companies use debt to continue rolling out new stores in a particular geo. Easiest way to think about the process is as follows: Open store 1 with debt, wait for cash flow to turn positive, use remaining cash flow to fund opening of store 2… repeat process assuming stores turn cash flow positive within a reasonable time frame. Some stores will not hit the metrics, shut them down, go back to square one and roll out in a new geo or the same geo but different location.

Valuation: From a valuation range perspective you're looking at roughly 5-15x EV/EBITDA, 10-30x P/E and PEG's of 0.9-1.9 or so.

Summary: This is a great space to understand since it is older and easy to pick up if you're younger. In short the ideal apparel company is outperforming on all of the key retail metrics mentioned above and doesn't have any competitive issues (example NIKE recently competing aggressively with Lululemon Athletica). The ideal company would look something like this: 1) High sales growth relative to comps, 2) revenue/sq foot increasing, 3) OPEX/Sq foot decreasing, 4) Average sales per customer increasing, 5) manufacturing efficiency improving towards 100% (will never reach 100% of course), 6) online metrics improving purchase/pageviews and conversion rate on advertising.

<u>**Grocery Stores (KR, WFM, SWY)**</u>

Whole Foods Market Example:

Everyone reading this is likely familiar with Whole Foods, the Organic health focused supermarket. While a few items such as positioning within the supermarket chains (focusing primarily on organics, higher-end and health conscious shoppers) are a bit different, the metrics to track can be used broadly as well.

WFM Metrics to Know: Roughly speaking: $14B in sales, 35% gross margins, 9% EBITDA margins, 400 stores, 15M square feet, square footage growth of high singles to 10%, comparable stores growth mid singles (better than more mature at low singles)

Same Store Sales: Again! Same metric will be tracked and is a staple metric across consumer as we mentioned. You want to see improving sales/sq foot growth and decreasing OPEX per sq foot in an ideal environment.

Employment Tracker: This is an important metric to track and is arguably more important for higher end grocers as consumers will purchase less if unemployed. Generally speaking when there are job losses (08 recession) then grocery sales decline materially as well. This is a bit more specific to a company such as whole foods as lower end cheaper goods would not be hit as hard during a recession (pasta/grains/bread as a simple example of a food that would be hit less in a recession).

Revenue Mix: All revenue is not created equal and you can see the expansion of four different streams within a grocery store. Bakery, branded, Hot/prepared food, and regular produce. Generally speaking we would want to see all of these lines growing, however an emphasis will be placed on branded items (think of grocery specific brand of produce, you see this at most major grocery chains) as they would command higher margins. Simplistically, if you own the entire process/chain you can usually generate higher margins over the long-term. Finally, prepared foods generally command higher margins as well (so focus in on prepared and branded/private label!)

Branding and Positioning: Most younger readers will skip this piece since it is unrelated to financials but it is hands down the most important part of evaluating the future. The ability to charge a premium price and command higher margins will be tied to the business perception of Whole Foods. You want to track (surveys can be a good measure) how the brand's perception is holding up. If people begin to believe the products sold at whole foods are no longer healthy or no longer "high end" the business model can suffer tremendously. Sales decline, pricing comes under pressure as people are unwilling to pay a premium causing margin pressure as well.

Valuation: From a valuation range grocery stores are about 1 turn higher on a EV/EBITDA basis versus apparels and a few turns higher on P/E metrics as well. You're looking at roughly 7-16x EV/EBITDA, 15-30x P/E and PEG's of 1.5-3.5.

Summary: A lot of the metrics are similar, however for grocers you can zero in on some other key metrics. We chose Whole Foods in particular as it is a bit more interesting due to the growth of "specialty" grocery stores versus simple blanket super markets. Looking for 1) same store sales growth as always 2) Branding/positioning to protect margins, 3) ideally expansion of branded product sales, 4) opex reductions per square foot and 5) private label/prepared food growth.

<u>**Automotive Parts (AAP, AZO, KMX)**</u>

Advance Auto Parts Example:

For those that are unfamiliar AAP is a ~$10B company and operates at ~10-11% EBIT margins. Given the mature nature of the business investors focus in on Stores Comps (exactly as it sounds comparable growth for sales at their set of stores) and operating margins.

To make this sector a bit more interesting AAP recently acquired a large aftermarket parts provider (General Parts International, $2.9B in revenue and $173M in EBIT). Given the size of the acquisition (taking AAP from a $6.5B company to a ~$10B Company) allows investors and analysts to take sides on the name determining if the acquisition will be a net positive or net negative.

Cost Consolidation: While the Company outlines a $160M cost cutting program in order to estimate if this is viable you're going to pour though locations and sales numbers to find if the transaction would be accretive or not. In simple terms, if there is an AAP facility sitting next to a General Parts facility, if one can be shut down but sales are retained the leverage from the model improves. (Note: AAP pre acquisition was a 4000 store group primarily on the east coast and GPI has a broader reach Canada + entire USA but with 1,250 stores)

Commercial and Retail Customers: Second in this analysis after running simple consolidation numbers on each geography is to split the customers by corporate and retail clients to determine how many will leave post consolidation. Simplistically, if you assume the material sales reps and executives remain onboard, you would have a lower attrition on the commercial side given the change is simply a swapping of logos. From a retail standpoint, it could cause issues as stores may suffer from over crowding or lower price competition – decreasing sales. (Note: AAP pre acquisition was roughly 40% commercial, 60% retail and GPI was 90% commercial and 10% retail)

Distribution Centers: This is similar to store overlap. If distribution centers can be consolidated cost savings can be seen over the NTM period as well. (Note: AAP had 12 distribution centers while GPUI had 38 at the time of the transaction)

Headcount: As many of you already know, head count reductions will of course occur. Overlapping jobs are eliminated and those that are high value are offered stock/competitive sales compensation to stay onboard. (Note: AAP had 54K employees pre acquisition and GPI had 17K)

Valuation: From a valuation perspective multiples are in the following ranges 8-13x EV/EBITDA, 13-30x P/E and PEG's of 0.6-1.6.

Summary: More likely than not, this space is rather boring to most of you given that 1) the industry is mature, 2) the metrics are easy to understand 10% margins with 12% as a goal and 3) Simple single digit y/y growth… It is still a solid place to start if you want to look through basic financial statements.

We recommend flipping through the slide deck of the acquisition, linked here: http://phx.corporate-ir.net/phoenix.zhtml?c=130560&p=irol-presentations (October 16, 2013)

Quick Service or "Fast Food" (MCD, BKW, PZZA, CMG)

Mc Donalds Example:

Sticking with examples, it is best to start with the quickest metric for fast food chains (Same Store Sales growth or SSS for short – it is back again!). Generally you're looking at ~2% same store sales growth on a global basis, ideally MCD grows at ~4-5% and you obtain ~6-12% EPS growth off of operational improvements and capital allocation (share repurchases).

While ROIC is also a valuable metric in the space (and for Mc Donalds), to simplify the view we'll focus on revenue and EPS drivers.

Inflation: With larger consumer companies inflation can be a tailwind or a headwind as people decide to purchase food at home or away. In short if the cost of food at home is increasing more than the food away from home, this would be a tailwind. If they are in-line would be neutral and if decreasing would be a headwind. Tracking inflation in this manner helps an investor paint a picture of where dollars spent are going and where price inflation is likely to occur.

Store Unit Growth: Assuming inflation assumptions are in check we can move down from the macro a bit and begin tracking total store unit growth. Of course the stores need to be profitable and we're looking for y/y growth in total units that is *higher* than its peers. In a positive situation, you're looking for unit growth to increase low mid single digits (call it 3-5%) and see these units turn into revenue growth meaning long-term growth of up to 5% (a solid number for a major corporation such as MCD). **Note this also explains the valuation/multiple discrepancy between a MCD (lower growth) and a CMG (high growth).

Geographic Growth: For major companies, not start up or growth quick service firms, you're going to splice revenue growth into geographies as well to determine if market share is being gained or lost and if each geo is increasing the operating margin line. This means splitting our same store sales numbers (SSS) by geography as well.

Food vs Beverage: After building a good high level view, you can then splice the market into food and beverage by looking at market share (on-premise and off-premise eating) and beverage sales (Coffee, hot/cold, smoothies). Generally the margins on drinks are higher relative to food so it may be a good idea to start in this segment to determine the underlying beverage growth and competitive landscape (Starbucks, Potbelly, BK etc.). Specifically, you would ideally map out the revenue by beverage (Mc Café as an example) but this will be difficult for MCD and more useful when looking at smaller consumer fast food companies.

Company vs. Franchise: Next, instead of splitting by beverage and food you will split the company based on franchise and restaurant income. For Mc Donalds you're looking at a ~$20B Company sales line and a ~$10B franchise line. Franchised income will command higher margins as they are calculated by taking revenue minus rent and depreciation. Net net, you're looking at~30% on the operating margin line for the firm.

Valuation: From a valuation perspective multiples for quick service companies are in the following range: 9-18x EV/EBITDA, 13-33x P/E and PEG's of 1.1-2.6.

Summary: Even with larger firms such as McDonalds there are a lot of moving pieces as you have different margin profiles and growth trajectories depending on the type of quick service Company you are working with. Just remember the main differentiators: 1) Same Store Sales Growth, 2) Growth by franchise/Company, 3) Margins and growth by beverage/food and 4) Geographic expansion.

Consumer Staples (KO, PEP, XLP)

Coca-Cola Example

No we are not going to use the classic Warren Buffet investment in Coca-Cola example which you can read in 20 different variations with a google search. Instead this is the last sector we'll cover as a lot of the items are redundant as you've seen from above. The main idea for the consumer staple space is the metrics become much more macro focused and in the case of Coca-Cola… Geographically macro specific as well.

Coke is a $50B top-line company (low single digit revenue growth) with mid twenties EBIT margins and EPS growth in the mid to high single digits.

Profit Growth: As you can imagine the revenue story is less compelling. Coca-cola is a massive consumer staples company and the law of large numbers weighs on the top-line growth rate… For those that are interested in the sheer numbers, Coca-cola sells ~28-30 billion unit cases in a single year.

The positive side? Profit growth can be quite compelling. Assuming volume continues to improve (concentrate sales and unit/case sales) leverage can be seen from the operating model assuming solid execution. Simplistically, continue to see stable to slightly improving volume growth/revenue stabilization and cost efficiencies in theory should drive mid single digit y/y EBIT growth.

The Weather: This is a serious metric to track for major companies such as Coca-cola. Inches of precipitation can cause material headwinds for the company as precipitation leads to lower consumer sales in general. If you don't believe this, look up the weather issues in February of 2014 and you can find many companies citing this as a headwind. It matters.

While it is difficult to predict global weather trends in the future, it is important to track the metrics across geographies so y/y growth rates can be appropriately adjusted. Using the February 2014 example, y/y growth rates should be materially better in Q1 of Calendar 2015 as the y/y comparisons will be easier to beat.

Competitive Dynamics: Everyone on here knows Coke's main competitor. Pepsi. Tracking their advertising spend is a material driver to Coca-cola. When you speak to the general public Coke is generally a better heralded "brand name", however aggressive marketing tactics from its closest direct peer can negatively impact earnings.

For those interested in the market share for carbonated drinks it is roughly as follows: Coca-cola at 40%, Pepsi at 30%, Dr. Pepper at 20%, remaining at 10% (primarily private label). On the Juice side of the market: Pepsi at 20%, Coke at 10%, Ocean Spray at 8%, Kraft at 8%, Campbell at 8%, Dr. Pepper at 7%, remaining is other.

International Branding, Taxes and GDP: Going to attempt to lump all of this into a single paragraph as well. You will want to track GDP growth by country (in Coca-cola's case the primary regions are USA ~40%, Japan ~10%, Mexico & Brazil at 6% each and China at 6%). After tracking revenue growth by region we then move on to analyzing operational issues (taxes and government regulation). You would analyze the performance here by tracking EBIT margins by Geo and keeping up to date with changing government laws (for example some unhealthy items are beginning to see increased taxation).

Valuation: From a valuation perspective multiples are in the following ranges ~14-22x P/E , EBITDA of ~11-16x and in this case the DCF valuation metric is much more meaningful (you could safely assume a low single digit terminal growth rate linked to revenue and a discount rate in the high singles).

Summary: As we stated above, the large staple players become macro centric names given sheer size. However, it is interesting to watch if you want a broad understanding of macro: 1) geo political issues, 2) high level competitive dynamics and 3) government intervention.

Notably, we primarily used Coca-cola due to this tear-sheet which gives a high level view of the "Coca-Cola 2020 Vision" (focus on the right side of the pdf).

Concluding Remarks: That about does it. Similar to previous overviews feel free to add points in the comments or ask any questions you may have. There is no way to hit on every sector (example splitting into tobacco, poultry, specialty hardlines/softlines, high growth premium brands, big lots vs. general super markets, discount and drugs etc.).

With that said the below top 10 bullets will work if you want to know the basics of the space and didn't want to read the above:

1) Same Store sales (monthly) – track the growth of each store by geo

2) Sales / square foot – see if the company is doing a good job of optimizing its foot print

3) OPEX / square foot – see if the firm is doing a good job curbing costs

4) Competitive landscape – track exactly where in the consumer sector they are branding, who they compete with and advertising dollars do matter

5) Inflation and CPI numbers

6) Growth by segment: can be as simple as beverage vs. food and online versus retail. Track growth and margins by segment

7) Franchise vs. Company growth

8) Weather can drive consumer spending

9) Cash flow is imperative as we mentioned many consumer companies use debt and roll out to cash flow positive and open new stores with subsequent cash flow. Hence emphasis on EBITDA in the valuation sections

10) Valuation use P/Es, EBITDA and PEG (generally). If smaller use sales metrics. If a large consumer staple company (XLP) then a DCF can certainly work.

Good luck!

****

Become A Minimalist Don't Be Frugal

People often confuse the term minimalist with frugality, they are not the same. The difference between the two is relatively simply a minimalist **chooses** what he spends his money on while a frugal man is **forced** to live his current lifestyle. When it comes to life it is best to make efficient choices all the way down to where you stand in a bar to what kind of clothes you buy. Don't let this be you. Unless you are rich you should begin with the following question "how can I efficiently maximize my results" that is how a minimalist thinks.

As a quick example if you are a deca millionaire you are free to blow money on whatever you like all day long. We're not losers that hate on the rich so you can spend your cash in any way you like. If however, you are making a measly $75K per year and you are going into debt for a sick whip, you're a loser.

This is how you can **Maximize** your **Minimalist** lifestyle until you've got those 8 figures, cold hard cash in the bank:

Weightlifting: Build muscle and have low body fat, as a young person the cost of clothing comes down because you can walk around in a fitted sweater, v-neck, wife beater, shirtless or otherwise. To help you see that its quite difficult to get ideal measurements here are the numbers. Arm size (2.52x wrist measurement), calf size (equal to arm size), neck (equal to arm size), waist leaned out entirely (hip to hip measurements no fat), Shoulders (1.618 times waist at lean measurements), Thigh (1.75x knee). Why do you do this? Now you will live longer because you are healthy. Not only will you feel better and live longer, you won't need many cheesy pick up lines, "hello" works just fine.
Dancing Venues: Dancing in general is healthy as it improves your coordination skills and makes you more flexible. Not to mention the fact that a smooth dancer is associated with great bedroom skills. Find venues where the drinks are strong+cheap. Most guys who are good dancers don't want to teach newbies so you can happily pick off the only cute girls at the venue. Besides, at the newbie dance venues, most guys are ugly. That's your competition, ugly dudes who can't dance. Layups.
Central Apartments: While it would be great to have that mansion and throw champagne parties 24/7, a central location in a major city is a much better set up. You are now more liquid and can simply use cabs to move around your city. Driving from suburb to suburb certainly doesn't help with logistics, besides now you're not on the hook for upkeep fees either.
Alcohol and Drugs: We have been over the use of drugs many times and only when picking up girls or going on dates should these be used, unless of course you need to focus to make some more $$$. Drinking at home with no girls is a waste of health and money.
Cooking At Home: Yeah, we should all have a 9.75/10 cooking and cleaning for us all day, but the reality is most people are not deca-millionaires so instead focus on controlling your diet 80%+ of the time. Take up juicing and remember that the sanitary conditions at restaurants is sub-par to say the least. Again, unless you are rich there is no value in spending a lot of money having someone cook for you. You haven't earned the right to that luxury just yet. Finally, you should be eating healthy organic vegetables and fruits, so find ways to eat healthy without killing your budget. No matter how you slice it, eating at $20-25 a pop on a daily basis at restaurants will certainly be more costly than organic foods, more costly both in $$$ and health.

Conclusion: That's about it a quick minimalist post on minimalism. Remember it's about "maximizing" all of your cash, not minimizing your cash. Constantly review yourself in an honest fashion, that $50K BMW is not going to make up for being 100lbs over weight or your lack of social skills. If however, you have $100M in the bank, we will become mute and let you do whatever you like. You are free to go because money, in the end, is what it's all about.

"It is not impressive to live in a studio apartment when you are forced to, it is impressive if you choose to live in a studio apartment and can afford a mansion"

****

Best of Braverman Volume 1

Today we're doing a book review of Eddie Braverman's soon to be released book "The Best of Braverman Volume 1". For those unacquainted with Eddie, he's an ex-trader who posts on Wall Street Oasis and has done so for several years. (Yes we have an account and we are relatively new to the scene – luckily it's obvious we work on the Street to the users over there).

With that said lets go ahead and jump into the review.

Enter the Wall Street Jungle: In the beginning of the book he covers his brief history of breaking into Wall Street. Out of the gate you know he has interacted with Wall Street Professionals as his first interview resulted with the following comment: *"The Passive aggressive comment flew right over my head"* After his interviewer gives him a direct insult. Hilarious. For those unfamiliar, the vast majority of Type A Wall Street professionals have next to no social skills and will use passive aggressive mannerisms to belittle you.

Finally, to put the nail in the coffin on his legitimate Wall Street experience the following quote stands out: *"How often do you see a sell recommendation on a Company that has a relationship with the bank? That's right: never."*

Life Advice For Twenty Year Olds: This was the most actionable and spot on piece of the book in our view: *"If you're in your twenties, the four things you should avoid like an Ebola victim bleeding out in Times Square are debt, marriage, children, and wasting assets."* We could not agree more with this statement. Nowadays, many people are simply following the herd going to college with no purpose racking up personal debt and subsequently living at home with mom and dad.

To drive the point home, we agree entirely with Eddie's take down of debt: "*Debt is an absolute dream killer. Debt will take all your options, hopes, and dreams and drop them like third-period French. You will be a slave."*

There are various job opportunities out there in the world, many are just unwilling to do them because they believe they are above them. Instead of asking if you're above a task ask yourself, how will this improve or damage my options? This is the correct mindset. If it means you have to eat shit sandwiches for a few years, instead of thinking about the present think about what you really want to become later in life.

Now That I'm Debt Free What Do I Do? This is the rather obvious follow up question after his dialogue on avoiding debt, marriage, children and wasting assets (note a wasting asset is essentially an object of no long-term value such as a fancy sports car). On that note the following quote he uses sums it up nicely:

"Do you really want to own all that shit, or do you just want to experience it?"

Again we agree with this comment on all fronts, this is why you should be a minimalist. In addition he goes on to explain that we should all at least experience some of these things from time to time, a fancy steak dinner, driving a Ferrari at full speed etc. We agree – who doesn't want to drive a Ferrari on a race track at least once? This is why being frugal is not something you should strive to become, as it could hamper your life experiences in a dramatic way.

Eddie is a Bit Red Pill: Surprisingly Eddie may be a bit more red pill than not and you can see this in another section where he speaks to masculinity. With the following spot on quote: *"The double standard I'm speaking of is the growing trend toward the feminization of men by society, which is causing a shortage of 'acceptable' men as far as women are concerned… So now we have 'men' in their twenties and thirties who still live with their parents, play video games for hours on end, and seem to have no real direction in life…"*

Followed by the following spot on masculinity advice: *"First and foremost that means slaying your own demons: your fears, your self-doubt."*

The above quotations could have shown up on this very blog. There is a vicious cycle of feminism promotion and masculine demotion that is causing this trend and it doesn't look like it is going to stop any time soon. In our view, the best thing you can do for yourself is shut off the main stream news flow, ignore your overweight or skrillex haircut feminist professors and of course never get married in the West (Sorry Eddie we'll have to disagree on your having kids stance in Western Societies – even if you want kids don't have them here in the USA, you'd be damned fool).

Finally capping off the life advice, the following quote should be written on your wall and stapled to your forehead. *"No one is looking out for you. That's a cold, hard fact."* Remember, no one cares about you.

Wall Street and Stories About Trades: Since our readers have a wide range, beyond Wall Street, we would note that a large portion of the book also involves a lot of lingo and stories that will go over people's heads. Most people have no idea what short selling a stock even means. However, if you're interested in finance stories that are spot on accurate and entertaining you'll certainly enjoy reading about them.

Concluding Remarks: Overall we enjoyed the book and believe the following people would find it of interest 1) Current Wall Street Professionals, 2) Fans of Eddie Braverman of course, 3) Men/Women truly interested in working Wall Street and 4) People interested in Wall Street culture and interest in advice from a legitimate Wall Street professional. Notably, we do warn that a large amount again is tailored to Wall St professionals (EG: stories about trades, taking down banks – which requires an understanding of the financial system etc.)

You can pick up his book here. (This is not an affiliate link and is an honest review)

Note to Eddie: If you get the chance, Backdoor Mark is certainly welcome to throw up a guest post. "*He's into his forties now, but the girls he's with have stayed the same age as back then. Incredible." – Game Recognized.*

****

Best Real Estate Investment? Buy the Building.

Best Real Estate Investment? Buy the Building.

We didn't want to write the post. But. This is going to be geared towards the real estate fanatics. As many people have noted, rich people practically *always* own real estate. Naturally, we also own real estate. We just don't do it like most people.

Outline: 1) Overview of Private Equity Real Estate Transactions; 2) How to Spot a Good Value; 3) How Does it Actually Work?; 4) Rentals: Short-term, Long-term, Fees and Why We're Against Hotels; 5) S-Corp and Exit Strategy

1) Overview of Private Equity Real Estate Transactions

Many people don't know what Private Equity is, but our readers are elitist so they definitely know. Private Equity is simply the act of ***buying poorly run or broken down assets and fixing them.*** No need to complicate the definition. If you want to add additional detail, the goal is to eventually sell the asset or take the company public (if we were doing this with a poorly run company with operational issues).

Reiteration. Since we are talking about Real Estate in this case, **your goal is to find a broken down building, fix it, and sell it for a profit.**

Structuring the Deal: There are only two real parties in the transaction: 1) Private Equity Firm and 2) the Investors. We don't like complicating definitions or using finance lingo such as "consortium" so this keeps it clear and simple. You are either working for the private equity firm or you are an investor.

Investor: The investor supplies practically all of the cash for the deal. To keep things simple we'll assume 100% of cash comes from investors. In return, the investors receive a *preferred* dividend. This means the investor is paid a dividend of ~6-10% (annually) paid out on a monthly, quarterly or semi-annual basis (after the ~1-2% of operating expenses are taken care of). What does this mean? If the Private Equity firm is not able to generate returns *above* the preferred dividend… They will make ZERO dollars in the form of dividends. In addition, when the real estate asset is sold, the investors will receive between ~40-60% of the upside in valuation. (Note: the two and twenty rule is for companies, not true for real estate… Yes there are always "exceptions")

Private Equity Firm: The firm takes on the headache. The Private Equity firm is not using their own money so they take care of everything. They 1) spot the undervalued asset, 2) hire the right people to fix the asset, 3) manage the property and 4) participate in *upside* only. If the asset produces a yield or cap-rate that exceeds the preferred dividend… That is money in their pocket. Also. If they are able to sell the asset at a higher valuation than the total investment (they better!) then they receive a handsome return.

Return Profile: The same return profile applies. You generally want to see a ~20% return on a year-over-year basis. If you can clip 20% returns then both the investor and Private Equity firm will make a grip of money. The real estate asset should be sold roughly 3-5 years down the line. So. You're trying to double your money in about 4 years.

Concluding Remarks: That is an extremely basic overview. But. Now you know how the transaction works. 1) Investors receive preferred returns and are "hands off" on the process, 2) The Private Equity firm generally participates in the *upside* only, 3) You're looking for 20% annualized returns – as we have stated before rich people don't own a ton of bonds and 4) you are doing this with straight cash because equity is the highest form of leverage while regular people take out debt for their 30 year mortgage @ 4%.

2) How to Spot a Good Value

We always come to the same conclusion. Do the opposite. Or more clearly:

"Crisis is just a another word for opportunity" – @WallStreetPlayboys

Back in 2009 when the housing market crashed, practically everything was a screaming buy. You could have bought housing assets in *practically* any major metropolitan area and made a huge return over the next 5 years. When everyone is selling because there is a [insert name] crisis, you know it is time to do some due diligence. Wait for regular people to start purchasing, see them lose money over 6 months, then buy when they think they made a "mistake" and are back to selling.

High End: No surprise here. If you're going to go through with a Private Equity transaction, you need to do this in a place where money is sloshing around like white water rapids. This means… Luxury only. While you can certainly make money by going through the headaches of renting to Low Income Housing tenants… You shouldn't. It just isn't worth it. Dealing with these groups is just not worth the time.

Multiple Sector Exposure: Choose a city that is exposed to many different economies. New York City is a great example and has many major economies: finance, fashion, entertainment etc. Even if one of these sectors is slow to recover… Others will certainly come back to life. You do not want to be exposed to a large city with *only* one economy. If that sector is down for 5-7 years, you're going to be in a world of hurt from a cash flow perspective and your returns will nose dive. Valuations for the actual asset will also drop off a cliff.

Minimal Foreclosures: While many will say that the best value will come in areas that had a high foreclosure rate, we'd look for cities with a *low* foreclosure rate. Why? It means that most of the people living in that area are actually well off. During the housing crisis the best metropolitan areas saw housing prices decline but not fall off a cliff. In addition, the foreclosure rate was relatively low. This means that rich people are going to stay in this particular location. A net positive and should be looked into.

Education: Everyone and their mom is trying to become an entrepreneur. But. At the end of the day *top-tier* colleges will be in demand. Parents want their kids to go to great schools and top tier schools offer decent careers that pay $150K+ out of college. Want an example? Just go to Boston. We realize mentioning both NYC and Boston in the same post is a hate crime to baseball fans, however, Boston has a fantastic college system. Even if you purchased at the peak of the housing market in 2006, you're likely up ~20% today.

Poor Rent vs. Buy Math: Finally, if you really want to get leverage out of the model you want to search for areas that have low yields. This may sound contradictory but is not. If people cannot afford housing in the area, they are going to be forced to rent. This hurts in the *short-term* but you will make up for this huge on a long-term horizon. Simple math below:

If Cap Rate is generally 10%: This means a $1M income building is worth $10M

If Cap rate is generally 5%: This means a $1M income building is worth **$20M**

You want to slowly raise the rent over time and the ***multiple*** on the asset is going to carry the valuation of the building. This is where the value is. Don't play the game for the short-term, it hardly ever works.

Concluding Remarks: We're not going to give away the exact cities we're talking about in the USA. If you work in private equity or in real estate you have an idea of what cities were ripe for real estate transactions in the past and which ones are starting to look good today. That said the key points are 1) rent to high end, 2) invest in cities with multiple "sub-economies", 3) don't buy in areas with extremely high foreclosure rates, 4) Education can help cities return to growth and 5) play the long-game and play the upside to the actual valuation rather than the yield.

3) How Does It Actually Work?

So you've taken a look and have a list of cities you're targeting. Lets get started.

Minimum Investment: For Real Estate Private Equity you need about $1 million to invest through a firm. This will allow you to be exposed to many options and you will develop a long-term relationship (assuming its profitable of course! No one hates someone who makes them money!). Now, if you're unwilling to put up $1 million, you can get into specific investments for around $100K if you're friends with the firm or are looking at a single asset.

(Note: We are sure there are many exceptions to the rules, there always are, but generally $1 million for a Private Equity investment is standard and $100K would be normal for a single specific outlay. $50K is usually the minimum for higher risk private investments in *companies*)

Informational Memorandum: There are many phrases for this "Confidential Information Memorandum" (CIM), "Confidential Memorandum" (CM), "Information Memorandum" (IM). We're choosing the latter since it is the most clear. You will receive a package with the short sales pitch for the investment you're looking at. Within the document you will find the following:

Returns: How investors will be paid and how the Private Equity firm will be paid. Preferred dividends (usually 6-10% for investors), Equity upside (usually 40-60% of the upside for investors) and expected time horizon of exit (usually 3-5 years).

Pitch: The actual memorandum is much more thorough but we like to cut straight to it: 1) who the target market is, 2) why they believe the rates will be X% – expected occupancy, 3) city overview, 4) location specific overview, 5) investment minimums and 6) Base case and upside case – (it's a pitch so they rarely show the downside!)

Facade and Design: Once they give you the quick overview, they will also provide photos/sketches of the expected architecture, number of units and expected yield of each apartment (again we are focusing on buildings). A good example of a sketch is below (no this is not the building we own, we're not *that* dumb):

Untitled

Contacts: You're probably wondering why you don't just do it all yourself! The answer of course is scale and contacts. The Private Equity firm will have deep relationships with construction companies, architects, designers etc. They will procure materials at much lower rates than an individual and will likely get the job done in a much shorter time frame as well. The Private Equity firm will also allow you to contact individuals you wish to speak to (Ie: provide emails and phone numbers for architects, designers etc.)

Gathering Up the Dollars: Once you are ready to sign the dotted line you place your deposit. This is usually 5-10% of your contribution to the project which waits in escrow (or held straight at the Private Equity Firm). It shouldn't take more than a month or two to fully fund the project and once it is done you the rest of your cash is released and the project begins. ~6 months later you should be practically done and ready to go.

Concluding Remarks: Once you've decided to take the plunge you gather your list of private equity firms and 1) calculate the amount you're willing to invest, 2) comb through IMs, 3) Dot all your I's and cross all your T's for which project you wish to participate in and 4) Make your initial deposit. *Note: This is written from the view of an investor. For a Private Equity firm you're calling and sourcing funds through your client list (new and old).*

4) Rentals: Short-term, Long-term, Fees and Why We're Against Hotels

Now that we're through the high level items, it is going to get even *more* opinionated at this point. We'll outline what we believe to be good and bad investment choices for short term and long-term rentals.

Short-Term: Calling all tourists. Repeat. Calling all tourists. This is the best time to invest in short-term rental buildings. If you have a building in the center of town in a tourist destination hot spot you should turn it into a short term rental. Many people will assume the occupancy rate will be in the 60-70% range but because of the location you should exceed this mark. Materially.

The best part about a tourist hotspot is simple: **Emotional Decisions = Expensive decisions.** People are going on vacation so they have an "I deserve the best!" attitude. This is going to line your pockets.

There is no need to "price gauge" anyone. You'll find that the best location in the best part of town from a tourist perspective is going to be highly overpriced. It doesn't matter. If everyone is renting at $X/day and you're renting at $X/day +/- 5%…. Who cares. You're simply giving market prices for the best area.

Lets reiterate. **Emotional Decisions = Expensive Decisions**. This is the main takeaway from motivational speakers who make good money catering to losers and morons.

Long-term: Education, Families and Frugality. That is your bread and butter. If you are going to go for a larger complex (mainly 2+ bedroom apartments) then you're likely better off targeting families and areas with great education. They should be *close* to metropolitan areas… this will drag in the right crowd.

What type of person cares about their child's education? What type of person is going to be financially responsible and watch his cash flow like a hawk? You guessed it. **Responsible risk averse families.**

They will make great tenants and in this case you can actually bring *down* your rent a tad. They are going to jump all over the value of the rental unit! They don't realize that you both win in this case. You're giving them a slight discount to market rent for the 1-2 year lease agreement, but at the same time… They are good tenants! A good tenant is a huge positive and will keep your occupancy rate well into the 80 percentile.

Say No to Hotels: This is simply a belief. Hotels will be of value for corporations so we're not saying you cannot make money off of them (Hat Tip: Donald Trump).

Instead. We believe that we're entering into a sharing economy. As more and more people begin utilizing sharing and connected applications such as Uber, Twitter and Air BNB… The demand for rental apartments should increase. This is both on a short and long-term basis since the millennial generation in particular is all about freedom.

Concluding Remarks: Short and sweet here: 1) target short-term rentals in tourist destinations, 2) long-term rentals should be targeted towards responsible families, 3) we believe sharing will continue to grow in the future and 4) Emotional decisions = Expensive Decisions… utilize that decision for *your benefit*

5) S-Corp and Exit Strategy

Ahh yes. The golden part of the post and the part where we can quickly weed out the scammers from the legit winners.

S-Corp Wins: When you start making real money off of a [***REAL* Business** (not $200K a year or some BS you can make at 26 years old as an investment banker)]. You will set up your entity as an S-Corp.

To avoid going into details we're literally going to copy paste the basic explanation from Wikipedia:

*"S corporations are ordinary business corporations that elect to **pass corporate income, losses, deductions, and credit through to their shareholders for federal tax purposes.** The S corporation rules are contained in Subchapter S of Chapter 1 of the Internal Revenue Code (sections 1361 through 1379). S status combines the legal environment of C corporations with U.S. federal income taxation similar to that of partnerships.*

***Like a C corporation, an S corporation is generally a corporation under the law of the state in which the entity is organized.** However, with modern incorporation statutes making the establishment of a corporation relatively easy, firms that might traditionally have been run as partnerships or sole proprietorships are often run as corporations with a small number of shareholders in order to take advantage of the beneficial features of the corporate form; this is particularly true of firms established prior to the advent of the modern limited liability company. Therefore, taxation of S corporations resembles that of partnerships. As with partnerships, the income, deductions, and tax credits of an S corporation flow through to shareholders annually, regardless of whether distributions are made. **Thus, income is taxed at the shareholder level and not at the corporate level.** Payments to S shareholders by the corporation are distributed tax-free to the extent that the distributed earnings were previously taxed.*

Unlike a C corporation, an S corporation is not eligible for a dividends received deduction.

Unlike a C corporation, an S corporation is not subject to the 10 percent of taxable income limitation applicable to charitable contribution deductions."

We have emphasized the important parts of the overview. You're smart enough to read between the lines and pay significantly less taxes once you understand what all of the bolded items mean.

Exit Strategy: Rolodex, Rolodex, Rolodex. Easy play on words. If you have a solid rolodex you'll be rolling in money once it is **time to sell**. At the end of the day, real estate assets are cash flow kings. Rich people primarily own stocks, real estate and cash (minimal bond exposure).

If this is your "first rodeo", from an investor perspective, you're going to thank your lucky stars that you are working with a solid Private Equity firm. They simply display the last three years of cash flow net of expenses and should be able to sell at the current cap rate based on a trailing twelve month basis (TTM).

Concluding Remarks: We're at the end of the post. The key actionable steps again are 1) set up an S-Corp and 2) have a thick rolodex come exit time.

—-

Normally, at this point we outline key bullet points to write down. Unfortunately this post was extremely detailed and nitty gritty so the main "bullets" are going to be different for everyone. Unlike other posts, if you have an interest in this type of transaction you should probably read every single section. Don't be afraid to go against the grain, we are simply stating how we think about things.

One thing is for sure. If someone is rich… They should always be able to make a ***Real Estate-Ment***… If you don't get that triple entendre please leave =)

****

Bitclout Looking at the Big Picture – Initial Analysis

[Bitclout Looking at the Big Picture – Initial Analysis]

At this point everyone in crypto has at least heard about Bitclout. Instead of putting up a complete campaign for it and instead of dumping on it, we're going to give a balanced view of the project. Usually when something sparks this much emotion there is at least one good idea inside the project. Again. We do think it is over valued considering that there is no sell button so we continue to be utterly confused that people are "surprised" it is going up in price. It has to go up in price because there is no sell button. So we can go ahead and start from there.

Over-Valued: There is no real argument here. The way the project was launched allowed insiders to get cheaper Bitclout. This is simply a fact and you can see it in the blockchain. Since there is no sell button, there is no way that the price is correct at the current levels. Also, you can get the Bitclout token for a discount (simply go to discord or telegram chats to confirm this). So, we know it is currently over valued when compared to the price flashing in the top right of the screen.

Adding to this, since people can use Bitclout to buy creator tokens, we know that the creator tokens are also over valued. Yes we're saying our own Bitclout account is over valued. As usual, we're transparent. Currently, we have *no* plans to sell a single creator token. In fact, we're trying to think about ways to help the people who already bought our "coin" but haven't linked to the platform yet (still not approved as of this writing).

So Why Bother? With the bad part out of the way, there is an interesting concept underpinning Bitclout. Effectively, if you're adding value to a particular platform you should be paid for it. We'll go ahead and use this blog as an example since we've been messing around on here for nearly a decade.

You never know who is a supporter. There is an enormous range. There are people that email us telling us we helped them make $1M or more. In return they give us $9.99 and that's it. There are other people where they make $200K and then they donate 1ETH in support which would be equivalent to about a 1% thank you. We have no ability to track this. We're not here to complain about it, this is simply how the world works. This is the case for every single content creator.

Enter Bitclout. Assuming the project is successful it would mean that creators could get rid of a lot of the noise. You could visibly see who actually appreciates your work. For example, if we knew how many people were copying our trades and taking our advice it would be a LOT easier to monetize that information. We'd simply cut out all the people giving us $9 and never talk to them again and bring the group down to 100 people. Why? That's how life works. Just like any business, you want to prioritize your highest paying clients and cut out the people who are simply draining your time.

Before moving on, we're well aware that there are solutions here. We could create a paid group membership. We could raise prices to remove more leeches. We could charge consulting fees instead of giving out information for free. So on and so forth. The reality is that this blog has been a hobby and we haven't really taken it seriously (as evidenced by the zero changes in web design for 5 years – we haven't even changed the name despite being uninvolved in Wall St for years!).

With that explanation out of the way, you can see how Bitclout *could* be a useful solution. Again the key word here is *could* as the project just started. In a Bitclout based ecosystem, you would be able to identify good content producers faster and you would also be able to reward the good content providers. For example, there are tons of fake twitter accounts with "50K followers" but they paid for 40K of them. There are tons of anonymous accounts with 10K followers, but they are all real. So on and so forth. With Bitclout this kills the entire gamification of social media accounts. While you could pay someone to "pump your coin" for a couple of days, it doesn't work long-term if everything you're saying is meaningless (not entertaining, not informative and generally not useful). In terms of what is "valuable"… no one knows at this point. It's a big black box of attention gathering across every single social media platform.

Some Mechanical Stuff: A lot of the current bells and whistles don't seem to make sense. Apparently you can reverse transactions and it appears that this is till centralized (IE. what kind of public block chain needs a password). We'll be able to see how serious the team is over the coming months. Long-term it has to become decentralized and if the creators (one being Chamath) are serious, they will not dump all of their holdings now that the coin has pumped due to an inability to sell.

The second interesting thing here is that the "high engagement" accounts came in pre-loaded. This makes complete sense from a marketing perspective. Anyone with a big account would be thrilled to see that they can finally make money off of all the value they are delivering. Also, it would make sense that anyone with a real following on twitter would be the ones with high initial value. The people who developed this likely looked at every account and were able to see which ones had paid scammy followers and which ones didn't. Again. We have no info on this but for now that's what we'd assume if the team is serious. If Chamath is publicly saying he backed this, you'd hope that he took a serious look at the project for a long time.

What We'll Be Doing With It: First, we're not going to sell a single creator token. That would be dumping on our following and doesn't make sense. Also we're guessing there are tax implications for that. Secondly, AFTER the token is liquid (assuming it is) we will then ask the people who bought the token what they'd like from us (ie. more content, more massive trolling events like what we're planning with hashmasks etc.). This is only fair as we should take the opinions of "investors" 100 times more seriously.

A second item we've thought about is using the tokens to invest in other people. Again, we won't do this until the platform is liquid because we don't see how that's fair at all. After there is liquidity in the market, we would be interested in investing in some of our followers. In theory if we help someone succeed and their profile grows dramatically we've created a win win. We've seen many people go from nothing to millionaires and being able to help "back them" and in addition benefit from their success seems like a no brainer.

In terms of content creation, we'll start juggling public Twitter and Bitclout for now. We'll use similar content on both sites and likely even reuse a lot of it until things open. After that we can ask creator token owners for their input.

Conclusion: As stated, Bitclout is over valued as there is no sell function. This is clear and obvious. This also means our own token is over valued (how is that for transparency!). That said, the project has been around for a few weeks and we do think the "ideas" behind it are valid. In a world where creativity, information and credibility are harder and harder to find, those with the three qualities should we rewarded financially. Also. This creates a "positive sum game" where big accounts can invest in upcoming accounts and support future winners.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life. **We hold Q&As 1x a month for purchasers only.**

****

Bold Prediction: President Donald J. Trump

Bold Prediction: President Donald J. Trump

Lets frame this up. First, we are not the original predictors, Scott Adams (Dilbert Cartoonist) and Mike Cernovich (personal friend) were the original people to make this call (Perhaps a few more we are unaware of). Second, this article should *not* be popular with Trump supporters because it is coming from a Wall Street blog (Branding 101 and why Mitt Romney failed). Third, **from a financial perspective we do not care who wins**, we are evaluating his candidacy solely from a *Branding* and *Sales* perspective. The only skills you need in life to get rich and live a life you could only dream of.

General Take On Politics

We have already learned more about sales from the debates, Trump's campaign and his rhetoric than any other election **in history**. We will give you a taste in this post.

*That is the *only* reason we are involved. Nothing in this article will talk about his *ability* to do the job.*

To reiterate. We do not care who wins as it won't impact us at all. Politics is one of the only times where "regular people" get a chance to have equal say as a successful person. So. No. We will not post a single politics related article (recent polls for example) unless it has tangible value.

Making This Prediction a Fun Game

We are certainly putting our money where our mouths are and took a fun bet with our friend Sam who is predicting a Hillary election. Our quick Twitter interaction summarizes the difference in opinion quite simply really. Here it is:

Interaction

In short, do you believe people are rational creatures? Do you work in Sales? You know the answer. They are not. Sales is the transfer of emotion.

In fact, if humans were rational and logical… Trump's Casino Empire would not exist would it? It wouldn't.

With the basic premise out of the way… that people will vote based on how they feel rather than rational thought, lets go through his ability to sell. In short, he has a tremendous ability to sell.

President Trump's *Branding* Campaign History

"I'm not using the lobbyists. I'm not using donors. I don't care. I'm really rich" – Trump (June 2015)

This is probably the first we all really heard of Donald Trump (running for President that is). He throws out three clear and concise punches and leaves you with an enormous negative. Why? He left you with the negative so the mainstream media could run out with a headline making him appear to be a brute and an elitist.

A fantastic trap wasn't it?

The media expected the following: He's claiming to be super rich! He is exactly like Mitt Romney who was also super rich! This is the tactic that tanked his presidency now Donald Trump is done!

Instead they got the following: Unlike Mitt Romney, I do not need *lobbyists* or *donors*. He anchored his previous sentence on those words for a reason. Instead of being branded as a rich elitist his rhetoric comes across as a blue collar guy who doesn't care about politicians. Which is why we saw the following as his second tactic.

"I'm so tired of this politically correct crap" – Trump (September 2015)

All of our readers are smart so you see exactly what just happened here. After letting the "I'm really rich fiasco" run its course he *doubles down* and now uses layman's language to 1) prove he is not going to speak like a politician (you were already thinking of politicians when you saw lobbyist and donor) and 2) **he's branding himself as *not a politician*.**

Our friend Sam disagrees with this being a good idea, his quote is right here: *"To win, candidates really need to be more political by kissing everybody's ass. Donald suffers the same disease as Mitt Romney. Because they are so rich, they just seem too arrogant to understand the math necessary to win a majority"* (no we're not attacking Sam just showing our difference in how this is playing out).

We will take the opposite view and say if he acts like a politician… his following will fall off a cliff just like a terrible Stock.

You know… like Macys.

Funny enough, you were thinking of Macy's right when you saw the word stock and that is not a coincidence!

Jeb Destroys His Own Candidacy With an Intern… Oh Politicians and Their "Interns" (October 2015)

While no one really knows *exactly* why Jeb has fallen off a cliff. Besides the fact that he is weak, a terrible presenter and a beggar. But. We'll take a stab at the *event*.

It is when the media and the GOP (whoever you want to blame for this embarrassment) attempted to plant an intern into a Trump event.

Now you're in big trouble.

We now know with certainty that the media ran out with a false narrative. Now you've woken up every single person with a social media addiction to scrub any and *every* story on Donald Trump since we know… again… with certainty… someone is attempting to dishonestly discredit him. In our view, that was the kill shot.

There was an attempt to double down on this strategy with a "Hitler" plant at another event, which has done nothing but backfire… **Again.**

Temporary Ban on All Muslims (December 2015)

Donald Trump stock gaps up and goes parabolic settling at ~40% of national polls and clear #1 leader.

Why? Donald Trump rises up as the only candidate to come up with an extreme solution to a real problem. We do have a problem. No one understands why we are being attacked: 1) September 11th was a Muslim based attack not Iraq based which Trump was against, 2) Boston Bombings, 3) Paris attacks and 4) San Bernardino.

The best part about this fiasco was *not* the headline. The headline was easy click bait for Mr. Trump as the media ran with "Ban All Muslims" instead of the actual message of *Temporary* ban on all Muslims which gave him several hours of air time to explain. A crystal clear tactic. Create hype. Lead.

"You're a Tough Guy Jeb!.. Let's see I'm at 42 and you're at 3." (December – The Final Debate)

Is it a coincidence that Donald Trump's best showing in the debates were on the first day and the last day? Of course not. While he cannot receive a script in advance, it was clear he wanted one last push. His comments went viral.

Summary: Given that these were the five most impactful pieces of the campaign (opinion) we now have the following as his marketing strategy: 1) I am not a politician, 2) I will not take corporate money because I do not need it but you're happy to join my cause *personally*, 3) the Media is out to slander me and we have proof with plants at my events, 4) I am willing to fight back for our country – we didn't even mention El Chapo! and 5) I'm here to win and you can see it in my numbers as we begin 2016.

Nitty Gritty Sales Specific

He isn't even trying but is out performing.

Everything written above this line was with regards to *branding*. Lets switch to his sales tactics by first looking at the most useless part of his campaign. His donation section.

Remember, Donald J. Trump does not need a penny. He has spent the least amount of money out of any politician and is still winning. If he is going to put a low amount of effort into anything it is going to be fund raising. We are only going to highlight a few points on the page to avoid giving out more information on why the page is good.

Donation

Anchoring: He is anchoring the reader to $2,700. Many will read this page and say hmm the middle number is $250. It is not that simple. He has anchored to $2,700 with the phrase "By law the maximum amount an individual may contribute is $2,700."

Did anyone know that was the maximum? Honestly we did not (again we don't care about politics). And. As soon as you're thinking about that number your anchor is now as high as it can possibly be.

Recurring Payments: Make no mistake. Donald Trump knows the best way to get a person more dedicated to his cause is through a monthly contribution. Simple psychology. The more people give you… the more committed to your cause they will become (human nature). In addition, notice something extremely subtle. The phrasing is "Make this a **monthly** contribution". Again highlighting the commitment.

No Begging: Again. This is a page he does not care about at all… yet it is done correctly. This page only exists to get people mentally committed to his campaign since he does not need a couple million dollars.

His phrasing is as follows:

"*By law* the maximum amount an individual may contribute is *$2,700*" (Select amount) "*Make* this a monthly contribution".

Compared to his competitors:

"*Chip in* to stand with Hillary in 2016" (select amount on three different clicks) "*Please* make this a recurring contribution."

All of you affiliate marketers can stop laughing now. Seriously, you can stop. We know you're laughing and we're laughing with you. Anyone who makes at least 4 figures a day online (we're drawing the line there) knows this is a material error and is sending the reader away from the page. By asking a person to "chip in" and going with "please" you're going after the lowest of the lowest common denominator and you're generating less money.

Don't worry… Jeb is using the "chip in for a dollar" language as well.

Incredible Voice Control

We wish we could find a better word, but we'll just use one of his. Tremendous. He has a tremendous ability to control the tone and cadence of his voice. We first recognized this ability in full force on Jimmy Kimmel when asked tough questions about the Muslim statements. The best part? People believe he is not speaking this way on purpose. It is being done with a **purpose.** He even takes *less* time to "temporarily" say the word "temporary"! (Ie: emphasizing the *feeling* of the word).

For fun, lets take a look at his latest video thanking his supporters into the New Year. We suggest opening a separate browser.

Here is the message:

"I want to wish everybody, a very very happy new year. Hopefully 2016, will be an unbelievably successful one. For our Country, for yourselves, for your family and thank you very much for all of the tremendous support that I have received."

We are sure you caught it. What you've read does not match what you've actually heard because it looks like a boring message with a run on sentence to close. Here is what really happened.

*****Rat, tat, tat, tat, tat*****

T-R-U-M-P

(Pause, the word TRUMP is erased in an even faster five paced motion, five again however)

"I want to wish everybody a very **very** happy new year."

(this sentence is done in a classic rainbow with the peak word being the second very easing into the new year statement)

"Hopefully, two thousand and sixteen. Will be an **unbelievably**… successful **one**."

(He spells out and elongates the word 2016 to give the viewer something to look forward to by how he *says* it followed by a single strong hand gesture to explain a successful *one*)

"For our **Country**. For **Yourselves**. For your **Family**." (pause)

(Three step process: he talks about the three things you care about the most in ascending order, you kind of care about the *Country*, you certainly care about *Yourself* and you absolutely care about your *Family*)

"and Thank you **very** much for all of the **tremendous** support… that I have **received**."

(the final delivery will also be missed, he has emphasized only three words and all you will remember is "very tremendous reception" – not the word received)

*******TRUMP Make America Great Again********

—

An entirely different feeling going through the second run through. Now, certainly it is laughable to think that this is going to make or break his campaign. We certainly have no clue if he will actually win, we are simply going through his sales techniques and are **banking** on his ability to *out sell* the other candidates.

Summary

We did an extremely small amount of work on analyzing his sales technique (maybe we will do another post if there is interest solely in his wording and salesmanship) but here's the takeaway.

– Trump is not a politician. If he goes the political route we see him losing ground (a lot of it as he will appear weak)

– The media is out to slander him, the entire nation has proof (intern plants) and now the main weapon is being devalued in front of our very eyes

– He is not going to take money from anything related to politics (doubling down on number 1)

– He is going to use *mass production and marketing* he will not need to pay for air time as the media will attempt to slander him (do not need to spend on distribution)

– If there is a financial crisis or a time of war, we believe he will run away with the election as it is crystal clear that he is the most charismatic candidate and the most hard nosed on the docket

Basic predictions going forward? We see him losing the Iowa Caucus, we see him winning the GOP, we see him going after Hillary's health, criminal actions and the actions of her husband (branding her as weak and unable to stand up for herself).

Will we be dead wrong? Who knows. But. That is why the claim is bold. We're expecting this to be the result after all.

IMG_3475

****

Book Intro: Decentralization – Starting Out for the Beginners

Book Intro: Decentralization – Starting Out for the Beginners

Welcome in decentralized generation and long-time readers. We've officially started our product which will likely cost a few bucks more and will be used to fund our trolling purposes on Twitter (more on this soon – wink wink, hint hint). Over the coming months/years we'll exit the Fiat system (this will be a long-term process as we're unfortunately not nine figure people). Many have complained that we don't have an intro guide to crypto and the below intro will serve as the intro guide. (honestly we should remove the investment banking Q&A soon as we transition all of our interests)

But Wait… Some Quick Notes: For those that believe we've sold out we commend you on being broke. The future of finance is crypto currencies and the world is changing at rates we've never seen before (we lived through the birth of the internet – unfortunately getting old). The reason we have to do this product and people need to pay attention is because of Darwinism *"Adapt or Die"*. If we didn't focus our attention in this area you would know that we fell behind in terms of advances in technology. If we figured out VPNs, Aff. Marketing, Hypervisors etc… It would make sense that we were following this space as well.

Will there be blow ups? Yes. Will there be 100x returns in certain projects? Yes. Do you want to have absolutely zero exposure to this type of market? No. The writing is already on the wall as high tech rarely goes to zero.

If you look at history, the internet was a massive bubble but it ended up being life changing technology. The car was laughed at and was a bubble with 1,000s of car companies but that was also life changing technology. We can go on and on. *If you see a massive bubble in anything that pops and comes back to life… You've found a real technology.* Remember that sentence for the year 2030, 2050, 2080 and for those that live longer 2100.

This is arguably the greatest opportunity the Millenial/GenZ population will see. With all the advances in AI and automation coming, you know that the digital world will come into play over the long-term. The key is positioning yourself for the future in a pragmatic and intelligent way.

With that we can give an overview for the newbies on how to "Get Started"

Starting Out for the Beginners

This is a painful section. Sorry to say that if you're reading this section, you've got a TON of catching up to do and are at least 5 years behind. We wish we were kidding but we are not. With the big warning out of the way, we're putting this section in here since basic questions are not a good use of time. For those that already understand the basics, just delete this entire chapter and throw it into the trash bin!

Not Your Keys, Not Your Coins: If you understand crypto currency this is one of the first things you learn. Under no circumstances do you use a third party custodian. This is the entire point of crypto currencies. You want to become your own bank, your own lending pool, your own stock exchange (so on and so forth – also more on these things later).

Not your keys not your coins means you need to have a *hardware wallet*. Previously, we wasted time telling people about all of the different options (paper wallet, phone wallet etc.). Since this section is for complete newbies you need a hardware wallet. Hardware wallet means Trezor or Ledger (at the time of this writing).

A hardware wallet is something that contains your crypto currencies without any connection to the internet. You plug it into your computer, send your coins to the device and unplug it. You can then store it somewhere safe and never lose it. This is by far the easiest way to get started. Yes it will cost you money to buy the wallet but if you understand the last three paragraphs you will understand that it is worth it.

If you're using a third party to hold your coins (Coinbase, any exchange etc.) you're adding additional risk for nothing. We repeat. Any coins held in a third party exchange is at risk as you cannot move them freely. This is why you're seeing large outflows from exchanges to self custody wallets (richer people are coming and they did their research).

What Are Keys: When you get your wallet, you will have to open it up and hook it up to your computer. At this point you will then receive a pass phrase. This is 12-24 randomly generated words. These words represent your keys.

Pausing for a second. If you do not hold your coins in a place that requires your 12-24 word pass phrase, it means that someone else holds your coins. Therefore it is not in your control. If you do not control your own coins you're defeating the entire point of crypto currencies in the first place. We're repeating ourselves but we have to drive in the point for newbies. You must own and control all of your coins. Period.

This 12-24 word password should be written somewhere in the **physical** realm. Do not type the numbers into a phone, document or any electronic device (***never***). Someone can very easily go on your computer and find it, then you lose everything. So you have to write the physical password down somewhere and keep it safe. Once you have a sizable amount of money (whatever that is for you), you want to invest in a fireproof product. Cryptotag is a good example of this if you're hoping to buy a fireproof product that memorizes your seed words (again as of this writing).

If you don't want to use Cryptotags, then you could physically engrave the words into metal. No, we're not kidding. Once you have enough assets you want to make sure they are fire proof and secure forever. A piece of paper is perfectly fine if you have a small sum, however, as the amount becomes more important you'll need to take it more seriously.

Now You Are Set Up: As a quick review, if you have next to no money, the minimal set up is a Ledger S or a Trezor. The smart/richer people will have Cryptotags for additional security.

Where to Acquire: The punch line up front is that you should acquire peer to peer. If you understand the absolute basics of crypto you know that it is better to pay a small fee to go peer to peer versus buying for a fee on an exchange. This will be covered in more detail later, however, everyone has at least heard of crypto so if you don't understand that sentence, the next 5-10 years is going to be extremely painful.

The best way to go peer to peer is to simply use chat rooms, twitter or your social network. At this point there is a near zero percent shot that your friends do not own it. As you spend more time in the space, you will eventually meet bigger and bigger holders which makes this a lot easier for you. This is also a fantastic "barrier to entry" as most will stop at this paragraph and give up since it is too hard to go onto websites and talk to peers. This removes 90% of the competition on day one.

If you end up buying on an exchange, that is your faulty decision (not ours). In the case that you make a bad decision like this, at least move it to a hardware wallet. That said, you've already messed up and you may as well store your coins somewhere else. (*Note: PayPal would be the worst solution of all time as you can never take your coins off and move them into a hardware wallet, you don't even own crypto you just think you do*)

Now What? Well, Triangle Investing certainly aged like wine. Sold at the peak of hype and gave everyone three years to accumulate during the downturn. Could not have been better, not to mention the recession call we made with the Spending Book which also occurred! Being honest here a ton of this has to have been luck. And. As usual, luck favors people who don't need it.

If you read that product, then you know the first step is to look at the "base layers" which primarily consist of Bitcoin and Ethereum at this time (according to market capitalization as of this writing, we'll touch on other ones later in the product).

What do you do? You simply purchase these base layer assets slowly over time with the income you're generating. In an ideal world you've followed Efficiency to the T and you can even convert some of your E-commerce sales directly into BTC or Eth.

Next Steps! Now that you have a basic structure set up (won't take more than a day or two to do), you can now look for high risk/reward opportunities. This means you're looking for promising projects with Air Drops (explained later). Essentially if you find promising new projects, you're paid to put your capital at risk. Uniswap was a fantastic example of this. When it first came out there were practically no supporters. If you got in with a small amount of money and simply held, you'd be up 10, 20, 30, 40, or even 50x! Most people don't hold on long enough (or don't get in early enough) so the ladder was for illustrative purposes.

Now you're asking, how do I get into the new stuff? Well you need to do a ton of work. We'll highlight a lot of the *"how this works"* in the product and give some high level advice. But. In the end, the space is changing at a rate that requires 8-10 hours a day of attention. This is also why you're seeing a complete course change on our blog and twitter. Again. Adapt or die.

Okay I Get It Endless Opportunities But How?! Glad you asked. If you look at the paragraphs above by the time you're here you have both some BTC and some ETH. In order to invest in a ton of these projects you usually need one of them (BTC or ETH). So. Make a decision. Which protocol do you want to support and which one will you dedicate time and research into. We're not "Bitcoin Maxis" and we're not "Ethereum Maxis". We're simply looking for promising projects as it is either a 10, 30, 50, 100x or a zero. That is the name of the game. So we can get started….

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life. **We hold Q&As 1x a month for purchasers only.**

****

Book Introduction – Efficiency

Book Introduction – Efficiency

We polled readers for post topics. The same items came up over and over and over again: 1) money, 2) networking, 3) opportunities in the future and 4) how to maintain a healthy social life while doing all three. After large scale polling we've decided to create it with a completion date around **July 2017 time frame.** Here's the introduction and how we think people should re-evaluate the rules they have been told to follow.

Introduction

Almost everyone who picks up this product is going to jump directly to the making money section of the book. Unfortunately? That will practically guarantee they will never "make it".

Below is a list of 10 basic axioms to follow if you're serious about success.

1) Obligations Are Now Gone: If you are starting at ground zero, you have absolutely no obligation to anyone. This includes your best friends, your teachers and even your family if they are not going to help you succeed. Everyone encourages you to join the Peace Corps or worry about "the children" and other social matters that are now irrelevant to you. We will reiterate. All obligations for you to do ***anything*** are now gone.

It is important to note, this ***does not*** mean you will live a life without consequence, it means that you will no longer have an excuse of "obligation to someone else". This means every action you make is going to directly impede or help your future success and the only person you get to blame is yourself.

To wrap up on the obligation piece, this is not "cold hearted". It is much more cold hearted to donate your time and help 20 people when you could have donated several hundred thousand dollars (or even millions!) that will ***help thousands of people instead.*** If Warren Buffett never became the investor he is today, billions of dollars would go to waste. By signing a giving pledge, he will do more for society by himself than thousands of workers combined. In addition, he can pay for thousands of people to pursue their own dream of working for charities. Just remember, without his donations they wouldn't be able to work in the first place.

2) No More Third Party Pump Up Sessions: If you waste your time watching emotional videos about *"going out there and taking the bull by the horns"* we have no doubt nothing will be accomplished. These types of seminars, websites, videos, speeches etc. are all used to create a cult following. If you get 1,000+ cult followers who "feel good" from the event and one of them converts (law of large numbers) then more and more people will join the cult. It is an ***emotional Ponzi scheme***.

Self-doubt is normal and it is something you will have to learn to deal with. If something "pumps you up" then you're being sold something on the back end. Stop consuming it. Reading about the struggles of someone else will not benefit you, if you need to read stories like this it means you're not taking your own life seriously.

When an outrageous success story can actually impact your life emotionally it means the creator of the content is ***converting your nervousness into positive energy.*** The "sale" is simply converting deep seeded insecurity into positive pump up energy to make you buy some product that won't actually get you anywhere.

Finally, to wrap up this point, when you're getting into higher risk situations the only thing that will help you perform better is preparation.

Public speaking is the best example. If you are nervous before the event, practice live demonstrations in front of other people ***thousands of times*** until you can barely speak. You'll find that you're no longer nervous because you're prepared and don't need some army ranger yelling at you to get "hyped". The more you practice the more you are desensitized to the potential negative emotions.

99% of people fall victim to the motivation Ponzi scheme because they are never internally motivated. **It means less competition for YOU**.

3) No Social Media, No Television: Unless you're using social media to make money, go ahead and shut it down. Joe and Sally from college, high school or your childhood do not matter anymore. It is not harsh. If you're not where you want to be, why would you waste time following the actions of people that won't help you get to your goal?

It doesn't make sense.

Most people are hardwired to care about what their friends are up to. They even waste time following celebrities who make all their money because… people want to see what they are up to. By following the life of someone unrelated to you and someone who will never help you down the line, you're wasting valuable time that you should spend on yourself.

To simplify this even more, social media should ***not*** be used to keep tabs on other people. It should be used to build up a brand and sell a product. Otherwise it was a colossal waste of time that would be better spent working for minimum wage.

For television, the point is quite simple. Every single hour spent on television is lost income while you **watch someone else do their job/career**. It makes no sense at all. If you run the math it becomes even sadder.

Average income in the USA is $50K, about $25/hour. The average person spends about 3 hours a *day* watching television. That is 21 hours a week.

Therefore? If this time was simply spent making money, it would lead to $27K in savings per year or a million dollars over ~36 years. The point? By simply working instead of watching TV you are practically guaranteed to be a millionaire even with no investment gains.

Before this section comes off as isolationist, lets clear up a point. Every single person bringing you up to your goals or helping you get there will remain in your phone forever. However. If they switch to becoming time sucks where they complain about life or drag you down in any way, they no longer deserve your time.

4) Find One Committed "Friend": You don't need more than one. Find a single person who wants to succeed as badly as you do and make sure you keep in contact for at maximum one time per month. That is only twelve times a year (you're going to be too busy doing work).

If you can find a single person willing to give 80+ hours of effort per week to becoming successful, the chances that you both make it will be magnified. You'll likely hit different hurdles and a one hour conversation once a month will help jump over those issues each time.

Importantly, you should choose different industries, this makes it impossible to compete down the line. In the long-run? Your questions will cease as the issues become too specific (a good thing).

5) Health Will Take a *Temporary* Hit: This will sound contradictory to the original statement that health is more important that wealth. That statement is still true.

The point of this bullet is that you have to find your own personal limits to work. Most people make the excuse of "needing" multiple things from specific sleep schedules to leisure time. If you're young, you get the ***privilege of testing how far your body can go*** and once you actually break down (once) you'll know exactly where the line is.

You'll find that your body sends off specific queues when you've officially reached your limit and once you can recognize them, you'll unlikely impact your health going forward. As a simple example, most will feel discombobulated when reaching their limits. They will misplace items, become disorganized immediately and make mistakes even with simple tasks such as pouring a cup of coffee.

To reiterate the emphasis around ***temporary health impact***, once you know your body's limits you won't "push through" as it does not end in productive work and is a clear hit to your personal health.

6) Find Your Talents: Most people are talented in several different areas. The difficulty is finding out if you'll be in the top 1-5% in the segment. Without breaking into the top 5% in your field it will be quite difficult to earn a large amount of money as income is not a standard curve (winner gets a much larger share of the spoils).

We're keeping this bullet basic by summarizing talents in a single sentence: ***you have to be good enough to have *other* people tell you that you're good***. If you have enough potential, this will happen on its own. It does not matter if you're interested in the item at all, if you want to succeed, ***becoming the best is much more important than simply doing a task that is "fun" for you***.

To reiterate, as you try out different fields, you'll only keep a list of items where *other people* tell you that you're good.

7) Learn Sales for Every Interaction: Even if you decide the path to making money off a business is not for you, the skills you learn by selling will give you the ***toolbox necessary to live a comfortable life***. While there is a negative stigma around sales, it is far and away the best skill to learn if you were to choose only one. Forget about complex mathematics, forget about hard science, if you can sell, you can transfer that skill into the most important aspects of your life: earning money online, dating, making friends and interviewing.

In short, sales is the ***most*** transferrable skill you will ever learn. Every single second you spend improving your salesmanship will give you a 100x return.

8) Focus on Scale: You will likely need to trade time for money at a *very early age in life* (covered later in this book). However. All of your free time will be spent on a scalable business. A scalable business that is worth your time has two attributes: 1) recurring income and 2) a large addressable market.

In an ideal situation, while you're learning a specific industry near-term you should find a niche market where you can be the ***expert***. This will then open doors to other markets assuming you have chosen correctly.

As a basic example, if you begin designing clothing you can then move into jewelry/accessories as they are somewhat similar. If you're good at both you could move into makeup and other ancillary markets to retail. Simplistically, every niche market falls into a major market and as you succeed in one niche, begin opening up peripheral vision to other sectors you can learn about and understand well. (Note: this may require a completely different brand)

As a basic terrible example? You're looking at it. A book is a horrendous way to get rich because each sale is one time in nature. If one person reads your book they will not buy another copy for no reason. In addition, even if they buy a book for a friend… That friend does not need two books either. Eventually you saturate your market and there is no recurring income left! Books are not good ways to make money because they are ***NOT RECURRING REVENUE.***

Since our readers are smarter than average… Now you 100% understand why magazines were sold on subscription basis. You had to renew every 12 months to create another sale for the company. Without new content the business model would die.

9) Stress is Okay, Worry from Real Problems is Not: The extreme Entrepreneurs and future billionaires will likely tell you to simply drop everything you're doing and go "all in". We take a bit of a different approach given everyone has different risk tolerance levels. We've found that worrying about paying your bills on time and struggling to get by usually results in too much stress that prevents your "creative juices" from flowing.

This is why we recommend a bar-bell approach that will be detailed later in this book. Where you build enough income to not worry on a daily basis (usually 10-20% above cost of living) then shift the remainder of your time to scaling a business and creating recurring income.

We have nothing against risk loving individuals and if you're unphased by being evicted and going through turmoil to become exceptionally wealthy we wish you the best of luck on your journey.

Our simple line is you should feel immense stress, but not enough to cause you to worry. Real problems cause people to worry which then impedes results over the long-term.

10) No Time to Live Above Your Means: This is why frugality is not a good strategy to get rich. The only difference between the recommendations of frugality and the recommendations here is this: frugal people spend time ***cutting cost***, future multi-millionaires spend time ***creating income*.**

If you're serious about moving up, you're not going to have time to spend thousands of dollars on fancy clothing, cars and bottle service (for now). When you've got enough money to never work again, you can spend as much as you like.

While clear bullet points are easy to remember the foundation, is simply this: ***we all have no one to blame but ourselves.*** This is why we emphasize the importance of no excuses. If someone "else" is dragging you down, you should have no qualms in deleting that person from your life forever. There is no reason to keep them even if *"society tells you that you should"*. You only get one chance at life and you deserve to pursue each activity… baggage free.

With the important introduction out of the way, below is a flow chart of the design and purpose of the book.

Finally, we'll note that the name of the book is called **"Efficiency"** for a reason. There will be a lot of extreme ideas placed here to save time. Many will call them crazy. We call them helpful. We have to make the most out of every single day. Why the obsession with efficiency? We don't have much time to succeed in life and the quality of life continues to decline once we hit middle age. There is no point in wasting our most precious resource: **Time.**

—-

Addendum: In summary, there is absolutely no competition for making it into the top 1%. If someone wants to be in the 1% all they have to do is follow the items above and it's practically impossible to avoid becoming a millionaire and making mid 6 figures. The reality is competition really begins at the 1% level because you fight two major headaches: 1) psychologically difficult to work as you don't need the money and 2) anyone still grinding it out when they do not have to is extremely difficult to beat. There is a "knee in the curve" and competition goes parabolic.

****

Breaking into Venture Capital

Similar to the Sell Side and Buyside there are clear and concrete ways to break in. For Venture Capital, depending on your background you must search out and find the right story to preach, which should involve five pieces. 1) Work Ethic, 2) Appetite for Risk, 3) Innovation, 4) Salesmanship and 5) Sector Knowledge. If you can get 3/5 on this five point checklist and you have an obsessive work ethic it is achievable. Cutting to the chase lets look at the five points.

1) Work Ethic. If you have Wall Street Experience for 2+ years, you pass. If not you're going to want to show you have work ethic by stacking your resume starting.. today. This would involve working your regular job while actively pursuing a job closer to the field of Venture Capital which would include ***Sell-Side or Buyside Wall Street Experience, Start Ups, Entrepreneur or Low Market Cap Tech or Medical Technology Companies as most Venture Capital is established in Technology.***

2) Appetite for Risk. From the above you can discern quickly that if you're trying to break into VC with no experience the best three alternatives will be Start Ups, Entrepreneur or risky technology company. Why? This is the best story to pitch for your initial break in if you're unable to land interviews with Wall Street.

3) Innovation. Working on the Street hurts you in this category. Venture Capital has more to do with passion and innovation rather than numbers as the majority of the companies you invest in report low to negative earnings. Instead VC's want to spot candidates with an ability to sniff out guys who are Entrepreneur's for "the money" versus for "passion", if they can't sell you their own product they are likely in it for cash which has a higher failure rate. Fixing a business ***financially*** to become profitable at a large scale is done by private equity firms.

4) Salesmanship. If you can sell someone on an idea get ready to break into Venture Capital as well. An interesting high risk alternative way into VC is to be in charge of bringing in clients to a high end Mutual Fund. If you can convince high net worth clients to put their money into your account you should be a fairly good candidate for finding significant equity investments as well.

5) Sector Knowledge. If you can carve out a niche, similar to our advice on investing you can begin targeting specific Venture Capital firms. An interesting angle could be Clean Tech/Solar work as many government programs actually invest in these firms to give them additional capital. Similarly, as stated previously most VC work is done in technology so you'd want to stay on top of that specific sector be it hardware/software/networking/semiconductors etc.

Conclusion: This is a relatively simple post however one thing should stand out dramatically after reading this. ***There are roughly five jobs to enter Venture Capital, Sell-side, Buyside, Start-ups, Entrepreneur or Knowledgeable Technology Hire***. If you are not in one of these fields it is best to make a two-hop jump into Venture Capital. Move from your current position to one of the five above. If you're extremely ambitious and want to do the full on business jump we suggest you check this out.

****

Building a Recession Proof Life: Ten Steps

Building a Recession Proof Life: Ten Steps

The photo is of Socrates *"If you want to be wrong, follow the masses"*. With consumer confidence at an all time high and the "Trump Economy" in full effect with tax breaks, it appears that everyone is ready for another bull run. In this case, it is much more likely that we see a recession. Why? Well consumer confidence is much more tied to recessions. If everyone is up beat the party is usually set to end. So we're going to to outline our basic items to help make your life more recession proof.

#1 Cut Recurring Costs: This is probably the biggest one. If you can take your recurring costs which are the largest drains on your bank account you'll be a lot better off long-term. One of the most obvious items is housing. When people try to buy homes they typically get the "biggest they can afford". Naturally, this leads to serious issues. Instead, we would recommend buying the smallest property that fits your needs (unless you're rich then you can always do whatever you like). A good example is doing the rent vs. own calculation. As soon as you can reduce your monthly expenses by purchasing you should jump at the opportunity. *Housing and Taxes are typically the biggest drains on your monthly cash flow.* A recession proof life has minimal monthly cash outlays to housing and taxes simply cannot be avoided. So take a strong look at this line item first and see if you can keep it as a low percentage of monthly income. Somewhere around 10% of income should be spent on total housing costs.

The second group of recurring costs are all of the membership items you have. The good news is that all of these items can be switched off if things get ugly. Your high-end gym can be downgraded (hurting your social life) but the payments stop immediately along with any other memberships you have from a country club to as cheap as a Netflix or cable subscription. Keeping all of these items as low as possible in the first place is a good start. Remember, if it gets ugly over the next couple of years you can immediately delete the recurring cost.

#2 Have a Bigger Cash Balance: If consumer confidence is sky high, this is probably the best time to start building up a basic cash balance. It should go up in a big way if consumer confidence is high because it is a reverse indicator. Feel free to click here and look at the max chart for this dynamic. It doesn't help that interest rates are going up as well! The good news is that if you build up that cash balance the returns on your boring old safety net will no longer read "1%".

More important than the actual cash balance is the ability to remain above water. *This means you're not dipping into investments.* You never want to be forced to sell anything. This is an important component since we're not saying to "never sell". Everyone is free to have their own strategy. The one item we are saying is that being ***forced*** to sell is an all but guaranteed disaster. Take a hard look at all of your cash balances and decide if it is going to be enough to sustain a 50% drop in all of your investments. This does not just mean a 50% drop in stocks, bonds, crypto and real estate, it means a 50% drop in all of your passive income as well. When tough times come in a 50% drop is possible and when that occurs cash flows can also decrease by 50%.

#3 Create a Recession Proof Income: Recession proof income requires doing something that is needed when people have no money. In an absolute worst case scenario, you'll want to find a way to be cash flow positive assuming your income streams dry up. This is exactly why most millionaires have 5+ streams of income. Recession proof income includes: 1) staple goods, 2) alcohol and other depressives and 3) time for money exchanges. Ironically, if absolutely everything is going wrong you should have at least one skill where you can exchange your time for money. Notice, this is dead last for all of the ideas but many people are not financially independent. If someone falls into this category we would suggest that they look at their skills and make sure they have a time for money exchange lined up for the next downturn.

#4 No Debt: Many people go and get MBAs and other degrees when the job market is dried up. We wouldn't do this. Going into debt and praying things are better in two years is simply a gamble. Debt in general isn't good unless it is making you money (mortgages and leverage as explained in triangle investing). It is better to find a way to live off the bare minimum than go into debt since you'll be chasing interest payments for items you consumed in the past. Any sort of debt entering a high consumer confidence time frame isn't good. Clear it all out and give yourself more buffer in case things get ugly. Mathematically, this means the interest payments you're making should be 50% the amount the asset produces. So if you have a monthly payment of $500 the asset should be generating $1,000 a month (you can weather a 50% cut to the income line and still not worry about missing payments).

#5 Cash Flow Out Three Years: Here is a good back of the envelope calculation. Take your bare bones living expenses and add 25% to them. Your bare bones living expenses do not include partying and fun, it is simply waking up eating, sleeping, going to a cheap gym and basic internet/cell phone use. Add 25% to this and that is your monthly number. Once you have this monthly number figure out if you can live for three years straight.

While obvious, we mean three years straight assuming your income get cut in by 50%. To avoid any confusion here is a basic example: Say your barebones need is $4K. This would then mean $5K per month. If you can get through $180K worth of expenses without selling anything you are set. If this person makes $7K per month, it means he has a $1.5K/month hole to fill for three years. $54K in cash + an assumed 50% drop in income… Would just be enough. Unsurprisingly, most people do not save any where near 50% of their income so this math hurts quite a bit. It also assumes we're entering into a pro-longed bear market of three years (most downturns only last 1-2 years).

#6 Do a Dry Run: If the above 5 items already have you thinking, we suggest doing a dry run. Since nothing has changed, you can simply do a dry run by taking all your expenses to a minimum. Use a spending tracker like **Personal** Capital and see what your monthly spend looks like in a downside case. We would do this in a very structured way. At the end of the month (say February 28), pay off all of your credit cards and every single payment you have. Everything should read as a "$0" when you click start.

Starting March 1 for example, you then test run your basic living expenses. It's a fun game to play once every few years (particularly when consumer confidence is high) so you can see what it would be like to decrease your living standard to the bare minimum. After this dry run you'll have the exact number from bullet #2. To be extra conservative you can assume you do not drop any monthly memberships so it reflects the bare minimum number for your current life.

#7 Have an Emergency "Out": Always have a Plan "B". This means a way to absolutely eradicate all costs from your life. If you've travelled for an extended period of time since you earn your money online, there are at least a few places where you enjoy living. This is typically cheaper! Surprise, surprise as to why your status is higher. Now that you've got this place in mind, see how much money you'd need to live in this location. Our guess is that the number will come in 50-60% below your current living expenses. This is the "world is ending" location that you can retreat to. In these situations, a good move is to have a way to bring cash into the country (or have it there ready for the exit).

The probability of pulling this off (or needing to pull it off) is probably under 0.00001% for most readers of this blog. But. It sure is fun to have in the back of your mind. There is a lot of truth in saying "screw it and moving to Thailand". While said as a joke, if you're single, this is definitely something you can do in an absolute worst case scenario. In this environment, you're assuming that your income will no longer be higher by living in the United States and all your income will be earned online. We all know you won't be working a "real" job or career out in a completely different developing country.

#8 Adjust Your Living Structure: If you do all of the steps above and realize the math isn't looking to good, decide if there is any way to adjust your portfolio, pay off an asset or simply live cheaply for a few months. When things are going right, the cash flow does not seem to matter and you're looking at a graph that is up and to the right so all of the small expenses just seem to flow out. Assuming you're close and can survive two years based on all of the above, go ahead and get that to three given current sentiments. When everyone is saying things are good, that's not a good sign since you should do the opposite.

The first step is to look at all your investments: 1) which ones are well into the green? If it's well in to the green by a large margin, consider trimming this slightly to get your number to three years, 2) if you don't want to touch this, calculate how many months you would have to live with bare bones minimum expenses to get there (ideally no more than 6 months) and do that and 3) if both of these options are unappealing, we'd look for a new stream of income to begin making up the hole between the two year and three year gap. There is just no reason at all to gather millions of dollars only to be forced to sell it at a low point because the cash balance wasn't quite high enough. It's a perfectly avoidable scenario and we'd adjust now when confidence is high versus later when confidence is low.

#9 Invest More in Recession Proof Stocks: This helps you offset the portfolio declines. If you don't have a consumer staples income stream… just buy those stocks during high consumer confidence scenarios. They would include things like McDonalds, Walmart, AT&T and Procter and Gamble… For those that bought Triangle Investing, now you know why we own them in our active portfolio! For this exact reason. These stocks are so boring and standard that they typically pay out increasing dividends in a down turn. Everyone needs to use the internet and have phone service. Everyone eats cheap food. And. Everyone needs basic health care products like toothpaste. No it isn't exciting. No it won't impress anyone at a bar or night club. But. Yes it will save your cash flow in a downdraft.

#10 Avoid Junk Bonds: While they are fantastic during bull runs (last 8 years or so), they have high default rates during downturns. Over the past 8 years many high yield bonds of 7-10% actually performed perfectly fine. Capital was easy to raise and we saw minimal down drafts in the economy since 2010. The reverse is true going forward. The default probability naturally goes up when cash is sparse. Assume that the returns will be negative and avoid all high yield bonds over the next few years.

Bonus – Have a Tough Conversation Before it is Too Late: If you have a significant other, it is best to have an honest conversation about your current spending patterns. This front runs the down-side and helps you combat the future. We are guessing 90% of our readers (including us) are not in this situation. That said, we do have some readers with signficant others, spouses etc. We'd go through this conversation now before it has to be done in a hectic time frame. Do the math. If you're fine, great. If you're off by a few months… fix the issue now so when the weather turns sour you'll be ready!

To wrap all this up. The only reason we are writing this now is because of the current comments about the economy and overall bullish tone. We could see another 5 years of upside (90% of years are up anyway) so who knows. That said, when people are bullish, bad and aggressive decisions are made (yes, sadly many people bought crypto currencies on credit cards in December/January). We'd stay the course and make sure all financial numbers are in order. If so, no need to worry and enjoy the week!

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by **Clicking Here.**

****

Building Unbreakable Confidence

You look around at your peers and they are all taking the wrong drugs getting no where in life.

You're only seventeen.

"I'm going to fix my life." You mean it.

You tell your friends "I'm going to gain 10 pounds of raw muscle this year and lose my belly". "Hahaha!" your friendzszs say.

Its been a year.

You look in the mirror, you benched 175 this year, you got down to 10% body fat, you walk on the beach one day in the summer and you notice that even these older broads are checking you out. ***You got a little bit more confidence. What else can I do?***

It's results day for college admissions. You didn't get into that Ivy your mom told you to get into. You didn't even get into a target school. Your friends come back and tell you it's not possible to get into Investment Banking now, you're not smart enough.

You're stressed, but you believe in yourself. You lost all that muscle you built up because you're working three finance jobs in college to make sure you can have a chance when you start cold calling those banks in 3 years. You're getting no where. No one wants you in their office. You keep on grinding it out.

You get one hit from a boutique bank for an internship. You get the job. Maybe improvement isn't linear. Maybe you're friends were wrong. Maybe you can hack it.

You work 100 hour weeks. You thought 100 hours a week was easy, its not. That's what you've been told to believe. You get the offer. You realize a lot of what you knew about finance was a myth. You saw a double jump in confidence and now you think you can hit those weights again because you earned a stripe in the war of life. ***You got a little bit more confidence. What else can I do?***

You land a more prestigious job at a higher ranked bank in M&A because of your work experience. Everyone around you has that ivy league education. You're dirt to them. You don't care. The market is firing, deals are going and you're the only one working 100+ hours a week and hasn't complained once. Time passes. They tell you, "we think you're going to be an associate you don't need that MBA". ***You got a little bit more confidence. What else can I do?***

Your ego is getting a little too big. You've got a couple girlfriends who know you can't commit. But you have that confidence still. You even kept the majority of that muscle.

You get into a fight at a club, you slipped up. Your arm is broken. You're struggling at work but its fine. Seven months elapse, a large recession. You're laid off. No one wants that young associate. Your girlfriends leave you in a blink.

You look at your life, all those hours are now worthless… so you think. No one is hiring. You're broken down. You remember how you got that first job and think to yourself. ***I've been here before. I've seen this before.***

You pound the phones, your ex-employer still loves you, eventually you get one interview. You nail it. It's at a less prestigious firm but at least you're still an associate. Time to get back to work.

Time elapses you've survived. They offer you a promotion. You accept. You recovered. ***You got a little bit more confidence. What else can I do?***

Some time goes by. You've been doing better and better. Your body is returning to normal because you know only losers quit. You're back to that weight room. You're at a new high, you don't even tell girls what you do for a living because you learned your lesson last time.

You decide to take a ski trip. When you're coming down that hill you realize you took that speed up too high, you break your leg. You're in the hospital again. ***I've been here before. I've seen this before.***

You get through those airport security lines. You're weaker than ever. Your superior lets you know "you know maybe we'll promote you soon". You can't tell if he's a lying stealing cheating banker. But you do know one thing. ***You got a little bit more confidence. What else can I do?***

You're getting read to sleep for more than 8 hours for the first time in years. As you're drifting off to sleep you realize every time you recover you become a better man. ***I've been here before. I've seen this before.***

Your last thought.

I hope I get fired. You pass out.

Buying Time from Low-Income All The Way Up to High Income

Buying Time from Low-Income All The Way Up to High Income

We've talked a lot about "trading time for money" and how this is a poor way to get rich. Without being paid on performance metrics at minimum… the path to getting rich is significantly more difficult. The opposite is also true. If you can spend money to buy time it can accelerate your earnings. The catch of course is finding a way to monetize the free time. Below we'll provide a brand overview of buying time.

Type of Time to Buy

Functional Time: This is the most valuable form of time. Lets assume the human body needs ~8 hours a day to sleep this leads to approximately 16 hours of "functional time". We'll go ahead and cut out an hour as well (waking up process, going to sleep process etc.). You're left with just 15 hours per day to dedicate towards 1) earning money, 2) exercise/health, 3) having a fun social life and 4) hobbies. From those categories alone we can see that purchasing time needs to unlock items one and two (money and health). If you're paying to unlock more social life activities or hobbies, you're likely in the 8 figure range of net worth. Since 99%+ of the population does not have access to 8 figures, we'll focus on the first two items.

#1 Commuting (Basic Level): We've never understood why people own cars if their income is currently sitting at $50,000 a year. Lets say some bad decisions were made and you're making the average/median income of $50,000… In this case, killing your transportation time is the best "bang for your buck". You'll decrease your annual expenses and *increase* your income if you're interested in getting rich. By using public transportation you'd be better off over the long-term and would be "motivated" by being in that environment in the first place. Run the quick math.

If you're generating $50,000 a year that is roughly equal to $25 an hour (assumes 2,000 work year). Taking that and applying it to the cost of "car ownership" you'll get to a number that represents around 10% of your annual *net income*. Seems like a stretch? Not quite. Even if you drive ~1,000 miles a month that would equate to $1,200 in gas (at 30mph and $3 a gallon) in addition we have to factor in depreciation, insurance and of course the up-front cost of the car multiplied by an annual return. To keep it conservative lets say the total cost is $3,000/year… That would be 6% of your gross income. But. *Your payments are after tax so we're looking at 8-10% of after tax income.*

While people will attempt to rationalize this amount of spending, we'd also factor in the time lost. A net loss means that it is quite difficult to do anything productive. Difficult to read, difficult to write and difficult to focus since you're putting your life at risk along with others every single time you try to take your eyes off the road. Think of driving a car as "sunk time". Sunk time is the definition of inefficiency as you're unable to accomplish anything. Even if you try and listen to audio books you're better off being on public transit reading since you'll consume more information (besides if you're not where you want to be taking public transit is perfectly fine). In a rare case we agree with frugality websites here because there really is nothing gained by driving yourself since that time can be used to: 1) respond to emails or 2) read. As a final note, there is nothing wrong with having a car and we're not advocating public transportation for people making large amounts of money. We're saying that it's the best bang for your buck and reducing "time lost" is what you'll need to do if you're starting from ground zero. Every hour you have needs to be spent wisely since you're trying to play catch up/get ahead.

#2 Paying for Organization (Middle to High-end): With the biggest time suck out of the way (commuting) you can then look to organizational tasks that are eating up your time. Organizational items include: 1) cleaning, 2) laundry, 3) cooking and 4) booking. We've placed the items in that order because it is likely going to give you the highest return on your time. Most people focus on laundry services first but you're more likely to benefit from a maid service on a bi-weekly or monthly basis when compared to standard clothing.

Cleaning services will cost at maximum ~$200 a month (we're sure there are higher numbers, however, a smart person can spend around $200 and be perfectly fine on a monthly basis). This would represent around eight hours of wages at a $50K income level. Or it would represent two hours at a $200K income level. Somewhere around $150K it becomes logical to outsource your cleaning as you'll likely free up more than three hours of time with a cleaning service. The key is that *you'll need to spend this free time earning money.* Do some quick math the next time you're in your home/apartment and see how much actual time you spend keeping the place organized, you'll be surprised to find that its well north of 3 hours.

Laundry services are next in line. Typically, your white collar professional tries to outsource this item first… even though he's better off hiring a cleaning service. If you're running your clothes through the wash you can use the spare time to work on anything you like. You're not losing much time clicking "on" for a washer/dryer since you're going to be in your home in the first place. The reverse situation is true for cleaning services since you're physically losing time organizing your place. Once you're in the ~$250-300K bracket, you'll want to free up the two hours or so per month you're *spending* on organizing clothing. In this range you're better off making a few phone calls, editing your website, writing code (insert any activity that makes YOU money). The amount of time spent can be freed up for a similar cost.

Cooking services are the third item to look at. This is when you're getting to more extreme levels of income. It doesn't take much time to order food or to drop by your favorite places to get food. You'll go down the cooking service line of thinking when you're no longer interested in tracking your own diet. We've got mixed views here since tracking and monitoring food can be rewarding as you figure out what types of vegetables, fruits etc. lead to positive reactions in your body (the basics are covered in Efficiency). Once you feel comfortable with your general diet needs and see no reason to *tweak* your diet in the future you can go down this route. As you can tell by our writing here, we're still on the fence since we're constantly changing our diets to see if our bodies respond positively (as a final note, yes your taste buds do change as you age).

Booking services are last. This is when you have your own assistant for all of your scheduling/time management. This is standard in a corporate environment where an assistant takes care of your expenses, travel booking and is “first line of defense” to avoid spam phone calls. Generally, it takes quite a lot of really justify this level of time saving when you’re running your own empire. We’re nowhere near that level of need given that most items can be added to a calendar in a few clicks but if you get to that level congratulations on making it to a high 8 figure or 9 figure net worth!

#3 Paying to Earn Money (Every Single Level): It sounds contradictory since most people look at earning income on an “hourly wage basis”. In this environment, paying for services to unlock more money does not seem plausible. This is also why frugality blogs focus intensely on using all of their effort to cut costs (after all their earnings are capped at time-dependent intervals!). Lets look at the biggest purchases that can earn you more money: 1) customers, 2) sales, 3) design/image and 4) “R&D”.

Customers are the hardest to convert and the most profitable to go after. If your company generates a 50% profit margin, you can spend quite a lot of money on traffic/advertising. Assuming you’re generating $100K a year in operating income (example) you can spend the entire $100K assuming that you’ll generate $201K in sales (you’d make $100.5K in operating income instead). This is why investors focus so much on the “addressable market” and the “audience”. It is because the niche you’re targeting is going to determine how many buyers there are to begin with. Once you can focus in on that group and target them directly, it’s simply about getting them to click “buy”.

Sales representatives would come next. It should come as no surprise that the second thing you’ll look for (after the customers of course) is a solid sales effort (assuming your product is done). Look no further than standard affiliate marketing or the SG&A line item for every single company in existence! If you have a solid set of customers you may need some soft touch relationships to keep it going (recurring revenue). In addition, those same sales representatives can help you convert the “no’s” to “Yes’s” during their down time. Similarly, you’re looking for the same dynamic where your total amount spent needs to generate a higher operating profit number when compared to your “stand-alone” set up.

Design and image is significantly more difficult to quantify. Here you’re making slow and modest adjustments to how you’re perceived which can help you change your target market. Look no further than your typical musician/actor. We’ve all seen the same story over and over again. When they’re young their personalities are targeted towards people in the 13-17 age group and as they get older they are told to “evolve” and end up becoming more and more “edgy” with tattoos or small misdemeanors and other click bait gossip type activities. Some go entirely off the deep end and suffer from serious issues, however, the transition was expected to happen. Difficult to profit as a musician at age 40 targeting teeny-boppers. While this is an extreme example, you can take the same concept and apply it to any Company. Are they targeting the high-end or low-end? What age group? What other products could fall under the same umbrella? All of this is taken into account as companies grow. For more specific examples, look at high-end retail and see how many companies are forced to take “branding set backs” and target slightly lower price points to expand their market while maintaining the perception of being exclusive/luxury (Coach, YSL and even Tesla are examples).

Research and Development is last only because we know absolutely nothing about making a technology product. R&D is supposed to 1) keep your product ahead of your peers and 2) help expand your company into new categories without changing the Company perception in a negative way. If you’re selling white label consumer based products there are clearer directions: 1) perfumes could expand to mens colognes, 2) suits could expand to casual wear, 3) Books periodically become movies, so on and so forth. Unless you’re trying to make millions upon millions of dollars you’ll unlike need more than a couple of good ideas with solid marketing making this last on the list for yet another reason.

#4 Travel: We touched on this topic in our post on “End of the Road“. We’ll add it here although it will likely be obvious for everyone (including mid-career people). When you’re done, the biggest headache is saving time. You don’t want to burn any unnecessary time so here is what you end up doing: 1) living right next to where you typically go out, 2) you know your city extremely well and yes you might even take the train! Why? Well who wants to sit in rush hour traffic if you know the train is faster… You’ll remain rational, 3) you’ll hate indirect flights and will happily fly economy if this means ***avoiding*** the standard 1 hour layover in city you have no interest in and 4) you will pay up for expensive travel if there is no other option (extremely rare) and 5) if you do end up becoming ultra-rich you’ll pick up net jets accounts or own one. We’ll wager the vast majority of people can make it to the third bullet (where flying business class is normalized behavior) however reaching level four and five takes a lot of good luck and effort.

On a final note… if you’re interested in learning more about making money, staying in shape and doing so without choking off your personality… You’ll probably like our upcoming book **Efficiency (Expected Release Mid-July)**. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career **and** the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (*the basics and all you need to start*); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). **Efficiency will be available in July**, subscribe to receive discounts or follow us on Twitter for the launch. Remember we can give the tools, but no one can execute on the plan but you.

****

Cash

Cash

Here is an overview on how you should think about cold hard cash.

Cash Buys Time: Simply put, you can use cash to buy yourself time. It can be as simple as a convenient store and parking to as impactful as elongating your life. If you meet anyone who disagrees that cash does not buy time, you can be certain they have never seen a loved one die in a hospital due to lack of top tier medical treatment. No matter what, we will use time to acquire cash of course, but do not forget that the reverse is also true. Hence the phrase “Time is Money”.

Hint for younger guys, if you waste someone’s time they are not going to like you. This will happen faster than you think in a good way or… in a bad way.

Cash is Not an Investment: We have said this many many times, cash in a bank account is deflating in value by ~3% per year. Regardless of what the CPI is saying, your opportunity cost is simply CD’s and 10-year bonds. So in reality? It’s probably closer to a 3-5% net loss per annum. If you believe cash is an investment don’t listen to us… Listen to Warren Buffet.

Cash Flow is King: From the video clip above you can tell there is a clear and implied message. **Cash flow is king not cash.** As a simple example, if someone tells you they have a net worth of $1M and make $2,500 per month from their profession are you impressed? No. Now if someone says they have monthly cash flow of $50K and a net worth of $500K… You're going to choose to be person number two. Why? It means you can continuously reinvest into other opportunities.

Take this to a personal finance perspective and apply it to your own life. Before you buy/invest in anything you should have a clear idea of how exactly you're going to turn the position into a cash flow positive event.

Cash is Ammunition: Hate to refer to the video again, but if you listen carefully he says "we will always have cash around but anytime we have **surplus** cash around I am **unhappy"**. Therefore, the second implied message is to create a minimum cash balance and find a way to invest the rest.

Lets take this to a personal finance level again. If you have money sitting around for longer than a year then this money absolutely needs to be opportunity money. You're losing 3-5% per year so you better have a rolodex of possible ideas coming your way.

Cash Makes Friends: Most people believe having cash makes you have the "wrong friends" and that you'll find out who your *real friends* are. In reality, the first idea is completely and utterly false and the second idea is absolutely true. When you finally make it in life, the people who clap and congratulate you are going to be your friends for life. The ones that beg you to help them and the ones that say you don't deserve it or become jealous… Go ahead and cut them off. Their loss anyway.

You will be surprised at how the cards play out. Don't worry about the one time drop in friends, you'll end up making many more friends because successful people all share a similar mindset.

Cash Makes You a Lot Happier: We have said this a million times, but it will be a short bullet here. Anyone who says it doesn't matter is either excruciatingly rich (0.001%) or broke. Play the odds and you know you're likely listening to a broke person when they say money doesn't matter. The fact is, real cash allows you to do anything you like. Re-reading point 3, ***you are only well off if you can survive off of cash flow from investments and maintain a happy lifestyle.***

This makes it incredibly obvious as to why it makes you happier. **You don't have to do anything you don't want to do.** So when you hear that all rich people are fat and unhappy, you can just go back to the classic move… Smile, nod, agree and ignore their future requests to meet.

Cash is Not a Cure: It takes many years to realize this, but one single thing will never fix your life. Even though it solves hundreds of issues for you, there is literally not *one* thing that will make you entirely happy and cure all of your problems. In general, happy people have the following qualities: healthy, positive social life, positive sex life, work they enjoy and no financial issues. In short cash is not a cure but it knocks out two important ones, health and financial issues.

If you can read between the lines here, the one thing that comes close to being the cure for happiness (if you're depressed)? Yep you guessed it, **Game.**

Cash Creates Baseline Trust: If you had to ask someone to watch your bags at the airport, would you choose the unshaven backpacker or the man in a high-end business suit responding to emails on his phone? Naturally you choose the person in the suit. The reason why cash creates trust is related to point 6, if someone has money they have no interest in taking anything from you because they don't need to. Go find a wealthy neighborhood… then go find a poor neighborhood… then ask yourself… Do I trust the people that surround me?

For the astute reader, you're going to realize you feel slightly uncomfortable asking the man in the suit to watch your bags compared to the questionable unshaven young man. Why? You realize his time is valuable.

Cash Makes You Mean: It took several years of work experience to understand the phrase *"the truth hurts"*. What does this phrase mean? It means if you are direct or blunt with people they will be offended because most people want to hear fairy tale pick me up stories instead of the truth. When you become successful you'll find they have one dangerous quality. If they like you, they will tell you how it is for better or worse.

So before you become upset when you dislike the advice given by a wealthy person… ask yourself… **Did he/she tell me the truth?** The real world is much much tougher than a few words of advice from a stranger.

Cash Makes You More Attractive: You can interpret this in many ways and in practically every way you're going to be correct. Unless you have honestly lost your mind, you're going to choose to hang out with a wealthy individual when compared to a broke individual. All else equal.

—–

Summary Remarks: Hopefully you now know everything you need to know about cash. 1) it doesn't buy happiness, but it helps a tremendous amount, 2) it is not an investment, 3) money buys time, 4) cash gives you a level of trust and 5) cash allows you to decipher your social circle.

Now instead of hating it, lets find a way to get more of it to hand to people we like.

****

Choosing Friends

This post is going to offend some people. It is broken into two parts, most will eventually pass through part one however part two is the next step.

The Basics

Most guys, girls included, have many "friendszszs". These people are holding you back. They are dragging you down. You're being suffocated as you stand in your comfort zone unable to venture out alone. Each day you're dying because stagnation is death. Your friends are your worst enemies. It is never what we don't know that gets us in trouble it is always what we believe to be true that isn't so. So ask yourself. ***Are your friends worth your time?***

For most people, the answer to the question above is no. Your friends are creating a negative feed back loop in your mind when it should be a positive feed back loop. If you're on the fence here's a cut and dry guide to sifting through your 500K friends.

1. Does this person encourage you to "just be yourself"? **Yes? Next.**

2. Does this person have a flash of happiness when you tell him bad news about your work or personal life? **Yes? Next.**

3. Does this person laugh at you if you get shut down at a bar or club? **Yes? Next.**

4. Does this person have a negative or "realistic" mindset? **Yes? Next.**

5. Does this person have a dwindling bank account with no actionable steps to improve his life? **Yes? Next.**

In this day and age the word friendship is dead, we are busy trying to "get ours" with no effort. Instead replace friendship with the word ***reciprocity.*** A reciprocal relationship is beneficial to both parties. If your best friend is dragging you away from events you wish to attend and is willing to battle with you for an obscure girl at a club, be certain he won't be there for you when you need a place to crash.

Advancement in Seven Steps

Assuming you've built up a solid social circle and none of your friends is an outright loser, it's time to step up to the next level. Building upon some of these key elements will take years to achieve.

Faith: This comes at an odd time after the recent bombings in Boston, however a key element to giving yourself unbreakable confidence is faith. While you may or may not be religious yourself, befriending a man/woman that has the exact opposite religious beliefs could do wonders for both you and your new friend. It is much easier to maintain a healthy relationship when the only activities consist of hanging out in bars and playing sports. A relationship with direct opposing views causes both parties to see the other side of the coin without lashing out in anger. You learn nothing from a man who simply nods in agreement with every spoken word.

Ethnicity: Unless you are in an odd city with no diversity, befriending a set of people from various backgrounds will open your mind to new ways of thinking. For better or worse, each ethnicity has a different stereotype associated with it and carrying these stigmas in your mind will cause prejudice. Befriend a man or woman from as many countries, origins and backgrounds as possible. If you do not, don't be surprised if you awaken one day and realize you are suffering from group think. We could have chosen "international relations" but ethnicity sounds much more catchy.

Willpower: Someone has had it harder than you. Someone has had it harder than us. Someone always overcame more. Consistently search for a man who has overcome more in his life than you have… and succeeded. This will make it incrementally more difficult to look in the mirror and say "I quit". If you have a cellphone in your hand with a direct line to a man who has suffered through more pain than you, how can you give up? You'll be motivated instantaneously.

Money: You must have a close friend who is wealthy. The wealthier the better. Osmosis will occur. More importantly, how does an average person obtain contact with a wealthy individual? You must add value to their life. This is how rich people think. Consistently search out a new mentor to get your money straight. The last thing you want to do is lay on a hospital bed with an expensive procedure on the docket to save your life… and you don't have the cash.

Hard Work: Similar to willpower, you must find a person who works harder than you do. It is much easier to simply state "I work hard". This is what lazy people do. They say they work hard but can't tell you what they did over the last 24 hours. You should have an hour by hour breakdown of what you did and why. This should be trumped by someone you deem as superior to you.

Positivity: The impossibly bubbly kind. Where no matter what happens in life the person will not be phased. Not the slightest. No sleep? No problem. Lost a job? Getting another one. Got burned by a girl? Out picking up girls that night. Family member dies? You never knew because it never came up. Broke a bone? Miraculously fast recovery.

Health: Always ahead of the curve. Knows the ins and outs of new healthcare technology. Always looking for more information and is in incredibly good health. No one steps in his way because he's a rock. No one questions his advice because he is living proof. Simply ahead of his time, which is something you can never get back.

With all of that said. How many of these seven traits do you possess? ***Or are you the friend that deserves to be cut off.***

****

Common Money Questions & Answers: Getting Rich, Investing, Saving and More

Common Money Questions & Answers: Getting Rich, Investing, Saving and More

We've taken the time to aggregate everything we've seen from the Q&A to go ahead and address common questions. While the Q&A will unlikely ever be opened to the public, the most common questions should be addressed here to 1) save time on redundant questions and 2) make things run more efficiently in the future. The most interesting thing we've noticed is the number of people who simply lack direction. This isn't really a big issue if you're under 24, but we're shocked at the number of people juggling 100 different ideas at the age of 30. It just doesn't make sense. So we'll jump in.

Deciding Between Careers: We're going to say this over and over again. Careers do not matter if you want to become exceedingly rich. Before we move on we will define these numbers and please take a look at our post on the Company man giving away his life.

As you can see in the post we linked to, you just won't make it to $10M working at a Company. Please do not use "that one guy" in banking, tech or sales as an example, he is generally the exception to the rule and was built for that specific position. If you want to be exceedingly rich defined at ~$10M (eight figures is rich by any standards) then you *must* start a company to maximize the chances of this happening. *This means most careers are not worth your time.* Careers are nothing but cash flow generating machines to fund your real idea. It is similar to a company with several declining business models, they leave them up since they generate cash to fund the growth side of the business.

With that out of the way remember that all your decisions need to answer that first fundamental question. If you're happy with ~$2-4M in net worth (age 35-45), you can focus more on your career and have a tiny side hobby. If you're not happy with this and want $10M+ (age 35-45) you *must* start a Company of some sort, you need ownership. This fixes all of the career questions at once. *If you want $10M we will always give you the same answer! Which is choose the Career with lower hours and ability to scale something else.* If you want to get to $4M or so, then choose the one with the fastest promotion/move up the ladder features. This is because your number is lower in the second option so you're going to be focusing a bit more time making sure you're at the "top bucket" in terms of performance.

Making the Decision ($2-4M): In this section we will address the $2-4M seekers. This is not us. That said we will address it anyway. If you're looking to get to this level your goal is to get promoted as fast as possible and start a basic side income of say $50K a year doing freelance consulting/basic real estate remodeling or something similar. Nothing crazy since an extra $50K a year is going to give you a massive boost to getting your net worth up. Why do we focus more on promotions? Well you need the cash flow as fast as possible. Investing say $100K at age 30 versus age 40 is a life changing difference. Even if it was only for one year, it would be worth around $400K by age 44 versus $400K at age 54. Not even in the same zip code from a Utility maximization framework.

This blog has been around for quite some time and we've already met several public figures who know our information is legitimate. That said, we still get the same "prestige" questions which are irrelevant. The only thing that is relevant in the prestige question is if you will be in a top performing group. We've noticed a massive sea change in compensation for "top groups" versus "bottom groups" but… at the end of the day you're still better off being a Vice President at a mid-tier firm than an career associate at a top-tier firm since you can't leverage your performance for bonuses that are multiples of your base salary. Long-story short, always remember to choose the one that gets you closer to the "final table". Wall Street is a massive poker tournament and the goal is to get to the last table even if you are short stack since you get cashed out in a big way even if you fail there.

Making the Decision ($10M+): You've decided that you want to be rich. Congrats welcome. It's brutal out here. Which means? You must choose the option that gives you the most free time to scale and grow your business. No juggling no nonsense like that. You will go full in on your idea. Most people who end up being ultra-rich don't even begin with large amounts of start-up capital so there are literally no excuses. In fact, we'd say the more money your idea costs to start the worse it is. Airlines are probably the best example since they needed government money and nowadays make their money off credit cards not flights. Pretty simple decision making there, go for it if you want to be rich. There is no other option which is a good thing.

Asset Allocation: There are really three factors for asset allocation. As usual this is not legal or financial advice and should serve as an opinion: 1) net worth targets , 2) amount of risk you're willing to take and 3) lock-up period.

When we look at these three, the most important one is probably your net worth targets. Surprisingly this is more relevant than risk since you're going to automatically make this adjustment based on what you want. If you're thrilled living off of $40K a year, and the current interest rate was 4-5%… You could probably just throw tons of money into CDs over and over and over again. You'd eventually hit your annual $40K a year of income target so there is no reason to take risk since it is unnecessary relative to your net worth target. Most financial advice says "take risk when young" which we do ascribe to. But. It's not one size fits all. If you don't need that much money to be thrilled with your life, then there is no reason to take on a ton of risk. You're just adding stress to your life.

Hopefully, you're looking aiming higher otherwise we don't know why you're on this blog. The problem with this is we'll never know what number you're shooting for so we can go ahead and work backward. If you're aiming for $10M+ the only *real* investment that matters is the money you spend on your business. This will never change. As long as you can get a high ROI by investing in new product SKUs, new buildings etc. You should do that. No questions. After that since you're looking to outpace inflation you should then look at our asset allocation in Triangle Investing.

Now we reach the lock-up period. As you get older you'll realize that cash flow matters way more than net worth for living standards. So you're going to have to create cash flow models for yourself. Stair step expiration of CDs, real estate payments, bonds, dividends etc. The basic outline is quite simple. Once you have hit your financial independence number (which is going to be below $10M), you make sure all your cash flows for the full year from investments only hit this number. Notice. We are not saying an exact number since we don't know what yours is. For fun, if it was $10K a month, this means your cash flow generating items should clip out $120K a year (no business income, no career income).

For those that are interested in what we're doing, we've officially gotten "old". So more and more money is going into cash. This is because we've already benefitted from a 12 year bull market, and while the market could continue to grow the next couple of years due to Trump and all the positive policies, the risk free rate is becoming more attractive. Our guess is that 2019/2020 we will be moving heavily into CDs especially if the risk free rate is near 4-5% where that equates to $80-100K on $2M dollars. Not a bad return for no risk! So there is no confusion, when we say "more into cash" it means 50% of all income not needed for anything is going into cash. The other 50% goes into the normal items, RE, stocks, bonds crypto.

Not Worth Investing: This isn't a complicated topic but for some reason it continues to pop up. Unless you have around $500K to $1 million or so (rough math no need to get fancy) investing essentially is worthless. It means you should be able to find *higher ROI investments with your own business.* Point blank and full stop, should be easy. That said, if you have *extra* cash and it would be sitting in a checking account instead, then yes just chunk it into stocks/bonds/RE etc. Not sure why this is difficult but it makes sense given the tilt of this blog. Unless someone has business income we will bet against them getting rich 99/100 times. Day in. Day out.

When to Go All In on Risk Free: This is a fun one that comes up. Since market returns are around 10% long-term and risk free rate today is around 3.0%, it says there is a 7 percent spread. Instead of doing the boring old, "it depends" answer we will give you the number we believe in. If your net worth is eight figures, we think 5% is the hurdle. You'd be making $500K a year risk free which is insanely attractive. If you're in the low millions, you probably need 7-8%. So those are the two bench marks for going "100%" in. If you are in the $7-8M range the percent is probably around 6%, so on and so forth. Our entire math assumes that $500K in income is more than enough. It's incredibly difficult to spend more than $30K a month ($360K) so we don't have any idea how people would spend more than that unless they have some serious addiction issues, materialism issues or otherwise.

Efficient Decision Tree: Our book is named efficiency since we believe that's essentially the key ingredient to life. You have to be efficient with your time. Looking at the paragraphs above, notice we force the reader to make a decision immediately. Do you want $10M? Do you want $2M? This is the question you have to answer. If you really want to become a billionaire or worth $100M, all of the stock market analysis stuff is essentially a joke, you won't get rich that way. Now if you want to get to $5M and don't mind working in a career for a large portion of your life, you're going to take a very different path of lower risk for the trade-off of lower reward ($5M isn't close to $100M). It's interesting since most people cannot make this conclusive decision. We're not sure why. But. It's a common problem. Make this decision first then you can easily decide between careers and business ideas. Without this decision you'll spin wheels in loose sand over and over again.

Saving Rates: One of the funniest things about frugality blogs is they don't talk about the downside of living off of $24K a year. You end up being forced to watch your budget and can't really splurge at all. We're not going to argue for a good amount (okay we think $10K a month is pretty good enough for the vast majority of people), but the lifestyle of $24K a year isn't going to be fun at all if you are in a fantastic city like New York, Miami or even Mexico City. If you really didn't need money you could have just become a monk and they live a similar lifestyle in monasteries!

The problem with savings and most "career decisions" is none of them are really meaningful. If you make an extra $20K a year, that is only $10-13K after tax and isn't going to change your life at all. Honestly it won't if you're gunning to be rich. Yet… the same questions continue to come up. People waste too much time and energy on things that don't really get them to the bigger goal/picture. The bigger goal/picture is 1) promotions in a career and 2) the biggest picture is ownership of a company even if it is small to start ($40-60K annual is at least something). At the end of the day these two points come up over and over and over again and people expect a different answer. *A different answer will not show up because smart answers rarely take more than a sentence to explain.* To conclude this paragraph, always remember, that there is a floor to savings since you must eat and live somewhere and there is no cap to earnings. You could earn $100K or $100M in a year, just need the scale.

In terms of scale, if you're trying to get to $5M net worth, you probably need to get to a point where you're saving around $200K a year (after taxes). It's definitely possible if you're putting that kind of cash away for more than 10 years or so. If you're looking at $10M+, it's all about the valuation of your company and how much you could sell it for (exit multiple). Funny how dramatic it is! To get really rich you need to own and sell. You can sell your company you cannot sell your job. Period.

The Funny Thing About Money: Before we wrap up this post we'd like to ask a basic question to anyone reading. *What is the point of the money?* We have no answer for you, our own view is to make sure any family member has premium healthcare, work alone with no boss and have freedom to do anything with our time. That's a good life. Now for the people saying the "must" have $100M our question is "why?". Some people really cannot answer this question. In fact, we get crazy answers like fame (which is terrible) and to buy exotic cars etc.

Take a pause there. Unless you really have a massive idea like starting a new spaceship related company, $100M and $10M is very similar in terms of an individual life standpoint. The return on money definitely declines. We're simply interested in seeing why someone would really need to get to this level. The good answers we have heard is 1) helping everyone not just their family have good jobs/lives – this is admirable and 2) a significant driving force to improve the world – in a serious way somewhat like Elon Musk. Other than that, it really is tough to justify tons and tons of money since money is just a tool. So. For those who weren't able to answer the original question of how much they need we suggest working backward. *"How little do you need to live the life you want?"* You can now answer the original question.

****

Common Questions and Arguments that Don't Make Sense

Common Questions and Arguments that Don't Make Sense

The title is as brutal as it gets. We're going to address several common questions/arguments that make no logical sense. While they do sound like legitimate questions/arguments, they haven't been deconstructed. This list will hopefully save a lot of time and outline ways to deconstruct other common complaints/questions in the future. Three categories: Money arguments, excuses related to trying and personal life excuses.

Money Arguments

"Not Willing to Sacrifice to Get Rich": We're not sure what these individuals intend to gain by making this statement but it is the most ridiculous of the group. If someone doesn't want to get rich because it takes too much sacrifice, then they wouldn't bother arguing their position. Why is that? Well if they truly didn't want to get rich and believed it took too much sacrifice they would be happy go lucky people living care-free lives on low income. This is essentially never the case. The ones that claim they have to sacrifice too much to get rich are 99.99% of the time unhappy bitter individuals.

If this isn't enough, just jump ahead. Who works harder? The guy who works for 40 hours a week for 40 years straight and retires at 60-61. **Or**. The guy who works for 60-70 hours a week for 10-years and no longer has to work again (unless he wants to). Mathematically, it isn't even close. Sure you can argue that millionaires continue to work pretty hard through at least age 50. But. If the goal was to sacrifice less, you'd be better off with option number two and calling it quits. Pretty contradicting isn't it? If someone really didn't want to sacrifice they would get rich to make sure they didn't have to sacrifice. Quite a conundrum.

To put the final nail in the coffin, the health argument comes up. And. The result is the same. Wealthy people live longer and are generally healthier. Now the one small part that is true? Your health will definitely take a ****temporary**** hit during the "pain period". This means you may gain weight, you might catch a few more colds than you would have liked etc. But. Again. If you look at the probabilities you're much more likely to be *less* healthy if you never get rich in the first place. Before we wrap up here. It is true that some guys try to get rich only to have something terrible happen, life ending disease or freak accident. The key part to remember? *The percentage is the same.* The random people who have sudden accidents and were on the path to get rich is equal to the percentage of deaths for people who live the 9-5 jive. There is no legitimate data that says "working 60-70 hours a week for 5-10 years leads to higher risk of death". We'd bet that working 9-5 jobs, drinking low quality alcohol and sitting on a couch is a bigger cause of death.

"Getting Rich Won't Make You Happy": We hear this a lot from two types of people. The ultra-rich which we define as $100M+ net worth on lowest valuations and the poor (must work to survive). Naturally we don't agree with this argument since we aren't ultra-rich! Life as a poor person is terrible while life as a rich person (but not ultra-rich) appears to be the sweet spot. Our best guess for why the ultra-rich don't believe money will make you happy? Personal life issues.

There are a few things that money won't buy and that list includes: strong personal relationships, a significant other who loves you, a cure for disease if it impacts you (your kids, spouse etc.) and additional time. It also doesn't protect you from one last critical item: responsibility. We think that last one is underestimated. If you're rich (you're going to own a small private company of some kind – at minimum) you're going to eventually hire people. As you hire people you're essentially putting *their* livelihoods in your own hands. This causes a lot of stress and pushes you away from what you wanted to do: live a care-free life.

So. While money definitely won't solve all of your problems, it sure cures a lot of them. Okay not a lot… 98% of them! Oddly enough one common item we've noticed from people who agree that money does make you happy? **They were born poor.** People who were born without money and obtain their first million or two rarely go belly up from what we've seen. It happens of course but the ones who always remember the beginning never take a risk that would cause them to lose it all. (if someone wins the lottery that's a different story since they didn't do anything to obtain the money).

Now we will concede with two final items. It is true that there is diminishing returns to money. If you have $10 million dollars and go to $15 million, your life really doesn't change much. For fun a quick way to think about the "slope" of the curve is as follows: 1) if you're in the hundreds of thousands of dollars, any time you double that is a big life change, 2) if you are in the 7 figure camp, the same formula applies, 3) when you reach eight figures you'd need to move at least 2.5x meaning $10M to $25M or so and 4) when you get to $100M+ not much else changes except ego. *As a clean disclaimer we already stated we're not at $100M+ and will unlikely ever get there, the bullet point was based on conversations not on experience*.

The final item: fame. If you become a public figure there is no turning back and it can be a severe negative to your life and lifestyle. Before you get on TV and try to become a "celebrity" make sure you understand the consequences: life time harassment for anyone you care about. People even send death threats to Weather Men and Weather Women. Seriously.

"**$5-10 Million Isn't Enough to Be Rich"** You definitely don't need to have any sort of "luck" to get modestly rich (call it $5-10 million). This frustrates a lot of people and some poorer people have the audacity to say "$10 million isn't even rich you're wasting my time!" We can't help but laugh. Unless the person is worth $100M+ he really doesn't have any say in the matter. And. If he was worth $100M+ he wouldn't leave this type of comment! (okay maybe 5-6 people in the entire world would take the time to leave such a comment… we'll go ahead and live with those odds… the ultra-rich wouldn't bother with negativity).

For fun we'll go ahead and prove out that $5-10 million is enough. If you can spend $20,000 a month into perpetuity it is incredibly difficult to feel poor unless you are a weak person. What do we mean by this? We mean that weak people will feel that $20,000 is not close to enough. Why are they weak? They have to live their lives according to the expectations of other people. If someone feels poor at this level they are likely being abused: giving money to people who don't deserve it or taking on too much responsibility which wasn't the point of getting rich in the first place. Cruel words. But. Try to find someone who doesn't fit that sentence who complains about their $20,000 in monthly spending ability.

Breakdown of Spend: Taxes on paid off property: $1,500-$2,500 a month. Living expense minimum $3,000. This leaves $15,000 of *discretionary spending*. Pretty crazy to think that anyone can argue it's not enough. If you were smart enough and strong enough to get to $5-10M you better have the strength to say no when "relative of so and so's brother" wants a loan. Oh and by the way? If you really need to spend more you can always keep your business open (we didn't even include working!). We almost stopped. This **also** doesn't include spending your principal! This spending assumes you never touch the principal. Forever.

Excuses and Laziness

"You Need to Get Lucky" We gave our opinion on luck in a prior post. While you *do* need to get lucky to become ultra-rich, you definitely don't need luck to get rich. It's just an excuse. In fact if you talk to these people they have the same common excuse: *"well it worked for him but that wouldn't work now"*. Which doesn't make sense. If we look at the past 40 years or so the average age of people getting rich appears to be going down. Meaning? The chances of becoming a billionaire at a young age is higher now than it was in the past. This is probably because technology accelerates the transference of value. If you have something good, you're rewarded in rapid fashion.

"I Don't Have Any Good Ideas": This is another common one where we laugh. All we would say is that's great because we would never loan money to someone with a good idea. In fact you have a better chance of getting rich if you don't have good ideas! Why? It means you're more interested in making money. Making money is more important than a good idea because it means you'll be focused on execution and not have emotional attachment to your "special" idea. We forget the specific saying but it goes something like this *"never loan money to the guy with passion, loan money to the guy who is only doing it for the money"*. This is because the second person won't have emotional attachment and will do what it takes to gain market share, improve profit margins and get that cash.

The second issue with this question is that it overthinks the problem. A "good idea" is just something that will fit into a growing industry. That is all. If an industry is growing it means people *want* the product. In the 21st century do we really "need" anything anymore? The answer is no. If all innovation stopped today, we could all use the internet, eat food, sleep, travel etc. Our needs don't change. Instead, if an industry is growing it just means people *want* that product. *If they want it, you can make higher margins on it.* If you don't believe this then why do aspirational goods have high margins (luxury anything).

In both of our products: Efficiency and Triangle Investing we have given out exactly what industries are growing and what markets have high potential. Do you need to be passionate about any of this? Nope. Do you need to have an interest in any of this? Nope. You just need to make sure people want it. If you're looking for inspiration just go to any common tourist destination. Watch in awe as people pay 10x for some trinket that costs $1 to make. Go to a high end club and watch people buy a bottle of champagne that costs 1/20th the amount of money in a super market. So on and so forth. Find a growing item, create a slight spin that makes it seem cooler than the other widgets and get to selling.

"I Don't Have the Money": Another crazy one. Even the most notable recent billionaires like Zuckerberg or Musk didn't start with a ton of money. In fact the funding only comes in when you really deserve it. People don't like that sentence but it's true. When you start from zero and have something small working, eventually you will need to raise money. If you raise money with "just an idea" you've essentially wasted people's time. Using a common pop culture example, have you noticed that Shark Tank always has people who have a product and/or some sort of revenue. This is because ideas don't have any value at all. Unless your only idea is a new airline there are billions of other businesses that don't require a ton of start-up capital.

Oddly enough we've tried numerous websites and brands and the one that required the most "start-up" capital was the biggest failure of the group. Starting with more money didn't make a difference. At all. Having "start-up" money won't change what people want unless you're an influencer with hundreds of millions of followers (you can now cause something to be cool/popular).

"Don't Have any Experience": Awesome. If you know absolutely nothing about the industry you're probably at an advantage. Why? Well if you think you know something, then you're the most likely candidate to be disrupted. You'll miss a product gap. If you don't know anything but see a clear product gap that's fantastic. Sure beats being the guy who has been in the industry for 30 years but hasn't created a single new SKU in years. Kind of odd when we think about it like that isn't it?

One item of warning. We're talking specifically about experience here. We're not talking about energy. Time is a cruel beast. Eventually your stamina comes down and this can dampen your chances at starting something new. Also. If you don't have any unique knowledge and are older, the game is probably over in terms of getting really rich. As a positive side note, we've stated before that anyone can make $250,000/year at any age. No exceptions.

Personal Life Excuses

"My Life Won't Change If I Was Rich" If that is the case we're going to say the person is a terrible human being. Feel free to troll the comments with the blog being full of sociopaths. We don't care. What type of person wants to go through life knowing that he can't help anyone he cares about. If you want to have kids can you imagine saying "I can't pay for XYZ life-saving treatment". If you don't have kids can you imagine saying the same thing to your parents who spent 18 years raising you. We don't know how these people sleep at night. It's disgusting.

Also. If the person's life "wouldn't change" what exactly are they doing all day? If the average income is around $3,000-4,000 a month… what can you really do? Watch Netflix, eat, drink a few beers and save for a 1-2 week vacation every year? Not sure why that would be exciting in any part of the United States. Hell. Even the people who want to "save the world" by entering the Peace Corps or some other charity would be better off getting rich. They would be able to do more good for society in a position of financial strength when compared to simply donating their time.

"What About Boredom" Not sure how a boring person found this blog. But. Congrats! (sort of). The problem is we don't have much respect for boring people. At the end of the day, boredom is a choice since you only get one chance at life. If someone is bored it just means they don't have the resources to have fun (see the above on why we think people should get rich) or it means they are just boring people. If they are really boring people and enjoy watching Netflix all day, then why do they bother coming here to ask such an absurd question? It doesn't make any sense at all.

The second group we take more seriously: "I sold my company for $X and am bored out of my mind". This is a serious issue. There are many individuals who sell their company only to become bored. One of the most famous examples of a disastrous sale was the creator of Victoria Secret (he committed suicide after selling the Company). This type of boredom is serious since the dopamine level achieved when becoming rich is untouchable. Once you feel rich (whatever the number is for you) the next hundred thousand dollars or even a million dollars doesn't feel like anything compared to the original high. Many of these people suffer from serious psychological issues. The good news? We have one backward looking remedy. If you've found this blog and are looking to sell your Company we'd say the following: "only do it if you are 100% sure of what you will do next". If your plan is to travel the world and hook up for 1-2 years… don't sell that Company. Why? If your plan was to take a year off, then you should just take the year off and hire a manager. If you are 100% certain of what you will do next, then you can just travel for that year and start the project as soon as your hiatus is completed! See how that works? Works pretty well.

Putting these two concepts together we simply ignore 90%+ of bored people. They are just complaining about their lives. If the person made a mistake and sold his company with no idea on what to do next, our only remedy is to tell him to start something new. There is no other choice. Unless you're over the age of at least 45 or so, you need to do something.

"No Flash What's the Point?" This is another common complaint here which is odd. If you're rich you can buy whatever you want. Buy an island if you want. Buy a $1 million dollar super car. We don't care. Also. We're not sure why people care that we don't spend on those things!

The point of the extra money is to buy insane amounts of flexibility, time and experience. Maybe there are some rich people who prefer buying the Lamborghini instead of multiple luxury vacations (we choose the second). Maybe there are some rich people who choose the ultra-expensive custom suit instead of the maid + weekly massage + laundry services (we choose the second). As a third example, maybe there are some rich people who choose the high maintenance girlfriend while other choose the carefree single life with no limit to discretionary spending (we choose the second). These are not choices we can make for anyone. But. We talk in absolutes to emphasize that it will be difficult if not impossible to reverse our view. We've seen the ROI on a flashy car (yes it does attract women). But. Does it beat the ROI of first class flights, constant high end restaurants and the flexibility to turn off the spending if needed? We don't think so (we've also seen a lot of examples to prove this out).

The last item we'll sign off with on this topic is we're actually not against materialism at all (if you enjoy it). *We're against lower ROI materialism*. If we had $100M to our names, we'd probably spring for the super car as well. Under $100M? Definitely better leverage elsewhere. There is a strange line between being the rich boring frugal guy and the stretched out rich guy who could blow up quickly in the future. The above paragraph is a good one to copy for when you get your first couple million!

"It Is Not Prestigious To Start XXX" This is a rare one but always gives us a good laugh. 10 years ago going to work for Goldman Sachs or Morgan Stanley was "prestigious". Fast forward to today and it's already a tier 2 choice and the "cool" spots are now Facebook and Google for example (especially sexy is "product managers"). Fast forward another 10 years and it'll probably change again. So the cycle goes.

While it is critical to create an image for something you start, it definitely doesn't need to be prestigious. Prestige is typically a topic that is a focal point for insecure people with low risk tolerance. If we had to choose between owning a $1M a year income pre-packaged wet napkin company or make the same at some prestigious firm… We'd choose option number 1. Every. Single. Time.

Also. We would choose the $1M a year wet napkin company over the $1M a year jewelry company. What! Why? Well, the first option is more stable and the second one has significant risk tied to the volatility of a more "prestigious" industry. In fact if you start a business that is not sexy but then *becomes* sexy, we'd know what to do. Sell it… Massive premium time (that is serious good luck).

"It's Lonely at the Top" Maybe we haven't made it high enough on the pyramid but this hasn't been true in our experience. What is true is that the regular people you passed up will say you're a lonely grumpy guy behind your back. Perhaps that is why people say it is "lonely at the top"? Who knows.

The basic take on this topic is two fold: 1) recognize that very few people will understand how you think. This makes sense because most people never get rich and never succeed. So your expectations should be lower anyway. 2) the second item is that lonely people are usually boring to be around (see our take on boredom). One of the primary reasons we choose to spend heavily on services and experiences is because of the atmosphere it creates. If you drive around in a sports car you get one person with you at maximum. If you rent a large home for a weekend, you can bring a lot more people. Either way, we think this loneliness problem is some combination of those two items. Haven't struggled with it so we always answer with the same: find a way to focus more on actual experiences.

"Everybody Says XX" As a finale… this is the most infuriating blanket excuse. If everyone believes something then it's not useful information. This is probably the most common error made by people. If everyone believes something to be true, then either 1) there is a massive opportunity or 2) it should be ignored because it has no real value. As an example, everyone knows exercise is good for your body. If you tell people exercise is good for your body, you will generate $0. Similarly, if you say "90% of businesses fail" you've added no value. Where you make your money is where you realize that 90% of those business that "fail" were either fake companies, run by incompetent people or in markets that were declining anyway (see the above on where to look in the first place!). Using the "general population" to help make a decision isn't going to work, because you'll end up taking the path that leads to a "general population" life. *If everyone is doing it, you shouldn't be interested.* Also. The *only* way to get rich is to be right when everyone else is wrong. This creates the largest spread between the payout.

Common Social Tells in 2018

[Common Social Tells in 2018]

We've been ruminating on multiple tells we've noticed over the year. Before we begin we're going to put this up front: *the *exception* doesn't disprove the *general* rule.* We are certain there are instances where the ideas here will fail. That said we'd at least try to take notice of the observations we outline below and decide if they are a pattern you notice as well. We can't believe how many people still ask for "verifiable proof or PHD studies" since anything new hasn't been proven yet (otherwise it wouldn't be new!). Simply take a look below, let us know if you see the same thing and we think you'll be surprised that a few (if not several of them) are broadly accurate. As a final disclaimer, always think about context and build a mosaic around the person. This will help prevent bad reads in the near future.

"I see" and "Interesting": These two phrases are usually used by smart people who don't want to be rude and say "I disagree" to your face. Context is always important. But. Look out for these two phrases. Typically, when you're explaining a decision you're making, if they don't add anything beyond "I see" as an initial read, they don't agree with you. The phrase "interesting" is typically used when you describe how something played out. These are critical differences and one should be able to tell how the context is different.

"I See" Example:i In the "I see" example you are specifically explaining a decision you're about to make. It is not about a decision you already made. You're explaining the logic behind a specific action you're going to take and the person responds with "I see" which could be done in a text message or verbally. Generally speaking, you should be wary of this comment if you receive it from someone who is high IQ. Also. There is a direct relationship between the amount of time it takes to explain your decision and the chances of receiving one of these "I see" responses. In short, the longer you speak the more likely you'll get a negative reaction. This is because good decisions are easier to explain in short sentences *and* long winded answers usually involve a ton of rationalization in them.

"Interesting" Example: This is not in response to a decision you're about to make. It relates to something that happened in the past and results. You tell a basic story and give them the conclusion. They don't agree with the conclusion of the story so they will say "interesting". It's not easy to tell what they truly believe but you can bet good money that the conclusion of the story is the part they disagree with. The conclusion could be 1) your interpretation of why things played out as they did or 2) it could be the ramifications now that it has played out. Be careful here particularly if you get an "interesting" response from someone with a deep background in the arena you're talking about.

What to Do About It: Here it gets tougher. If you call them out on it and the person is honest they will likely give you their real answer or belief. If you don't call them out on it then you don't get any information beyond the fact that they disagree. Depending on the situation, you want to call them out or take note of their response. If it is something important to you, calling it out is likely the best answer since it could have bad ramifications for your future. If you want to keep your cards to your chest, sit down and think about how your conclusion or decision could be wrong and try to solve it yourself. There is a time and place for each one. But. One thing is for sure, if you don't call it out immediately you're less likely to ever get the real answer (they will become more guarded and smile and nod the next time the story is told).

"Makes Sense": For some reason people believe that "makes sense" is similar to "interesting" or "i see". It really isn't from our experience. Makes sense is typically used by smart people to put a period or end to a specific topic/conversation. As usual, we aren't interested in the words/phrases used by regular people since their opinions rarely matter in the first place. We're focused on polite elite people since they matter a lot. When you hear this phrase it means they really do agree and are trying to put a touch of finality around it. You go back and forth with them on a specific topic get to a conclusion and it ends with "makes sense". For one reason or another there is usually a pause as well before they put the topic to an end and it's more like "(pause 1,2,3 seconds) makes sense."

Sound Annoyance: One of the common tells of richer people is their noise cancelling headphones, ear plugs or other items to drown out the noise. Sure some people do listen to a type of music but the point is the same, they dislike noise that is not being controlled by themselves. One item we tweeted about is cell phone ring tones, the vast majority just leave their phone on silent with the vibrator, that's it. So if we add this up you can build a mosaic as follows: 1) has noise cancelling headphones or ear plugs, 2) doesn't use his cell phone ring tone – perhaps as an alarm if needed, 3) will go as far as changing and office phone to have a different ring so he never has to worry about missing his line and 4) a social one, easily startled since their focus is pretty intense when staring at a computer screen.

Never Really Jealous: This is a tough one, since it is a special breed of person. If a person is both successful financially **and** socially it is difficult to make the person jealous or overly competitive in meaningless items. This is kind of funny because your average guy thinks being overly competitive is a good thing *"Because omg Michael Jordan was hyper competitive bro!"*. The reality is that the majority of successful people don't need to be the best at everything, they already learned to specialize. So if they aren't the best soccer player in the group, they will play as hard as possible but they are not going to yell and cry about the game since they know it isn't their core competency. These people are rare no doubt. But. When you start to see them, they will stand out like sore thumbs. Unless it's in their area of expertise they don't have the time and energy to devote serious attention to hobbies. It's just a fun activity to them and they aren't sore losers. This overlays into financials as well, even if a guy makes more money than they do, you won't see a shred of jealousy since the person is already rich so there is no point.

We're going to pause here because if you read this it sounds totally wrong. Why? Well in the work place it is totally wrong. Everyone thinks they are the best and they are directly competing with one another. So of course that is an area where everyone will compete as hard as they can. Similarly, that same guy who was okay being a mediocre soccer player is going to ratchet it up 5,000 notches if it's related to the company he runs. He isn't going to waste his energy on soccer he is going to focus it all on killing that other start up trying to eat into his market share. As we warned in the earlier part of this post, context matters. A lot!

No Need to Pass Blame: You're really dealing with someone who is high up the chain when the person is unwilling to pass the blame and takes ownership/accountability. You will never see this in middle management. Okay never is an overstatement but it's not far from the truth. The only people who are unwilling to pass the blame are the people who are too critical to the firms success. That's you as the CEO or "you" as the high up person within any organization. Passing the blame is one of the most common tactics used by middle level people trying to look good. They don't want to touch anything negative so they sluff off all the negative items to the side (hurting someone else). This is also why they are quick to get fired. The ones who pass the blame enough get caught and popped.

Spotting Blame Passers: For fun, the most common physical tell of a blame passer is a guy with his hands in his pockets constantly. "Hello Wall Street and the financial districts" we see all you guys walking around with one hand in your pocket constantly. Why is this a tell? It is a tell of insecurity. Insecure men typically walk with their hands in their pockets (generally one) and is seen constantly in financial services. People who believe they are important but don't want to take on any risk/responsibility for any failures they incur. If you didn't spot this one before you're going to spot it over and over and over again if you work on Wall Street in particular.

Obsessive Compulsive: It's a bit of a running joke that successful people can suffer from mild autism and obsessive compulsive disorder. Unsurprisingly, we agree with this joke. There is some truth to it since it is not quite natural to have intense focus for multiple hours in a day. If you find that someone has *minor* amounts of OCD or somewhat autistic behavior, they are likely intelligent. Don't let a couple of the odd mannerisms take you off guard, you probably have some of them as well anyway!

Eyes and Tone: Ever notice that smart people in cartoons/movies are always depicted as having more intense focused stares and a tone of voice that is nerdier? Well that's because those two items are pretty accurate. As time goes by and Artificial Intelligence becomes more accurate, we're able to see that "he looks smart/stupid" is a legitimate statement. It's not 100% accurate but the baseline reading can be accurate for something around 80% of people AI reads. There is the natural "attractive or unattractive" which is dependent on symmetry, but, there is also intelligent or unintelligent. There is a "dead" features in the eyes for people who are of lower intelligence and there is a "intense" feature for the eyes of people who are of higher intelligence. We're trying to figure out a better way to explain it, but a good way to practice is to look at a year book of random high schools and guess the person's GPA. This isn't a great test but will help improve accuracy since the photos are in a similar stance across the board.

Finding Lucky People: This is more of a bonus for the post. At the end of the day, luck is a big factor in the magnitude of success. Anyone can be successful, but magnitude is amplified by good luck. While we've created a decent blue print to get lucky, here are a few tells to spot lucky individuals. The answer: look at timing. Timing is really what luck is about. Did someone close a massive deal right before their Investment Banking Bonus is being decided? Did the person buy a stock/crypto currency right before it really took off? Did the guy have *bad* luck in a time frame where it *didn't* matter at all? Did the guy have no emotional reaction to said bad luck? Did the guy hit the right market product/sku just before it became a fad? Did he sell or exit his company when there was still a "blue sky" scenario on the table to command a larger valuation?

These are the things we're also working on to help flush out the right people to hang out with. We've essentially come to the belief that luck is contagious. It is a disease, an addiction a transferable product by osmosis. Seriously. We believe this now. As you continue to move up the ladder you'll find that the people you hang out with are generally luckier. In fact, you could even argue you're *forced* to hang out with lucky people since they were born with the right genetics to become successful or have natural good looks (women in this case). Luck is nothing more than a transferable infectious *good* disease. So we hope you also take those items into account now that you'll be using the above tips to sift through and find smart, rich, successful people. Good luck!

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality … You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by **Clicking Here.**

Compounding, the Most Important Rule in Life

Compounding, the Most Important Rule in Life

Remembering that everything compounds is a good way to think about life in general. This applies to fitness, work and even your friendships/relationships. The bigger issue isn't so much the dollars in your account going up and down, but the consistency and habits you develop over several decades (yes decades) as a single year is a drop in the bucket (we promise you'll have some blow out years and some years of near depression). The key is the constant pressure you're putting on yourself to improve in a particular area. We don't know a single person who attempted to make it for 5+ years that failed. Most expect a turnaround in a year and it never happens (rare unless born into a wealthy family). So we'll outline the major things to remember before deciding to go out and drink beers at yet another low quality spot with your friends.

You Don't Owe Anyone Anything: This is specifically addressed to the 20-year old crowd. The biggest deterrent to your success is the deadweight that hangs on your shoulders right now. If your current set of friends are busy drinking beers on the weekend living paycheck to paycheck, you're in a bad room. This is because you're borrowing time from the future to have fun in the present. Realistically, you're going to revert to the mean. If the average person you're spending time with is living paycheck to paycheck… this is likely going to repeat… for *you*.

Another part of "reversion to the mean" that people forget… People born into wealth are not going to drag you up. This is probably *the most common mistake people make.* Just because you're in an area full of people with money *does not mean they earned a dime.* While this will certainly work if you're an attractive female looking for a husband (ie. Gold Digger), it doesn't work as a male.

So what do you do? The answer is that you only search for people willing to work 60-80 hours a week on practically any business or career. Seriously. If someone is willing to put in 60-80 hours of work per week to live a great life in their 30s, you've found the people who will eventually climb out of the gutter. Also. If someone is willing to kill themselves work wise, the chances that they were born rich is a lot lower. The individuals who are born rich are already starting from a higher position and have a smaller amount of "dues" to pay relative to people at the bottom.

Your Relationships will Compound: If you think the above simply means that you should avoid unsuccessful people… it's much more important than that. If you correctly choose the right people to attach to, that has more value than the money you'll be making. Why? Well rich people only trust individuals they have known for long periods of time. If you've gone up the ranks in real time (everyone around you sees the effort and results), if you ever need to call in a favor they are going to be a lot more open to writing you a check. That goes for a new venture, a new product and any sort of scaled business model.

A good mantra we've seen is that your 20s are for learning/working, your 30s are for earning/scaling and your 40s are for delegating. What people forget is that this applies to your relationships as well. You should be scattering the world looking for good contacts in your 20s (no not hostels in Thailand), earning good money because of your contacts in your 30s and delegating to "up and comers" in your 40s.

Your Work Compounds: This is the bulk of the issues in your 20s. The following work related items compound: critical thinking, speed of processing information, speed of understanding information, accuracy of work, type of information consumed and your emotional intelligence.

Starting with *critical thinking*. If you're not working to solve problems yourself (looking for solutions from new sources), you end up being a cog in a wheel. It means that you're being told what to do constantly and are not learning new information. This is the first item that should go. If you can't come up with your own ideas or conclusions that are self created, you'll never be a differentiated individual. This seems like a "low bar" but it is an extremely high bar. How many people have 100% of their information taken from other people's ideas? Probably 99% of the population.

Speed of processing information accelerates. This means you're given new information and are forced to make a decision. Have you ever met a smart person who takes years and years to decide? No. Why? They have developed rapid information processing speeds. You give them a specific situation and they can typically come to a quick conclusion (and a correct one) without much time spent.

Speed of understanding information refers to obtaining the core concept quickly. When you combine processing information with understanding information, you will see significant gains in all of your performance metrics. Why? It means you're able to take in new information get to a conclusion and solve the problem at rapid speed.

Pausing for a second we can actually use this blog as a good example. While it is a hobby as a whole (evidenced by no sales funnel, extremely basic design and extremely basic navigation features), the amount of content being produced looks high… looks high to a poor producer! While people talk about making the most "dollars per hour" no on ever asks the most important question… *how do you develop that efficiency?* The answer is decades of work from the past.

To give everyone an idea, it takes about 1 hour to write 2,000 words. More or less. So we spend about 1 hour on this blog and maybe 30-45 minutes a week tweeting (we don't tweet all that much). Yes there are always exceptions but that's the general framework. Now… can your average person write 2,000 words in an hour without much effort? Can they maintain a social media presence with a few minutes a week? No. They didn't develop any skilled related to information or processing. This is no different than lifting weights. An extremely powerful person can move 500lbs with ease, the same actually applies to *cognitive tasks as well*.

Accuracy of work. This is another important skill that is completely ignored. While the average investment banker will think this means deleting the tick-marks on graphs and formatting dollar signs appropriately, it is actually an important natural instinct to have. Being able to produce content/value that is nearly error free reduces friction. Instead of going through numerous revisions on a document, presentation or contract, you're simply proof reading and hitting the send button. This is also why major companies have templates for practically everything, it reduces friction creates consistency and makes "on-boarding" a seamless process. Oh and by the way, when you're able to produce error free work quickly, you'll also spot issues in contracts being sent your way!

Information Consumed. If you're consistently consuming information that is different, you'll be able to make unique connections. All products are simply a new way of doing something… or a hole in the current market. Simplistically, by making connections across different sub-sets of different markets you can identify new opportunities.

A common question we get is how to "see the next trends". The only way to do this is by living it. We've talked about a ton of trends on here over the past 7-8 years of writing and those that have followed have seen pretty good accuracy. Timing is always difficult but getting the direction correct is certainly the most valuable as "a rising tide lifts all boats". As always, you're only going to get new information by trying things yourself and looking at information from unknown sources (if everyone already knows about it, it's not new or innovative).

Emotional Intelligence. The last one is the real money maker. At the end of the day, there is someone at the top making major decisions. We can talk about machine learning for days but someone is eventually making a decision on where to take their company. Currently, there is no such thing as a company run by robots.

Developing emotional intelligence will separate the millionaires from the non-millionaires. Being able to tell what the decision maker actually wants (and how to offer it up) will separate the yes's from the no's. Just like anything else, this takes years of practice and if you've worked in sales you have an enormous leg up.

Your Fitness and Diet Compounds: Ask anyone who has been working out consistently for at least a decade. They will tell you that even if they have a set back (can't work out for a week or so) they are able to get into shape rapidly. Why? Muscle memory is real and no we don't have any scientific proof for it (just tons of life experience). The same applies to getting in shape in the first place. If you wait too long, *the amount of effort needed to get the same results goes up exponentially (compounds)*.

Another one that is also ignored is your diet. People believe that your diet cannot compound… But… This is simply false. As a good starting point we can say with conviction that if you've eaten a clean diet for a decade, when you turn 35 the unhealthy foods will make you physically sick. In fact, at this age you can't even have a lot of sugar without feeling sick right after the fact. While you're certainly going to have something unhealthy once and a while, your body is going to reject the food like it is poison. For exact descriptions, your stomach will feel heavier, you'll get a bit nauseous and your energy levels will go down. The funniest part about it is that people will make fun of you and you won't be able to relate. Since eating unhealthy food isn't even appealing despite all the marketing that goes into the sugar and fast food industries.

Another thing we've noticed… (people in their 30s) that attempt to work out and "eat whatever they like"… is that they look older. Their skin is not radiant or clean. Health is just like anything else in life, you can't do "part of it" to offset your other bad habits. You either do everything right and get rewarded or you cut corners and don't get any of the major benefits. If you're put together and do everything correctly, you'll look 5-10 years younger than everyone else.

The Reverse Of Compounding: The last major item is "accelerated declines". What this means is that you will be fighting an enormous uphill battle in every category if you don't start today. Putting it into perspective, remember that a 50% decline requires a 100% gain to break even. So if you give up 5 years of effort in your 20s you will likely need to put in 10+ years of effort to make up the gap (all talent related items equal). No. We are not kidding. As a year in your 20s is certainly worth more than double when compared to a year in your 30s (energy perspective). Feel free to believe that drugs will offset your energy levels… Just remember that incredibly talented people already started working hard a decade ago. So. Even the equal speed isn't enough to gain ground anyway.

Long story short. The one major theme to be taken from anything written on here is that every single year compounds in a massive way. The successful people who are millionaires in their 30s, are not millionaires because of decisions they recently made. They became millionaires at age 20 when they made smart decisions that paid off over 10 years.

****

Controlling Emotions

If there is any skill that you should learn it is the ability to control your emotions and the emotions of others. The degree to which you can accomplish this task will improve both your game and future financial prospects.

Investing Control: We already wrote about dollar cost averaging, however most investors lose money in the market over the long-term as they tend to sell when they see their portfolio decline, particularly if the magnitude is large. Psychologically, it is much more difficult to take a loss relative to an emotional high following a gain. With that in mind you should train yourself to invest consistently, this skill alone is going to net you **hundreds of thousands of dollars**.

Dating Women: If you're upset when your girlfriend dumps you or if you get turned down during a regular approach, your emotional control is weak. If you have emotional reactions to a woman's evaluation of you, this means she has hand in the relationship. This is counterintuitive to successful business men who continuously prioritize and service relationships. Simply put, if you care about a woman's opinion of you as a man, you've already lost.

As a quick check for people who are just now learning the nature of women, a seasoned player will never place his hands in his pockets after a failed approach and instead will happily move on to the next one. Body language is a dead giveaway here and the surrounding women will notice as well.

Emotional Persuasion: Any time a person attempts to persuade you regarding a purchase or action based on emotions, you should run. You will notice this is a heavy tactic for convincing someone to get married or to sign up for a get rich quick scheme, diet pill or muscle building formula. Once you realize that both of these actions only have emotional arguments you will quickly remove the blinders. Look for the following characteristics to avoid these emotionally charged decisions: 1) arguments for love, 2) descriptive language that paints a picture or story, 3) no basis of logic, 4) easy or relaxing and 5) time constraints. If you can consistently look for one of the five flaws listed here your emotional control will increase as you won't be sold a lie. Avoiding pitfalls is just as important as making gains.

Fear is Paralyzing: Fear is the most common medium used to sell sketchy products. "Aren't you afraid of dying alone", "Aren't you afraid of missing this opportunity of a life time", "Aren't you afraid of what XYZ person will think". This is the hardest emotion to control but once you have it by the throat, the world will open up to you. The only thing you should be afraid of is living your life on someone else's terms. Living a life you've been told to live is not a life worth living.

Emotional Control is Self Improvement: There is not a single man or woman in the world that has complete control over their emotions. You will catch yourself slipping from time to time, however you need to make emotional control a major theme in your life. Allowing your emotions to drive actions will lead to poor decision making as you will act based on how you feel at the moment. Instead you need to continuously strive to act on situations based on their long-term return. Disregard temporary pain and suffering.

With all of these comments in mind, we strongly suggest you check own emotional IQ. The sooner you can improve your IQ, the faster you will succeed in life

****

Conventional Retirement is a Scam

"Save 10% of your income for life and retire when you're 60"

The trap here is deceiving. This type of simple math causes a long-term problem of lifestyle inflation that destroys the exact thing that retirement is supposed to represent… freedom. Freedom to let you make life-long decisions. If you ascribe to the quote above this article is certainly for you.

Spending 90%: This sounds like an idiotic point so we'll dive in further. If you continue to spend 90% of your income… the years you previously saved are worth less today than they were yesterday because your lifestyle has inflated if you make more money. If you made $50K a year and 10 years later make $100K… well your lifestyle retirement spend is now on a 90K salary.. ***this is 200% higher than the 45K you were originally spending*** when you made 50K. Instead why not find the minimum amount needed to live your life.

Retirement is not an End: Do you remember summer breaks when you were little? ***If you were poor they sucked.*** Why did they suck? You were bored out of your mind so you did nothing but watch TV or play sports… whoops can't do that last one effectively at 60 unless you're lucky. In fact many people got summer jobs! So the infatuation of "doing nothing" is a trap in itself, when we're busy doing something we ***dislike*** we constantly want to do nothing and when we are doing nothing we want to be having fun! The word dislike is highlighted for a reason as it gives us a hint to a long-term solution…

The Wall Street Playboy Solution:

Partial Retirement: Now we're getting somewhere. No one really gives this option out in your financial classes but why not shoot for a "semi-retired life style in the 30-40 range?". Instead of saving up for an "end to it all" how about you shoot for mobility and a job that you enjoy doing. For us weight room freaks it could simply be working at a gym, a health nut could be at a juice bar and a person who loves kids could teach. This type of cash should be your ***spending money*** while your accelerated savings can cover your living costs. This way you're doing something you enjoy for the vast majority of your life while you leave your savings unscathed.

Percentages: Now lets take a look at the math in percentage terms. Lets say you save 33% of what you make instead of the old wisdom of 10%. In roughly, 25 years you'd be able to "retire" on 7% returns for the rest of your life. I can hear the hard core players already… "You're too old at the point to crush it in the game"… well lets stop and take a look. The 25 years assumes ***you have zero income.*** Instead we will make the assumption that you could easily replace ~1/2 of your current income with any hobby you like and your time to retirement sinks like a rock, ***you're mobile in a decade.***

Here's the math of the suggested scenario for $60K:

1) For 10 years you save 33%. 20K annual would get to $200K

2) With 200K you are now able to earn $14K a year without doing anything… 14K/40K is now covering ***35% of your life expenses without touching the initial 200K***

3) From year 10 on you can now earn 26K plus doing any job you want for the rest of your life.

The scenario above is a terrible downside case as it assumes you never make any more money and the 20K a year you save is not reinvested until it grows to 200K. For the mathematically sound, the biggest determinant to your freedom is actually ***the rate of spend you need to be happy***.

Conclusion: Naysayers and people with high cost lifestyles are going to be unable to relate. Sure a select few of us may start a successful business and it is true that you can make a lot of money that way, but life is tough and unfair. You could see yourself sidelined and forced to work regular jobs. With that said it is Thanksgiving and ***the one thing we're thankful for is game.*** Getting a body, eating healthy, stacking capital and never buying expensive things we don't need combined with game gives us hope that the future is bright for an early "retirement".

****

Cover Letter

We have gotten a lot of emails about this, before we begin here are the reasons why your cover letter does not matter. We will give you a template below if you don't want to believe us but lets begin.

1) We receive thousands of resumes every recruiting season. That alone is 1,000+ pages to review.

2) We have automated computers to search for key words and GPA's (3.5+ GPA, Top Schools, Investment Banking, Research, Trading, Private Equity, Venture Capital, Hedge Fund, etc…)

3) We have no time to read 1,000+ three paragraph essays

4) We don't know your name until you walk in the door, if you have friends who received jobs on Wall Street they will tell you every interviewer will ask you to "walk you through your resume" (hint we did not even bother reading your entire resume either)

5) We know that people who are hired just out of college are bottom barrel on the importance scale, as a reminder no one cares about you.

The above is harsh truth but really think about it. If you were trying to generate millions of dollars for your firm, the last thing on your mind is an introductory cover letter from a 20 year old college graduate. With that said, your resume is extremely important as it outlines what you can actually bring to the firm. This compares to your cover letter should be coherent, error free and to the point.

Think of your cover letter as your "elevator pitch" on why they should hire you and why you would like to work for the firm. Along with everything else you do on Wall Street, keep it short to the point and valuable.

Cover Letter

COVID-19 Update Easy Solutions for Big Problems

If you've been following our twitter and general view of the virus, unfortunately COVID-19 has gotten much worse. Instead of wasting time debating people online we're just going to outline some basic ways to make sure you're in good shape once this virus plays out. Fortunately, you don't need to do much beyond basic precautionary items and some additional cash. We'll go ahead and get started!

Step 1 – The Basic Stock Up: There is no need to go overboard. If you're buying stuff you would never actually use in the future (that's a bad move). Simple things include: brown rice, water, some frozen foods of your choice and replenish some canned goods. Notice we're not telling you what specific foods to buy since it doesn't matter *that* much. If you have some grains (rice) some protein (beans) a variety of canned foods and a bunch of water… You're pretty good to go.

Step 2 – "Act Broke": This means you should make a few simple choices. Instead of spending money on a falling stock market, a falling bond market etc. You should go ahead and just take the amount you would normally invest and buy the following: 1) toothpaste, 2) soap, 3) toiletries, 4) basic medical supplies etc. We're assuming that you do not have a year's worth of these items and the chances of the products going "bad" is next to none. Why would you do this? Quite simple. By doing a bulk purchase you guarantee a price that is a bit cheaper than normal (majority reading this unlikely go to Costco very often) and you would have bought it anyway. This is effectively a guaranteed return. By buying a bunch of items you would have paid 20% more for, you've locked in a gain on future costs by simply taking additional precautions. Nothing crazy here. If the stock market recovers the 5-10% it lost, oh well, you saved on goods equal to the return anyway.

Step 3 – Avoid the Blame Game: Unsurprisingly, irrational humans will now blame anyone and anything for the spread of this virus. Instead of wasting time trying to place the blame somewhere, go ahead and focus all attention on what you can control. Classic "stoic response", which means you'll only focus on things that are within your control. Don't blame other people for the stock market declines (no one can predict a pandemic out of the blue) and don't blame doctors for following medical procedures. None of these things are within the control of the individual so focus on the micro tasks.

Step 4 – Simple Micro Tasks: This is quite easy! Simply decrease the areas in which you could be exposed. If you can work from home, work from home (some major companies already allow this due to the breakout). If you need to travel, cancel them unless necessary – free excuse to stay at home. If you can avoid the gym go ahead and use your own barbells and exercise outside in a more desolate area. This isn't really a lot of change but significantly reduces your chances of being exposed if you're worried about the potentially contracting the virus.

Other micro tasks that are extremely specific: 1) stop touching your face, 2) stop opening doors with your bare hands and 3) avoid public restroom facilities. Again, some of this is simply not possible but you get the bigger picture. You want to avoid mass gatherings and avoid physical contact with strangers. It makes a lot of logical sense because this is where the virus could easily get to you.

Now why would you do this now? Pretty simple. At this point, even the people who claimed it was "just the flu" have given up. There are too many cases, international growth is accelerating and we've lost the ability to predict exactly where the infection originated in some situations. What does this mean? It means that over the next 3 weeks or so we'll finally see what the real numbers looks like. People are going to go out less, party less and congregate less at least for 3-4 weeks. Expect more cancellations of major mass gatherings. And. There is absolutely no way to know where it is (today) so basing your behavior based on current cases doesn't make much sense. Simply take 3 weeks to be a bit more insulated: read, cook at home a bit more and public settings where germs are quickly spread.

To wrap it up, if you must go to work (majority will) just take a few simple other precautions. Try to walk up the stairs to work, don't touch elevator buttons with your hands, don't touch anything except items in your own office/work area. This isn't difficult to remember and costs nothing (maybe 2-3 minutes a day) as you spend a few extra minutes making sure to wash your hands properly 2x more than usual.

Step 5 – Is this an Overreaction? Not really sure. Implementing this for a few days already hasn't really caused any damage at all. Going for a jog and doing physical pushups to failure and sit-ups/pull ups to failure hasn't been a big change. Having weights at home isn't a big deal as well. In fact, not much changes. The only part that is "painful" is the not going out part. But. Most people are reducing that anyway… So not that big of a deal (yet again). It's almost like a free vacation at this point. Business stalls a bit, you read a bit more and spend a little bit more time on your computer. The only part that is "annoying" is the going to Costco part. You have to get the basic essentials out of the way and after that there isn't much of a change. You'll end up saving money by bulk purchasing food anyway and it won't cost you more than $300-500.

Step 6 – Rational Math: The main problem with the virus is not the death rate of 2%. That's already bad. The real problem is that humans do not understand compounding AND step-function risk. If you attempted to explain step-function risk to 80% of the population, they would not understand it. Step-function risk is associated with this virus/disease. What does it mean? It means that some people get no real reaction. It feels like the common cold, nothing happens and they get over it. Other people (the 2%) are potentially dead with a high percentage in intensive care units. *You do not want to be in an intensive care unit*. Intensive care means your body is going through extreme pain/suffering.

The second part, the "step function", is probably the bigger issue for us. If it travels like the flu, that's already bad (high probability of catching it)… But… The step function is not good. Under no circumstance would we take a 2% chance on life when it can be avoided by staying indoors for a few weeks. It's not that difficult to talk to people through video conferencing. A 2% chance of dying to a virus that will likely moderate in a few months is just not worth it. Imagine a game where you have a 98% chance of being "fine" but a 2% chance of dying completely. You'd never play that game and three weeks of your life reading and lifting weights at home to avoid it would certainly be easy.

Key Highlights: While we're not going to tell you exactly what to buy since you may enjoy certain foods over others here's what we're stocked up on: 1) brown rice, 2) beans, 3) variety of frozen food items from Costco – Chicken Bakes are likely well known to most, burritos and some frozen veggies, 4) a bunch of cases of still and sparkling water and 5) a few cases of granola bars and a few large packs of organic soup.

On the other side went ahead and bulk purchased: 1) toothpaste, 2) dental floss, 3) some multi-vitamins, 4) toilet paper/paper towels and 5) soap/hand sanitizer. As you can see the list of items will last forever (practically) and you will use them eventually. So you're not "wasting money" by stocking up in the first place. You're simply well prepared and the money wouldn't change your life (we doubt buying the S&P 500 on the exact dip with $500 is going to make a difference in 30 years.

What to Watch For: We said it once and we'll say it again. Do not go to Asia. There is just no reason to go out there and we do not believe the situation in Thailand for one second. Significantly more people go to Thailand than Japan/Korea from Wuhan and other parts of China. Their infection rate is likely understated as many of them simply had "no real impact" from the virus (see step function risk). Again. None of this is going to change your life much. You simply take a step back for three weeks, let everyone else figure it out and play it safe. Also. By doing this you won't be stressed out at all since you know you've reduced your chances of catching it by a wide margin and that's all you can really do in the first place.

****

Create a Hard Working Well Rounded Person in a Single Post

Create a Hard Working Well Rounded Person in a Single Post

Most posts that address this topic talk about "motivation". As you know, motivation is primarily targeted at the bottom 90% of the population. People who need to be motivated are born to fail (maybe 0.1% turn it around but that's due to the law of large numbers). Instead, we'll do the opposite and create a how to on "creating a hard working individual". None of this is scientific fact (who cares about science since PHD studies are always years behind businesses – a topic for another day) but it is based on a large amount of observations.

Three Item Overview

Grow Up "Poor": One of the common traits of well off people is actually being born with less. This is in quotes for a reason, when we say less we mean *"less relative to the environment".* Your average person complains that he was born with the wrong starting hand. But. Refuses to acknowledge that rich people are rarely born rich to start.

What is "poor" in this situation. Poor means you're constantly surrounded with people who got a head start. This then causes a "fight or flight" reaction where the person complains that his peers have more than him or a "fight" reaction where the person decides to outperform them despite having less. We're not exactly sure how to flip that switch, but you can see it from the beginning. In fact, there is the classic cupcake story where kids were forced to stare at a cupcake for ~15 minutes and if they survived they would receive two (if they ate the cupcake they only got one). This ended up being a marker of future success. This makes sense. While put in a position of discomfort, being seen as "lesser" than peers, being forced to delay gratification etc. the correct response is to "tough it out".

The conclusion from this first step? Create a feedback loop of delayed gratification. If a young person already has a trust fund, the answer would be clear. You'd never tell them about the trust fund and create a positive feedback loop when the child/person delays gratification for a reward. Then you scale up the amount of gratification with the time they must delay. For a cupcake maybe 15 minutes is fair. For a bike maybe they have to mow the lawn for a few months. So on and so forth. The key is creating a natural positive feedback loop between effort, reward and delayed gratification. The last thing we would add is to give it all at once. You want to train the person to realize that longer delayed gratification means bigger rewards. So if someone mows the lawn for 5 years, you'd give them the one time reward after 5 years. Why? Well you don't want them used to small time rewards of $1 since the dopamine rush and connection would be smaller. **In short, step one is to create a positive feedback loop between delayed gratification and reward. Expand this over time.**

Spam Topics: Bill Gates recently stated that success is finding something you can be world class in between ages 12-18. While this sounds good it misses one big point "will the task make any money?". You could be perfectly built for digging ditches with a shovel, but as long as heavy equipment machinery is around… You're not going to make any money doing that.

Instead we'll make a change to this idea. You'll "spam topics", since we know which skills will be more valuable in the future it is a lot easier to choose all the topics. If you're telling someone to spend their time learning how to iron clothing (you're wasting his/her time). If you're telling the same person to learn UI design, you may have a winner on your hands. This is why the spam approach is important. You place the person into an environment to train for 100s of different items. A few months is more than enough. The kicker? *You then encourage them to choose the one they are the best at.*

This last part is critical. Even if they "love" doing topic A if they are really going to be world class in topic B… They must go in that direction to succeed. While there are always "success stories" of someone following their dreams, it just doesn't work out most of the time. Instead you want to go into the direction where you have the most raw-talent. After all, a successful person is much more interested in winning than they are in feeling good about the moment (another form of delayed gratification). **In short, step two requires the person to try numerous topics that will be profitable in the future and choose the one where he/she has the most talent.**

Place Them in the Center: The person now has a good amount of will power (delayed gratification) and knows where his/her talent is. The next step is clear… Make them move up the value chain. If the person is competing in the same age bracket… They are not talented at all. This sounds rude but it is true. As a simple example, anyone who has played sports will know that playing on the "varsity team" as a junior is not impressive at all. You want to be playing at that level as a freshman/sophomore at minimum. If the school is talented at the sport you're likely a sophomore and if they are not great you should be playing at the varsity level in year one. This is the easiest example since we see it in our everyday lives.

What is the "center". Well if you compete up (meaning against people older than you), you're then a middle level person. It is unlikely someone picks up a task in 3-6 months and is suddenly world class. Instead you pick up the task and constantly compete up to a point where you're still able to improve at a rapid rate.

You don't want to compete to a point where you're only playing against the #1 person in the field (losing every day). Instead if you are number 1,000 in the world you want to compete against the guys who are #400-600 or so. After that you move up and up and up.

The last item for the center position is mental state. Many people believe being the best in their age group is their "competition". It isn't. If you truly want to be the best at something you have to seek out people who are better than you. This is a mental model more than anything else. **In short, by placing the individual in the center (constant competition) they are then improving at a rate faster than they normally would.**

Creating "Dedication"

Dedication: This is just a terrible word thrown around by people with no talent. Right up there with passion. We can't decide which is worse. Dedication is essentially the ability to work every single day on an *important task*. This is not the same as "working hard" because working hard on something that adds no value is just a waste of time. Therefore, the answer is quite simple. You create another small reward system for completing the most important task. In the day of smartphones and instant gratification all you need to do is say *"unable to do anything else until five hours of progress on item A is made"*. This requires shutting off all vices before the day begins. Just remember, dedication only counts if the time is being spent on the right task. We don't even want to know how many hours are wasted working hard on something that could have been done with a single line of software code.

Is This Useful? If you're already in rhythm and have a good work ethic, then this is the only question you need to ask. If you're reading this blog we think it's unlikely that you're lazy. Most people have no interest in being successful and are more interested in stretching their current run-rate as far as possible (See: most expats – Thailand, coupon clipping etc.).

Applications of this question are clear. The first one gets rid of worry. "Is this useful?" forces you to step back into the present. Sure bad things could happen but worrying about them is the exact opposite of useful. It is a horrible distraction. The second application comes from your interactions with people. If you're poor or out of shape (enter any item) and you get a distraction ask the same question… Is this useful? If you're trying to make more money, only respond to conversations that move in this direction until the day is near complete. This sounds "rude" but it also works. If we had no money starting today we would do the exact same thing. Cut off contact with items that don't make money and return to them when we had the money to put them into the loop again.

Will I Regret This? This is the last question to ask every single day before any task that takes up more than a couple of hours. If you're already rich it is unlikely that you'll regret going out at night to party. If you're late on rent and going to the movies… Something has gone horribly wrong. You'll regret that decision instantly.

Regret is a moving stick. Some people would regret buying a penthouse apartment if it breaks the budget, while others wouldn't mind if the penthouse never went up in value (see billionaires looking to buy for simple life style improvement). As a simple test you can group all of your daily activities into the "will never regret" and "will likely regret" buckets. While never is a strong word, using polarizing features gets you to the 80/20 mix between good and bad. Eating a healthy meal and going to the gym are in the "never regret" area unless you're missing out on a larger opportunity. Going out to party is likely in the "will regret" area if you're low on cash while in the "never regret" area if you're already set for life.

By creating this basic list in your head you can then move simple low-end vices into the never regret territory. This can range from golfing to partying to travel. The list never really ends. The basic premise is that as you become more and more financially well off your lifestyle improves to include things that regular people wish they could do on a daily basis.

Maintaining a Personality

Keeping Them Well Rounded: The next step is moving into a completely different direction. The above strategy largely works for making money, athletics and competitive endeavors. The formula is simple since you're looking at a triangle where the money flows to the top. If you follow the framework it'll essentially fall into place.

Well rounded essentially means "social life". Social life is the exact opposite strategy as making money since we have to now relate to your average person. The reality is that less than 4 out of every 100 people you meet will have a million dollars. In fact, if you're under 40 that number shrinks well below 1% of all people you interact with. Instead of squabbling over the exact percentages, the point is that the hardworking/smart person that was created is not "relatable". Naturally, people are attracted and connected to people they feel comfortable around and relate to.

The solution: playing dumb. Your average person believes they are smart and they feel they are better than you at first glances. This is human nature. So the person needs to learn the art of appearing dumb. While they are extremely meticulous in work related activities, anything in the social bucket should be thrown out the door. The easiest way to do this is through basic social boosting. All the person needs is a few nice items of clothing, some cash to tip a bartender heavily and being amicable to the staff. You'd think there is something more complicated than this but it isn't. This would be the easiest way to move the sticks in your favor and get "started" so to speak.

The Jealousy Test: While we understand that people have preferences when it comes to dating, there is still a rough rule for beautiful people. Symmetry of faces, hip waist ratio etc. Instead of telling anyone who to date a good way to see if someone is "batting above average" is when they receive jealousy from other people or they get the classic "she must be with him for the money" comment. Both of these are good signals for someone with solid social skills. If people in your same peer group (rich as well) largely agree you're doing better we'd say you're solid from a social skills standpoint.

Pause for a second. There are still people who believe being successful is only related to income and we'll never agree with that. Being rich and stuck in a personal life equivalent to hell is a failed experiment. What was the point of the money in the first place then? There was no point if it didn't get you what you wanted in the first place. And. What people want is a fun/exciting life. **In short, since we've given the overview for a hard working person, you can use this as a "litmus" test for personal life success in the dating category.**

The Health Test: This one is tougher. You can't put a value on good genetics. But. It has to be quite high. If you're born with good genetics you're going to age slower, feel more energetic and look younger. So we'll go with how you *look and feel*. That is right, despite some biometric markers of health which will likely be optimized by private medicine the key is how old you appear and how you feel on a day to day basis.

Simple example is when you turn 30-35 or so and then 40-45 etc. If people correctly guess your age (the people guessing need to be above age 40), then you're in "okay" health. If the people are guessing too high and you're actually younger… then you should do more work on your health. Finally, if people are guessing much lower then you're in good shape.

Now this isn't scientific because the point is related to *stress*. It is stressful trying to get rich, however once you get rich, taking your foot off the pedal is the right move. Stress is the worst item for a person's health and there is no research paper that is going to convince us otherwise. It impacts your skin, immune system, muscles and brain. Looking at all of these things, since we know your body can take a lot more stress in your 20s, it makes logical sense that you should decrease the wear and tear as you go into your 30s and 40s. There is no reason to sacrifice health for money because you don't need to.

Doubling Back on Things to Avoid

In just three sections we have structured a successful person (on the right path, which suggests we believe in nurture over nature for most things!). That said… we do need to double back and find "checkpoints" to make sure things are going according to plan. So we'll highlight a few red flags.

Health Red Flags: If any of the following occur for longer than a short span of time (couple of months) consider it a big red flag: 1) registering as overweight, 2) significant decrease in skin pigmentation, 3) bags under eyes at young age (40), 4) joint/tendon damage that was not caused by injury, 5) foggy memory/disorientation and 6) significant decrease in sex drive (typically hormone related). If any of these flags occur its time to stop and go back to the health tests since we know there is a problem. If they occur for a day or so due to a large project, this is acceptable. If you're on the fence, we'd go ahead and say there is an issue since health is the #1 priority over everything else.

Financial Red Flags: While we outline our specific numbers in Triangle Investing, we note that every single person is different. A broad stroke is that 1) net worth should continue to go up and 2) the savings percentage should continue to go up. People say this is not possible but that is because they do not run a business where you can grow your income at X% and increase your spending by X%/2 (causing a natural increase to re-investment/savings rate). The only exception will be material recession years where everything is down 50% and if you have entirely retired and now spend your time traveling the world and hanging out.

Social Red Flags: These are harder to admit. Everyone believes their lives are in perfect order (according to their social media posts which are then sold to companies that sell them diet pills (wink)) so we'll use another bulleted list. 1) still interested in learning "tricks" to meet new women past age 25-30 or so, we'll be generous and say 30, 2) contact list can be summarized by two industries – work/old friends, 3) every weekend is spent with the same handful of people, 4) unhappy with current living arrangements – already financially independent and 5) weekend activities are the same 80% of the time. All of these items are bad signs for social health, so we'd look into it quickly. The most interesting thing about social red flags is that they are harder to address as a person ages. Good luck turning someone around at age 40 from a boring guy into someone interesting. It rarely happens.

Concluding Remarks and Biases

Naturally, this framework for building a person only works if your beliefs are in-line with this blog. The best way to come up with your own framework is by building out pieces of people you interact with daily. Remember, time is extremely valuable and skipping on any of these items could lead to a lot of regret (visit people nearing death who are much more likely to tell the truth). There is also a lot of reading in-between the lines in this post (for example that feeling "poor" or "mediocre" is dependent on your environment… And…. that competing with people well outside a range doesn't lead to improvement – a 9 year old swinging at MLB level pitches for example) but we'll leave that to the reader.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality (***essentially the point of this post!***)… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by **Clicking Here.**

****

Creating Focus

Creating Focus

Regular people are watching the Super Bowl as this post is being written. We have no interest in the game since we didn't see a good set up for blow out odds to make money (unlike the presidential election where numbers were *emotionally* set at 10:1). Instead of writing some non-sense motivational speech on how to get amped up about your life, we're going to outline a way to consistently get into "the zone". Getting into the zone is something everyone has experienced at least once in their life and figuring out how to replicate that will separate yourself from the pack rapidly.

Create the Zone First

Step 1: Write Down One Task: This is pretty simple, every day you wake up and you write down the one thing that is most important to you. It should be no longer than one sentence long. *"My #1 priority is X"*. Now you won't waste your time hitting the snooze button on the alarm because you have not done anything to progress on the most important item on your list. Don't waste your time worrying about your other priorities, this will actually kill your focus. Instead you wake up and write down one thing most important to your life and we have no right saying what that item is. Some will say "build second source of income" for others it may be career related. So on and so forth. At this point the only thing you're allowed to do is eat or drink something (get ready for the day) and don't allow yourself to do anything until *progress* is made on the #1 item on your list. Finally, the phrase is not an "end-goal" the phrase needs to be set up as progress otherwise you'll get sick of it rapidly.

Step 2: Create a Reminder: The #1 item on your list should have a substantial reason behind it. You then want to create a visible item to look at on a daily basis as you progress. We are not sure what the reminder will be, that said, we prefer a personal quote made by yourself (not some motivational dude who doesn't care about you and just wants your money). If the task is building up your second source of income then it could be something as simple as *"Do I want to rely on someone else for my livlihood?"*. Place your personal reason in clear view when you sit down to start your task. In this clear example, before you get to do anything to start your day you're going to be reminded that you're relying on someone else to put food on your table. Not a good feeling and should spur on action.

Step 3: You're Not Allowed to Read: That's right. Reading feels like you're progressing on something but we've seen a total of Zero purchases made by books read. We've never seen someone purchase a Ferrari with "number of books read". In fact, we don't know a single time in history where a person reads a book and suddenly gets more money. Secondly, if the item is physical *"I will lose weight" or "I will gain muscle",* then you're not allowed to sit down and read up on new diets and exercise routines. You're going to go straight to the gym to train physically.

The biggest problem with "reading" as it pertains to the most important item in your life is that it feels like something has been done. We've done this many times in the past. Spending 2-3 hours reading about a topic only to find that all of your most valuable energy is completely drained by the time you're done researching…. This is not an efficient use of your brain. Reading is relatively low energy and will simply drain your body before you're able to even get to work. This is also why we do not recommend checking Twitter, Personal Emails, Blogs, News Websites etc until you've started to get to work on the task.

Step 4: Remove All Noise: This is both literal and figurative. Unless the tasks requires phone calls (calling customers as an example) or access to the Internet at that specific moment, you should shut everything out. Take it to the extreme. As an example we prefer turning off our phones before starting to do real work and remove all tabs/browsers unrelated to real time work to prevent any distractions.

This is actually a rare time where we can look to athletes as an example. If anyone has experience in competitive sports… thinking about anything but the present task is a recipe for disaster. The small fraction of a second where focus is lost can cost you the game or the race etc. Just think of all those examples of athletes celebrating before finishing the race, looking to the side or falling asleep as an opponent is able to easily cruise to an extra point. By removing all noise you're going to be left with two items, your brain and the task at hand.

Step 5: Create a Mental Zone: At this point you're about to start the task. You've already recognized it as the most important to you, you've already reminded yourself (utilizing fear) as to why you need to accomplish the task and finally, you're in a place where you cannot be distracted by any means. Now comes the fun part of creating a "zone" or focus point.

The final step before starting is to remind yourself of a previous success. It does not matter what it is, just choose the biggest achievement that you remember (or one of the biggest) and lock into that that time frame. After walking through it in your head as if watching a movie (should take a minute or two) you're going to repeat the task and remember being "in the zone". This is also more commonly known as neuro linguistic programming, but, we'll try to take it a step further. Once you have played the event in your head once or twice the final time, instead of remember the event, remember the mental state you were in. Try to remember what you were thinking of during the event. You'll find out the exact same thing. You were not thinking about anything. Ever wonder why we refer to people that are in the zone as being "unconscious, well now you know.

Step 6: Take Action on the Task: If you've done this correctly your mind will not wander. You've prevented this by starting an action before doing any research at all. If we look at the process, by breaking any of the steps… your brain will become distracted. This is human nature and a natural flaw of all humans. You'll worry about doing other things unrelated to your most important action of the day.

Step 7: All Out or Full Speed: Since our bodies and brains get tired over time the best way to progress is at full speed until exhausted. Since this is hands down the most important task to you, you'll need to continue in this zone until you lose the mental ability to continue. The vast majority won't do the check in steps listed above and will pay dearly for it as the value of the work will decline dramatically. If you're distracted or not 100% focused the value of the work is likely cut into a third. One hour of extreme full speed work and effort will be equivalent to 3 hours of regular effort work.

After Zoning In

After this period of mania (we've found about ~3 hours can be obtained) you'll need to check back out of the intense work mode. Once you find that your mind is wandering onto other topics rapidly and you're not able to focus specifically on one task only, then you're likely out of the zone. Instead of attempting to force your body to re-enter, it's smarter to step out entirely. We recommend meditation for about 15 minutes where you think about nothing.

Re-evaluate the Work: Now that the intense focus period is over, we'd turn to less demanding items that we refer to as clean up. If your time was spent working on a new ad to place online, then we'd switch to proof reading. You can also switch to display issues and other bugs that may occur on your page. Unless you have hired someone to go through everything, you can simply do the lower level items that are less important. After a period of meditation you'll have enough energy left to go through mundane items that are less meaningful but can make a big impact.

Ask a Few Basic Questions: Part of the reason that you'll fade out of the mania stage or "in the zone stage" is you'll run into a hurdle you can't seem to jump. If you see the problem consistently ask yourself what exactly is causing the problem and write it down once for later research. We'd recommend doing all research well into the end of the day since the energy needed to do so is very minimal.

Switch to Task Two, Three and Research

Now that you have made a substantial amount of progress and "cleaned up" the work you've done, it's very easy to move onto your second less important item for the day. Generally, since it is not the premier item for you, this will not require immense focus on your part (not logically sustainable given no person is operating at peak performance every single minute of the day).

Again, we do not know what is important for you. All we know is that there are several areas where you're likely interested in improving. For the remaining items we recommend linking up with a person who is more motivated than yourself in that category. Using the most common items "money and fitness" if your goal is money, then you'll need to find someone who is in better shape than you to hit the gym.

We strongly recommend working in more "team" oriented areas for tier 2-4 priorities. Why? Well if it's not the most important item to you then it is likely the most important item to someone in the group you decide to be a part of. This makes your progress significantly faster than before.

Finally, once you're done with your activities for the day you can flip to researching the answer to your question when you're wrapping up the day. You'll find yourself getting distracted (more likely than not) and this is normal. The positive side is through the extremely easy task of researching a solution you'll find at least one answer and apply that the next day.

Massive Pitfalls to Avoid

We have a laundry list and instead will focus on bullets to get the point across quicker

1) Telling people your #1 priority. This will cause nothing but problems for your progress. Psychologically, telling someone you will do something sends signals to your brain that you've actually done something to make progress (not the case!). Do not confuse marketing with "telling people"it is not the same because when you market you're already done creating a specific product (or practically near done).

2) If you need to tell people… you don't really want it. This is another good way to see if you're actually interested in doing it. Material goods are another great example of this. If you actually want to do something and are not doing it just to create attention, then you're not going to be interested in voicing your priority to the masses.

3) Creating games instead of habits. You're better off changing your long term habits than making crazy games such as "for 10 days i will do X". This will just send a quick dopamine rush when you do something for 10 days and complete the task. Instead by creating a habit you won't have to make up any sort of short term time frame.

4) Constant obsession with priority #1. It's not physically possible to be at peak performance for the human body at all times (otherwise world records would break daily). Therefore the check in process shouldn't lead to constant thinking in the future. Once you've put in the high quality hours and minutes into the priority, set it aside and move on.

5) Negative Thought Spiral. When getting into the zone you're not allowed to frame anything as a negative. This is why visualization of a past success is extremely important. Once you think about how much you want to improve on item X then you immediately shift gears into a previous success. If you're thinking about "what could go wrong" you'll waste valuable brain cells on worrying (this usually leads to thinking about other items unrelated to your project – negative thinking).

Concluding Remarks: Overall, if we continue to follow these steps to check in on a daily basis into the most important item on the list… we'll subsequently improve on the other items. Generally, when your primary item is improving by leaps and bounds, the rest of the items tend to fall into place because your confidence goes up (able to do most important item, will be possible to do the second most).

****

Creating Luck

Creating Luck

According to the dictionary, luck is "Success or failure apparently brought by chance rather than through one's own actions" and the more popular definition is "Luck is what happens when preparation meets opportunity". Unsurprisingly, we don't like either of these definitions! Instead we define luck as ***"good fortune*** *that goes to people who don't need it"*. Why? Well once you know how luck works you'll adjust your personality to make it come your way. For fun we're going to provide a step-by-step luck creation machine.

Lucky to Be Alive

Before we begin, we'll point out the obvious. Anyone reading this is lucky to be alive. Millions of people died which diminished the gene pool. There was a one in a billion chance for you to be alive today (probably lower). The chances of being alive in the 21st century? A miracle. The chances of being born into a 1st world country? Another miracle. **And.** The chances of finding this blog? Another miracle! (half joking)

We're sure you've all heard this before and we think the one additional item is the amount of information available to you. That is hands down the most critical change today versus 100 years ago. If someone creates a revolutionary new product, you'll likely hear about it within a year (at the latest). Just ~30 years ago, information was delivered extremely slowly (snail mail) and new information took years to become well known around the globe. Now? ***That could happen in five seconds.***

With the invention of the Internet, you can gain access to information written by investors, billionaires, millionaires, athletes, doctors, etc. While it is up to you to discern which information is most valuable, the availability is meaningful. Remember, one of the primary reasons for the USA being where it is today? Information. Guns versus Bows & Arrows. Therefore, access to information helps level the playing field for anyone living in the 21st century. There are no excuses in the 21st century because the necessary information is available.

"Luck: Good fortune that goes to people who don't need it"

Think about it for a second. Have you ever met a "lucky" person who needed the luck in the first place? Unlikely. Even the broke folk who win the lottery? They lose it quickly! The luckiest people seem to never need the luck in the first place. So we have our hint on how to obtain luck: *When you no longer need it, you'll receive it. As a bonus note? The reverse is also true.*

The Corporate Guy: We know, you're probably questioning our definition already so we'll ask you to think about your past and see if it's true. Have you noticed that the happy guy who isn't interested in moving up is typically the one who does move up? Have you noticed that the same guy has no problems with being laid off yet is never laid off (ever?). Have you noticed the reverse? A guy who is desperately in need of the job/career gets laid off. Or. The guy who recently took a large mortgage is typically the same guy to get cut first? We've noticed as well.

Now, we're not saying you'll simply move up the ladder by doing nothing the real key seems to be stress. They are called "happy go lucky" for a reason not "unhappy stop lucky". Luck seems to favor those that are in a relaxed state and we'd wager it has more to do with 1) performance and 2) mood/demeanor. What person works better with massive amounts of stress hanging over his head all the time (recall the last time someone stood staring over your shoulder as you tried to work)? What person would promote a guy who is constantly negative all of the time? You all know the answer. No one. At the end of the day work is about performance and more importantly people management as you move up the chain and the "Happy Go Lucky" guy is typically the better fit 99 times out of 100.

Dating: Another fun one. Always common for ex-girlfriends or flings to show up right around when you're in a new relationship. Similarly, once you've stopped partying hard for a while and simply go out to have fun here and there your ability to meet new people goes through the roof. Luck? Or the creation of luck? We'll go ahead and say you've created luck. You no longer need social validation and that improves your overall demeanor and it is beyond easy for you to strike up conversations while sober in a night club or a grocery store. No difference to you.

Not good enough? Think about all of the guys you know who tend to do well with women. Are they constantly looking for the next "trick" to get girls? Are they willing to give up their entire career or business to move to a third world country just to meet girls who are 0.5 points better on the same old 1-10 scale? Are they going out incessantly to get "better"? Of course not. Unlike the guys who are faking the actions of successful, relaxed and confident men… They already have these qualities so it doesn't need to be faked. Once again. Once you don't need the validation, opportunities begin to show up on your door-step.

Money: This is what you're here for. Good ole' money luck. If you're reading a blog called Wall Street Playboys and have no interest in becoming a multi-millionaire… we have no idea how you've stumbled upon this website. That said, money luck requires the most mental and physical control. If you don't need it, you'll stumble on it several times over the course of 10+ years. In other words, "the rich get richer", a rare saying we 100% agree with.

Now to prove our point, have you noticed that large opportunities seem to land in front of people with money first? Have you noticed that people who are happy with what they have tend to stumble upon more ways to make even *more* money without needing it? Well we have too. The reason is simple really… when you don't need to make more money you value your time. By valuing your time more? The options weed themselves out for you. Instead of working for a $100 a hour when you were young, you're able to say no and go out to lunch with someone else as a favor instead (doesn't make economical sense but makes sense from a utility maximization sense).

Step by Step on How to Create Luck

On to the good stuff. Before we begin, we're not saying you'll stumble upon *Good Luck* by sitting at home doing nothing. The only people who will benefit from doing nothing at all? Those set up for generational wealth (see lucky to be alive!). Instead, we'll go ahead and give you the step by step to creating luck from scratch! After all who wants to work hard when this crazy game of life can throw money at you for simply having a good time.

Step 1 – Get Financially Stable: It is practically impossible to be happy go lucky when you're broke. Rare specimens can turn it around in terrible situations (think Trump in the 90s). That said, we'd focus on creating a nice financial buffer before trying the more extreme versions of luck creation. A decent buffer is somewhere around 2x annual living expenses. You'll become much less tense knowing that a layoff won't leave you on the Streets.

Step 2 – Keep on the Path: The biggest way to ***destroy*** luck? Go down multiple paths at the same time. You see, for some reason luck favors people who are unrelenting and hard headed. If you've decided to go down the sales path it does not make sense to jump into a coding boot camp. In addition, if you've decided to go into Technology please avoid starting a real estate company. So on and so forth. You're allowed to choose *two* ways to earn an income. You'll focus on these two paths (no more) until luck comes your way.

There are a million ways to get rich. Just don't look at the ones unrelated to you. Luck is distributed equally according to our advanced calculations (we've done none). If you spend 10 years on one path you're more likely to get lucky than if you were to spend 2 years on five different paths. Keep searching and each street, avenue or freeway will have at least one pot of gold. Much harder to find if you're constantly looking at the paths unrelated to you (wasting valuable time!)

Step 3 – Learn to Laugh at Yourself: The second biggest way to ***destroy*** luck? Taking everything seriously. You already know the type. Those guys who are constantly stressed out about the next Career move, the next investment, the recent price in XYZ stock that they were "going to invest in but forgot". So on and so forth. Sure Steve Jobs and others make billions and take everything seriously… If that's the life you want to live, this blog probably isn't for you. Who would enjoy going through life taking every single detail seriously when he could get his pot of gold… blow a good chunk of it in a party infused flame of glory… only to have no way of spending it all anyway! We're hoping you're in the second group otherwise you're probably not fun to hang out with anyway. The feeling of embarrassment is for people who take themselves far too seriously.

Step 4 – Identify Trends: As stated earlier the more popular definition of luck is "Luck is what happens when preparation meets opportunity". The problem is that we're discounting your ability to perceive the future. Does it take a rocket scientist to realize that live streaming will displace "news reports"? Does it take a rocket scientist to realize that mid-teir education systems will go the way of the dinosaur after being displaced by online resources? Does it take a rocket scientist to realize that sales is harder to automate when compared to book keeping? It sure doesn't. Your job is to identify trends and ideally see an inflection point ~5-10 years out. This gives you a full five years to live in the abyss staring at an opportunity that no one sees until it is too late for your competition to catch up.

Step 5 – Hang Out With Lucky People: In the "48 Laws of Power" the Book recommends avoiding the "Unhappy and Unlucky". The best way to do this is to find lucky and happy people. Importantly, if you're finding that people are unwilling to hang out with you… Well guess what that means? You're likely unhappy or unlucky. And. If you're either one of them, you're likely to be both soon! Before it's too late, try and mirror the traits of the happy and lucky (women are generally bubbly and happy for a reason, they know how good luck works!)… Sure enough you'll be one of the people everyone wants to hang around for good luck. Who knows, they may even rub your head for good luck in the future (joke).

Step 6 – Do Not Hope or Wish For Luck: This is the last item on the "avoidance list". By wishing for luck you'll guarantee it won't happen. Luck isn't interested in people who need it (see our definition). Luck is only interested in people who don't have a care for it. So you switched affiliate offers the week before it dried up? Laugh at the stroke of luck and have a shot of tequilla. Had an infographic go viral that results in a one day windfall of 5 figures? Go ahead and blow $1,000 at the wine bar and hand out free drinks to everyone in sight… say nothing about your good fortune. Luck favors those that are willing to lose it all and by blowing some of it you're likely creating more of it anyway. Just don't hope or wish for it otherwise the music changes from James Brown to the Jaws Theme song.

Step 7 – Stay in the Flow of Money Luck: The best way to get money luck? Be there when it is present. No we don't mean rap videos, we mean the transactional nature of money. When large amounts of money are moving around, someone is typically being paid to facilitate the transaction (make the market). Imagine owning just a piece of something as popular as Coinbase. You can create a large amount of money and be exposed to multiple currencies all at the same time. If you don't believe in staying within the flow of money just ask a payment services company (Paypal, Visa, Coinbase, ADP etc.), a major bank or a high end real estate agent.

Step 8 – Create a Stress Free Life: As your income goes up, your net worth also goes up. This is where the fun balance comes in. Constantly take on more risk so long as your stress never increases. This means you never want to feel like you're under a lot of pressure (see performance declines) and it means you should enjoy taking on more risk. If you feel uncomfortable clicking buy or levering up… shut the deal down. Luck rarely favors those that are uncomfortable with the risk they took. Notice. The key is that you must feel comfortable with it. That is why many people can take on a lot of risk and sleep like a baby.

Step 9 – Sit Down and Realize Life is Meaningless: If you've done all of the items above your luck is likely improving. You'll get to a point where you "feel" like you're searching for meaning. Make the mental jump and realize *everything* is meaningless! We're only going to live for a 100 years or so and none of that valuable time should be wasted on "discovering the meaning of life". Nobody will remember if you died with $100M, $10M or $0 in the bank. After all, you're rich already so the only excuse for being unhappy is staring right back at you every single time you step in front of a mirror! The word that describes rich intense unhappy people? Easy. Boring!

Step 10 – Create a Troll/Hobby Website: Create a website entirely made for the laughs since blogging for money is foolish. Somehow it grows despite any effort at all. Change the direction of the blog. Leave an industry you worked in for several years. Write a book on it and give it away for cheap because you've already left the sector anyway… So who cares if competition goes up! Good old luck will probably show up somewhere down the line because of this anyway. Name the website WallStreetP…. Wait.

Let us know if you have any other tips for creating luck. If they are serious in nature? They will be deleted because we'll know you're lying!

****

Crypto Currency a Basic Introduction… The Future.

Crypto Currency a Basic Introduction… The Future.

Decentralized crypto currencies are here to stay and will revolutionize the way we live. The naysayers typically bring up topics such as quantum computers (solved with a fork), 51% attack problems (would be self-defeating as value would go to zero after spending on compute power) and government regulation (which was unsuccessful with BitTorrent for the music industry). Instead of exchanging value with middle-men (banks and money exchanges) we'll be able to exchange value directly, quickly and without the need for expensive fees. While scalability is an issue, this is no different than scaling the internet back when it was difficult to near-impossible to send pictures. With enough developers solutions are found. Now that we've made a bunch of aggressive comments we'll jump into the fun point of going through how to get involved. We have a personal finance book coming out in January of 2018 that will explain how we would invest in the space.

Why Does it Matter? In a sentence, the use of crypto currencies will allow us to communicate instantaneously without the use of middle men. No longer will you need to send $100 to a friend in London and pay a $5-30 transfer fee (this will be a mere penny in the future). *The deletion of a middle man is profound as it allows you to trust anyone in the world*. Imagine being able to buy and sell products online to people anywhere around the world with 1) minimal transaction fees, 2) knowing both the sender and receiver will not be burned and 3) the transaction being done instantly. That's essentially the most common value proposition of crypto currencies.

The second part, which we won't go into in detail allows you to offer the same value as a fill function. Meaning, if certain triggers are hit the "value" or crypto currency is released. If Floyd Mayweather wins a fight and you bet on him, the funds for your bet are then released (counter party risk is deleted as it is an automated escrow release). While a simple escrow release is an "if then" feature, there is nothing preventing a fill function from being performed on 1) cars with gasoline, 2) supply chains that need new product, 3) the medical industry to make sure all the right drugs are on deck… so on and so forth. Instead of an inefficient human making this decision, it will automatically signal the order to be "filled" releasing the funds for the transaction… Before people suggest that this is science fiction we would recommend googling around for examples of this (fill and auto send responses)… *They already exist*. Scale of course is still a major issue.

What is the Implication? Well for one, a lot of the value that Banks had goes away. Crypto currencies are a *dis-intermediation technology*. In our book, Efficiency, we specifically recommended avoiding certain parts of the investment banking food chain (ECM in particular will not be a good place to build a career). Take a step back and imagine all the intermediaries who simply accumulate fees for providing "trust". Since trust will now be ubiquitous the value in those intermediaries go away. Don't even think about investing in things such as Money Gram or a Western Union long-term!

Now before this sounds like it is simply "bad" and there will be no jobs… the good news is you're now scalable! Forget about middle men taking chunks out of your value to society, the money will go directly to you. Any business that saw profit erosion due to transaction fees will now see margin expansion. You as an individual (yes everyone reading this!) now get to be *free*. You're now free for your overlords which allows you to take full responsibility for all of your value (this includes your money, so if you lose your keys you have no one to blame but yourself). More responsibility, means more rewards.

Sovereign Individuals: The third most important topic is the idea of becoming a sovereign individual. If your money and worth is now tied to the Internet and you're in charge of your money… the government will now need to compete for your residency. After all, if your worth or money is now seamless and portable around the globe, you'll be free to live in any country of your choice. We doubt this level of freedom will be seen in our life time but it could certainly happen (need to be optimistic). Hint Hint: if you run an e-commerce site be smart and start accepting crypto. You can also read the book the Sovereign Individual from Amazon for a few bucks.

The Bad Parts: Now that we've given out the big highlights there are a *ton* of problems with the technology today. We don't even know where to begin but we'll go ahead and start: 1) the transaction fees need to come down to make it more scalable, 2) transactions cannot be reversed at this time making it difficult if a single error is made… your coins can also be stolen with no intermediary to help you, 3) the speed of the transactions need to be improved dramatically, 4) privacy is a long-term issue with no apparent solution, 5) an alarming number of scam companies are using ICOs to raise money which will eventually lead to a collapse and damage the built in trust and 6) there is significant debate amongst the development teams (on each blockchain) in terms of what the best solutions are for all of the problems listed above.

Example of a Scaling Debate: Since the bad parts are broad will give an example. When Bitcoin forked into Bitcoin Cash and Bitcoin… the sides were split on the best way to scale Bitcoin. In short, Bitcoin is going to be scaled off chain through the lightning network (essentially creating a channel offchain to allow for micro transactions) while Bitcoin cash suggested that the block size was the major issue and by increasing the block size, everything can now remain "on chain". Before the trolls jump in, the key items for Bitcoin Cash are: 1) larger block size, 2) replay attack protection and 3) changing rate of block reward which is why there are more BCH than BTC in circulation today. We'll keep our predictions for the book, but as you can see scaling Bitcoin (improving transaction costs) is not an easy solution and the debate ended up splitting the Bitcoin community. (for fun… a hard fork is when you have two separate chains, versus soft forks which are software updates on the same chain without a split)

How To Get Involved

As stated we'll keep most our predictions for the personal finance book, that said we'll outline several ways to get involved if you're interested in investing some money into crypto currencies today.

Buy on an Exchange: Most novices begin investing by logging into an exchange and purchasing crypto currencies with cash linked to their checking accounts. Examples of exchanges include Bittrex, Coinbase and Kraken. These coins are then stored on the exchange where they can be kept or sold back to the market at spot prices (+ a typical transaction fee).

Storing Your Coins: The individuals involved in crypto currencies for the long-term do not store their coins on an exchange. Look no further than Mount Gox which caused a collapse in the price of Bitcoin as the exchange was hacked. The *blockchain* was not hacked. The *exchange* was hacked. This would be equivalent to giving the pin for your ATM card to a random person (easy to steal at that point). Instead of leaving this potential risk on the table the two more common storage methods are a hardware wallet or a paper wallet. To cut to the chase if you'd like to use a hardware wallet you're best off with a trezor or nano Ledger S. If you're going to store on a paper wallet, be sure to keep the paper in pristine condition and store in a fire & water resistant safe.

Become a Miner: If you're looking to remain entirely anonymous and never go through exchanges, you can also mine the crypto currencies. There are many different crypto currencies and if you find one that you're interested in… go ahead and build or purchase a miner. Just remember, the electrical costs in a first world country make a lot of these ideas unprofitable.

Where to Do Research

In just a couple of pages we've outlined why people should care, why it will matter and how to store all of your *coins*. Now for fun we'll give a peek into what we'll cover when we come out with our investing book. Here are the coins the typical person should understand:

Bitcoin/Bitcoin Cash: To avoid the trolls, we're putting them both into one paragraph. Understanding the coin(s), the scaling debate and how the software code works is the first step into crypto currencies. Think of it as the gateway drug. Without understanding the value of Bitcoin and understanding why decentralized, open source software code is valuable… the average person will be in a world of hurt.

Ethereum: The second most known crypto currency developed for smart contracts. Ethereum offers a significantly different value proposition, the code is run differently and the network is separate from Bitcoin. This is a Turing Complete virtual machine which allows for "smart contracts" (recall the fill and send application highlighted earlier in this post).

Litecoin: Essentially a similar coin to Bitcoin but with small technological differences.

Monero: Another coin similar to Bitcoin with more privacy. A "vanishing" coin that makes it impossible to track at this point (unclear if this will be the case for decades in the future). It doesn't take long to understand the value of 100% anonymity given the illegal drug market.

NEO: Essentially an Ethereum competitor that allows for a variety of programs to be run, compared to Ethereum which is run with Solidity. Solidity is a contract-oriented, high-level language whose syntax is similar to that of *JavaScript* and it is designed to target the Ethereum Virtual Machine.

Hopefully we've already stirred the pot a bit and look forward to seeing how many people understand the space at this point. It should be incredibly clear as to why we left Wall Street at this point (disintermediation technology is not going to help banks).

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like *Efficiency, Get Rich Without Giving Up Your Life*. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality)

Crystal Clear Structural Changes After COVID

Crystal Clear Structural Changes After COVID

For our astute readers, we've been missing in action for a couple of weeks as we were finalizing research into the great depression of the 1930s along with the impact of money printing. Some of the things we're seeing today are eerily similar. In addition to that, a strange dynamic has occurred where parts of the world are actually open: Korea, Japan, China, Taiwan and Singapore are in much better shape than the USA. The USA has a narrative that we should blame the virus on China (fair enough), but, it doesn't change the end result. These countries are operating at normal (or close to normal) while the USA has no clear timeline to recovery until at least September/October. Pains us to say it but the US is just too far behind tier 1 Asian countries to catch up, the propaganda we receive stating that we're ahead of them simply isn't true (those who are well travelled understand this). The US needs to invest and invest NOW. With that said lets jump into the changes.

#1 Structural Change – Money Printing: If you cannot figure out what to invest in when governments are forced to print endless amounts of money you either need to do research yourself or you need to focus more on making money. Why? Well the only people who cannot figure this out = people who have not made any real amount of money or people who don't like to read. They are usually the same person.

With the tough love out of the way, the answer for the lazy is simple: commodities and crypto. These two asset classes make the most sense and is in-line with views we made several times and even predicted a recession in our book Spending for Maximum Return. In fact, this book was so timely we're shocked it isn't outselling Efficiency!

When you increase the money supply, all you are doing is changing the price of goods long term. People who do not like to read will ask questions like "how come it isn't going vertical RIGHT NOW!". These are low quality questions because you cannot simply go into market place and "market buy" $1-2 trillion dollars worth of anything. Imagine trying to buy $1T worth of Apple stock, even at a $1T+ valuation, you're attempting to purchase over half of the company in a single day. The price will go vertical and you'll completely crash the market.

The time lag is roughly 60-120 days (give or take). When you hear about the next stimulus bill (you can bet they will give people money as surely as the sun will rise tomorrow), realize that this won't really hit the system until 60-120 days later. Until we have some sort of sense of normalcy, unemployment rates of around 7-8% or so, interest rates will remain at zero and maybe even go negative.

#2 Structural Change – Work Environments: The low quality comment from March was that Companies would need more office space to social distance. This comment was beyond crazy as you'd have 1-mile long lines to get into major elevator banks at high rise complexes. After a few months, even Google stated they would be doing more work remote. This was significant as they spent hundreds of millions on new campuses. They had skin in the game to push for a return to normal work… they are now back pedaling.

Going forward you want to become a knowledge worker at minimum and move any of your ideas online. We've been pushing the online income angle for years and those that succeeded are actually UP in terms of income. Take any brick and mortar and think of ways to convert that into an online business. Sure you won't be able to see immediate returns, but like anything in life, the real gains are seen down the line after sudden inflections upward.

Since more people will work from home, this means suburban areas just became more valuable. Having a home office is a real selling point and you will likely see security system sales increase as well. If you are leaving major cities due to crime, you can guess that security systems will also be of value to you.

#3 Structural Changes – Taxes: This is going to become VERY interesting. There is no clear conclusion yet but there is a clear answer here: taxes will need to go up. (Notice this means 401K tax deferral just became meaningless if taxes actually go up later). Does this happen next year? Probably not. Does it happen within the next 5 years? High likelihood. There are too many scenarios here so we we'll go ahead and outline all the various ways for it to happen:

Tax Adjustment Potential: 1) tax free states begin to tax their residents, 2) federal tax brackets change, 3) subsidies for companies begin to go away, 4) wealthy people move to the most tax advantageous regions, 5) real estate taxes go up, 6) consumption taxes are increased and 7) capital gains taxes are changed. If it gets really really bad, you could see governments quite literally take money from accounts as we saw in other countries (IE. you have $100K in a brokerage account and they take 10% from everyone instantly after locking their accounts).

This is going to cause a lot of interesting issues. If you're wealthy you're going to leave the high tax states for good. If they attempt to change the rules in a place you just moved to… you can move yet again. This is the reality of the new working environment. If all of your work is mobile, you can jump around with relative ease.

What does this mean long-term? Call us crazy but it seems like this will be the first step in causing countries to compete for the best and the brightest to move to their country. If your work is entirely remote and you're a high quality producer… Your country needs to find a way to keep them. For those that don't understand why this is so important look no further than NYC. When billionaire hedge fund managers leave, they cause such a large tax hit that the entire state is forced to reduce government employee salaries. Now imagine this but at a MASSIVE scale. Instead of attacking the talented you have to find a way to keep them in your country. Otherwise you get nothing but brain drain and are left with talentless people who drive down the production in your country.

#4 Structural Change – Global Work Force: For all of the people who are thrilled to be working from home, it is time to remember that this has opened up world wide competition. If your job can be done remotely, there is no reason to hire someone in the USA vs. any other country assuming their skills are higher. While there are some communication issues, in general, you've opened up the pool of competition quite a bit.

If you're working remotely it means you're going to rely on technology. If you rely on technology it also means that you're going to have a net reduction in human capital needs. This is a simple fact that many don't want to believe. The entire point of technology is to remove remedial human tasks. As more and more companies look at remote set ups they will learn a lot about video conferencing, automated calendars and software tools to get more capacity out of their technology infrastructure.

This is great for you. If you start your own e-commerce/online based income stream, you won't have to hire anyone. You can scale for quite some time without the need for a single hire. Building out a "team" becomes a relic of the past. You only need a few high quality people who actually add value and the rest can be ignored. You've created an entity that not only grows faster but has higher margins! Overhead walks on two legs.

#5 Structural Change – Crypto: This is going to get very interesting as well. In fact the next 10 years is going to be fascinating as a whole. Crypto currency is an answer to not just the financial system but the overall transfer of data and information to the user vs. a random "woke" Company. Instead of being forced to give away your data, you can have choice. Instead of being forced to hand over all of your photos to Facebook and Google, you can choose to block access. So on and so forth.

Crypto creates an establishment of trust world wide when we live in a society that is becoming more skeptical in nature. You cannot print trillions and trillions of dollars and expect people to believe the economy will suddenly recover. You cannot force people to close down their businesses and then expect them to maintain all of their employees due to an interest free loan (that still needs to be paid back by the way). You cannot have mass riots on the Streets in expensive areas and believe that rich people will simply "live with it". These conclusions are not even debatable.

If the 2000 to 2020 range was the year of the internet and software, 2020-2040 should become the year of decentralized finance and new internet economies. A form of money that is devalued by trillions every 3-5 months is not going to store a lot of value.

#6 Structural Change – E-sports: If you were not bullish on e-sports you should be extremely bullish now. How can you be negative on a growing sector when people are forced to stay at home and have nothing else to do for entertainment? It seems quite obvious that e-sports will become more and more popular for the younger generation.

Notice, we're not saying that this is healthy for them. But. You'd be a fool to avoid investing in coca-cola stock just because it isn't good for you. With high unemployment, video games are a form of cheap entertainment & they can be used globally.

The only issue we see in the near term is that online gaming leads itself to cheating. Without organized venues for competitions a lot of people will use hacks/cheat codes to make sure they win. This is something that will be solved over time and it is a lot easier to socially distance with a computer room. All you'd need to do is have each room manned with a representative from the Company (check them to see if they are cheating) and move on.

#7 Structural Change – Humans are the Same! This is a fun one… humans are structurally the same and always will be. This is why we're going to load up on Canelo Alvarez whenever he fights and remain positive on Trump winning the election. No matter what changes, humans are going to make the same short term decisions and think in the same manner as they did before. The only difference is they apply their flawed logic to a new ecosystem.

If you want proof of this look no further than Litecoin. The founder sold all of his coins at the top and the conclusion was that "he was trying to remove a conflict" which made little to zero sense at all. The price crashed since everyone knows what it means when a founder sells his entire stake.

If humans are the same this means it is likely that Trump wins. We have had this same view since 2017 when his odds were 3:1. We've been positive on the same trade since then. Even though he is losing in the polls by the time October comes around, people will have to make a choice. Right now people are focused on the issues with COVID-19 and the economy.

By October they have to make a choice. Vote for the guy who did a great job when times were normal or vote for the guy who can't even remember how many grandkids he has. A person with visible issues that appear to be the onset of dementia or the status quo. Also. Lots of Trump supporters know they could be fired for being a Trump supporter so they would never answer polls honestly (unless they want to risk their jobs/careers).

#8 Structural Change – At Home Care: From gyms to saunas to facial skin care products, more and more at home solutions should succeed. Why go to a gym when you are now living in a home and can build one yourself? Why go to a professional skin care person when you can have your own routine and avoid catching a dangerous virus? Why go to spas when you can create one yourself in your much larger living situation?

We realize these changes refer to the rich but we have to think about that market as well. If you're rich, you value health and privacy a lot more than the average person. This ticks both boxes and it might even create a much healthier routine for you as well. Take a wild guess if we'd recommend starting an internet biz based on this theme!

#9 Structural Change – Home Improvement: This is going to continue for the foreseeable future. We're not sure how to invest here besides basic stocks like Home Depot. Our best guess is that there has to be a business venture here in landscaping. No rich person is going to spend their time digging ditches, pouring concrete and watering plants. They will pay thousands of dollars to have their yard work taken care of by others.

An interesting angle is to look at the latest and greatest tech products for landscaping. There has to be disruption in the next 3-5 years if we already have robots that take care of distribution/warehouses. Find the right products to help with a common task (retaining walls, concrete pouring, plants and creating a terrace).

The big big big downside here is that this is currently a people business. This involves a lot of headaches, being yelled at by rich people and having to listen to their every little detail. The good news? If you have nothing else to do to make money, this is a good backup plan for now.

#10 Structural Change – Real Estate Value: This is going to be quite messy. Major cities are seeing large reductions in rents. If you had a cap rate of just 2% and suddenly your rental income has to go down 20%, now you can't even pay the mortgage with your tenant. Since people are extremely egocentric, they think that it's perfectly fine to not pay rent "my landlord is rich!". Even though he might be losing tens of thousands of dollars per month due to missed payments.

Moving on, this means you should be very careful when you invest in real estate. While prices may go up due to unlimited money printing, it is not clear if particular major cities will benefit. The major cities are stuck between a rock and a hard place. Raise taxes and rich people will leave. If you don't help the mid-low income families, you see an increase in crime… which causes rich people to leave.

Our simple take is that you want to be exposed to mid-sized suburban homes. This is because families will be forced to live together for longer periods of time and the value of these homes is reasonable. You are in the middle of the risk curve. If things go back to normal quickly, there is still demand. If things do not go back to normal, you own an asset that is in extremely high demand. Think middle class suburban home in tax free areas with good school districts and high quality healthcare systems.

Making Some Fun Predictions: With the high level out of the way, we're going to be looking for all of the following: 1) notable real estate issues now in 2021, originally we expected this to blow up some time in August/September. However. New legislation is going to extend the laws on evictions. So this can't blow up by definition until that is complete. This puts us into 2021 (see we do adjust opinions sometimes!); 2) increased number of gamblers as a percent of the US population. This sounds quite random but makes logical sense. Sports betting and anything to get a "high" will be in demand. If you can't drink, party and do drugs you're going to chase dopamine somewhere: options, betting and leveraged bets on crypto will be likely; 3) big increase in religion, we've been saying this for a while. Since many will go through terrible economic times, they will need a form of hope and optimism. Religion offers this and is one of the major benefits of the entire culture; 4) lots of stealth wealth. If you are making money right now you're better off hiding it. You should be spending tons on growing your business… And you should be hiding your success. The current environment allows you to pretend that things are going bad for you. Take advantage of it since flashing money (today) is just going to lead to crime. You can show off more when the economy is normal again; 5) big divergence in fit vs. unfit people. It was already bad but it's going to get worse. People who are interested in self improvement are likely seeing significant gains. They went from being forced to workout while exhausted to being able to workout whenever they like. Should lead to a lot of at home gyms and healthier living for a large chunk of the population and 6) you're going to see a lot of pain and suffering for people in their 20s. They will be forced to live at home due to the current circumstances. This is going to stunt the growth of many young men so you can expect that in 2030 or so, a lot of the 30 year olds will have the mindset/thinking patterns of a person in his mid 20s.

From an investing perspective you only need to know that the money supply is going to go up. That means you're simply going to own bitcoin/other crypto you believe in, gold and tech stocks. That has been the trade for quite some time. If you force us to choose we're going to say the same thing we said when it hit $4,800, likely the best performing "asset" for the next 2-3 years will be bitcoin/crypto in general.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life. **We hold Q&As 1x a month for purchasers only.**

Dating Life for the Average Man in America

Dating Life for the Average Man in America

Lets take a look at what happens if you decide to be average in the dating market. It isn't pretty so lets go ahead and jump right in.

Joe in College: Professors who have accomplished nothing, are teaching him about sociology and life. They obtained PHDs in XYZ humanities major to pursue a career in teaching the exact same major. He believes that women are princesses who should be treated accordingly. Besides, they have been oppressed for so long.

Joe gets black out drunk at college parties. He gets a sloppy make out here and there… he even loses his virginity by acting outlandish at a party. He can't put two and two together. He catches feelings for this new "girl" and she rejects him.

Joe 23 Years Old: He gets on tinder and every other online dating program there is. He still doesn't have the skills or courage to simply meet people in real life so he sets up dates by utilizing "online game".

Oddly enough, every single date he goes on ends with some sob story from the girl he is with: "Oh my god this D-bag I was dating cheated on me…"

He nods and consoles her. At the end of the date he gives her a hug and doesn't even bother going for a kiss. It's too soon.

He cannot convince her to meet in the future.

Joe 24-28 Years Old: For some reason his matches on Tinder are increasing but he is still not able to secure a girlfriend. He gets too drunk on dates, but surprisingly, a lot of these drunken dates end up in a notch or two. The girls immediately have no interest in Joe the next morning and go back to their regular lives. He feels slightly happier about his life but somewhat empty inside, he feels the need for a relationship.

The girls? They get high fives from their friends. Her closest friends call her a "slut" and it is taken as a complement. They proudly keep their "Come Party With Sluts" t-shirts from college Spring Break.

Joe 29 Years Old: For some reason he is receiving a higher amount of eye contact from women. He just turned 29. Miraculously, out of the blue, he meets a 29 year old woman who is "done with the scene". Everything is perfect! He's ready to settle down, she's ready to settle down… What could possibly go wrong? He ignores the fact that she approached him at a party. It is odd because this never used to happen before.

What a coincidence!

She forces him to wait 7 whole dates before they have sex and he is completely cool with it. He never gets the details about her previous partying past. Unbeknownst to him, it was chalk full of drugs, alcohol with strange men and many, many, many one night stands.

Joe 30 Years Old: Joe is somewhat happy in his current relationship, he is gaining some weight but it's not a big deal. His girlfriend invites him to multiple weddings and she attends many bachelorette parties in Las Vegas. Joe is no longer on Tinder, he does not have any online dating accounts. Everything happened according to the *"life plan"*

As his physique gets slightly worse, he begins dressing slightly worse and naturally the reaction from women is slightly… worse. He doesn't have the social skills to recognize the changes and continues down the path.

Joe 31 Years Old: He finally pops the question to get married. She immediately agrees. They begin sending out wedding invitations.

The photo on the cover is a picture of him kissing her on the cheek and her staring directly at the lens. The classic photo for a wedding afterall.

Walking down the aisle, he is on cloud 9. He finally found that missing "piece" in his life.

Joe 31-34 Years Old: He sees that many of the likes on their wedding photos are from men. Some of these men are even the guys he used to hate in college, those "dude bro d-bags", those losers.

His wife is now pregnant and he assumes the mood changes are due to her conception. Things will change in a few years he says.

Joe 35 Years Old: Nothing has changed for the better. Joe is changing diapers, running around the house and trying to bring in more income at the same time. His wife did not lose the weight she gained during her pregnancy and she wants to quit her full time job.

As the days go on he continues to question his life decisions. A life he cannot live again…

****

December Q&A is Closed

Q&A is now closed thanks!

****

Deflect or Agree with Everything (a Huge Time Saver with Regular People)

Deflect or Agree with Everything (a Huge Time Saver with Regular People)

This blog is essentially regular people repellant. The average person takes one look at the name of the website and eyes begin to roll. Instead of reading through and finding out we've already met several people in real life and this is not run by a bunch of broke people, the average person moves along quickly. In essence, this website encapsulates what we call "rapport breaking". Everything about it is set up to push away and detract regulars (also known as mosquitoes).

Now unfortunately… you're going to have to interact with regulars on a daily basis and no one should take on the tone that we use in this blog (although it's what we actually think!). We'll go ahead and summarize the best way to go about your day to decrease your interactions with these value leeches …. *Deflect or Agree*.

Two Key Principles

Principle #1 – The Blame or Praise Game: The average person believes in superstitions. Make no mistake about it. The typical person has lucky socks or lucky shirts or some insane item categorically unrelated to success or failure. This is an absolute necessity to understand. People will attribute "value" to obscure objects that are unrelated to success or failure.

If you said hi to someone in the hallway and they got fired 20 seconds later… There is a chance they will blame you for the event! In addition, if you said hi to that same person 20 seconds before getting a promotion, they might view you as "lucky".

There is a reason why weather women routinely get hate email in volatile climate areas and it has nothing to do with logic or reason. They are just looking for someone to blame.

This strange phenomenon is also known as "Shooting the Messenger" or blaming the person who delivers bad news. Unfortunately, *the phrase is not entirely correct*. The correct way to understand this phenomenon is "Shoot **or** Praise the Messenger". If you need an example of praising an unrelated messenger… just look at Television Game shows where people hug and kiss the host of the show even though he had nothing to do with them winning the prize. All of the people who win the prize will say "the host was amazing!".

Hopefully, with the short paragraphs above, you've already identified a few people who view you favorably or unfavorably for unrelated reasons.

Principle #2 – Forced Connections Cause More Hate: This is the second most important item to understand. Due to some sort of "sixth sense" people do not like it when others attempt to become the messenger (or avoid being the messenger). If a good event happens and an individual comes out of the woodwork to praise them… a baseline value of contempt is built. In the reverse scenario, if you witness a negative event and run away suddenly, the person will then believe you had something to do with it and… a baseline value of contempt is built.

Now we see the clear conundrum. Fortunately, there is an answer which is the *Deflect or Agree* framework.

Deflect or Agree

Deflection Points:

Avoiding the Blame or Praise in the First Place: Once we all agree that there is an implicit blame or praise dynamic at play the first step is to play offense. Like practically everything else in life, playing offense sure beats playing defense because you can continue to put the pressure on the opposing team to recover. Playing offense in this case requires you to **deflect** situations where Blame or Praise will take place. The last thing you want to do is have a group of regular people blaming you for their problems (regular people have a **TON** of problems with nothing to lose). In addition, you don't want them asking you for help either (time suck).

#1 Steer the Conversation: Since you'll develop a solid baseline set of sales skills, you will have solid conversational abilities to help steer any and all conversations. You'll naturally find yourself mirroring the body language of everyone you speak with, helping you establish a baseline level of rapport and nothing more. Now your goal is to avoid being associated with anything positive or negative. *Deflect* the conversation to irrelevant pop culture or headline items.

For one reason or another, this seems to work and there is always some meaningless article on Yahoo, Twitter moments or otherwise to pull from. The most consistent item to use is a "widget description" conversation. During the rare times where you're forced to interact with regulars you will ask them about the latest "widget" that came out. New iPhone, New Oculus Rift, New Restaurant… so on and so forth. Now you'll see what we've done with this set up!

After steering the conversation to something "new" that came out you get to ask questions about it since 90% of people will know about it. Pretend you don't know much about it and have them *explain* the widget or what food the restaurant serves, so on and so forth. This is key as you become the "student" in this situation and the person will feel like they added value by giving you information. Importantly, *do not ask them for any actual advice.* All you are doing is asking for *descriptions*. This will make it extremely difficult for them to claim that they added any value to your life since all they did was regurgitate something you could have learned with a five second google search.

In short, ask for *descriptions of innocuous items* and be happy/jovial about the response so you can be the "normal" guy in their eyes.

#2 Deflect All Advice Related Topics: Unless you're asked for it, never give any advice. People don't want advice they just want to hear what they already believe. Since you'll rarely be asked for any advice (a good thing), don't dig your own grave by giving out advice on any topic. Never have an opinion on sports games, politics, making money or otherwise. In fact, if at all possible, your default deflection response is "I don't know anything about XXXX to be honest, I really wish I knew but I've never learned about XXXXX".

There is a strange part of human nature where it is difficult to watch someone do something incorrectly (your instinct is to help)… Don't do it! They won't want the help and even if you're right they typically won't listen. Again, don't give any advice and deflect all advice related topics.

You know you're moving in the *wrong* direction when regular people are asking you questions all the time in your day to day life. Deflect *all* topics away from anything opinionated.

#3 Physical Deflection: You know who regular people don't trust? They don't trust clumsy people (psychology). So you've guessed it! Appear a bit clumsy. If you know you'll be forced into a regular person interaction mess things up a bit. Make your collar unaligned, carry a glass of water far too full of liquid so you're walking around carefully and spilling a tad and of course carelessly drop irrelevant items here and there.

People will not ask for advice from someone they view as clumsy so physically acting the part can certainly help deter any questions. To add to the clumsy-ness you can ramble when asked basic questions so people become a bit frustrated that it takes you five sentences to say something that could have been communicated in 10 words.

Final Note on Deflection: While we've kept it short, these three items alone will make it excruciatingly difficult to be involved in any blame or praise situation. We'd wager you're safe 90% of the time if you follow those cardinal rules: 1) steer to description related conversations – them talking not you, 2) avoid opinions by pointing to a certain aspect where you know "nothing about it" and 3) physically act a bit off or clumsy to avoid direct questions (bonus: they will talk secretly about how they can't believe you're so clumsy!)

Agreement Points:

De-coupling the Connection: Life isn't fair. No matter what you do you're going to have "regular" people ask for your opinion at some point. There is no escaping this situation. Sure we would all rather physically peel back each and every nail from our fingernails to our toenails than be in this situation… but… like paying your taxes, you're going to be forced into this situation from time to time. We're now in agreement mode to avoid the contempt framework where you're associated with some sort of an event where you want no responsibility.

#1 Guess Their Opinion: This requires a lot of quick thinking but you may be able to knock it out quickly. Anyone who asks for advice just wants to hear their own opinion as stated above (reason for avoiding advice). Your goal is to guess their opinion… the one that they have *already* formulated. Typically the structure is *start small and agree*.

If someone is asking about making money, start with some outrageously small way to earn money off their current skill set (time for money exchange for the win!). If it is about physical change add some meaningless item that adds a couple minutes to their exercise routine (add a few sprints!). So on and so forth.

Notice… the framework is exactly the same as advertising directed towards regular people. It involves some small "trick" that will "transform or shock" the person. *What this really means is that people are looking for small changes.* No one wants real advice that requires work, they just want some tiny change that will "change things". The enormous benefit of this line of thinking is that your small edit or suggestion won't hurt or help them. It will be neutral. This helps you avoid future requests and helps you avoid contempt (their feelings towards you).

#2 Suggest a Third Party: Have a quick list of large popular websites and forums to refer the person to. *This is a great way to avoid repeat advice.* You're going to bank on herd mentality. By recommending a large popular website or forum for the answer you can guarantee at least one person on the website/forum knows what they are talking about and you avoid burning one of your actual contacts who knows the answer inside and out.

#3 Keep the Smile and Nod Consistent: Keeping everything together, once you find that you're in "agreement" with some innocuous change lock into the smile and nod set up. "Hmm yeah that makes a lot of sense" should be your gut reaction and make it seem like they got something out of the conversation.

Final Note on Agreement: You're going to find yourself in this situation a few times and you'll be forced to provide an opinion. If you can zero in and agree on some small meaningless change you'll reap the following benefits: 1) no impact in being blamed or praised and 2) correct deflection to a "good source" saving you time

Concluding Remarks

– This set up is specifically for dealing with regular people since they will not change

– Regular people are extremely emotional and irrational and will blame or praise you for association

– Don't try to be involved positively or negatively ***stay neutral*.** If you try to swing it to be a positive you could build contempt and on the flip side they may ask you for more advice (time suck!). No winning in swinging the pendulum.

– Play offense by deflecting all conversations to description based items when possible. If you're forced into those boring topics like sports then go ahead and play "neutral" which is something regional based (home team fan for example).

– If forced into advice situations, start SMALL. No regular person actually wants to improve their life they want some small trick that could change everything for them. By making small irrelevant changes the impact is neutral and you can refer them to a larger resource beyond yourself.

Good luck in dealing with regulars, it isn't easy! It took many years to avoid arguing with idiots on the internet and giving advice to people who desperately need it. Remember these rules and you'll save hours of your life (more likely months or years).

As usual NO questions. A new Q&A will be sent to email subscribers shortly (this week).

****

Developing Belief Systems

Developing Belief Systems

After taking a quick vacation we're back to posting. The two most vouched for items were a fitness routine and belief systems. Today, we'll start with the latter.

Girls:

Overview: The first tenet that applies to both men and women is that you cannot *make* a person do anything. You can only *sell* them on doing *something*. In addition, the older a person gets the more set in their ways they become.

Given that backdrop, the ideal girl for you is going to be different from the ideal girl for person B, C and D. You look at the mosaic of the girl and bucket her as you wish. Maybe she's relationship material, maybe she's only good for a one night stand and maybe she's simply someone who is going to dislike you upon hello. Nothing can be done about this.

Once you recognize that you can do nothing to change the initial woman you're meeting, your fears of rejection will go away. As an example… If you're well dressed and well groomed when you approach a woman and her first reaction is to tell you *"Go away you're ugly!"…* Is that really a person you want to meet in the first place? The answer of course is no. You should have a good laugh because someone is going to pick her up and become disappointed in his choice later on. You won that war.

No Woman Is Perfect: Once you stop looking for a perfect woman you're going to broaden the set of women you approach. Dramatically. If you like 80% of her you're in great shape, if you like 90% of her you're in better shape and if you like 50% of her then you're looking at a one-night stand at maximum.

American Women: They are a function of the environment we live in. The USA is incredibly prosperous and no one is in dire need of food or shelter (relative to other countries) so they have no reason to **need** a man. Simply accept this as part of the territory. You cannot change how American culture operates. You're better off improving yourself and ignoring all the doom and gloom about the USA. If it gets bad enough go ahead and ex-patriate.

Cheating: If you decide on the relationship route, do not spend a split second worrying about your girlfriend cheating on you. It is a waste of your valuable time. Simply assume she is not (unless your social cues catch on).

If she is cheating? Simply leave. Do not give her the war by showing any emotions. You explain that she did XYZ and that you're leaving. Emotionless and cold. You do not return any phone calls, text messages or emails. You are gone. If you become emotional or cry when someone disrespects you, you've already lost as it implies you cared about their opinion in the first place. There are no second chances.

Women are Hyper Competitive: You'll find that women are quite catty. They will compare the status of other women who are similar to them in some way and become jealous incredibly easily. *Jealousy truly is a female trait.* This is fine and appears to be part of human nature. Under no circumstances, however, should a man become jealous of another man.

Women are Fun: No man with good game can possibly debate this. A girl you find attractive who is entertaining, bubbly and fun is going to put you in a state of calm quite quickly. If you are speaking to another man and he does not find women to be both fun and relaxing you're speaking to a man with very poor people skills or minimal experience.

Marriage: Under no circumstances do you get legally married in the USA. The court is against you and she will have no reason to be loyal to you. At most you give her a ring, give her the ceremony, but you do not sign the contract. At the end of the day, if she is in love with you, she's going to be okay with this arrangement.

Cliff Notes: With the belief system summarized above here's the cliff notes: 1) you need game in order to sell a woman on going on a date, 2) there is no ideal woman only a person who fulfills your list of needs – example list: Loyal, Bubbly, Size C Chest, Age 21-24, enjoys swimming, 3) American women need you the least so your search is likely harder, this would happen in every country around the world if given the same GDP, 4) Don't waste time on stalking a girl's every move – it reeks of insecurity, 5) Women get jealous of other women quickly, 6) women are a lot of fun, so if you're not having fun meeting them you're in the wrong place or taking it far too seriously

Work

Overview: As we have stated before, retirement is a scam because work is only work if it is something *you don't want to do.* The fastest way to avoid doing something is to have enough cash to work in any profession you wish. Cash flow is king.

Careers vs. Jobs: A career is something everyone should have, a job is something everyone should do when they are in high school to become more motivated about their future careers. How so? A job trades time for money and a career has leverage. We have beaten this one to death so we'll leave it there.

Law of Positivity: Under no circumstances do you say anything negative about an individual. None. You simply say nothing and shine the light on something positive instead. *No one gets credit for bringing another person down.* Repeat that one many times over. If you bring someone down and they become aware of it… There are quite a lot of people who will do far worse to you than yell at you. Avoid any negative associations as it is not worth the risk.

On the same topic, the implied message is to bring as many people up as possible. If you know person A is better than person B, you do not say anything about person B. You simply phrase your opinion as follows "I believe person A is ready for that task at this time".

Co-workers are Not Friends: Absolutely everyone who competes directly with you is not your friend. Do not make this mistake or suffer the consequences. The only co-worker friend relationship you have should be 100% unrelated to your job function. If you are part of an investment banking associate class and believe another associate on that floor will help you… Get ready for a pink slip if it means he can make an extra $5K getting you fired.

Go High Up the Chain: If at all possible always develop a positive relationship with a top tier manager. This does not mean your boss, but two levels above him. If you can obtain momentum from a person 2x more powerful than your boss, it is going to be significantly harder for him to view you negatively (hint hint you're helping his pocket book as well with this positive association). While not fun to talk about office politics matters *a lot.*

Savings Improve Performance: Another reason you should save aggressively? The more money you have in your pocket the less stressed out you become and the more efficient you are at work. Don't believe us? See how you feel when you have your first debt free day or first $100K net worth day etc. You'll focus much more on the task at hand as the back of your mind will no longer be clouded with financial worries.

Cliff Notes: We have written a lot about work in the past but some small items were added above. The short of it is as follows: 1) always choose a career, 2) do not bring down any employee – large or small, 3) positive momentum will apply to your career – eg: help a low end employee get promoted implies you're a good manager, 4) directly competitive co-workers are not friends, 5) reach for the juggular at all times – develop as high up the chain as possible, 6) politics matters a lot, 7) cash in your pocket will improve your performance and finally 8) *the more money you have the less likely you have to do anything you dislike*.

Investing

While the commenter did not specifically ask for this one (we'll have a few more) it is an important one. The best piece of advice we could give is the following: "When it comes to investing you should be a machine". Anyone can get rich over a long duration.

95% of People Will Fail: That is a startling and negative comment. But, it's the truth. By 40 years old most people do not have $100K to their name. This is hardly a drop in the bucket. The positive side? It is incredibly easy to find mentors in their 30s and 40s. Just look for someone who built their net worth from zero.

Doom and Gloom: Every single doom and gloom prophet is of no value. If you listen to the media, they have correctly predicted 25 recessions out of the last 2 we have had over the past 25 years. If you do not get that comment then you're in trouble! You're going to be perfectly fine if you simply invest in assets and *never sell*.

Financial Statements: If you cannot read them or build them you should never have exposure to a single security. Under no circumstances.

During a Recession: In short, nothing changes. You already have cash on the sidelines as we have outlined previously so you continue to buy. *"Fear is a bigger driver than Euphoria"* what this means is euphoria will drive a security to high prices but fear will bring it down below the actual value. The mathematical fact is you'll gain from fear. *Fear is opportunity* for the mechanical investor.

Macroeconomic Predictions: Even Warren Buffet who runs $80B+ has no predictions for the macroeconomic environment. Neither should you. Anyone who tries to predict the world is playing God and is likely broke. Just smile and nod.

Cliff Notes: Summarizing the section 1) most people won't invest or will simply fail at it, 2) Doom and Gloom prophets are of no value to society, 3) if you can't understand the financial implications of a company you shouldn't invest in it, 4) fear is opportunity for the intelligent investor, 5) macroeconomic predictions are a waste of time.. Don't believe us? When the S&P hit 1,700 we posted this idea yet people simply still asked about the macro… we're at 2,000+ now.

Friends and Acquaintances

Overview: If you have more than 5 real friends your life is already set. Do not worry about about having a lot of friends as your standards should raise dramatically each year bringing your true friend count down over time. Once you realize you have 5 friends you're a wealthy man. You should however, have hundreds of acquaintances which will serve as valuable networking tools for you in the future.

Friends: A friend is someone who will actually help you financially and physically if a negative event occurred in your life. This does not mean a brawl at a bar (leave this to the fools who fight in bars), it means a true life changing event. They should be willing to drop what they are doing and help you regardless of the near-term cost. The number of people you will meet who can either 1) afford both of these tasks and 2) be willing to do these tasks will be less than 0.01%. You should return the favor as well. This relationship is not written as a contract but is well known by both of you, under no circumstances would either of you flinch if a real problem arises. *Cost and time are not issues* when helping either of you recover. If you think about the underlined section you'll realize how little friends you truly have.

Acquaintances: This is the difference between healthy social skills and unhealthy social skills. While a club owner may give you free entrance and free drinks you know it is still a tit-for-tat arrangement. You're going to help bring attractive girls in from time to time, or you're going to leave a heavy tip as a thank you for the "boost in status" when you're at the venue. This tit-for-tat arrangement is great for both parties, he makes slightly more money as you bring in girls and you know how to leverage the perceived status. Under no circumstances do you confuse an acquaintance with a friend, keep them separate.

Managing the Friendship/Acquaintance: This is quite easy with a friendship, if you've known each other for 5-10+ years its easy to keep them happy. *You simply keep improving.* On the acquaintance side they are usually more interested in how they feel in your presence. In short, you keep them happy by allowing them to use the perks of other acquaintances you've established. See how *positive momentum* applies to friends as well? Ideally they become acquaintances.

Have a Spine: You will end many acquaintances and friendships over the course of a couple of decades. In short if someone insults you there are no second chances. An insult is clear where as a typical ribbing is not. As a rule of thumb if people consider you petty you're ending too many relationships. If people believe you're a happy-go-lucky person… but you feel insulted… It's likely time to walk. It bears repeating, only a fool would give second chances since there are too many talented people out there.

Cliff Notes: You do not need many friends, a handful is more than enough and remember 1) do not confuse friends for acquaintances, 2) have clear separation between the two groups, 3) maintain a positive tit-for-tat relationship with acquaintances, 4) have an extremely strong spine and walk when you realize someone is dragging you down – no apologies.

Life

Overview: Now for the bulkier part of the post, if we think about all of the sub sections written above we can now form an overall thesis on how to evaluate your life. *The goal of life is to maximize life-time happiness.* If you can spend 100 years out of your 100 years of life in a state of happiness, you've won. The chances of this is zero percent of course, since everyone will have a bad day, but it remains as the number one goal.

Grind Through Your 20s: Why do we recommend this? *It works.* That is simply the best answer. As you move into your 30s you will notice that your body is slowing down relative to your 20 year old self. Even athletes who take performance enhancing drugs cannot compete with men in their mid 20s. In addition? All of the fun activities that can be done at age 25 can be done at 35. Therefore it makes a lot more sense to work hard in your 20s and find what makes you happy… Then spend your money on fun in the following decade.

60 years: This is another reason retirement is a scam. If you go and work in healthcare you will find that most people are not functional by 60 years old. What can you really do with $10M by 60? The answer is practically nothing. You want enough money to take care of basic needs and should not have any regrets about the past 20 years. Think about the 60 years as a weighted timeline.

At age 20 you should spend 15% of time on fun (chasing girls, drinking, socializing), 85% on improvement (sports/health, career/business) by the time you're 30 this should shift to a 25%/75%, 35 years old it should be 45%/55%, by 40 years old 75%/25%. Then likely maintain that ratio for the rest of your life.

25% of your time with a successful career/business should allow you to reap what you have sown. The sad part is most will be unable to live this type of life.

Avoid the Herd: We got a few questions about being stressed out while in your early 20s after making all the right decisions. This is a funny one because it is *mentally taxing to do the opposite of the herd.* That is half of the reason why this blog exists in the first place. Make no mistake to everyone who made the right decisions, by the time you're 3-4 years into your career you'll be too far ahead of your peers to be caught. You can take that to the bank.

It is painful watching everyone else have fun but they will be the exact same people asking you for advice from 25 years old and beyond. Get ready to walk away from a lot of acquaintances, some may even attempt to drag you down.

Always Learning: Under no circumstances do you allow your brain to rot. If you are not reading something with your spare time, go and buy a book today. Anything. If you cannot think of a book we recommend several. This is the easiest way to remain interesting in conversations. Finally, you learn nothing from television – nothing, use it for entertaining guests but it should not interest you in the slightest.

Confidence is Built Overtime: Absolutely nothing good happens over night. If you are able to stay the course in life, making the right decisions consistently, it will snowball. Confidence just like knowledge, just like investing, *compounds over time.*

Cliff Notes: Everyone is going to have a different belief system but we believe this posts outlines some good ones to get you started.

1) Do not expect women to be anything besides women. Asking them to be men is absurd.

2) You build your life up over a long period of time, since decisions compound, the earlier you get started the better off you will be

3) Cash is your friend as it buys you time. It buys you life.

4) Only a fool will not work hard in his 20s, he will not be able to catch you in his 30s since he simply won't have the energy

5) *"What is everyone else doing, it is probably a bad idea"*

6) Walk away from life cancers immediately, have a backbone

7) Say nothing or say something positive, you gain nothing from dragging someone down. The only thing that is gained is anger in your heart and mind.

8) It bears repeating, if you have 5 friends you are a lucky man

9) Health > Wealth

10) Finally, balance. The best way to find balance (entire post objective), is to find people who are older than you that are living the life you wish to live (or a similar life if you already won!)

****

Digital Scarcity and Finance

Digital Scarcity and Finance

We're still getting tons of the same questions related to DeFi and digital scarcity. While our views have not changed from 2-3 years ago (in terms of assets to own), the growth of DeFi has been remarkable and is a high-risk high-reward situation. The reason why we wouldn't jump straight into it is due to a risk reward profile. If we know massive institutional money is going into the top two major coins, it reduces the risk. Now if someone is already financially set for life they can go ahead and go up the risk curve to look into DeFi related assets such as AAVE, LUNA and more.

What is DeFi Again? Pretty simple, you put up a crypto currency as collateral (BTC or ETH for example) and take a loan against this collateral. That loan comes with an interest rate. The person giving the loan is protected by the assets you put up for collateral (BTC or ETH), so if the prices drop and the loan is not repaid the BTC/ETH is sent to your address. We've simplified this quite a bit but it is an easy way to think about it. It is similar to you giving a pawn shop $10,000 worth of gold and taking a loan out from them. If you don't pay back the loan they keep the gold at a certain agreed upon threshold.

Now, there are multiple DeFi platforms so it is unclear (at least to us) which one will succeed "for sure". While we'd bet that at least a few survive, the exact winner isn 't obvious to us. What is obvious is that ETH and BTC are being used as the collateral. So what you've done is you've made BTC/ETH a usable asset. Someone with $10,000 in BTC can now take a loan out for $1,000 without giving up their BTC. This is clearly beneficial for taxes as well. You wouldn't realize a gain on the sale if you bought it at a lower price.

The Second Group – Digital Scarcity: We'll be dabbling in digitally scarce items in the near-future. That said, the belief that these digital items are just screen caps is beyond crazy. You are not the owner of the asset. This would be similar to saying that a particular baseball card or art piece is worthless because you can make an exact replica. The reality is you cannot make an exact replica because it would not be the original.

Take a second angle to this. Over time, as technology develops these digital art pieces will be visible in the virtual world (VR/AR). As that develops one could lock the image and only allow certain people/individuals to enter their digital museum to view the work. It is quite logical to believe that a digital museum would be of interest particularly as digital art moves from two dimensional viewing to full 3D rendering and interaction.

The NBA has already started with this development through their "NBA Moments" initiative. Instead of packs of cards, they sell digital images/clips of particular moments in NBA history. You would own that "moment" in time and as it becomes a more and more popular the value of the moment would increase. Imagine owning the last shot that Michael Jordan made over the Utah Jazz to win his last ring. Or imagine owning the moment of any well known snapshot in sports history. While it may not be interested in owning these moments, sports fanatics would be interested (creates digital collectables).

The Third Aspect is Streaming Money: If we assume that musicians can lock their content, this makes music and art even more valuable. How? A famous Artist Named X wants to release a song. He knows that people will attempt to copy it and steal it quickly. Instead he locks this music song into a smart contract that says "XYZ dollars need to be sent to unlock the song". This creates a guaranteed return to unlock it before it gets diluted by copies and massive spread.

In an ideal world, you could also have streaming money/content. Similar to a concert, you would charge people to attend your venue by the hour/minute instead of charging people for the entire segment. Say there was a concert with 3-4 people and you only wanted to see two of them. You could lock these individuals out of the VR concert and sell the ticket based on two shows. In fact, this is something that is occurring already in a more rudimentary form. Individuals buy expensive concert tickets at the front and they live stream it. The live stream paid for the tickets so they get to experience a front row concert without the front row cost.

Finance Without an Intermediary: If you've been following this blog/twitter, there is simply no excuse. You should be well versed on the basics of crypto currency. Effectively, you can now buy/sell digital assets, take out loans against digital assets and create smart contracts for agreements settled in digital assets. You've disabled the need for a middle man.

This is significant as it allows every individual to access complex financial instruments from their phone. Instead of being kicked on or off a system, you'll simply act as another node on the system instead.

Security: Perhaps this sounds far fetched for those that are not keeping up with changes in technology (it is a significant issue if you do not understand what is occurring). So let us look at the security side. The argument is that Bitcoin can be shut down… Well how are they going to confiscate all of the Bitcoin?

If you look at the news there is an interesting story where a man stole $60M worth of BTC. He was sent to jail with a catch: he never gave up his passcode. So while he is serving out his sentence, the coins remain locked despite authorities hoping to recoup the assets.

This is a big story as it shows how secure the network is. Unlike gold (easy to physically recoup) there is no way to grab the assets without the security code/password.

Structural Decline for Regular Finance: Outside of M&A, it is hard to see why one would be positive on the outlook for financial services. If you can take software code and offer up the exact same services without the cost (fund raising can cost up to 7% in terms of fees) why wouldn't you switch?

With interest rates at zero or negative in many cases (along with a guaranteed loss due to inflation), holding large amounts of cash is incredibly risky. You know the value will go down over time (purchasing power). So even if you were to add a small amount into a fixed supply asset like bitcoin, the price by definition goes up (there are more millionaires than there are bitcoins).

So you have two different issues here for regular finance: 1) you can't offer a return to your customers at 0.01% interest or less and 2) you can no longer offer fundraising services at a high cost – either the costs come down or people fund raise in entirely decentralized way.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: [1) Efficiency](), [2) Triangle Investing]() and 3) [Spending for Maximum Return](). In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life. **We hold Q&As 1x a month for purchasers only.**

Do You Need a Car?

[Do You Need a Car?]()

Growing up, cars were known as a cool luxury item. We all want that Lambo, Ferrari… maybe even a Hummer. This is a trap. While we do advise that the average male learn how to fix cars as it is a profitable business if you can bring a car from not running to running and slang it on Craigslist, overall ownership is a dismal financial choice to say the least. Lets run the numskies.

A Honda Civic.

This is arguably one of the best items to use as your average daily use car. It gets you from A to B and is a relatively cheap investment, lets look at the below diagram depicting the depreciating value.

Notes: Years 1-6 are pulled from Kelly Blue Book and year one represents a new car.

Wow. Year two may as well represent what happens when a dime piece passes thirty.

Return Profile: Lets ask a simple hypothetical question, assuming you're a bright guy and do not buy a new car what happens to that $10,702 (Yr-3) if you simply put the income into 7% yielding bonds and got rid of the car instead? Lets take a look.

Notes: Honda Civic value is run off Chart 1 numbers. Investing in bonds grows at 7% and starts at $10.7K. The percentage difference takes the 7% return in bonds less the negative decline in car value.

Above Market Rate Returns: As you can see, by avoiding a car you're effectively creating above market rate returns. As the old saying goes a dollar saved is a dollar earned. ***In this case you're getting 1.5-2.0x long-term market rate returns.*** If we showed you the black chart alone in any sort of investor meeting the books would be closed before the meeting began. If someone were to simply invest in 7% bonds for 7 years he would have $17.2K in the bank, interestingly enough roughly equal to the cost of a brand new car.

We're Not Done Yet: Beyond the above mentioned loss you're seeing the average person drive ~1,000 miles a month (conservative estimate) at $0.25 per mile in total cost we can assume you're losing out on an additional $3,000 a year. Add to this another ~$1,000 annually for insurance, tire changes and other wear and tear items and $4,000 is your additional cost. ***This is a low ball estimate.*** With $4000 a year you can easily afford public transportation or even walk/bike to work. In reality, for men out there public transportation may act as a large value add to your life. Instead of suffering from road rage and traffic you can bring your tablet/kindle/library book and simply read on the way to work (this way you're being productive during your commute).

The Comparison: To end this grim financial picture lets compare car ownership over 7 years to a commuter who we'll peg at ~$120 per month**.** The below diagram shows the cash flows over the next 7 years.

Conclusion: After living in a large metropolis it becomes difficult to justify the costs of long commutes. In this post we haven't even touched on the cost of commuting in a car, with an hour extra a day you could be hitting the gym, learning a language, reading about a new business opportunity or at minimum reading something inspirational. With that said, if someone is flush with cash and has F-you money, by all means go ahead and buy that dream car.

****

Donald Trump Brand: Part 2

[Donald Trump Brand: Part 2]()

Before starting we'll again state that we were not first to predict the rise of Trump, [Scott Adams]() and our good friend [Mike Cernovich]() posted on the topic much quicker than we did. We ****will**** however take credit for laying out ***several thousand dollars*** on a major bet on him winning (late last year) so we are now heavily biased with odds clearly stacked in our favor… as the spread thins faster than a sexy girl with a cocaine addiction. Before jumping into how his brand will change, we will answer a few questions and readers can review Part 1 if needed.

Frequent Trump Related Questions

1) How Did Wall Street Feel About Trump? As everyone knows by now we *exited the Street earlier this year*, but, we do know that Donald Trump was absolutely hated by Wall Street in general. At least that is the vibe… so that was an easy answer.

2) Are you actually Pro-Trump? Yes. Donald Trump is a successful business man who has more skills than Hilary Clinton, Bernie Sanders and Lyin Ted Cruz combined. Anyone who read the capitalization table on his company (before he took his share of the family business) or looked into his actual trademarks would realize he is an enormous success and has been planning for this election for several years. Besides, a billionaire who is ~70 years old is not going to gain much by "ruining" the USA economy. A guy who has been obsessed with success since age 25 is not going to suddenly burn down the entire country… unless of course you're an unattractive Anti-Trump hater.

IMG_3668-2

3) Are We Upset by His Language? No. Anyone who cares more about what someone "says" instead of what they *do* is an imbecile. This is a classic game in business. Typically, the people who are extremely nice and happy go lucky all the time in front of you…. are sharpening the knife to stab you in the back. Never trust a person who says nothing but nice things to you all the time.

Anyone who is afraid or upset by Trump's use of language has lived a pathetic and privileged life. Much better to talk the way you would normally talk than to tip toe around everything like a dork. ***It's not mean if it is true.***

4) Do We Think He is "Thin Skinned"? This is a *resounding* no. Anyone who has managed to create a billion dollar business is not thin skinned. He has made hundreds upon thousands of really tough decisions and has undoubtedly made some mistakes as well.

He is going to fight back every single time a reporter writes negative articles about him because he has ***thick skin*.** Only a castrated loser would allow someone to openly trample on his campaign. Only a weak or "thin skinned" person would allow all the negative press to run with no repercussions.

5) Do You Think He Will Make a Good President? Irrelevant. The president has very little power in the grand scheme of things. The goal is to elect Trump and rid ourselves of politically correct culture and absolutely outrageous attacks on Free Speech. It should be illegal to be fired if you are simply a Donald Trump supporter but that is sadly *not the case* in the United States today.

With the extremely aggressive answers to the common questions lets just move along and see how he will easily become the President through simple branding and image changes.

Imaging Changes Going Forward

Commander-in-Chief: As we get closer to the general election the phrase will be used more often to emphasize that we need *leadership*. We're next to 100% certain everyone has seen this hilarious ad created by the Trump campaign. Fortunately, Trump will have very little trouble positioning himself as stronger than Hillary Clinton. He has a much longer and better track record than her and has absolutely *no* ties with special interest groups. He will highlight *over and over again that he is self funding his campaign*. How can you be a leader if you're begging for donations?

Family Angle: The family first angle is just beginning. Going forward he will bring more and more family members into the campaign, particularly his children and wife. Lets go ahead and start with his kids.

FullSizeRender-2

To the untrained eye, the only take away is that he is receiving support from the Utah Speaker of the house. The real issue is actually at the end of the tweet. He was sold by Donald J. Trump Junior. Expect this trend to continue because he will begin pitting his family against the Clinton family. This is a no lose situation as none of the previous arguments against Trump will work.

Here are some basic examples:

1) “Donald Trump is a mean man who didn’t bother raising his kids and just sent money”. This argument is now dead. If we look at what each of his kids have said publicly both now and more importantly *over the past 10 years prior to this event* you will find that his kids love and respect him. The argument that he is a terrible father dies over night.

2) “He got two divorces!”. This argument will also die. His current wife has shown glowing support for Donald Trump and even his *ex-wives* have said Trump has a good chance of winning with no material negative comments. Good luck.

You now have a man who has typical personal flaws, (reminder 50% of marriages end in divorce and even more than 50% have considered divorce) nothing to complain about. And. The average American is now asking in the back of their heads… Bill Clinton who cheated on his own wife… Is he actually supportive of Hillary on the inside?

Second question. Do we want a woman running the country who couldn’t even stand up for herself? What type of message does that send to the world.

3) “He’s a misogynist!”. This argument will die instantly as well. His daughters have been as successful, arguably even *more* successful than his sons. How can a guy be a misogynist when he has clearly helped create a successful family that includes both men and women?

We are sure there are a few high level personal issues that people will dislike, however, it is clear his family can be leveraged to dismiss the majority of the issues.

Anti-Establishment: As expected, he has tripled down on his anti-establishment rhetoric. The GOP is making an enormous mistake by making comments that suggest “The GOP decides who gets the nomination not the general public”. By phrasing the race as the Establishment vs. the People… the frame is now broken. He will continue down this framework until the GOP finally acknowledges he will be their best chance to defeat Hillary Clinton.

More Presidential: Going forward, the debates will become less brash and he will turn to a more even keel disposition. Trump certainly has the temperament to manage his emotions, otherwise he wouldn’t be a successful multi-billionaire. Managing emotions is the only skill needed to succeed in life since everything is sales. He is a top tier salesman. In short? He is going to down shift his tone to become more mild mannered but will continue to punch back hard if hit with negative press.

Decrease in Financial Rhetoric: You’ve probably noticed, he has toned down his comments surrounding how rich he is. This is to increase his mass appeal. He used his net worth to gather attention from the media which they took as bait (hook line and sinker) and stole the headlines. It is an irrelevant part of his campaign at this point and will be de-emphasized unless Mitt Romney wants to continue embarrassing himself with his comments.

Long story short? Donald Trump is actually running classic “game” on America. What does this mean? It means he is following the general path to success: 1) Grab headlines with some extreme ideas, 2) use social media to dig up the truth, 3) when attention is grabbed close a hard sell, 4) when the sale is near completion switch gears to your viability long-term. We’re undoubtedly in step four of the process. The general population is now leaning to Trump they are just not sold on him from a “warmth” perspective. This will change as he becomes more even keel and shows a softer side.

Don’t worry though… He will continue to throw punches back if ever attacked by the media.

<u>*Reiteration Absolutely No Questions, No Clarifying Questions Either. They Will be Deleted with ZERO Exceptions*</u>

****We will hold a Twitter Q&A to subscribers only next week****

Don’t Dilute Yourself: The Importance of Becoming Recognized at Your Favorite Bar

Starbucks was a company struggling in 2007 where its Mojo was lost as the company deviated from its core strengths to venture into breakfast sandwiches in addition to invoking other changes including bringing in an automatic espresso making machine.

So what was the problem with this stuff?

First, the cheese from the garbage sandwiches began to overwhelm the aroma of their coffee. Second, the decision to move to an automatic espresso making machine removed much of the romance and theatre that was in play with the use of their La Marzocca machines. No big deal you say? Well in 2007 their stock price dropped from $35 bucks to $20 (40%+ decline). The vast efforts to reform lead to the company to temporarily lose its identity, as focus expanded beyond core strengths.

The solution:

This eventually lead to a change in leadership as the early owner HowardSchultz stepped in to succeed (the then) CEO Jim Donald. Schultz’s vision was to go back to emphasize its roots in producing…fresh roasted Coffee! Shocking (not)! He said “Growth, we now know all too well, is not a strategy. It is a tactic.” The result? The stock went from $20 (at the end of 2007) to a shade under $60 (today).

The franchise’s ventures out of its area of strength resulted in a temporary loss in leverage. ***This same principal applies to managing where you choose to go out.*** As the case with Starbuck spreading itself too thin, you should not over extend yourself in the night scene. In other words, you should NOT be consistently venturing beyond 3-4 of your favorite bars unless you’re attempting to move beyond your comfort zone, you need to have a “go to spot” if you are in a rut. By favorite, we mean places where you stand the best chance of succeeding with the girls/guys you want. These 3-4 favorite bars is your blonde (pun intended), medium or dark roast – its your core strength. The bars you dabble in beyond these represent your burnt cheese on the breakfast sandwiches or unoriginal espresso makers – its not worth it.

So how does this work?

Get to know (inside and out) the supporting staff. Bouncers, bartenders, bar backs, bottle service girls/guys. Develop family-like rapport with them – know their names, names of their friends, what they like to do outside of work etc…Offer to buy them shots, introduce them to your friends, invite them to your own social gatherings, you get the picture. Since these people are embedded in the night scene, they are often very entertaining people. Great, so how does this benefit you?

You are now well-positioned to establish status for yourself. This same status equates to freedom from waiting in pretentious lines, discounts on drinks, and most importantly, that you are a central figure. From an ROI perspective, this is also in your benefit – reduced time waiting in line, lower net costs, and increased popularity. Yes – we are all drawn to people in control – this is an automatic +2 point bump for you. Get ready, your popularity will gradually snowball overtime.

So what is needed? Guys… showing up to a place with 4 guys is not ideal for any bar or club. The only exception is if they are good looking, like 7+. The industry recognizes the importance of garnering a good looking audience – they make money from it. As a general rule of thumb, shoot for a 1:1 ratio in your group, at least in the early-going. Once you’ve established yourself, and only once you’ve established yourself, your dependence on girls can subside overtime. Girls, there is no advise here, as long as you take care of yourself, the night scene is your oyster (assuming you’re in the 7+ range, nickels don’t help too much in making cute girls jealous).

Our experience with this?

We have our preferred neighborhoods set up so that everyone in the club/bar knows us. Our apartments are in the same zone as the stomping grounds. Our chosen bars are within a TaylorMade’s R11 shot (aka ~320 yards, or .1818 miles) away from our beds. We have built and cultivated numerous relationships over the years with people in the “industry”. Our favorite bars on Friday and Saturday nights have lines that threaten to waste one’s night by 15-45mins. When is the last time you’ve waited in these pretentious lines? We hope it was during the recession in 2008. We show up (with a decent looking crowd), complement or lightly flirt with the same bartenders, introduce our friends to them, and place our orders which take under three seconds. The general rule of thumb in the industry is 3:4, meaning it is ok to give a customer a free fourth drink after they buy their third. Our ratio: one-one. This equates to 33% net savings (assuming $10/drink, as 3:4 equates to avg cost/drink at $7.50 vs. 1:1 at $5). So now that we’ve quantified the benefits of time savings (15-45mins) and costs (a 33% off sale), let’s get into what’s most important.

Just last night, one of us had a group of random girls say “you seem to know people here, I can’t believe they just let you in and we have four girls with us.” The group of girls opened me, and this happens often guys. You end up introducing the pack of girls to dynamite drinks not on the menu and ended up taking them to another bar, bypassing the line and actually getting free drinks this time around. The net result? Brought home the Swiss girl in the group, a hard 8.0.

So now ask yourself:“Do I have leverage?”

If not, its time to re-evaluate in the same manner Starbucks had. Stop going to new places if you have not found yourself a home. Hone in on your favorite bars, where logistics are in your favor and begin to build fun, new and advantageous relationships.

Good luck.

Note to readers as the following grows we will certainly add more aggressive photos to prove what we are talking about, at this point it is unfortunately just not there yet.

****

Don’t Focus on Net Worth Focus on Adjusted Liftime Spend (ALS)

Don’t Focus on Net Worth Focus on Adjusted Liftime Spend (ALS)

The early retirement crowd is about penny pinching and living like a monk. The masses lack discipline, causing them to spend every pay check that comes in. Both are wrong.

If the end goal is not about Net Worth… Then what is it about?

Adjusted Lifetime Spend (ALS): Is that an actual personal finance acronym. Nope, just made it up. Lets go ahead and define ALS.

ALS = Total dollars spent during your peak years on an an inflation adjusted basis.

Lets define each letter clearly and move onto the conclusions at the end, starting with “A”

Adjusted – Utility Definition: In Econ 101 you learn about the marginal utility of an item. This is a key aspect to our ALS formula and the concept needs to be understood quickly. In simple terms, every dollar you spend is not equal. Example, if you are starving… a single slice of pizza is well worth the $3 you spend to obtain it… however… you would not spend $300 on 100 slices of pizza to eat at that moment in time.

With the most rudimentary example out of the way, lets apply the concept to your financial future.

We have explained over and over again that ~7% returns are obtainable over the *long-term.* In addition to that, if we factor in a 2% inflation rate it means the **real buying power of each dollar invested increases by 5% per year.** If you invest early (emphasis on early) you will increase your buying power. Meaning that $100 invested at age 22 (on business education or investments) will likely grow over the next 20 or so years, leaving you with more money to spend on entertainment. When you start approaching the age of 40-50 you should likely take you foot off the gas (we will get to that later). Now with this in mind we do not want you to become a stingy early retirement evangelist. Run your life like a well oiled business.

An intelligent business man knows two things. **He knows that you need to spend money to make money and all investments compound.** This is key. Knowing that you need to spend money to make money, you are not going to burn all of your money in your 20s.

To be crystal clear here, burn is defined as money that will not return *additional* money in the future (entertainment spend).

– A shot of alcohol by yourself at the bar nets you $0 in the future.

– A nice suit that will help you interview will likely net you positive $ in the future.

– An expensive watch will likely add $0 in the future.

– Spending $10,000 on advertising in a day may or may not add income in the future (if it does KEEP SPENDING!).

So on and So forth…. The crux of the issue is that there are two buckets for money.

Bucket 1 – Spending/Using money for more money – marketing, investments, building clients, business expenses

Bucket 2 – Spending for Entertainment/Utility – partying, concerts, sporting events (all of your non-income generating hobbies)

The end goal over the course of your life is to ***maximize the dollars spent on bucket number two.*** Just realize that bucket number one helps you obtain more of bucket number two in the future.

Clear? Clear. Now lets see how you maximize the peak years.

Lifetime – Peak Years: Assuming you do not spend to impress other people (a futile path to happiness as you're allowing others to choose what you enjoy), the goal is to maximize spending in your peak years. No matter how many drugs come out to elongate your life, you're going to have a grand total of 40 peak years. Lets call it 20 to 60 years old. At 60, no matter what you've done, it's going to be quite difficult for you to live it up partying, traveling, playing sports etc. If drugs were really the answer, then athletes would never be forced to retire.

Once you accept this fact, you're likely leaning towards the masses: You Only Live Once (YOLO!)… the mating call of the middle class. What most do not realize is that your youngest years is where you can grow your income the most. You have an enormous amount of energy to build income streams (recurring cash flow), lock down intelligent friends and go out to learn the rules of the game without blowing a grip of cash.

To summarize your decades simply look at your peers and apply the follow rule "What is everyone else doing? Do the opposite"

20s – Masses: Blow large sums of money on night game "having places on lock with $10-20 tips – LOL". Get blacked out and grab bottles to go to the same club as Lil Wayne – LOL again. Work a dead end job and become an alcoholic. Naturally these guys know all the "best places to go out at night", as you can imagine… They don't.

You: Be smart and do the opposite, day game like a champ. Spend that money on slick clothes and a place with great logistics (does not need to be high end, emphasis on logistics). Put every other cent away into smart investment vehicles. The girl will give you a pass for not being a millionaire, you're young, handsome and energetic. Besides, how many people wake up drunk every Saturday and Sunday earning Zero dollars over 3 days. Yep. Everyone.

By focusing on day game, you improve your sales. By living logistically close to your career and the epicenter of the city? You have no commute and save precious time. You are giving yourself the tools to succeed.

30s – Masses: Follow the masses again to find the truth. Your typical 30 year old is just now realizing he made some serious financial mistakes. He has "some" interest in starting a business but didn't build any necessary skills to do so. He is intent on making money though. He starts reading personal finance blogs, he cuts his cellphone bill from $80.55 to $65.66 to save $14.89. He doesn't realize that these "retirement experts" are actually running a business. No worries, at this point he is going to start dolling out financial advice to anyone who listens and will cut back drinking a tad because he can't afford it… gotta save to "retire!"

You: Ah you did the opposite. You have more than enough money in the bank. You have control of your emotions and don't worry about 10, 20, even 30% corrections in the stock market! It doesn't matter because your net worth moves by 6 figures every month anyway (sometimes even in a week!). Get ready to ratchet up the spending. Your competition is gone! You go out and realize your only competition is high energy young guys who cannot keep up with your lifestyle game. They are pitching drinks at the bar, you're going to the World Series next week. Who wins that battle? In short, you're spending more because you can.

40s – Masses: The masses are now scattered. Some are out of the game due to divorce, unable to catch up financially. Others are still trying to save money but can't seem to get leverage from their salary or hourly jobs (job not career). The common thread? They can't make a mindset jump. They need to stop trading their time for money… But they just can't. They are usually disturbingly risk averse at this time.

You: You've paid your dues for a good 20 years (roughly). If you did really well you already transitioned to the 40 year old lifestyle at 34-35. You simply put your business/career/side hustles/equity/bond cash flow items into cruise control. This does not mean you allow yourself to degrade, you simply have enough success to choose your pressure points. When you see an opportunity to make a significant amount of money you jump in. You work hard. When no opportunity is around, go back to your hobbies (sports, partying, dancing, etc.). The main ideas is that you no longer have your foot on the gas jumping into new situations at all times. Instead you're waiting intelligently like a lion in the grass for the next smart move.

50s and 60s – Masses: Ahh yes the final frontier of the peak years. If you have experience in healthcare you realize that this is where serious issues begin to show their ugly heads. It can be as small as injuries that require surgeries to full blown strokes/heart attacks. Not pleasant. This is another item you wish to avoid.

You: Even if you played your hand perfectly, your body is slowing down. Yes you will be significantly more energetic than the masses but you won't be perfect by any means. Maybe you have a kid, maybe you don't, but at the end of the day you should be spending even more aggressively. Likely in line to slightly above your late 30s and 40s. This is not a material change from your 40s, you just become more and more particular about opportunities that are worth your time. If you're real smart, in your 30s and 40s, you already know some bright old heads to bounce ideas off of (real successful men in their 50s and 60s).

Summary Chart: With the important issues of this post squared away lets take a look at a general framework for your Adjusted Lifetime Spend (ALS). In the chart below we look at how your spending will change (does not include the masses). Yes there are jumps and gaps in the chart because this is how a lot of income production will change (energy levels also change rapidly).

Chart: Net Income Spent by Bucket – Click to Enlarge

Spend1) Notice that bucket one spending is extremely high in your 20s. You don't know much so you learn by doing and failing over and over again. You make many mistakes but your money is being used to generate more income later on. You spend a bit on entertainment but you leverage your youth to stick to cheaper venues.

2) Notice there are jumps, by decade, in income production. If you are learning new things every day, you are going to start scaling your skills and will break out of the $100-150K barrier sooner than later.

3) Through your late 30s and 40s, bucket one spending becomes quite variable. Some years you spend 0-10% on bucket one (already financially independent anyway) and 100% of your income on bucket 2. Other years you spend upwards of 50% on bucket 1.

4) As you approach the end of your peak years, you maximize bucket 2 even more. While you could have done this earlier, you still see good business opportunities arise. Each year you become increasingly picky, hence the increase in bucket 2 spending.

Spend – Dollars Out the Door: The final word in the ALS equation. Spend. Spend is simply bucket two of the summary chart. Money dropped solely on entertainment/hobbies that will unlikely yield a positive cash flow return. While this does not seem like it deserves a section on its own lets go ahead and look at the ways you can spend.

– **Alcohol/Drugs:** Decrease in lifespan, one time increase in happiness

– Sports/Lifting: Long term increase in lifespan, long term increase in happiness

– Art collections/Car collections: No material change in lifespan, long-term increase in happiness

– Traveling: No material change in lifespan, long-term increase in happiness

– **Game/Girls:** No material change in lifespan, long-term increase in happiness

– Mentoring People (Kids for those that want kids): No material change in lifespan, long-term increase in happiness

– Pure Entertainment: No material change in lifespan, short-term increase in happiness

– Charity: No material change in lifespan, long-term increase in happiness

What is the point of the list? The point is that you can spend your money to build an extremely interesting lifestyle the earlier you begin. The only real vice that needs to be taken in at moderation is alcohol/drugs. We're not saints over here so you can certainly partake from time to time, just realize it is likely smarter to do these activities when you are young and to do them intelligently. Drinking and doing drugs on a weekly basis usually means you're an alcoholic. If drinking or drugs cause you to lose income, you ARE an alcoholic. Doing these things when you succeed at a task? Not so much.

The real point in the spend part of the equation is that you are going to die. You don't want to die with $10M in net worth having spent only $5M over the course of your life. Assuming you have no kids, if you made $20M in your life… You should spend $20M by the time you are dead (over $20M for the debt loving financially savvy types as they ready to kick the can – wink wink).

We're not going to fault people for their interests so long as they do not deteriorate their personal well being or the well being of others. If you are obsessed with traveling, feel free to sky through 50+ countries. If you are a car person, get a new whip every year or collect them and fix them. If you are an art collector… build those walls! Just don't become a weird guy who no one wants to hang out with because he penny pinches with a several million dollars in the bank.

Now lets conclude with an example, the dreaded 401K will help frame the point of this long winded article.

The Dreaded 401K: As we have said hundreds of times. Absolutely no one gets rich with a 401K and no one ever will. Even if you hit 7% returns (5% real rate of return) you only end up with about $2M in inflation adjusted dollars (real buying power). With that said, we can use this to explain our ALS formula in much greater detail.

Here is the Framework:

1) Imagine you put away $18K a year (the new 401K maximum) every single year and obtain a 5% return

2) Now we assume you max out your first contribution at age 22 giving you 38 years of returns

3) This results in a total of $2M (this is real buying power)

Now for the kicker, how much of the $2M was attributed to money you put away early versus later? Lets take a look.

Chart: Percentage Contribution to Your Future $2M Retirement – Click to Enlarge

Percentage1) A whopping 5.6% of the $2M comes from your first $18K investment

2) Less than 1% of the total is earned in your latest years (if you continue contributing)

3) By 40, you're more than set to cover living expenses in "retirement"

As you can see, the laws of mathematics work for you if you run your life intelligently and work drastically against you if you do not. You cannot fight compounding returns. You can however, accept the numbers and take advantage of the increases to live an amazing life over your peak years (~20-60).

—–

There you have it. "You only live once" so lets make the most of it. You want to maximize your **Adjusted Lifetime Spend.** Don't forget it.

1) Money helps you make money.

2) You are going to get older. You are going to die.

Balance. Maximized spending.

With that said, for the young guys out there…

Lets Get It. Lets Get it. Lets Get It.

****

Dressing Sharp: Ignore What People Say, Go By The Results

[Dressing Sharp: Ignore What People Say, Go By The Results]

Once in a while we have to cut out the [frugal people] who accidentally come here and believe we're in the same group (not even close). Frugal people believe in scarcity which is why they focus on cost cutting even though there is a significant floor to cost cutting. No matter how much you try and reduce your expenses, you will still spend money. We're going to walk through the escalation of spending and how becoming a millionaire to eat lentils, beans and rice is equivalent to getting in shape to develop a heroin addiction (defeating the purpose entirely). The progression and lifestyle changes will be covered in our book coming out later in the year to complete the trilogy but this should be a good way to think about the future.

The Five Most Common Arguments

"I Wouldn't Buy That": This is the starting point for all the excuses. People who don't have money claim that no one cares about brand name goods, higher end apartments, nice cars etc. Back when we had no money, using mild salsa and draining it to get vegetable intake for the week, this was a common argument "I would never buy that if I was rich". The reality? This was an obvious sign of scarcity belief systems. Anyone who eventually makes it knows that the quality of the goods certainly makes a difference. With many things in life, after you get to certain net worth and income level (described in our book) you'll actually *lose* money by trying to act like you're still broke. People have mistaken our comment about "stealth wealth" to mean that you should dress in $9 H&M t-shirts. This couldn't be more wrong. *Stealth wealth means you're not famous but [people know you are not struggling for cash]. This is the right balance.*

"No One Knows the Difference": This one is just unbelievable. There are studies that say regular people cannot tell the difference between shoes. There are also studies that say "women don't like muscular men". Since they are incredibly wrong, we have to highlight them. Unless you're born under a rock you know for sure that by being muscular and in shape you will certainly have more dating opportunities in any environment where you will be shirtless (the beach, outdoors playing sports etc.). There is just no argument here and studies don't work since a "study" is *based on what people say not what they do.* Making decisions based on what people say would result in failed decisions for life. It's similar to pornography and racism. Everyone "says" they don't watch porn but it's the highest traffic industry. People "say" that racism exists but then you ask people to raise their hand if they are racist… crickets. These are two clear as day examples to prove that going by what people "say" is a disaster. *Bonus: people also say they "don't click ads" on the internet. Then how come the ad companies make billions of dollars.*

"On Credit": This is the third most common excuse. People claim that luxury brands are for broke people buying on credit. Also not true. The Luxury market is primarily dominated by international travelers (this of course makes sense as frequent international travelers are unlikely broke). While it is true that many people go into debt status chasing (not something we recommend since that's hilarious), the largest buyers are actually rich. The large buyers do not buy "just one" unit of anything. They typically have a set of items they rotate at minimum. When you go to a high end place frequently, instead of assuming people there are only "flexing" for the day… wait and see if they come back. If they come back several times and always have different nice items on… They are rich and there is no need to hate on it.

"I Don't Like Fancy Clothing": This one is just as bad as the "studies" excuse. It is easy to take down. Anyone reading this right now can go ahead and prove that it makes a difference. Go through your entire wardrobe and put on the nicest stuff you have. Do not lie. Everyone and their mom has a "nice outfit" for going out, weddings, special events etc. Now after you've put on the best outfit you've got, ask yourself if you feel better/more confident/more important. Use any positive attribute. Unless you're afraid of becoming rich or you're lying to yourself… you know you feel like ten million bucks. Since it changes the way you feel and think this naturally works.

"Not Worth It": The final item sets in. It "isn't worth it". Sure. If you want to live a boring life, it isn't worth it. That is for sure. It means that getting rich in the first place was a total waste of time. If you want to get rich to walk around in $5 t-shirts and drive a Honda Civic to your $150,000 home in the suburbs… you should have retired years ago! If it really wasn't worth it and it really wasn't something you envisioned having… then the person also wouldn't have the need to comment on it. It's always the people that are the most jealous that will comment on it. Same story. Every time.

The Five Most Common Mistakes

I Bought XX and It Didn't Work: The beautiful thing about being well dressed is you *don't* need the highest brands at all times and you *don't* need to go directly to the top end. This is the truth. It takes several years to develop your own style that gets the best reactions based on your personality, your skin tone, body type and the venues you go to. If you're going out in Vegas/Miami your ideal "look" is not going to match the guy going out in New York or London. There are different vibes for each city and the city you like naturally has a specific personality trait as well. This is the most common mistake. People think they can just "buy some brand" and have it work. That's not how style operates.

The most common one we've seen is when people get their first high paying career/business going. They always do the same thing. They cut corners on spending (food/dry cleaning etc.). They save save save… Then they buy some Ferragamo/Gucci loafers and entry level luxury watch. This is so common it honestly hurts typing out. This is sending the ***wrong*** message. The message being sent is that you're trying to get attention because you have one or two items that are "high-end". Even worse is when the shoes don't match the clothing which happens pretty much 99% of the time. Again. If the clothing color and style doesn't match, no one is going to care about the brand because "something is wrong" and everyone knows it. You're trying to impress people and that's never a good thing.

Not Congruent: Everything needs to be in the same region. What does this mean? It means that you shouldn't be carrying a $5 plastic wallet if your suit is worth $1,000. It doesn't look right. Similar to the section above where the shoe style or colors don't line up, the general categories need to be in the same region. You're allowed to have 2 items at most that are not in-line. By way of example, if your cufflinks are $30 and your socks are only worth $5… no one is going to notice or care. In fact, a couple small items that are cheaper typically have a "story" to them hence why you're wearing it. To take it to the other extreme, being incongruent is like going into a Chipotle with a custom made suit and Gucci Oxfords on… That image is quite painful as well.

Have to Get All Clothing on Sale: Stopping here for a second. The main reason why you're learning to look good/dress well and know the right brands is to attract the type of women you actually want to date. Stop and ask yourself "Would this type of girl date this type of guy". Be honest. Anyone who really believes that an *attractive* woman would choose a fat slob with $100M over a well dressed in shape muscular guy with $10M… is clearly insane. If the girl would actually choose the $100M person, it means she's likely for sale (you either see it and notice it or you don't).

Now back to the point, the most common mistake is trying to do everything in the same range at once. This is not necessary. If you're going to go out to a normal venue where you suspect you won't see a single suit… Don't wear the high end stuff and leave it all at home. You're probably going to wear something more fitting like a high end pair of jeans, a basic blazer and even a regular t-shirt. The goal is to stand out in a positive way that matches the actual environment. Over time as you get wealthier and wealthier you're not going to have a "versatile" wardrobe and it'll evolve into the higher end in general anyway. No need to buy stuff you aren't going to use. If you plan on going to a nice place 1-2x a month, you need 1-2 upper tier shoes. If you are going to go every single day…. Well then yes the upgrade is needed.

Upgrading Where it's Meaningless: We're sure there is some angle here, but at the end of the day, upgrading wardrobes being used for outdoor activities or the gym are low ROI. Here you can go ahead and buy those basic shirts and shorts (nike, adidas, it doesn't matter) and use that for the gym. If you're smart, you're already in a high end gym so that's the "entry price". As long as you're not walking around in shirts/shoes that are 5 years old, you really don't need to have anything special. Also. If you do end up going to a nicer gym you'll notice that the attractive girls always have nice gym outfits as well. This is just how it works. The more attractive they are the more focused they are on their appearance which means they are on their "A game" even at the gym.

Another meaningless upgrade is actually work! That's right. If you're still grinding it out at work and there are no clients that day, there is no real reason to wear anything brand oriented. Those shoes and shirts are going to get more wear and tear on them and you can simply chuck them at the end. Your higher quality items are for 1) meetings, 2) events and 3) higher end venues. Since everyone wants to know the exact formula we'll use examples: 1) meetings would be anything that is going to generate you money, 2) events would be any event where you're going to meet someone of importance and 3) higher end venues would be a place like Catch on a Monday in NYC, the Wynn/Encore at Vegas or a Michelin Star Restaurant. If you have a rough weekend coming up with long hours of work, you should just use some of your "throwaway clothing", items you wear to normal days at work or to a regular lunch spot/bar.

Overspending: If you've found this blog we'll guarantee that this will occur when you first attempt to adjust your wardrobe and style. Why? Well if you already followed our basic style advice from Efficiency you'll already know it works (we already got numerous emails about dates/promotions attributed to looking professional/sharp). Since you know it works, you're going to have to go up the learning curve and will likely overspend up front to figure it out. The only way to prevent this is to sit, stop and think about the type of people you're trying to attract. The more you can target your audience (i.e. Facebook ads!), the better the results! On a serious note since the prior paragraphs make it seem like the changes need to be made today, *you have to know what you're going to do*.

That last part needs to be read a hundred times. Unless you know the type of places you like, the cities you're going to go to and the people you enjoy being around… Tailoring specifically to your audience isn't going to work and you'll blow up. Tying this back to Ferragamo loafers (classic style error), they *do* work for people who typically operate in jeans and drive a lot. They *don't* work for guys who like to dress in custom suits and drink champagne (the shoes need to be flipped to oxfords or double monks for example). There are small nuances like this. Ferragamo shoes are great for the right venue and are not great for the wrong venue (just like every other brand on the planet).

The second part of emphasis here is finding the "light version". If you're not sure who you want to be yet, or what venues you'll go to… there is always a starter brand. If you look at the design of the upper mid range: To Boot New York, Magnanni, Allen Edmonds and almost anything else found at a place like Bloomingdales… you'll find that they try to mirror one of the top end brands.

As a basic rule of thumb, if you can find it on sale… that shoe type/brand is not upper end as the real high end brands don't have "sale racks". As an extra point of emphasis, this is why certain high end brands only have certain *types* of shoes that show up on sale on rare occasions.

The Benefits – the Best Part

Quite a lot *should* change over the years (otherwise why are you working so hard!). You should be able to go from "getting looks" because you learned how to have good style/basic dress code abilities (typically just a tailor and clothing from a place like Nordstroms), you then move on to made to measure products with some nicer shoes (anything in the $400-500 range) and then you move to the high-end custom made clothing and brand name shoes/watches (some people even get custom shoes etc.). Now people can complain all they like, but anyone has the ability to at least do step #1 which is learning how to dress with the right colors/fit and prove to themselves it makes a difference. It makes an enormous difference.

#1 Regular People Repellant: That's right. It actually deflects people who you don't want to talk to. When people see a well dressed guy with clothes they even know are not cheap.. they will avoid you. This is worth 100x more than the dating category (second) because people literally move out of your way. They will constantly talk smack behind your back and as always.. leave empty handed. A good way to describe the people you're deflecting? The 3-star review Yelp Crowd. The 3-star review Yelp crowd constantly complains about "prices" for high-end clubs because they shouldn't actually be there as they haven't made it *yet*. The 3-star review high end bar/club is going to be your bread and butter since it's typically the best place (rich people always attract the best looking women). For further explanation of this effect, look no further than the front 10 rows of any major sporting event.

#2 Dating: This is the second most obvious category. We'll re-emphasize. The girls who do not care about your clothing/looks are not the girls you want to attract. The ones you want to attract will 100% care that you look good and are "put together" the most common saying. No attractive girl wants to introduce her "man" as a beer swilling, blue jeans wearing slob. Just like her interest in purses and nice shoes, the way you look is a reflection on her as well. The way this scales up is pretty simple, it goes from: 1) more looks and comments such as – i like your overall outfit/look to 2) "where did you get that" to 3) the most blatant = "Nice XXX". It can get *much* more overt from here but like everything it is an art. Once you're getting complements consistently, you've done it right. Again using the scale, it should go from 1x every 2 weeks to 1x a week to the pinnacle which is "daily" whenever you dress up to your "max potential". Before moving on here, remember the same old quote, "*if she can't experience it, it doesn't exist*". You don't want to be seen with an unattractive poorly dressed woman and we can guarantee you the feeling is more than mutual. You don't need to look like James Bond 365 days a year… but you better be able to pull it off if needed.

#3 Self Confidence: Can't put this into words but we'll try. If you're already making good money, you will still benefit by creating your own distinct style and vibe. You'll go out shopping or look at something and the girl you're with will say something like "I knew you'd like this it's your type". That's when you've essentially hit gold. You're now at a point where you're establishing the direction you're going in life. Besides, *you didn't get rich and succeed to be the same guy did you?* Of course not. So once you have hit your stride you'll slowly upgrade in that "direction". The baseline clothing slowly turns into throwaway clothing, the second level clothing becomes daily wear clothing and the final level is worn maybe 30-40 days a year. Eventually, you end up with only two tiers, the daily wear clothing and high end which look increasingly similar. Funny how that works!

#4 More Events: A hidden secret of high-end fashion/clothing? You'll be invited in. If you're looking sharp all of the time who is the most likely person to recognize high-end fashion… Models and other designers of course. What does this mean. It means those types of people are more likely to talk to you. Take a second and imagine a standard good looking model. Do you see this person talking to someone who looks like James Bond or your average middle aged american. Be honest. We all know the answer is James Bond as this fictional character is easy to compare and contrast with. So. If you're dressed more similar to a rich James Bond type person, you're more likely to attract the right crowd. This ends up ***saving*** you money. Despite what frugal people will tell you, if the ideal version of yourself attracts good looking women, you'll have a hundred more opportunities by dressing sharp and getting invited to events/house parties. The only other "easy" way into this "level of the video game" is by getting into the illegal drug scene.

#5 More Income Opportunity: Here is the slippery slope. When it comes to rich people there are really two categories, people who are extremely frugal and those that aren't. By knowing how to dress sharp and do all of the above you're giving yourself the opportunity to sell to this side of the equation. The frugal side will look down on your style so you should always have that second tier to avoid making them feel insecure/upset. Essentially, by knowing how to look good, you'll open up a door that's essentially shut off from the masses and a lot of rich people as well. It's a good strategy as you never want to close a door when it is full of rich and attractive people.

Conclusion: This should repel a lot of regular people who confused "stealth wealth" with wearing $10 t-shirts and plastic shoes. It also gives a good hint on how detailed our lifestyle/spending book will be as we didn't explain when to buy and upgrade (or the types to go for!). For people that are on the fence about all of this we'd say, get to level one first (90% can't even do that) then take a stab at level 2… then you'll be 1,000% convinced. You're not going to go broke wearing nice clothes when you've made it. The key here is that you've made it. If you're making $200K pre-tax a year, you're definitely not going to buy Gucci shoes and $5,000 custom suits. Now if you're making $50K a month after taxes… you can buy whatever you want and slowly infiltrate the fashion community (it's worth it!).

To emphasize how easy it is to make a difference you don't need the ultra high end today. All you need to do is *show* that you're the type of person who won't be a cheap guy. If you're willing to spend a little extra to look good the message is that when you make more, you're not going be stingy. This is the implied message you send when people see you. And. When we say people, again we're talking about the ones you want to attract. The guys in the Cole Haans and Aldos will hate on you… This is good (they don't waste your time).

****

Easiest Way to Improve Is With a Top Down Approach

Easiest Way to Improve Is With a Top Down Approach

Back in high school, teachers would tell you to really "learn" the material otherwise you'd be at a disadvantage. Their strategy was to teach concepts and by looking into the back of the book for answers you were harming your future self. Unfortunately, that is terrible advice. The reality is that finding the "answer" and working backward is actually a good way to build up. In finance there is a phrase "bottoms up" and "tops down" when building a picture and believing that tops down never works is simply false. With this we'll apply it to your life in general.

Find the "Top Down": Generally speaking, you're never going to find an exact ideal of who you want to become. You're going to find guys who you respect from a money making perspective, style perspective, athletic perspective etc. You can't really become any singular individual as their skill set is also quite different from yours (genetics as well).

All of that aside, we still recommend finding people who are around 10-15 years older than you. This will narrow the pool to a few people who you would like to emulate. Ideally you'll choose three of them. Perhaps one is good in your particular career/business, one has a lifestyle/work-life balance you're envious of and another is simply in great shape and you'd be happy if your fitness level was on par with them in 10-15 years (notice if you're 15 years younger, your bar is naturally higher).

At this point you can calibrate for what you plan on doing in the future. If you have a "role model" the chances of success are slim since your skills are never going to align with a singular person. Instead if you have a general picture, you can then find where your skills are better or worse vs. where your plans are. If you're already naturally fit, you can reduce hours here to increase your social skills. Or. If you're already making a lot of money but have fitness issues… you would reverse them. Either way once the picture is built "the answer" you work backward.

Step 1 – Be Smart Before Incorporating: Generally speaking, successful people are talented. If talent didn't exist then everyone would be able to train to break a world record in athletics or create the next Amazon. This is where we'd say the vast majority of people mess up. They mess up ***bad*.** Take a step back and ask yourself if the person is actually talented or if they learned the skill. *This is not the same, will never be the same and is not up for debate*.

Self-awareness is the only way to tell the difference between talent and learned skills. The average person is not self-aware as they constantly think they are better looking, smarter and more talented than everyone in the room (the chances of even one of these being true in a room of 40-50 people is practically zero).

So. Take a look at the handful of people you'd like to emulate and decide "is this person simply too talented or did they figure it out through effort". If the answer is they simply had talent, you have to delete them from your list of people to emulate. This causes a lot of ego destruction because you're admitting that someone has significantly more talent in a particular area. Most won't pass this first test and simply have a list of role models that they will never be able to emulate (copying a life path with less talent is a guarantee for failure).

Before moving on, the key easy indicators of someone having talent is as follows: 1) they are able to produce more than everyone in their field – same level – while working 50% as much or less, 2) the individual claims that everyone can catch up if they just worked hard enough – this is what talented people believe since things come easily to them, 3) their productivity actually increases with higher work loads, what this means is they can efficiently reorganize without any performance drain… similar to good software code and 4) take the results that are being delivered and ask if a person with similar attributes could achieve the same with 2x the amount of time. If the answer is no… again they are too naturally skilled to emulate. As usual, none of the prior four items are "guarantees" but this filter should help you get a clear picture of the future.

Step 2 – Find the Process: Building on step 1, if you're sure the person doesn't have any innate talent in the area in which he's successful you can work backward from their end result. Instead of wasting valuable time trying to recreate the wheel, take the core competencies and integrate them immediately. Coming up with your own spin is not going to work on day one since fundamentals need to be built up first.

You can narrow down the fundamentals by observing how they operate relative to their peer group in a particular environment. If their social skills are high quality, then look at the word choice, body language and style of clothing relative to the group. Until you can find 5-6 items that are definitively different, there is no point in integrating any mannerisms. Copying blindly doesn't work as the only competitive edge is going to come from differentiation.

If you've done this correctly you can now integrate the fundamental differences into your daily life. It takes roughly 6 months to make something a habit. There is no point in trying to create an "on and off switch" since it just leads to underperformance. To make a sports analogy, it would be similar to having two different golf swings, one for practice and one for competition… This makes little sense. If you find something that works, integrate it and move on.

Put the process on repeat. It is unlikely that you'll find all the differentiation in a single event. You have to repeat this process to pick up on all the changes over the course of a few months. When you start to see results in your immediate life, you're effectively done with the basics. Sticking with the same example, once you have copied the habits in a particular social environment and you see a big change in the results you're looking for, you've got the direction right which is good enough. No need to look for additional tricks that unlikely exist anyway.

Step 3 – Thinking For Yourself: This is where most people hit a road block. Copying fundamentals is a good starting point but to differentiate you have to take advantage of your own personal skills. For example, maybe you're a better communicator and lower energy. You probably want to put yourself in environments where there are fewer individuals making it easy for your speaking skills to be seen. On the other hand, maybe you're a polarizing figure. If you're polarizing, you want to be in an environment that address a wider distribution as it increases the chances of finding the right person to connect with.

These are nuances that most people don't think about. It takes a lot of work and requires a lot of introspection. If you see your general results increase, you have to then take it to a micro level and specialize. Without specialization you can't differentiate which is the entire goal (going above normal expectations). By way of example, your "look" and "personality" needs to match the environments you frequent. This applies to work, dating and even your normal social life. By copying a single individual's preferences you reduce (dramatically) your ability to improve your life.

Step 4 – Simple Top Down Example: The reality is that our example will likely go over the heads of an average person. The average person thinks they can "learn" anything even though it is simply not true. You have to specialize in any particular task to improve your results. So we can use a sport as an example, we can go with basketball since that's a commonly known sport in the USA.

If you're trying to become a better player, the first thing you should do is master the basic fundamentals. Instead of looking for a role model, you have to video tape yourself learning all the basics: shooting form, footwork, basic positioning when on defense and a sense for what type of moves you're faster at (some people have better foot work so spins are better than crossovers etc. – common for taller athletic people)

If you've got the basics down, now you can look for someone to emulate. Most people just choose the "best person" in the game which doesn't help. The chances of matching your skills to someone who is actually the best in the world… practically zero. So you find a top 50 player and decide if your style can mirror them. A good example of this is trying to emulate LeBron James versus someone like a JJ Reddick. Their style couldn't be more different and we'll bet everything that starting with LeBron won't work.

Continuing on, we'll assume that you're actually not fast but you've got good foot work and an accurate shot. What does this mean? It should narrow down your search to players with more methodical styles and less reliance on athleticism. Clear examples would be a Dirk Nowitzki, Tim Duncan and Nicola Jokic. If you're looking for shorter versions of the same style you're probably looking at someone like Mark Jackson who was a strange point guard with some speed but played a lot in the post.

At this point, you take film of the individual most similar to where your advantages are and see how they react in particular situations (basically, the person you're emulating is the answer at the back of the book). Since they are not fast or all that athletic, they will have different strategies when catching the ball at the top of the key, in the post, or off a pick and roll for example. For fun you've really mastered the basics of "copying" their style when you play and people say your playing style is similar to them. The reality is that anyone who actually learns how to play basketball (mastering the fundamentals) – or any other sport for that matter – is going to be better than 90% of the population in general.

To conclude, at this point you're now able to become "yourself". If your style of game is similar to person A and people go out of their way to say you're similar to person A… you have to make changes that take you to one level higher. The only way you can do this is find another relative strength. Assuming your style is too similar, there is going to be at least one or two areas where you have some differentiation, say jumping length (while height may not be good). In that case you can practice passing lane steals and chase downs to prevent fast breaks. Or maybe you're an extremely good corner three point shooter but the rest of the floor is not accurate. In that case you'd play a lot of mid-range and then go out to the corner where people will leave you open.

As you can see at this point it gets extremely specific and since the average person 1) won't learn the fundamentals of any task and 2) believes they can be world class by mirroring someone who is not similar to them… they never get any better.

Concluding Remarks: Unfortunately, sports are the easiest example for a short post like this. That said, it can be applied to stating a business and making money as well (we'll cover that very shortly). But to avoid 5,000 word lengthy articles this should be a good start. Take a step back and ask "where am I most similar" then scale up from there. This will work a lot better versus the average person who thinks they can learn and become good at anything (simply not true). Talent is real and winners figure out where they are talented despite "liking" or "disliking" the activity. Since the end goal is to be successful regardless of how exciting it is.

****

Economic Changes Ahead

[Economic Changes Ahead]

At this point, the stimulus is already complete. We've taken interest rates to zero, gave no money to the middle class and created a barbell in American society where only the lowest income brackets (temporarily benefit) along with the ultra wealthy (think market cap north of $100B+). We'll explain what this means for you and fortunately our advice still doesn't change. While many people laughed at our strategies they've worked over the past 8 years and if you followed "the plan" you should have at least 2 streams of income each generating a living wage (or better). This creates a level of stability that will allow you to survive in the coming years as well (and potentially move up the socioeconomic ladder).

What Happened? The income being sent to people is flawed to say the least. People who were making around $100,000 in high cost of living cities like NYC, San Francisco, Los Angeles etc. get nothing… Even if they were laid off. If someone kept their job and is still earning $100,000 we can see why they didn't need money. But. Take five seconds and look at the map. New York is the hardest hit, has one of the highest cost of livings in the world and yet the vast majority there will receive nothing. That doesn't make any logical sense. Using a $75,000 marker actually helps middle america the most… Where there are practically no cases (comparison to NYC, Los Angeles, parts of Florida etc.). As many of you remember our view as to imply issue everyone money quickly and have a 100% tax if you made over $XYZ in 2020 income. And. Of course it didn't happen.

The second thing that happened was a massive debt bailout for airlines, Boeing and several other companies that were simply levered up for no reason. Don't even get us started on people who levered up to use an apartment for AirBnB rentals… That one is going to end in tears as we doubt people will suddenly ramp up traveling in 2020. A full year of next to no income is not a situation most can survive (assuming they are levered up)… The ones who were debt free will make it through.

The last item that happened? We saw a significant decline in interest rates and we're even seeing negative yields on treasuries (3 month and 6 month). In fact, the 12 month treasury yield is also near zero and could go negative! This means we're inching towards an environment where banks are going to be forced to charge fees to simply hold onto your money. The system was hit so hard that we may end up like Europe where you're better off buying a complex safe and storing physical cash in a secluded area.

#1 Small and Medium Sized Businesses (SMBs) Get Crushed: This is the first implication. Since they do not receive any serious consideration, they will be under massive pressure coming out of this. The current set up to give them a 3-4 month "forgivable bridge loan" if they keep their employees is laughable at best. Anyone smart (who runs a small business), will not take this loan. *They do not know the revenue line when they start back up again.* If they have to keep the same headcount they would avoid this insane amount of risk. At best, they will hire part of the staff back and use the bridge loan for a smaller company size. So no matter what those SMBs just got smaller and likely less profitable. In order to catch up they will have to find a way to make use of technology to decrease back-end costs.

Oh and by the way… They will get absolutely dismantled by the large corporations. This is because large corporations are first in line for the cheapest debt. Apple is much more likely to get 0% (or negative) coupon debt vs. Mom and Pop's Pizza Shop. So take a wild guess what they will do? They will take out 0%

debt and cut prices putting consistent pressure on the SMBs (Yes we realize Apple won't compete with Pizza shops but if someone doesn't understand the point they should probably leave this website for good).

So you've got large companies who now have near infinite ways to make returns. If your hurdle rate is "0%" all you do is borrow as much as you can and buy anything with operating profits. This may lead to the creation of monopolies in the future. The mega companies win the most in this situation (assuming they are not massively levered today). Also. The good businesses with leverage already, can take down their rates through refinancing and survive if they make it through the current downturn.

#2 Middle to Upper Middle Class Killed: A large amount of the jobs in the USA that pay $75,000+ a year are in major cities (NYC, Bay Area, Los Angeles etc.). They get nothing. If they keep their job they may get to survive but they certainly do not participate in the $1,200 checks or the 0% loans. So if you are in this camp and make around $75,000-$250,000 a year, you got crushed. Not only did you get nothing, but upper-middle class income is one of the highest "expense" lines for a firm. Take a wild guess on what area major companies will target to improve their profit margins. There is a reason why VPs are first to get fired in investment banking during a downturn. Unsurprisingly the SMBs getting killed lines up with the middle to upper middle class. This makes sense given the barbell approach the stimulus plan took.

#3 Real Estate Will Suffer: Coming out of this there will be a lot of bankruptcies and distressed properties. Sure, unless you're connected you won't get the "best ones". That said, there will be a lot of opportunities coming out of it. If oil prices were at $20 in any other time frame it would be on the news 24/7/365. However, the global pandemic is making many people forget about this issue. If oil prices really stay at $20 (or even drop below for a long period of time!) parts of Texas will have a lot of economic problems.

What to Do? In our typical fashion, there is a lot more to this beyond the main items we highlighted… But these main points are the most important. If you are in the middle to upper middle class you have no choice but to start some sort of second form of income that utilizes low operating expenses (Ie. Online sales). There is just no other option and fortunately we've already explained how to do this 100x on this blog alone (and in our products).

Why? Well, the only way to grow and compete is by running ***LEAN***. If you think you were running lean before, think of ways to run even leaner. You have to find a way to ratchet up your use of technology and decrease your use of anything manual. Yes… this means services based revenues will take a bigger hit and people will have lower disposable income. In simple terms, all of these policies have accelerated the use of high-end technology. So if you don't use them… you will have no shot at competing.

Fortunately our step by step recommendation is essentially the same. Get a white collar job (as high paying as possible), ramp up your political standing, get a high rating and then spend 100% of your extra time earning money online. Until your online income is 2x your regular income, you're not allowed to relax. This is 100% possible and we get tons of thank you messages every month now. Why? It works. The people who say it is not possible are just inefficient and ineffective at work. They make excuses and spend their downtime watching Netflix and YouTube at work (or texting). Example below of a successful person, not only did it work but he was one of the people *who didn't* get let go… Gee wonder why?

> @WallStPlayboys so glad I read efficiency and got out of this crisis unscathed (thriving better than ever actually), whereas company men with no business income are taking a massive hit
>
> — Garrison (@GrowthGS) March 27, 2020

The one item of warning we'd add? Financial services are worse. Much worse than before. If you can choose between tech sales, software and investment banking, avoid investment banking at all costs. The only area you should even consider is pure M&A at a high quality firm. The rest will see fee compression. No one is going to try and take their company public in a massive down turn.

Investing: Luckily we've somehow called this stuff right. Pure luck saying it'd hit 2,100s and then go up. That said, at 2,600 it's no longer attractive again but you're forced to find ways to "maintain your wealth". For the vast majority, our view is that you should stay heavy in cash and try to buy a place in an area you like when the dust settles (if you're fortunate enough to have this type of money). If you're not wealthy, investing isn't even on your list of priorities. Again. If you don't have $1,000,000 or more, investing is a colossal waste of time and you're better off just buying indexes or the items recommended in Triangle Investing. Every hour you spend researching "ideas" could have been spent building up a life-long income stream which we promise will generate WAY more than $1,000,000 (probably 7-10x if you're above average). The return is always highest in investing in yourself.

Final Notes: The tone of this post is probably a lot angrier than usual and this is not surprising, we're furious with how this was handled. While there is nothing we can do to stop it we do want to highlight that we're aware that the tone is much more abrasive (should really show how bad this stimulus plan was). For the wealthier readers, we'd also recommend hiding your wealth for a good 3 years or so… Having 10M+ (potentially) unemployed and showing you have money in public is going to attract crime. We wouldn't be surprised to see a lot more home break-ins over the next 12 months as stock markets don't correlate with people having jobs or not. In short, be careful out there.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending. **We hold Q&As 1-2x a month for purchasers only.**

****

Efficiency

Efficiency: Get Rich Without Giving Up Your Life

We have written this book as if writing to a son who is interested in becoming rich **and** maintaining a healthy physique and social life. We've seen many people become rich… yet they lack social skills (trapped in relationships they desperately want to escape) or… their bodies have seen material physical decay. We're putting out the framework in this book and you'll have all of the **tools** you need to get get rich and have a fun life at the same time.

We're not going to lie and say this is a "guarantee" to become rich. There are no guarantees. Getting rich and winning at life is no different than sports. We can give you every single step to take and how to do it. But. **It is up to YOU to execute on the steps.** Instead of buying 10 different books at the same time, we'll give everything out in ten key beneficial points:

1) How to get into the top 10% physically with one hour a day of exercise per day. You're going to be busy and unless you're a professional athlete, dedicating an hour a day will be enough. This is the first step to become a well rounded individual as a healthy person can work longer hours, has more energy to go out and have fun and extends his life (the most valuable asset in the world: Time)

2) How to eat correctly to be in the top 10%. We'll give you the rough blue print for items to eat on a daily basis. By simply following the framework you won't need to count calories/macros etc since we're trying to be efficient with our time. By following the framework, you will have less stress (no longer calculating everything you eat) and you'll give yourself some wiggle room to go out and drink when you feel like it.

3) How to figure out what type of intelligence you have. We give you a process to figure out where your skills are. Everyone has *relative* advantage in at least 2-3 categories. Use this to your advantage and develop your natural talents. We believe talent matters more than passions. Talents are natural to you and if they didn't exist everyone would be able to make money in the exact same industries or throw a fastball at 100mph. Finding your type of intelligence is the first step to becoming rich.

4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales. We have talked about this in the past and you'll notice we're adding a new wrinkle. We're giving you the tools to figure out what company to join. You'll have basic mathematical formulas that will tell you if you should join Company A or Company B when the offers come rolling in.

5) How to start an online business and sell (*the basics and all you need to start*). This one is self explanatory. We go into details on how to start an online business and how to sell. The best thing about online businesses? The margin structure. As you'll see the cost of running a website is practically nothing and you'll need minimal start up capital to begin today.

6) Clear outline of how to create and start an online product business with correct copywriting. You'll never be an expert in sales. No one is! Why? Every single second invested in learning more about sales will lead to a financial return. The game continues to evolve but we can give you the basic framework to start.

7) How to go into affiliate marketing if someone wants to take a stab at the competitive space. We give you both the legitimate affiliate marketing route and the dark side as well. The overnight success stories are "too good to be true" because they are. That said there are legitimate ways to do affiliate marketing as well. If you don't want to create a product (yet) most people start here and move to starting a Company later (once they learn a specific niche)

8) Overview of how affiliate marketing operates and how to do it. Beyond the overview, we also tell you how to do it. Both the legitimate way and the dark side as well. We explain why the legitimate way is better long-term, but we'd be lying if we said everyone is selling on an equal playing field (they are not).

9) How to do all of this and maintain a normal social life (avoid choking off your personality). This puts everything together, we give a basic schedule and explain how to improve your social skills and meet new people frequently without losing traction with your business and career. If you're able to keep your composure and go out twice a week, you'll see your phone numbers increase and you'll be much more interesting than the average person who works, sleeps and watches TV all day

10) Common questions and a schedule. We provide a rough schedule on a weekly basis under the assumption that a person is not rich yet. In addition, we answer a large number of common questions and provide good answers to "questions around morality" which essentially says "Break every single rule you can because someone else will, just don't break the law. Ever." this is essentially the gray area that you'll operate in if you're new to any field.

Click Below to Buy the E-Book (PDF) for $9.99

Buy Now

Notes: 1) we also take Bitcoin if there are payment issues, email Admin@wallstreetplayboys.com and 2) keep your email as we'll hold Q&A's for buyers only… You'll see why we set it up this way by the time you're at the second half of the book.

Email us for the address to send to (BTC, LTC, XMR, ETH are accepted).

Notes and Details

Keep Your Receipt: To help prevent constant stealing, we're only going to host Q&A's in the future for people who have purchased the product (rare exceptions maybe 3x a year that will be open to public). If the product was not purchased 1) we're being forced to answer repetitive questions and 2) we don't want to burn time on people who didn't have a few bucks to invest into their future. We will likely update the book periodically (every year or two) and anyone who purchases the product will get the newer versions for free. We realize we can't prevent all theft, however, there is a ton of value in Q&As when specific questions come up in the future. By cutting this off, the thieves will be forced to struggle on their own. *Keep your receipt as you'll need it for future *free* benefits and future products/services etc.*

Writing Style: The writing style is practically identical to the blog. We write to the point and with some incorrect grammar (for dramatic impact of course). It should hurt to read in a sitting since all of the information is actionable. There is too much information and a missed sentence/line could result in valuable information being lost. That said, it is organized in a smooth fashion and should give you a lot to chew on.

Length: The book is 160 pages. Unlike other products, it is written in standard 12 point font (Garamond) on a standard 8.5″ x 11″ pages with no filler photos to take up space.

****

Efficiency is Now Up

Good news, at this point everything is running smoothly.

If there are any issues there are three items 1) PayPal holds foreign transactions for 24 hours before releasing the funds – releasing link to product, 2) if you have not received it all you'll need to do is *email us with your receipt or the transaction ID number provided by the PayPal account and we'll manually fix it* and 3) remember to check both spam and junk mail particularly if a foreigner.

Efficient Market Hypothesis Does Not Make Logical Sense

Efficient Market Hypothesis Does Not Make Logical Sense

We are going to take an extremely complicated subject and attempt to make it understandable to anyone. We will fail miserably at this given that it's our first attempt at describing the idea. In this case we're using the readership as our Guinea Pig so thank you for reading! Essentially, we are going to walk through from start to finish and explain how markets are not efficient along with how they are becoming more inefficient through the use of ETFs.

The Beginning

Efficient Market Hypothesis: In basic terms, the efficient market hypothesis states that it is not possible to outperform the stock market because *"all share prices reflect all information"*. This means as we sit here today, every single stock perfectly reflects the value of the underlying Company. Now if someone is an efficient market hypothesis believer we can look at both historical examples and current examples today to prove this is not the case.

Historical Example Internet Bust: We'll start by looking into the past. During the Internet bust there was a Company called "Pets.com", it is now infamous for being one of the biggest disasters in Internet IPO history. To keep it simple, the Company generated $619,000 in revenue (that is thousands of dollars not millions) yet the Company raised a total of $300 million dollars (yes million not thousands). More importantly, while the Company earned $619,000 per year in total sales it was also spending millions of dollars leading to a total cash flow burn in the millions. Please take a look at the photo below from the Pets.com IPO.

To avoid deeper explanations, here are the basics… The line that says "Proceeds, before expenses, to Pets.com" is essentially how much money would be added to a checking account: $76 million dollars. Not only that… but the checking account already had $30 million dollars in the bank (see Balance Sheet Cash and Cash equivalents). Now the checking account has $106 million dollars which is shown in the Pro Forma as Adjusted column. This sounds great because if the Company is going to see that checking account go up in the future, the total value of the Company is well above $106 million. The problem? It's losing millions of dollars… quickly.

Fast forward a little bit (a little bit over a year to be exact) and after losing tons of money there is practically no money left in the checking account. No problem… they will just go and ask for more money to put more cash into that checking account. Unfortunately? No one wants to put money into that checking account because they believe it will never actually go up in the future. Therefore, the Company goes under.

We're not saying that you should never invest in a company that is losing money today. Far from it. We're saying that the "Efficient Market" was unable to correctly value the future cash flows of Pets.com. On a small scale, if you created a website that lost $50 in the first month, it does not mean your website/idea is going to fail. The same applies to any large company that is currently losing money. If it can get to positive cash flows in a timely manner or raise funds easily, it will be around for a long time.

The Efficient Market hypothesis defenders will say *"Hindsight is 20/20 it would be impossible to predict the failure of Pets.com if you were an investor at that time"*. Well, that is what was said about the real estate pop… and a few geniuses *did* figure it out and made hundreds of millions of dollars in approximately one year. To emphasize this point, they did not "guess" they went directly to the source of information and found the underlying issue with the real estate market and made millions. While it is true that 99.99% of people could not figure out the underlying issue, saying that the top 0.01% could not is factually incorrect based on the data. While we will unlikely predict the next major crash or boom (would never claim such a thing) saying that 100% of people cannot do this? We'll take the other side of the bet!

Fast Forward to Today

Assuming we've convinced you that markets are not 100% efficient, we'll begin to tie this to the market today. If you're still convinced that markets are 100% efficient we have no problems with it, we'll simply agree to disagree. This will prevent the comments section from turning into a large scale debate. We're being extremely careful with our wording using the phrase 100% which means every single stock and bond is currently priced correctly today to reflect all information. Not 99.99% but 100%.

Enter Index Funds and ETFs: We have long suggested that people dollar cost average into index funds. That is because over the long-term, we think the American Economy will continue to do better. This is not a new concept given that Warren Buffet himself has recommended this strategy. So if a recession happens and someone loses their money from an index fund… please send hate mail to Warren Buffet instead of a bunch of crazy people on a blog called "Wall Street Playboys".

Back to the point. What exactly is an index fund or an ETF? An index fund/ETF is a vehicle that tracks the overall performance of a *group of stocks*. Using the S&P 500 as an example, if you invest into an ETF that tracks the S&P 500 you're getting exposure to 500 different stocks. Remember, investing in the S&P 500 is not an investment in "America" it is specifically an investment in 500 of the largest stocks in the United States. If you wanted to invest in all American equities you'd have to buy somewhere around 4,000 different stocks and buy one share of each.

Now lets think about why this matters. If everyone decides to invest in nothing but index funds (take the case of 99%) it means that the market is inefficient. Why? Well if everyone buys the exact same stocks over and over again… no one is helping "correct" the market except for the 1%. Lets look at two basic examples using a smaller index fund.

In this index fund we'll have four Companies (Pets.com, B, C, D). Since 99% of people have decided to become "cult like" passive investors all we are going to do is buy the exact same four companies forever. The people in the 1% sit and wait as more and more bids to buy keep coming in and eventually they capitulate and sell at an enormous valuation. The strategy is to simply click buy and forget about it so the passive investors don't look at the performance of the companies. In short, *there are millions of people hoping to buy 1 share of all four companies and eventually someone managing their own money decides to go ahead and sell it to them*.

Pets.com suddenly loses a ton of money. And. The market did not recognize a change. Why? Since there are 99 buys coming in for every one sell, there is always a new person who is willing to buy this dying company (remember people are blindly throwing money into this fund). Put this together and you'll see that while the stock price may function for a while… Does the current price reflect the true value of Pets.com? The answer of course is no. While Companies B, C and D may be solid companies, Pets.com is essentially obtaining money for free by issuing new shares to sell back to the market. As they burn more and more money, they just issue shares to the market to keep the balance sheet full of cash and go back to losing money hand over fist.

Now… lets move to a more applicable example since the one above is not realistic at all. There are approximately 2,000 ETFs in the market today (probably more). Lets call this index fund the "Candy Fund". In this fund people get to invest in every single publicly traded company that makes candy (chocolate, taffy, gummy bears etc.).

Everything is going well in the candy fund until chocolate company #1 goes bankrupt due to accounting fraud unrelated to the consumption of chocolate. Now the ETF is valued at $45 since Chocolate Company 1 no longer holds any value. But wait… Should chocolate Company #2 be worth $5? Lets assume there were only two places in the world to buy chocolate… In that case chocolate company 2 is probably worth $10.

The problem? It's still sitting there at $5 and *when you buy an index fund you're equally buying each candy company.*

Now that everyone is thoroughly confused (we're having a hard time putting this new concept into practice ourselves) lets think about what this all means in a few simple ways: 1) As more and more people invest in baskets of stocks, the underlying assets are receiving bids equally even if they deserve two bids instead of one. In the candy example, a smart person would happily pay $5 for the second chocolate Company. 2) In addition, as more people move to passive it also means that many companies are receiving bids that don't deserve them. Pets.com is an example where there is a bid for an asset that shouldn't be worth a cent and 3) Flipping this around, if someone panic sells the "candy fund" with billions of dollars, it will bring down the price of all candy companies even if one of them (say the company that makes mints) sees an increase in cash flow of 100%

Fast Forward to the Future (All Real World Items)

Currently, more and more money is flowing into passive investments (indexing). With our confusing examples listed above (hopefully it wasn't that confusing) we can see that this will create market inefficiency. During the next downturn there should be a *watershed of opportunities*. As companies go bankrupt and other companies go public, there will be a large change in the securities held by each index fund.

We'll go ahead and repeat that. Since there are around 2,000 ETFs today, many of these ETFs will hold the *incorrect* weight of stocks.

The second thing that will happen? We will see a lot of people become extremely rich. Why? Well… if more and more people are ignoring the entire stock market and believe they can never identify an opportunity… That by definition means there is more opportunity for YOU. If you are an expert in say real estate you'll want to study every single publicly traded real estate ETF and Company. If you're an expert in oil and gas you should spend a good amount of time studying oil and gas ETFs and the companies held by each ETF as well. As we move forward, if any particular ETF continues to go up in value that just means more and more opportunity for you during the next recession.

All of that said if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like our upcoming book Efficiency. The benefits include: 1) How to get into the top 10% physically with 1 hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career **and** the *right* company: Wall Street, Technology or Sales; 5) How to start an online business (the basics); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). **Efficiency will be available in July**, subscribe to receive discounts or follow us on Twitter for the launch. Remember we can give the tools, but no one can execute on the plan but you.

Note: Since you've made it this far in the post we'll explain how the pre-sale will work. All members subscribed to our email list will be given a link to purchase the product at a discount (for one day). The product will then be sent to you once it is officially launched (the following day). Have a great week and we'll go back to our normal posting schedule (focusing back on the normal topics).

****

End of the Road. What to Expect and How to Spot Them

End of the Road. What to Expect and How to Spot Them

When you reach your financial security levels, most people ask "what next?"

Instead of answering the question, which is impossible for each person, we'll provide a sneak peek at how your actions will *likely* change. As noted this is from the perspective of a business owner and no longer from someone interested (at all) in Wall Street. In addition, we're assuming you're a single male.

Finally, this post can also be interpreted as “how to spot someone who has made it”.

1) You Will No Longer Have an Interest in “Opinions”: A common criticism here is we delete comments from people we don’t like and mark them as spam so they never return. Why? Simple. *We don’t care about the opinions of people we don’t know.* When you’re set for life you think differently. This is not a forum for “discussions” (see waste of time) and should never be viewed as one.

Instead of doing what most regular people do, we do the opposite… The typical person will ask 10+ people their “opinion” on a topic to make sure they make the “right move”. When you’ve already made it in life you’re not wasting your time discussing topics. *You’re spending your time getting things done.* This is simply because a successful person ***knows how to find the right answer*.**

Most people don’t deserve the right to an opinion in the first place. Why? They have not succeeded in the topic they wish to speak about. Instead of polling tens, hundreds, or thousands of people to get an answer that feels right, you’ll have a clear and concise step-by-step process to finding the right person to answer the question. Instead of asking strangers or acquaintances, you’ll go through your personal process and find the right person. *Once that person is found, you pay the price to obtain the answer from them and execute as they say.*

2) Disconnection from People: In our prior post, explaining how money will change your life, several unsuccessful people attempted to ignore the word ***temporary*** when we walked through the ***temporary*** negative effects of money. This is because your average person is looking for an excuse to avoid getting the things they want the most (fear of failure). This disconnection will likely ebb and flow depending on your own personal state. But. For the most part, it will be ***temporary*** in nature as you learn to hide your wealth from society (assuming that is the path you take).

It is certainly not normal to wake up on a Monday or a Saturday and not know the difference. For most, the days are clearly different as they have people to report to and deadlines to meet.

Interestingly, when financially set, you’re better off creating a reason to get on a somewhat normal schedule on weekdays to create your own grounding mechanism (avoid downward drug and alcohol spiral). This will help bridge the disconnection gap a bit. The gap will always be there. But. You’ll find ways to ground yourself for a more “relatable” life style.

Hint: there is a reason many rich people turn to charity work, forced human connection.

3) Nothing to Talk About: Unless you’re out with friends to meet *other new people*, you’re not going to have much to say in one on one conversations. You’ll come off as eccentric already. Most people have many issues they want to vent about while your entire goal is finding new challenges or sources of entertainment (dopamine rush without the health impacts).

You’re certainly not going to blow the lid on exactly what you’re doing so you’ll find yourself avoiding the topic everyone talks about: Work/Money. Ironically, once you have it, you don’t talk much about it during your *personal life* (again assumes you’ll be a stealth wealth person).

Since you have less to talk about, your social priorities will shift quite a bit. The only way for you to be enticed to go out and have fun is if there is someone you specifically wish to meet. Otherwise, you’ll likely go out solo and have a carefree night without being interviewed for the 100th time about *“What is it that you do again… exactly?”*.

4) No Stress: Assuming you’ve learned the art of stoicism, you’re not going to have any stress in your life at all. Your only interest will be in maintaining your current health, which is worth more than every single cent in your bank account. If we think about stress, it usually involves negative things that could occur to you if you fail at doing something. Therefore, if you can fail at anything and still be fine… it is almost impossible to become stressed. Your only stress will be self inflicted through physical exhaustion (fitness) or product creation (mental stress).

The real takeaway is that no one can apply stress to you anymore because they have no control over your life. Similar to creating forced human connections by picking up a routine that is done during the weekdays, you’ll create self inflected stress. Most will turn to the money game, trying to increase the numbers on a screen since it is the hardest game to play. *There is no fun in life without a challenge.*

5) Irrational Buying Behavior: You won’t think about *planning* for purchases anymore, you’ll simply look at items you want… buy them… or go through long stretches of buying nothing. If you’re *earning more than you can spend* the behaviors you exhibit won’t make much sense. Sometimes you’ll find yourself buying many items at once for prices that appear to be inflated (you won’t care) and other times you’ll delay purchases for long periods of time because you don’t feel like spending the time to obtain them.

The key here is that planning is no longer in your vocabulary when it comes to general goods/products. You’ll learn that possessions don’t matter much to you and all of your planning will surround memorable life events (trips) that take up material blocks of time.

6) Skyrocketing Time Value: The value of your time will increase at an exponential rate, you’ll become more protective of your free time on a *weekly basis.* Tolerance levels also decline at the same rate. This means you’re going to quickly change priorities and where you spend your time will rapidly evolve on a monthly basis *at minimum* as you review each week and the time you used wisely or burned each day.

An interesting note is your hobbies will evolve as well, for better or worse this blog will become a more sporadic hobby in the future. We haven’t seen much need to write anymore. We feel the content on the blog is already enough for anyone with a high IQ and competitive drive to succeed without silly motivation or discussion.

On a more positive note, we’ve officially started creating a basic product we wish we had several years ago. When our internal metrics are hit we’ll go ahead and press publish with limited “marketing” since books are **not good products for money making purposes** (Why? it is non-recurring revenue).

7) Rapid Learning of Complex Topics: Since the two types of growth are essentially financial and mental, you’ll find time to dive into complex topics. Each month (or year) you’ll find a new “difficult” topic that interests you and become a quasi expert in the field. We use the word quasi as you’ll know enough about the field to have interesting questions, but you won’t have the tools necessary to solve those questions without giving up another major slug of your time.

Maybe you’ll be different but every 3-6 months you’ll find the *truth* about a new topic which only makes you much more dangerous as people will be unable to lie to you easily. You’ll find yourself saying the tried and true “Wow, I don’t know anything about XXX can you tell me about it?” only to see if the person is a liar.

8) Mainstream Understanding: Instead of being part of the mainstream, you’ll understand the psychology of the mainstream. This is vastly different from being a participant as you’re simply selling your items based on mainstream philosophies while you avoid partaking in any of them. To put it more simply, the things you find fun… people will loathe and the things you loathe… you’ll sell, because its what the mainstream wants.

There is nothing wrong with selling mainstream products as that is where the market is. The joke is that your own preferences never match up to the needs of your average customer. If your product works and you use it yourself… the way you sell it would unlikely ever work on yourself.

9) Stable Dopamine Levels: The largest rush you’ll ever get is when you’re free. There is no doubt about it and once you’ve gone through the temporary drug/alcohol spiral to try and chase that next high, you’ll settle into a steady emotional state. People can yell at you, they can suck up to you, they can even attempt to get physical with you… Your emotional state won’t change much. Unless your life is actually at risk you’re unlikely going to get a material adrenaline rush.

This does not mean you have no emotions, it simply means you will always be stable. The highs and lows are smaller and day to day changes are quite irrelevant. Try to envision a buddhist monk and you'll get an idea, the only difference is a slight smile to your face as you won't require the intense mental concentration.

10) Distain for Authority: So long as you're not breaking the actual law (sent to jail) you're not going to have a shred of tolerance for anyone who attempts to act as an authority figure over you. In short? ***You're no longer employable.***

An accelerated increase in your pushback to anyone telling you what to do will be seen in short order. We can't speak for the rich men with wives who boss them around as we'll never understand those folks, but the rest usually exhibit personality traits of a recluse. Historically, it was bad to be ostracized from a tribe as it was part of basic survival. In this case, the isolation will be self inflicted as answering to someone will not be on the priority list.

11) Inability to Be Bored, Only Frustrated: Assuming you have a type B personality, you won't find yourself being bored. You'll go through spurts of being social and spurts of learning new topics as stated above. There are too many topics to learn about and too many places to see to possibly become bored for long stretches of time. In fact, you won't be bored for short stretches of time.

The one downside, is delays in time (airplane delays, traffic etc.) will drive you nuts. Burning of your time is one of the rare items (next to health/your family) that will have any ability to impact your emotions negatively. This shows up in two ways: 1) if it is a travel delay you'll scramble to find productive things to do… likely fail at doing something remotely and 2) if someone is wasting your time, you'll pay the bill and leave or simply leave the conversation abruptly if there is no reason to wait.

12) No Impact from Rejections: This is a broad topic but can involve trying to sell a product to dating. When you know that you're already set, it becomes impossible for anyone to rattle you with a "no". If a person doesn't want to buy your product you simply move to the next. Similarly, if you're chatting to a girl on a date and she is negative towards you it won't even be an after thought. Previously, most people will feel some emotion when hearing a "no" in either work or play. But. Those days are long gone and you can even take an emphatic no publicly. The event will be forgotten within 24 hours.

You'll only remember positive things from your past as the negative items won't seem relevant anymore. Again. Forgotten instantly.

13) Decrease in Mental Circles: When you're doing everything to climb up, your brain is "on" constantly. You're trapped in your head for the most part trying to figure out the next move. When you're done, it is *extremely* easy to turn this function on and off. You could have emails, phone calls, text messages and a siren going off in the background but you'll be able to tune out all of it at a moments notice.

This is critical as being trapped in your mind actually reduces work performance. Being able to shut down all thoughts as if you are at rest will allow you to learn and create at faster rates than the past.

14) Annoyance With Travel: A small topic but a dead giveaway someone is very well off financially. They absolutely hate flights that are not direct. They absolutely hate being in the airport. Finally? They also absolutely loathe specific cities and will do their best to avoid them at all cost.

"To travel to love to laugh" is something younger people want to do. "To see the world". You'll be tired of moving around a lot and will have a few set places you will call home.

15) Everyone Knows Each Other: The triangle gets smaller and smaller on the way up. The reality is that anyone who works in the same industry as us (no, not Wall Street anymore) has probably already crossed paths several times. In fact, we'd wager that if you're in the top 1% (keeping it simple) in your industry… You'll know every single person who is at or above your level by first name and last name basis within 6 months. Simply no chance it won't be the case.

Funny enough, when you go to events/parties… Everyone will know the same people as well. This is why it does not make sense to put your face out there unless you are willing to pay the toll of being famous.

Summary Notes

Below is a quick summary of what to expect and we'll also throw in some fun nuances and see if anyone recognizes similar traits in people they know (that are financially set).

– No interest in opinions, therefore will come off as a "know it all" and will generally dislike people unless prefaced with a reason to be speaking to them.

– Generally disconnected from society creating a largely eccentric personality by default

– Does not want to reveal much about his/her life with new people and therefore avoids all topics that most people chat about (work/stressful situations)

– Appears to be largely carefree

– Irrational behavior when it comes to spending habits

– Difficult to get a hold of unless "sold" on the event

– Interested in many new topics and continues to learn a new obscure item each year

– Understands human psychology well, yet all decisions on personal basis appear to be done with cut-throat logic

– Un-rattled emotionally, yet easily annoyed when treated like a "regular person" by a regular person.

– Zero tolerance level for wasting of time or being told what to do (unless specifically asking an expert and likely paying for said information)

– The word bored is killed from the vocabulary list

– Cannot seem to understand negative feelings associated with rejection, because rejections have no impact on their lives

– Clarity of thought

– Speed of travel is more important than comfort of travel (will travel "in style" if it does not impact flight duration)

– Seems to have the same biz contacts that remain unchanged for many years

****

Enterprise Sales: A Legitimate Career to Get Rich

[Enterprise Sales: A Legitimate Career to Get Rich]

This is a guest post from frequent commenter "Tech Sales" who works in the industry and has already *made it* up the stack so to speak. Enterprise sales is one of the few careers we recommend in Efficiency and we thought it would make sense to do a cleaner overview of how to get into the space and luckily he was willing to do the post. All of the words are his and we've made some basic organizational/formatting changes. **We'd like to thank him for his contributions and the Q&A section is now closed**. If your question is redundant we didn't approve them. Thanks!

How to Make It In Enterprise Software Sales

Next to Wall Street, Enterprise software is one of the best careers out there. The earning potential is extremely high, with the higher level VPs earning high 7 figures (search for the top earning tech sales people, they make over $5M in Google). That was a few years ago, and is likely higher now… *The median for an enterprise account executive seems to be around 250k, with base salaries going to 100-150k and good years bringing your total earning up to $1M (or more)*. The one funny thing about Enterprise software is that people do not hate it as much as Wall Street. On Wall Street I don't think anyone likes their jobs. In software, plenty of guys working at home 40-60 hours a week making a killing loving life. No need to have "exit options".

Where else would you exit to? Plenty of people will stay in sales their entire careers and not hate their lives, unlike people in Wall Street who all want to leave. See the founders of this blog for example. (*WSPs note, as many of you know we left many years ago and we agree that around 95% of Wall Street professionals don't like their jobs).* I've heard plenty say the job is super easy. However those were the guys who were good at it, a large amount drop out before they make any real money.

Where can I end up? Assuming you start as an SDR.. that should be much shorter than an analyst stint (1 year of your life. 6 Months if you're a crafty hustler and 2+ if you let companies abuse you). A lot stop at enterprise account executive. If you get lucky you can have your established accounts and just do new demos and manage accounts working from home for 40 hours a week. *This position takes years to get to but with a six figure base and multiple six figure comp, most do not mind.* If you want to venture into leadership there is the VP of sales, CRO, and CEO in a lot of cases. At the very top is founding your own company, see the Salesforce founder for example. His LinkedIn indicates he was a VP at Oracle before going off on his own.

Can I Do Sales? The best sales guys I have met have a very high EQ with a level of social skills and the ability to hustle and grind. If you're your a nerdy guy who as Aspergers and can't pick up the phone you will most likely have a hard time getting your first job, then subsequently fired if you do get your first job. Feel free to give it a try however, it's completely possible you will make it. To be honest the answer is I don't know.

Even guys who I thought would kill it have given it up for greener pastures. If you are a hustler and are good with girls (this is a dead giveaway, can you cold approach a girl and have decent results? You'd most likely be a good fit then). The only real way to tell is try it for a few months. You'll know pretty quickly if this is something you can hack or not. Emphasis on the cold approaching part. If you can cold approach comfortably and do well, this would almost definitely be an excellent fit.

Career Progression

The career progression typically goes: SDR (6 months to 2 years) ==> Small Business Account Executive (1+ years) ==> Mid Market Account Executive (1+ Years) == > Enterprise Account Executive.

Enterprise Account executive is where everyone wants to be (along with the six figure BASE salaries and 1M earning potential). Keep in mind this path is not set in stone…at all. Some guys start as Account Executives, but most start as SDRs. You can do this in 1-2 years probably if you are a killer and start as an SDR at a very early stage startup. Then get extremely lucky and given enterprise accounts to close because they need someone that minute… and by chance you're the most senior SDR.

For most it will take 3 years on the very low side for those talented/lucky to 5 for those who are engaged. Longer even if you let companies use you (a lot of companies will keep you as an SDR as long as they can, 2-3 years in some cases. The best solution here is to leave to a better company as an AE after 1 year max. Different geography if there are not a lot of options).

Compensation and Roles: Keep in mind these are rough numbers, and you might see different numbers places. The advice given is for those who want to become an enterprise AE, or higher as fast as reasonable. SDR — $45-110k All In. HIGHLY dependent on geography and market you sell to. A small business rep might make 45k in Kansas for example, while an enterprise SDR might make 110k in NYC. You're setting appointments for the account executives. 100+ calls a day reading from a script. Probably equivalent to being an analyst minus the 100 hour weeks… More like 40-50. My SDR role was in at 8 AM out at 4:30 sharp with an hour lunch break.

What to do: Get promoted from this role as fast as possible. There is not a lot of money to be made unless you get a few % on the backend and somehow originate a million+ dollar deal. I would say it is almost worse to start at Oracle than a startup. Oracle makes you stay in an SDR role for 1.5+ years. I've seen it done in 6 at a startup, and even faster. However, starting at Oracle is a great resume booster, so do what you want. There is not a lot to do except learn how to use the phone and position yourself to move into an AE role at your current company.

When I started I spent 1 day training, the next day I was on my phone and set up my first appointment. Don't feel bad about leaving as you are probably adding value day 1. Most jobs take 1 year to be beneficial to the company, a good SDR will do it on DAY 2. You're already generating revenue. After 6 months you can start looking for new AE jobs at another company unless your current employer brings you up to speed.

DO NOT GET TRAPPED HERE. Plenty of companies will hire you as an SDR and just leave you there. If they do that look to lateral to an AE position after a year to another company. It's not worth it to take the time to look for the perfect SDR job. Everyday spent looking for a job is a day you can be grinding putting in your time trying to get promoted. If you're not long out of college think of this as grad school. Eat ramen and have roommates for a bit.

SMB AE — 100k-120k (Estimate) and Mid Market AE — 120k-150k (Estimate)

What to do: These jobs are much better, but still a stepping stone if you're the kind who wants to make it to the enterprise. Additionally, you will start doing demos and do a lot less cold calling. Minimum duration of 1 year. It's possible to go from SMB AE to enterprise AE, but you generally need 3-5 years of experience. So you're paying your dues until you can get to the big leagues. The most common route is probably SMB 1-2 years ==> MM 1-3 years ==> Enterprise however.

Put up solid numbers until you can get promoted. No reason to leave unless you get pigeonholed or you cannot be promoted any more. Enjoy the higher salary and ability to live a decent life. Enterprise — 200-300k. Up to Millions with accelerators. The big leagues. Same as before, but now you're selling to companies with thousands of employees. After you make it here no need to sell to SMB or mid market ever again.

Same as the other Account Executive Roles. Ideally you do little cold calling, as there are not that many fortune 100 or even 1000 companies to call. If you add in a few reps and few SDRS, that's less than a few hundred companies per person, much less than a highly productive SDR can contact in one day. Many stay here. 150k base, 250k OTE working from home a lot earning up to 1M. Not too bad…. at all. (Wall Street guys might disagree…. seven figures or bust?). *Note:* Some companies go SDR ==> Inside Sales == > Outside Sales. The timeline and pay is similar to SDR ==> SMB/MM AE == > Enterprise AE.

VP on up. Can't really comment here as I'm not an expert. The general consensus is that you make more than most reps, but less than the best. Which is how it should be, and why many stay selling to the enterprise indefinitely. However it is less selling, and a lot more managing and training. If you want to chill on the grind, this is a good place to go. If you are one of those "I gotta be at the top" types. Working your way up and shifting over to enterprise leadership at a big company as soon as possible might be a good route. Flirting with the idea of starting your own company of course, or figure out some way to get a good chunk of equity as a sales centric founder or even as a rep.

Keep in mind you are NOT an "idea person" as a cofounder. Without deals, the nerds have nothing to make. Again, I'm really not the best person to ask here… so look elsewhere. The advice in this section is purely speculation.

How Do I Get a Job?

The best way is by far internal referral. If you have a family friend, neighbor, relative, friend's dad. Literally ask them for a job. If they are a manger they might be able to hire you, if they are a rep they can recommend you to their manager and you might get an interview. Alternatively ask someone in software sales. Maybe I'M not hiring, but I probably have a friend who needs good people, and I'd be doing 2 people a favor. People in the industry often know others in the industry naturally.

Otherwise apply online for SDR jobs until you get something. It might take a few interviews for you to land something. Once you get it feel free to take it if you want, grind it out for a year or so and move to AE. Cold calling also works. Might be kind of weird in other professions, but if you can cold call and pitch a manager you can probably pitch a prospect just fine. Plus it puts you ahead of 100 other candidates…. Otherwise messaging on LinkedIn also works I'm assuming (never tested).

Target School List for Oracle Class Of Program: If you're wanting to get into Oracle right out of school I suggest going to one of these schools: "Baylor Berkeley Boston College Cal Poly Cornell Duke Georgetown Stanford SMU Texas A & M UCLA U Mass U Michigan UCSB UNC USC UT Austin UVa U Wisconsin Indiana Penn State THE Ohio State Wake Forest Va Consortium HBCU*" That was copied word-for-word from a response from an Oracle Sales Manager when I was gunning for software sales at the end of college. So do what you want with that information. I think a 3.2 is also preferred… If you want this I also suggest getting in contact with an Oracle Sales manager via LinkedIn or another method, they might be able to help you cut the line and get you an interview.

Conclusion

Enterprise software sales is perfect for the low to mid 20's hard worker who does not know what to do. You can realistically reach enterprise in a few years (before 30). One of the realistic (albeit VERY hard) to make a million dollars a year before 30. If anyone asks you the often dreaded "What do you do?" — "I sell enterprise software".

Probably the best answer ever. The person probably knows you make a lot of money, but has no clue if that is 100k or 1M. Emphases on them knowing you are **probably** well off, but not knowing if you are actually rich or not. It seems like everyone knows of someone making a killing in software sales.

What to do (in a few words): Get a job as an SDR, grind to an AE position, make it to enterprise AE. Congratulations, you're in one of the best reasonable-to-attain jobs on this planet. Feel free to celebrate.

ON GETTING THE JOB TO ANSWER YOUR QUESTIONS

1. When you're Interviewing for a job, here's what they look for on your resume:

A college degree. It is possible without a college degree, however this is highly recommended. You might be able to be a rep with no degree, however getting into management will be very hard. You're on your own if you decide to go without it or not. I'm assuming if you're reading this blog you decided to go to college…Underwater basketweaving from Local Community College is fine. One of my managers went to a for profit school…. it just gets you in the door. After you're in you're in.

Sales experience. Even door to door or retail count. The rationale is that it makes you much less of a risk to hire if you have already been successful in some sales environment. If given a choice a manager will choose someone with 1 or 2 years selling pots and pans door to door successfully over a decent candidate from a good school. Mr. Pots and Pans honestly has a better chance at making it because of his proven record. However the new grad still has a decent shot.

Easiest way by far is from an internal referral. Even a rep giving your resume to a manager will very often get you an immediate interview. I've gotten friends in with zero experience from the inside and they skipped the entire interview process at a start up, all because the sales manager WAS HR at that point. We had no candidates lined up, so it was literally: He sounds like he can sell, He's hired!. Literally no one else to compete with. Usually sales hires for sales. HR does a god awful job deciding who would make a good sales person.

If breaking into Investment Banking was a 10 on the difficulty scale, software would probably be between 4 and 6 depending on factors. Challenging, but doable for most college graduates. Apply to a ton of entry level roles. Go to networking events. It took me a few interviews until I was finally hired. No harm in starting at a start up. It might actually push your career forward at lightning speed. Oracle makes you stay at the basic level for 2 years, it took me 6 months at a start up.

2. When you meet or email someone. Talk about your ability to hustle and how you work really hard. Talk about your good social skills. Tell a story about how you were in a frat in college and partied a bit and everyone loved you. You thought you might be good at sales. Talk about the sports you played in college and how you are super competitive. If you're a nerd, talk about how no one realizes it but that academics at a top tier institution are ruthlessly competitive and you are extremely competitive in that aspect and how you hate losing. I'm not sure if this is true but it would most likely work.

3. When you get an interview focus on… Focus on not being nervous. If you were in a sport emphasize your competitiveness. If you didn't play sports on college emphasize how hard you work. Talk about how money is a good motivator for you (important). You want a big house, fast cars, and your girlfriend likes to spend cash like crazy. Even if you don't it will help you get the job. *(Sales Manager is thinking: "This guy is going to work his ass off")*

Act confident and a bit of aggressiveness helps. Talk about how you are good with women if you think the sales manager is young and might be comfortable on the topic. A lot of sales managers know that the two are extremely similar and this will put you in a positive light. Watch out though, it is possible this can backfire if you have a female manager or some sort of weird SJW manager.

4. If you still have trouble… Get a sales job in business to business. Paychex, ADP, anything really. Show some success and you will have an easier time getting interviews. Try contacting sales recruiters. If they can place you they will for a quick 5k+ (their commission from the client). Honestly even if you are a complete dweeb eventually a hiring manager will give you a shot for you to prove yourself at one of the second tier companies. If you can't sell (Ie get fired more than a few times from sales jobs for not performing) that's a bigger problem and not something I can help you with. It might be time to find a new career.

5. How to improve sales skills…. Go out and chase women, pick up a mild alcoholic habit and hang out at bars. Learn to like people. As much as this blog tells you to hate average people, you're most likely going to sell to average people and that attitude will NOT make you friends. So at least fake liking them. There are a ton of books out there on this topic. To start: fanatical prospecting, challenger sale, and so many more. Oh, and before anyone asks. I have NEVER been drug tested for a business to business sales job.

6. Other Random Thoughts: *Even for guys that are good, you are going to have huge ups and downs. Even the top producers have them.* Some days making money is so easy is a joke, some days you will feel like you are trying to walk through an endless desert trying to sell. It also depends on the company/market fit. If you have a ton of hot leads waiting it can be as easy as a few phone calls. Sometimes you'll be given a list of random people and it is very difficult.

It's best to be friendly with your co-workers. There are usually enough leads and territories to go around. Your job is to create opportunity, and very rarely is there a "limited" area to prospect. Of course it is a work environment so don't trust anyone too much, but be friendly if you can.

The reasoning? If one of your "buddies" leaves to go to Oracle/SAP, a hot new startup, becomes a manager/VP at a top company, or you need a job in a year you can give them a call. The best path to a good job is through a referral. There's less throwing you under the boss. Managers will be on your ass if you don't produce, but if you do you can pretty much do what you want.

On recruiters: I love sales recruiters. Many people hate them and find them really annoying, however I really don't mind them. They're one in-mail away from hooking you up with jobs extremely quickly. Just remember that they get paid to place you, so be sure to vet the jobs they show you. Never harm in seeing what jobs they have at that moment that might pay a multiple of what you are currently making

Wall Street Playboys Note: It is important to recognize all the Careers outlined in our book are 100% fine. We never worked in Enterprise sales and that is why we brought in a Guest poster. If you are currently an M&A investment banker or working at Facebook in tech… there is no reason to switch.

****

Evaluating Location Independent Income vs. Corporate Income (Some Career Ideas)

[Evaluating Location Independent Income vs. Corporate Income (Some Career Ideas)]

To be clear, we're making no change to our original recommendations. For a summary of why you need to start a Company or business at some point (ideally now) you can see [our post on the Company man].

That said, we got into a quick Twitter back and forth about the perils of traveling abroad and attempting to live the nomadic lifestyle. The push-back was that "everyone knows someone living on $100K tax free due to specific hurdles if you spend 330 days out of the year outside of the USA". First of all these are clear exceptions to the rule as most are not in this situation and even then it's interesting because we'd rather earn $300K at a company in the USA instead. We'll explain why here.

Frugal vs. Earning: We've read those [frugality blogs] already. If you save 50% of your income you can retire in 17 years so it's not about how much you make it is about your percentage savings rate. Great. No one asks the most important question (Elephant in the room), do you actually want to live like that forever? If you're earning $100K a year and spend $50,000 a year… You're never going to be rich. It's simply false. You're better off earning $200K a year, and saving $100K a year since the option of "living abroad" is always there!

It's interesting as this seems to be a foreign concept to many people who never got a chance to earn high amounts of money. Sure earning $250K a year in NYC or California is taxed heavily. That said… That person likely has a lot more income mobility than the person living off of Air BnB income of $80K a year living out of a suitcase. No matter what he does, he can't really gain leverage out of his income without either starting a business or going back to higher cost of living city.

Before we move on, we know there are exceptions to the rule. There is always someone who has "pulled it off". That said, for every guy that has pulled it off there are 99 guys who are living off of just $60,000 a year at age 35. An ugly ugly ugly sight to see. Now if someone has successfully scaled a business that's a different story as your earnings are not tied to your location. We're simply attempting to compare the high-end corporate employee to the nomadic suitcase traveler making $80K or so. In 99.99% of cases, we'd rather be in the corporate position as your skills are likely improving at a rapid rate.

How to Evaluate Your Options: To keep it simple we have a few rules when evaluating the corporate position with the "leave for good" scenario. The first one is obvious, you never quit any career based income without something else lined up already. We don't care how much you hate your Company or how much your Boss hates you. You always hang out till the very last day to collect severance, a healthcare package and a few extra paychecks as they get the paperwork ready to lay you off.

The second one is also severe, when you start your business/side income… You need to earn at least 2x what you're making in your career before you quit. If you attempt to quit when your business is making the same as your career income (after tax numbers), you've made a terrible mistake. Any business is going to have volatility so you exchanged higher volatility income for lower volatility income for no good reason. The one exception is if you're forced to quit in order to unlock time for higher revenues. This makes logical sense as you've hit a wall in terms of juggling two items at once: your career and your side business.

With the two biggest items out of the way we strongly suggest looking at your "true total comp". While you can hang out on the Blind app all day to find total comp for every Company, it doesn't really tell you the "true total comp" since high paying positions have many perks. Here are a few just to get you started: 1) how many days do you travel?, 2) how much are you spending on food on a daily basis as you can easily expense food up to $100/day at many companies – when traveling, 3) how much leverage are you getting out of your healthcare benefits?, 4) is there a benefit to your Company's 401K/retirement income match – while unimportant if you become rich it is important if you're not rich yet as a match can easily add $15,000+ more per year and 5) what other services do you get for free from the Company?

While the above may seem like a bunch of fake questions, if you've entered into any of the careers we mentioned in [Efficiency] you know that they are real questions to ask. If you're still climbing the ladder, we would bet all of these benefits add up to well over $30-40K or so in a year. Not paying for food 100 days out of the year is already a large number after tax (not to mention pre-tax) and the points you accrue if a frequent flyer will not be laughable (easy to accrue enough for a international business class flight – vacation – and free hotels for the trip as well).

Thinking About Switching – Think Slowly: While the above just refers to the perks, if you get another career offer we would recommend thinking extremely slowly about the switch. For example, jumping to a new Company for 10-15% more income is likely a foolish move. Why? If you're in great standing at your Company, the fact that you're not on the "lay off list" is worth more than 10%. While we're currently in a bullish economy, knowing that you'll be safe in a downturn is definitely worth a lot more than 10% as the cash flows for a full year are quite substantial. As a starting number we'd say you need to move up at least 25% for the switch to be worth it for you.

Speaking of switching, if you're considering the remote work job for less pay, we suggest you run the math extremely closely. Again, if you have a successful business you run (100% ownership) none of this matters. Instead… If you're in a position where you're deciding between "remote work for less pay" and "higher pay at expensive corporate headquarters"… The answer is to go to the headquarters. You're only fooling yourself if you believe that the CEO of the organization will take the remote worker seriously. Imagine yourself as the CEO. You get to choose between two people, one you see every day and you know is fully committed to the organization or the second person who is working remotely from Hawaii. You're going to choose the first guy. Oh and by the way? One of the reasons why Companies are allowing people to work remotely is so they can't move, get paid less and they know they are stuck and can't do much about it!

That final sentence is brutal for most people as they have never been in a hiring position. The reason why you allow for remote work is you know the employee gets stuck in his cushy lifestyle and is now unemployable and unattractive to all competitors.

Now the Math: When you become a millionaire, the game is a lot less about savings "rate" as it is about "dollars saved". This is another distinction that needs to be flushed out. If you're a millionaire and you can somehow generate $100K a year tax free by living abroad, you have to ask yourself "How many dollars can i save and invest with this set up". The answer is likely no more than around $50,000 a year.

This "sounds fine" you say… Until you put it into excel for 10 years. If you could have worked in a high earning corporate position earning say $200K after taxes… You're way better off staying in the high cost of living area. Why? Well even if you spend $100,000 a year and save $100,000 that is 2x better than calling it quits today. Don't laugh at an extra $50K since it's a huge number over the course of ten years. You both saved the same "percentage" but the result in the future is not even close to the same.

Naturally, the past few paragraphs are going to upset people. The "remote work" trend is not something that is benefiting employees it is actually benefiting the Employer. It is extremely naive to believe that a Company is looking out for your best interests by allowing you to work remotely. They know that when you pull the trigger and get accustomed to being at the "top of the food chain" in a lower cost of living city, you're never going to downgrade your lifestyle. By the time the employee realizes what has happened, it is too late for him to suddenly go back and climb the ladder again.

Compounding is honestly nuts when you add up how much this impacts your net worth (working remotely vs. sucking it up until you get a real high profile business running). Remote work is likely costing you at least 20% per year since you're going to be paid less and promoted slower (if at all). Since this is a compounding effect just put the numbers into a calculator and assume 10 years of "living the remote life" and you'll get an ugly number of 6.2x (1.20^10 = 6.1917).

Interesting Corporate Angles: One other corporate angle we'd recommend is the "consultant" or "token" employee. If you move up high enough you can actually negotiate a high paid position with minimal work hours without the upside. This is only for people who are successful (many of you will fall into this camp). If you do succeed with your side business and it earns 2x what you're making at your Company (career) you should seriously ask yourself "am i indispensable". While 99.99% of people are replaceable, if you're generating enough value there may be a way for you to become an adviser/face of some sort. Extremely similar to being a board member.

As an example, if you're a sales person who simply has high quality relationships with major customers. You can go ahead and negotiate a high base salary (no bonus) and you'll simply "monitor the major accounts". This is actually good for the Company as they get to pay you way less and they have zero disruption. They will no longer include you as part of their "leadership model" and things like that and your hours will drop to the 15 hours per week range. In exchange you can go ahead and move to Miami Beach and focus the majority of your time on your business while collecting a nice salary for showing up and shaking hands 5-10 days out of the month.

The above scenario is actually quite common it just isn't advertised. If you want to find the people who are doing this, simply look for senior people in your organization who live in "strange places". Then see if their numbers are "flat" year after year. These are the people who likely negotiated a set-up similar to the above. The other interesting part is that you're pretty difficult to fire. Since you are accepting numbers well below market rate and they don't want to disturb their major payers, you are left alone with minimal micro management. Also. As an item of warning, similar to the idea of quitting, if you pull this trigger realize that your career is officially over. You're trading in an annuity that should last a decent amount of time for the freedom to work on something else.

Concluding Remarks: There are a few items in here that should be taken seriously. The first is asking yourself "what bridge am I burning". We don't mean a personal relationship, we're referring to a general path. If you begin working remotely for example don't expect promotions or raises anymore.

The second item to think about is the concept of dollars versus percentages once you get past the age of thirty or so. The reality is that "low cost of living areas" are always going to be there. If they aren't there in the future then those same people benefiting from it now will be in a world of pain if the cost goes up.

The third item we want to emphasize is that it *is* possible to have both location independent income and high earnings. That said, it won't be coming from a career, it will be coming from an online based business you run. Headquarters = where real decisions are made and where you want to be until you're "The Boss".

The fourth item is that true compensation is difficult to calculate. Your personal standing within a firm is valuable, your perks are valuable, the way you are treated is valuable etc. The worst thing you can do is simply leave for 10-15% more only to find out your hours went up 25% and your side business dies due to the increased stress.

The fifth and final item? Always look at Compounding. This relates to your earnings, your relationships and your investments. Most individuals only look at their portfolio when they think of compounding but this ignores reality. By way of example, we doubt you view your friends of 10-20 years in the same light as people you've known for 5 years. The people who have known you for more than a decade have seen you go through a lot more and you also got to see their reactions to success and failure.

****

Even the Top 10% is Seeing Compression Time to Get Rich Fast.

Even the Top 10% is Seeing Compression Time to Get Rich Fast.

What a crazy time to be alive, we're seeing interest rates go down, unemployment levels drop dramatically and the top 10% of earners are actually seeing wage ***compression*.** That last part is quite shocking as it implies a bigger shift to "two economies" predicted quite a while ago on this blog. Either way we're sticking with the same old 2021 likely a down turn unless something drastic happens. In case people attempt to *"troll us"* in the comments we've done exactly what we said we'd do. Dollar cost average into index funds since 2011… Bought Real Estate… Bought Crypto… and ended with some fun individual bets on stocks. For the entirety of 2019 we've only put money into two things: 1) crypto and 2) cash. That's it. So to emphasize, no we did not *"sell"* as there is no point to selling unless we see a significant down day. **If we sell stocks** we'll let everyone know. This means our stock positive as a "dollar basis" is higher, but as a percent of net worth is much lower as all money earned this year went into cash/crypto. Now onto the post.

When Breaking Records Isn't Good: When everyone is bullish you should be bearish and when everyone is bearish you should be bullish. This is the same old theory thrown out by Warren Buffet who suggests buying when there is "blood in the streets". A good indicator of overly bullish scenarios is the unemployment rate. This rate is currently set at just ~3.7%. That's an insane number from any perspective. In the year 2000 it was just under 4%…. (followed by dot-com bust)…. In the year 2007 it was around 4.6% (followed by the real estate bust) and now it is 3.7%…. lower than both of those previous lows.

Seems like an obvious sell? Not quite, you have to also look at the rate of decline of the unemployment rate which is still severe. When it flattens out, that's the time to get out. If we look at the numbers when the rate of declines slows it means that unemployment can't really move much lower. Then the bottom falls out and we go into unemployment hiking territory. Don't get us wrong, recessions are awful and ideally we never see one. That said, the chances of "never seeing one" is basically zero especially if it has been over a decade since a downturn.

Wage Compression: This is an unbelievable trend that we thought would not occur for some time period. To be in the top 10% you have to earn ***less*** than you did a year ago. Which is absolutely insane to think about. It means that we're seeing wage compression for high earning white collar jobs in addition to regular pressure across the middle class. We have no problem saying we got this totally wrong. We thought for sure the top 10% would at least be fine, but it appears that you need to be in the top 5% to really make it! This is such an interesting stat we're still having a hard time thinking through the long-term consequences. The one clear one is that people will become extremely class aware going forward. When people are seeing buying power go down they wear it physically on their faces and body language while those who are not will have a hard time *"hiding "*.

Taking a look at the chart above, we see that buying power went down for every single segment excluding the top 1%. Now sure we can argue that $20.5K to $22.0K was a big jump… But it's more likely a rounding error similar to the move in the bottom 10% (the bottom brackets always move around more due to the gig economy, minimum wage changes etc.) When we look at the 50% to 95% range… Nothing really changed from 2018 to 2019. That's quite an interesting trend as the cost of goods is certainly going up over time. Sure. People can come into the comments and say there is "no inflation" but simply ask yourself "Am I paying the same price for everything from 5-years ago?" We all know the answer is that things got more expensive. Meanwhile the top 1% saw a notable increase of ~7% to $328K.

Before moving on, we realize these are national numbers. If you live in high cost of living areas such as New York, Los Angeles and San Francisco, the Top 1% number moves up to $500,000+ and the median moves up closer to $70,000-90,000 or so. That said, the trend is actually similar in high cost of living areas. After an initial increase in income (5-7 years after entering work force) the numbers flatten out and you either make it big or you're stuck in the center. This is why you see a lot of people in the $150,000 – $200,000 range with a huge age band of 25 – 40 years of age.

Declining Rates: Unsurprisingly the fed has started to cut interest rates by a pretty large amount. People will look at the numbers and say "1.875% is not that much different from 2.40%"… But. It is a huge change. The reason why it looks small? The average person looks at it from a small numbers perspective. If you've got a $100,000 loan and it has interest payments of $2,400 a year versus $1,875 a year, this unlikely breaks the bank for most people.

So why is it a big deal? It's a big deal when you look at the percent change and use large numbers. If you've gone from 2.4% to 1.875% that is a rough 22% decline in the interest rate. Now… run these numbers on a very large sum of money. Say $10 trillion dollars? This means the total interest payment would be $240 billion versus $187.5 billion dollars or a whopping $52.5 billion.

Yes we have simplified the concept quite a bit, that said, if a 25% decrease doesn't sound like much just look at all of the prior recessions. Generally speaking, the Fed has attempted to begin cutting rates in advance of an official recession. This occurred before the dot com bust and before the global housing crisis. Some historical facts, in the late 2000s the rate was at 6.5% or so and went down to around 5.4% before we entered an official recession (-17% decline in the rate). In July of 2007, the rate was around 5.25% and declined to about 4.0% before we were officially in a recession (-24%).

Now onto the more important item, since we know the fed is attempting to cut before recessions it's a good idea to time this out. Between the first rate cut and official recession in 2001 was about 15 months. Between the first rate cut and official recession in 2008, it was about 6-7 months. For fun we can look at the early 90s as well where it was around 14-15 months. With this rough math it implies we've got around 8-16 months from October of 2019… *This puts us into June of 2020 to February of 2021.* (Now you know why we expect a downturn by 2021 or so). Funny enough, this is more anecdotal, however this blog now gets more page views on the posts about spending money (clothing etc.) vs. earning money at this point. A significant shift from just 3 years ago (generally not a good sign as it means people think their wages now are "normal" versus significantly inflated when compared to mid-economic cycle wages).

The Positive News: As always, crisis is just another word for opportunity. We've said that for years and are excited for the next downturn (if it comes) since it's the easiest time to make it into the top 1% or top 5%. Think about it like this, if everything is crashing down, it means assets are not priced correctly. Look at stocks and real estate for the most ludicrous mispricing back in 2008-2009.

The bigger positive news? If you're worried about making money, this is your time to strike. It is undeniably the easiest time to secure funding and to find a niche market. We're not saying that the market will last. But. If there is an obscure niche market like the fidget spinner craze, you can make out like a bandit in a single good year. No one really does the math and all you really need is one or two good years for your life to change. If you were to save $500,000 after taxes (one event income) due to a clean strike when the iron is hot, it would lead to $2 million dollars in value in around 14-years assuming you simply earn money to pay the bills during that time frame.

The other important item is that "talent goes on sale". Since large companies are littered with politics and other riff raff, when a downturn takes place it is quite easy to find talented people at a reasonable cost. In raging bull markets (like the one we're in), you have many people overearning or quite literally doing nothing as headcount ballooned and management lost sight of the department.

This Money Making Game Shouldn't End: Another fun math exercise we ran through is how quickly people can fall out of the 1%. This is an important thing to recognize. If you take your foot off the gas you will fall behind QUICKLY. Not slowly. QUICKLY. So lets take a look at these rough numbers. *We include home value in all calculations of net worth to keep it simple.*

In the Age 30-34 band, to be in the top 1% you need a net worth of $925,000

In the Age 35-39 band, to be in the top 1% you need a net worth of $2,307,000

In the Age 40-44 band, to be in the top 1% you need a net worth of $2,865,000

In the Age 45-49 band, to be in the top 1% you need a net worth of $9,666,000

In the Age 50-54 band, to be in the top 1% you need a net worth of $14,745,000

Take a look at those numbers. The only time the numbers seem to decelerate is around the late thirties to early 40s band as the cost of having a family likely weighs in on results. That said, the numbers are extremely clear. Even if you're in the top 1% at age 30, there is no guarantee you'll be even close by age 45-49. Assuming that money doubles every 7 years, if you had a million by the time you were in the 45-49 band… it means that you only really have $4,000,000 so you have to come up with a $6,000,000 spread. If this doesn't prove the point that winners continue to work after becoming rich… we don't know what will.

We'll have our usual monthly Q&A on Friday of this week November 8.

****

Everything Comes Down to Ego: Feed it to Get What You Want

Everything Comes Down to Ego: Feed it to Get What You Want

The reason why people want to be famous? They want to be the center of attention (we have no idea why anyone would want this). The reason people want the Patek watch, Ferrari and big house? To get more attention. The reason why people buy brand name clothing? To get more attention. And. Of course. The reason why people want more money? So they can buy even more stuff to gather attention! Eventually, the ego drives everything and the smart people will prefer being out of the spot light. Sure you can use money here and there to press the greed button (some random girl at the bar) but… It doesn't actually result material amounts of utility. Except feeding the ego. Now the good news is you can take large scale advantage of this.

How to Use the Ego

Use the Ego to Obtain a Contact: To become likable take the opposite tone of this blog. Don't talk in blunt, direct sentences. Don't give out hard facts. Stick with being in the grey area. Since we know facts and opinions are looked down upon, you'll simply talk around topics until figuring out what their opinion is. Once you find their opinion that will now be "your opinion". The best way to do this is with the following topics: politics, sports, celebrities and the economy. If you know the person is a liberal, agree with something like wage inequality. If they think the stock market is a short or a buy… simply agree with them. You don't gain anything by telling them you believe the opposite. By doing this you now have someone who is open to your opinion on something they *don't* have a strong opinion on.

Now you see where we're going… this all ties into your network. Lets say you need help finding the right place to manufacture your product. Once you find the right guy, you'll talk to him for a little bit to build rapport. You're going to ask him for help so he needs to like you first. Agree with him on politics, sports, etc. After a few weeks or months he'll like you and begin messaging you as a friend. Now you'll go ahead and "close the sale" asking for help with your product… We've given enough hints on where we're going with this sub section!

Praise a Different Quality to Establish Rapport: Making it harder, the person doesn't have a strong opinion on any of the hot topics. If they had a strong opinion you latch onto it because those are heavily emotional (politics, religion, sports, economics, etc.). How do you proceed? Well you target a quality they are actively trying to improve. If you take the time to try and build rapport, you'll inevitably find one area where they are insecure and trying to improve. This could be fitness, diet, their own social skills etc. It is inevitable.

If you find out that they are the shy type and don't have many friends invite them to a party. If they are trying to fix their diet, invite them to eat in situations where they are forced to make the right health decision (don't tell them it was pre-planned of course). You see the point by now. If you can help them take even 1/2 a step in the right direction and do nothing but give them positive encouragement, there is a zero percent chance they will dislike you.

Always Tell Them it is "Worth a Shot": There is no point in trying to change someone's opinion. So what you should do is bias towards the standard *"Everyone needs new experiences and it sounds like it ***could*** work"*. Even if you think the idea is terrible, chances are they are going to do it anyway. Since they are not asking you for money you're in good shape because you really lose nothing in the situation. Why? Well look at the logic flow below!

If you tell them "it could work" they will give you some credit in the case that it did work. "Everyone else said it wouldn't work except you!". Now if it fails? Well you hedged it with "could" so you already had the standard 1-2 sentences of what the risks were (hedged it all out). So even if it fails (most ideas people pitch you on fail), they won't be upset because you believed in them and they just got "bad luck". Emphasis on the bad luck part, never tell them it was their fault go with bad luck 100% of the time.

How Get Rid of Your Own Ego

This depends on the situation. As you know, if you're an athlete for example, being humble is just foolish. You earn less since you want to gather more attention to get endorsements and more followers. The quiet athletes don't have the "look" or the "vibe" to pull in the mega deals and contracts. In other cases you do want to kill the ego…

Do You Want Money or Prestige? This is most prevalent on Wall Street. Many people choose prestigious banks even though they may pay them less long-term. They just see the name brand and think that's the right decision. It isn't. Always choose the right environment for you to move up the responsibility ladder. We've covered this many times but people still email us with Career questions! There should be no "which bank" questions. You always choose the one that leads to promotions. You're better off working at Citi Group than Goldman Sachs if you're never going to get the chance to move up the ladder. This is a classic example of choosing the money over your ego. Never let the ego win because you'll lose long-term.

Do You Want Freedom or Attention? Another good question is if you'd rather sell shoe laces online for $200K a year or work at a name brand company for $200K a year. The first one is terribly boring. No one cares about your shoe lace business but at least you're hanging out online selling them from a beach in Rio de Janeiro. This one is quite interesting because we know several people who sell extremely boring products online that live well (working from a computer screen). The flip side is when you get into the standard *"what do you do?"* question from regular people they won't be interested.

Do You Want Function or Flash? This one kills the ego as well, if you can afford brand name clothing and cars do you actually want it for yourself or do you want it for attention. There is nothing wrong with being interested in cars or threads… the question is the "why?". If the answer is you're spending money to impress other people… that usually ends in disaster. The people impressed by it are not the people you want to attract. Think about it like this. If you can afford a Ferrari are you impressed by a Ferrari? The answer is no. All you'll think is "cool car". The people who are impressed… can't afford one. Why would you want to attract these people? So on and so forth.

There are certainly exceptions to this rule, if you're part of a Ferrari club or some exclusive yacht club you'll meet a lot of good connections no doubt. At the same time… if you were successful enough to make it this far you already know the same people! The higher you move up in the pyramid the closer everyone is.

How to Avoid the Ego Trap

The last part is more of a life long commitment. No one enjoys losing money on an investment. No one enjoys being wrong. No one enjoys "smiling and nodding" when someone tells them something factually incorrect. None of these things are fun but they are a necessity for mental health.

Smiling and Nodding: This is the best strategy we know of. If someone tells you something factually incorrect "smile, nod and agree". This will go against every single bone in your body. You want to tell them how they are wrong and even have the facts to back it up. Don't bother!!!! *If you smile and nod, they won't talk to you and you'll save time.* You're not going to change their opinion anyway (they never actually asked for your opinion they just started spouting out nonsense).

Put Yourself in Failure Situation: Say you're not a good lateral athlete (just an example). Play some sports like tennis that require it. This will result in a lot of losing. If you lose at least once a week in something, you will then realize there are many people who are better than you. This is a great exercise. Most average people will make excuses blaming referees in sports or saying they were somehow "cheated". Instead you'll do this to simply remember what it's like to lose once and a while. Also. It's a good reminder of someone always being better. The money game is a great example since there are around 2,000 billionaires in the world and therefore it is practically impossible to win that game.

Avoid Debt: We practically never talk about debt here… Because we don't use it. In rare cases a mortgage can be taken out for a rental property, however the cash flows need to be funded by a passive or semi-passive income stream. This makes it a lot easier to keep the ego in check. Even if you're near 100% certain that a good investment has come up, levering into it just doesn't make sense (you built up 7 figures in net worth so why would you risk losing it all?).

Concluding Remarks and Questions

These are the main things we've noticed: 1) don't bother changing people's opinions, 2) by having no real social media presence your opinion can conflict from one person to another to help build rapport and 3) lots of money is lost chasing attention – instead of the end goal of more freedom and money. If you have good strategies for making people like you by feeding their ego please leave them in the comments. As we said, a good example is to take this blog, built on ***rapport breaking*…** and do the opposite.

****

Everything Has a Good and Bad Side… Including Money

Everything Has a Good and Bad Side… Including Money

While the title is all encompassing we'll go ahead and say that health is the only category where we can't think of any upside. Becoming disabled or significantly impaired. One item could be "appreciating life more" if you know that you only have a few years to live. Besides that we can't really think of any benefits from becoming ill/sick. This is also due to our belief that Health is always #1 followed by your personal relationships and money. Essentially we have a bias towards health that makes it impossible for us to recognize why being impaired would ever have a silver lining. That said. We used to believe that getting richer was always a good thing… that isn't true as well. So we'll highlight some interesting things to think about.

Bad Side of Getting Rich: If getting rich means you have $100,000 in your account, then there isn't much downside. We've been there before and not much changes (you simply lose the fear of becoming homeless any time soon). When we refer to rich, we're going to draw a minimum value at around $1,000,000. At this point, things start to change. This is because you will have to be a lot more careful. Even if you're flying under the radar for the most part, anyone who spends more than a few hours with you at a time (per month) will eventually figure you out. They won't know how much you're worth *exactly* but they'll know that you're doing well. It could be free time, it could be the amount you fly, it could be your demeanor when money conversations come up (every average dude spends a ton of time talking about money and you won't relate). Or the most likely culprit… people will realize that you never complain about money.

You'd think there is no downside, but there is a big one: *general distrust.* This can also be called cynicism, the richer you get the more likely you'll develop more cynicism as you'll notice people "angling" for something. It could be as small as "oh sure you can pay for this you're rich!" (while at lunch) or as large as "Hey I know this isn't a lot of money for you so let me do the project" (classic). Essentially, unless the person is not directly competing with you (in your field) and the person is also rich (millionaire at minimum), it isn't easy to trust them. The life you live compared to a person still trying to "make it" is unfathomable.

For fun this is also a good way to tell if someone is actually rich. They don't complain about having "a lot of friends". People who have no money are the ones who are most likely to suffer from "a low friend count". If you're rich and socially intelligent you'll limit the number of real contacts to handful. This isn't due to anti-social behavior. It is due to experience. Essentially, people who don't have much going on for them will always ask about "how to network better" a polite way of saying they want to scam their way into a good network of rich people without doing any work. These same people will also ask how to become “the life of the party” because people are less likely to hang out with unsuccessful people. Funny how it works. When you make it, you spend more time avoiding people than you do trying to get into a new network. You already have your network since you had value (ta da!).

Bad Side of Spending: One of the other interesting things to be aware of is the downside of spending. Travel is probably the biggest giveaway. Once you’re well off and you’ve traveled to say 30-40 major cities, you don’t feel a “jolt” when you go to a new one. For people on the younger side of the age spectrum, packing your bags and landing in a new city (Moscow, Buenos Aires, Miami, etc.) is exciting. You feel a rush of adrenaline and excitement. We’re here to tell you that this goes away! Eventually, when you have gone to numerous cities, the plane flight and the new city are not exciting anymore. You simply land and you feel like you’ve already been there before. Essentially you’ve become desensitized to new cities unless something extreme is happening.

This same desensitization will overflow into material items as well. If you grew up with no money, buying a new item (car, suit, shoes etc.) gave you a rush. Fast forward a few years after living a more comfortable life and this feeling declines. In fact, buying clothes will become mundane/boring (usually the most common one to go first). You will simply look at your shoes or shirts and say “oh yeah i need to replace this it’s old” and go buy a new one. There will be no emotion and you might even get questioned by the sales people “are you sure you want to buy this so quickly you’ve only been in the store for 5 minutes”. Hilariously, some people will ask you for your ID since your rapid purchase will look like someone who is operating with a stolen credit card. They will be even more confused when you tell them to cut off all the tags and throw away the receipt (no returns).

The final downside of spending? Comfort. The more money you make the more money you’ll spend on comfort. Not sure why this is but it’s a common trend. If you are then forced to stay in a terrible hotel or sit in the middle seat of a plane all the way in the back, you’re going to feel terrible. This is again a “1%er problem” but is a legitimate problem. *The more you get used to something the harder it is to go back.* This simple sentence is important and explains why we don’t believe in spending more than you make. If you’re saving over 50% of your income, you’re able to live the same life for at least a year without any sort of cash flow.

Good Side of Being Broke: Flipping this around but sticking with money, there is one very big upside to being broke… you don’t know what you didn’t have! Sure you always knew that other people had access to more resources than you did, but you definitely did not know what they were consuming. This means your decisions going forward are *hopefully* more practical. If you’re used to viewing a $100 purchase as a big deal, you’re going to save and invest like crazy until you actually view that purchase as tiny. Odd how that works.

Keeping it simple with examples, take your living situation. If you grew up in a richer home we’ve noticed that these individuals hate living in smaller places out of college. This creates a need to “upgrade” their living situation over and over again (increasing fixed costs). On the contrary, a person who grew up with no money and had to live in a shared bedroom for his life, is going to feel perfectly fine in a one bedroom apartment. In fact, that one bedroom apartment feels a bit big and annoying making him more likely to stay and simply hire a maid for once a month cleaning. When we think of this example it helps explain why the top 1% changes so rapidly every 10-20 years. It’s because the offspring of rich people do not know what a difficult life looks like. This requires them to spend more to try and mirror their prior lifestyle even if they don’t have the money.

The last upside of starting from zero is that each small gain actually gives you a rush. If a person grew up upper middle class, being able to go out to dinner once a week is not special. If you grew up with nothing, being able to go out and spend $50 on dinner every week is an absolute luxury. This “life style high” lasts a long time. Why? Well if $50 can give you a big “life style high” then you only need to earn ~$50/week for a few years in a row to keep this high ($2,600 in annual income spending). Compare this to someone who “expects” to do this. They likely need to spend an extra $500 a week to get the same high ($26,000 in annual income spending).

Good Side of Being Low Status at the Beginning: While this is a different bullet it it still related to being broke. Anyone who started with almost no money, knows that they are treated differently from people with money. This is the same for attractive and unattractive people. Believing that a good looking or rich man will be treated the same as an ugly or broke man but the general public is unbelievably crazy. If you don’t “look” the part or people can get the sense that you “don’t belong” they’ll definitely try to ostracize you and push you away. This teaches you a valuable lesson on human nature and also makes you significantly better at reading people.

The work place is probably the best example. Once a person from a lower status background gets moved up once or twice, he’ll immediately recognize the difference in treatment from people below him. In fact, he can figure out which of those people came from lower or upper classes based on how he’s treated. As a general rule? If the person grew up rich he’ll always believe that he deserves your spot and that he’s underpaid. You see this a lot on Wall Street which is why we used it as an example. If anyone reading this is still on Wall Street, please let us know when the industry wakes up and realizes the best hire is never the guy who grew up rich. The best hire in the guy who grew up with nothing because he had to do a lot more work and stand out to make it in the first place. The only exception is the ultra rich candidate who can somehow immediately bring revenue into the firm (his dad/mom is a client for example, which happen all the time too)

The other major benefit of being low status is that your close friends are more trustworthy. This relates to the prior paragraphs as your friends when you had nothing are the same people you’ll trust when you have everything. Naturally, you’ll lose a ton of people through attrition but it’s always good to know that the people who also make it are unlikely going to stab you in the back any time soon.

Bad Side of “Success”: One of the themes here is “detachment”. While it could be argued that this isn’t bad but a by product it does help us understand why many celebrities and artists die of drug abuse. When you make a big break through (sell a company, make the next big music hit) you get an enormous high. You’re thrilled beyond belief and feel like you’re a king. We imagine this is what your average person feels like when he goes to Thailand or another cheap place where he’s suddenly in the top 1% of the pecking order.

The big negative here is that you’re going to spend a lot of time trying to chase that high. In some cases it won’t actually show up. We’ve seen too many cases of one hit wonders and multiple failed companies (after one successful one). While it hasn’t happened to us (yet and hopefully never) it is very very very easy to see how it happens. When you make your first breakthrough we’ll all but guarantee you go through a stage of hedonism (nothing is ever enough!). If you’re smart/lucky you’ll recognize it and break the pattern. But. There is no doubt that many people fall victim to the spiral if they can’t find anything to replace the high they got from success (money/success is the most powerful drug in the world).

Good Side of Mediocrity: That’s right, there is an actual good side here. The good side is that you’re likely emotionally stable all of the time. While we don’t think this is a life most of our readers are interested in, just take the life of a monk (an extreme). By being able to remain stable at all times, the person is relieved of all worry from his life. He doesn’t have to worry about investments or people angling for his pot of the pie since there are no investment and there is no pie. Instead he’s able to make due with what he has and simply “lives”.

There is a lot of good here that only makes sense once you’ve seen success destroy a few lives. Don’t get us wrong, we strongly prefer immense success with emotional control. But. Living a basic life has many merits. It can create a meditative calm around your life as there are no tasks that need to be done. If you want to see what this is like, try to turn off all of your electronics and leave them for at least 2-3 days. You’ll be surprised at how addicted you are to working and “moving forward”.

Bonus: One last negative for being rich is motivation. If you have $3M in investments, you’re generating $180K without moving at 6% returns. This means a new idea that makes $20-40K but occupies your time, might be a complete waste of your time. This won’t make sense to regular people and will also become apparent when you’re unmotivated for projects most people would die to have.

****

Everything You Need to Know About Choosing a Career

[Everything You Need to Know About Choosing a Career]

For one reason or another we're getting more and more questions about "what should I do?" and other such variations of this question. With that said lets go ahead and set the framework. Assuming you are young and intelligent you should have a lot of choices. So lets go ahead and break this down step by step with the following outline

1) What Careers are even worth pursuing and why?

2) What is a Job and what is a Career?

3) But so many people make $150-250K per year, what about them?

4) But isn't everyone replaceable?

5) How do I find a legitimate mentor to show me the truth?

6) How do I find out if I have an interest in this?

7) Why do you talk about starting businesses if you're talking about careers?

8) Concluding remarks

Once you've gone through this post you'll have all the tools you need to make an intelligent decision about your career. **If you mess this step up you'll lose $5M+ over the course of the next 30 years and you will also work 2x as many hours**. That is not a typo.

1) What Careers are even worth pursuing?

The only careers worth pursuing are **Sales** (ANY variation, higher end the better), **Silicon Valley** (equity exposure) **and Wall Street** (front office – Hedge Funds/Private Equity/Investment Banking/Sales & Trading/Research, in that order… feel free to flip PE and HF if you love transactional work). It really is that simple and the hard work has been done for you in a single sentence. Here is how the leverage works in each one of these industries

- Sales: You are paid for each sale you make. Each sale is an *event*
- Silicon Valley: The leverage in your financial model is equity the sale of the security is the *event*
- Wall Street: You are paid for each transaction closed *event*, or each position closed *event* and to a lesser degree each handshake that results in increased business *event*

2) What is a Job and What is a Career?

This is pretty simple. Event is underscored in an annoying way above for a reason, in any other position you have no event. You simply work more hours and you get paid more or less and your hourly wage moves up or down based on your tenure etc. **You are essentially a money making machine for someone else.**

No matter how high your hourly wage is, **someone else is writing your check** correct?

Lets play a game then… You are a business owner and you are paying Joe Hourly a wage of $500/hour! Man that's a lot of money! Wait… As a rational business owner… You are only going to pay him a fraction of his actual value otherwise he should be fired right? **Correct.**

Want to be depressed now? **In general you are being paid 5-10% of your net value.** Go through the revenue, operating expense and net-income line of your company if you want to see the truth.

3) But so many people make $150-250K per year, what about them?

Playing musical chairs! You remember that game in elementary school? That is exactly what you are playing if you are not the ***first hand shake revenue generator***.

Lets see what happens if there is a recession. Most people (see people who think $100K is a lot of money – it's not), believe it is "last in first out"… When in reality it is based on headcount for each office and the business performance in each sub-segment of the firm (usually revenue and net profit).

With all that said… You make $150-250K a year this must mean someone who matters knows who you are right? You couldn't be more wrong.

Since most people don't take the effort lets look at an extremely basic calculation from a company everyone knows… Walmart for the real nerds you can double check our work here. At SEC.gov:

http://www.sec.gov/Archives/edgar/data/104169/000010416914000019/wmtform10-kx13114.htm

Walmart Example:

"As of the end of fiscal 2014, the Company and its subsidiaries employed approximately **2.2 million employees ("associates")** worldwide"

"During fiscal 2014, we generated total revenues of **$476 billion"**

Now lets do some real simple math here…

Average Revenue Per Employee – *$*476,000,000,000/2,200,000 = ***$216,364***

Think about it. Walmart… a massive retail store that employees ***hundreds of thousands of people at minimum wage*** can generate revenue of $216K/employee. If this doesn't make you feel replaceable nothing will.

4) But isn't everyone replaceable?

In short, **YES.** Even that BSD Managing Director is going to be replaced by someone, maybe they find someone who makes less in revenue but they can secretly pay him less which in turn improves business margins. Maybe they can consolidate two sets of clients and give it to the even bigger BSD since he wants to earn more money for his family this year. In short, yes a thousand times yes everyone is replaceable.

Now this question misses the point of course – by a country mile in fact. By choosing a legitimate career you are doing multiple things: 1) you become less replaceable – downside protection, 2) have numbers to point to in terms of revenue generation – ability to leave to a competitor, 3) be paid based on performance – generate significantly more in a macro up tick, 4) let your savings buy you **precious time** and…. the REAL point

By going into a revenue generating role you are building skills that will be directly transferable to starting your own successful business in the future

5) How do I find a legitimate mentor to show me the truth?

Okay I finally get it you say.

"By going into one of these three industries I am building a skillset early that will drive future earnings in an *exponential fashion* instead of a *linear fashion*. My job will likely be *gruelling* as I learn the ropes but I will be paid well and will *give myself a future I wouldn't even believe myself"*

Now how do you find out which industry is right for you? The answer is **look 7-10 years ahead of you**

Why do you have to look so far into the future? The people who are only 2-3 years ahead of you are likely 1) bitter or 2) poor performers.

Why? For high compensation positions **the drop out rate is 80-90% in the first three years.** This means if a guy is fresh on the job, the chances you're talking to a poor performer is significantly higher than you talking to a top performer.

With that said, if you search for a real estate agent in his **early 30s if you're in your early 20s**. If you're thinking about Wall Street, do not bother with the opinions of people who are not **Vice President or higher.** If you are looking at engineering, contact people who went to **top engineering firms** and left after 3-5 years.

This is a rare case where the people 2-3 years ahead of you will always lead you astray because chances are you're not talking to a winner.

6) How do I find out if I have an interest in this?

We get this question a lot and here is some more harsh truth. This is a dumb question.It is a dumb question because it *implies that you never even tried it*. Go try it and find out which one you like the most and go for it.

Make sure you like it because it is better to be happy for 52 weeks out of the year instead of only 2 weeks out of the year — see the vast majority who hate their jobs.

7) Why do you talk about starting businesses if you're talking about careers?

This one is a layup. Most people, even talented people, do not have the skills to start a business immediately. Most don't have the risk tolerance or simply don't have the business acumen established.

There is no reason to put your personal finances into a downward spiral if you do not have to. Build a career and continue to think about business ideas on the side. Once you get one feel free to leave.

Anyone with experience knows, **on a risk adjusted basis, your own business is the best way to get rich.** So absolutely go for it, when the opportunity is there.

8) Concluding Remarks

We already know that people are going to jump in with "exceptions to the rule". At the end of the day these exceptions always have the same story, the person caught a break or somehow eventually ended up in a 1) business or 2) quasi sales position.

You can absolutely start your career at a McKinsey, a Google – non-engineering, a start up – non-engineering, etc. Just remember that if you want leverage you're going to need to generate at some point. If you're looking to skate by without any generation… you're making the worst personal and financial decision of your life. The last thing you want to do is ***have* to work in your 30s, better to *want* to work in your 30s.**

****

Expanding Your Comfort Zone Versus Taking a Risk

Thinking back through life experiences we believe that young men today are unable to distinguish the difference between the two. The major difference is that ***an expansion of your comfort zone entails zero risk.*** Unlike buying a pink sheet stock, or getting into a bar brawl, when you step out of your comfort zone there is absolutely nothing to be lost. Seeing that our culture discourages talking to strangers and encourages following the textbook men in particular suffer from extreme social anxiety issues by the time they graduate from college. With that said here is a blueprint of extreme baby steps to take in order to improve your comfort zone over time.

1) Create a Fake E-mail. This allows you to post on blogs and ask questions to people you look up to and maybe you'll get lucky and catch a response. This also helps you evade your irrational fear of being "outed"

2) Talk to Store Clerks. From now on you're not going to go into a store without asking a question, any question. If you're buying a pair of shoes and you know which pair… No matter what you'll ask someone their opinion at minimum.

3) Sign Up for a Social Event. If you don't live on an island there will be free social events for you in a variety of hobbies. Go every week.

4) Take Up a Hobby You Would "Never" Do. It's time to do the reverse of your personality. If you're not changing you're dying. Learn to sing, dance, write, paint anything you would never do.

5) Begin Talking to Everyone. Your goal is to befriend a "stranger" and keep in contact with them. Your social skills are now improving as you're able to turn the switch on uncomfortable interactions.

6) Begin Filtering. Your new goal here is obtain strong relationships with the right people. Whoever you want to be. Rich, Artsy, Artistic, Smart, Sexy… insert description.

Repeat Step 4.

This list sounds like it is meant for a computer nerd. It is. The reason is that the computer acts as a quasi-contact to the real world when in fact it is no where near reality. You're going to repeat steps 4 though 7 over and over again. When you can't find things that make you feel uncomfortable, congratulations, you're becoming a man. At this point you should turn your sights to making the full transformation. ***A real man is not afraid of real risk.*** The level of that risk can increase or decrease his value. If you need further proof think of all the men we look up to Entrepreneurs, War Heroes, Fire Fighters and the list goes on. The list of risky behaviors is quite large as the premise, unlike comfort zone expansion, is the following ***"To obtain we must give up".*** Real risk involves downside to your physical, mental or financial well being. Three main concepts below.

Invested Time (Emotional/Financial). This one is the most obvious, block out a substantial amount of time to obtain or build something. The trick of course is that you should be using "borrowed time" you should be [so busy already](#) that you're giving up another hobby to obtain this new skill/lucrative business. In this case you're taking a small risk as you're assuming the next venture will be more lucrative to you over the long-term than your current invested time.

Going All In (Financial). During your build up phase you've learned something. It's time to use that knowledge to go all in. Draw upon your knowledge base and offer a service or invest heavily into something you know better than the back of your hand. This one is more related to financials as you're banking on your years of knowledge for monetary gain.

Dangerous Situations (Physical/Emotional). Take that map of Manhattan and throw it into the trash. Get on a bus to Queens/Bronx/Harlem, anything that would make you feel physically threatened.

Conclusion: Since we live in a fearful society that encourages being scared of everything your best approach is to slowly raise your risk tolerance over time. In the extreme case where we're afraid of "strangers" we should instead start at the very bottom as an anonymous person who admits he wants advice and build up to a person who is willing to take real risks. As you become more and more comfortable in your own skin, everything else will fall into place. Assuming of course you're always putting in your best effort.

****

Explaining Life Traps and How to Spot People Who Fell For Them

Explaining Life Traps and How to Spot People Who Fell For Them

We've covered a lot of topics here on this blog and we'll attempt to put two together in this post. Essentially this will help explain why some of the information appears to conflict. It is largely due to timing, since your financial stability, age and location determine what makes sense for you at a certain point in time. To make this come together, we're going to make comparisons between what your regular person does and what a future successful person typically does. Reminder. Our view of success does not mean "money" since we would never trade places with a rich old, out of shape, overweight, boring guy with a miserable personal life (no friends either).

#1 Instant Gratification Trap: This is essentially the very first trap that regular people fall for. In a rare case, we have empathy here since people are targeted at ages when they are impressionable (14-20) or so. They are sold a dream that if they lever up with debt, they will go on and get a 4 year degree that grants them a good paying job/career. Fast forward to 2018 and we know with certainty that this is not true at all. Many people with college degrees are the same people working at Starbucks, Retail Stores and Restaurants. They don't have a choice since their debt went towards a degree for a school that does not have high quality *exit opportunities*

Your typical successful person will see through this trap. They will go through the weeds and figure out the following: *"Does this actually lead to higher income streams"*. If it does not, then why would someone spend 4 years drinking low quality beer to obtain the degree? No logical person would. To emphasize, we realize this is quite a tough task for your typical teenager since they don't have much life experience. And. This is why there is such a large separation at age ~20 or so between the haves and have nots. We don't make the rules here we just adjust to them. Here is an older post that is still relevant on how to operate the college system.

We have used basic math formulas to decide if the education is worth it. Simplistically, we think it makes little sense to take on debt unless you're positive that it can be paid off within ~1-2 years. If you're already working, then you would also include the opportunity cost of your work. For fun, at this point in time, our recommendations haven't changed from the older post. One thing that has changed is we would recommend coding boot camps now. The high quality programs that require significant commitment to both obtain acceptance and complete lead to high paying careers as of this writing.

#2 The Stress Trap: Assuming someone was able to avoid the first trap, the second big trap we see people fall into begins around age 22. They usually have the exact same friends they had in college/high school and are attached at the hip. This leads to similar group think where they seek out other people who have also known each other since high school/college. Similar to smart people thinking alike, regular people also congregate in the same areas. This is typically highlighted by the striped t-shirt un-tucked with jeans out at the bars.

Now what is the stress trap? It is essentially the endless cycle of drinking 4 days a week gaining weight slowly but surely as the savings rate stays at around 10%. Instead of focusing on the issue (which is time lost due to "social obligations") they continue looking for ways to squeeze more income out of the Company they work for. They incessantly talk about trying to interview to a new place. They incessantly talk about trying to make an extra 5% working for someone else. This creates a lot of stress since the Company is never incentivized to overpay relative to market wages. Constantly worrying about how to squeeze more income out of the P&L usually leads to… you guessed it! More drinking and low quality socializing to "relax". Our favorite comment of all time is the people who say "oh man it feels great to drink a beer after work"… every day… in front of a TV with other people who just barely made it through the week. In short, the signs of incorrect decision making surround ***survival*** if the person gives off this vibe you know it's time to smile, nod, agree with their issues. And. Avoid them in the future.

Naturally, we have less empathy for this group because they are trading the highest amount of energy they will ever have for a few beers and low quality comrades. This is entirely controllable and should be recognizable. The smart person in the group looks at his situation and reassesses it. Sure you don't want to give up your entire social life. But. You don't want to tread water because of it. Instead of going our constantly, you find any source of secondary income over the next 3 years. People think this needs to be a massive number, but it doesn't. It just needs to create a buffer room between you and your stress levels. One distinct inflection point was getting enough money to pay for the 8 nights a week of going out (Thursday/Saturday). Once your online revenue is paying for your social time, you feel less guilty, you drink a lot less and it doesn't create any stress (was funded by income unrelated to your work).

#3 The Leverage Trap: Here is where the big change in net worth occurs from what we have seen. Your average guy is barely saving money and is worried about the *expense* line. Therefore? He looks directly at his cash outflows which will read: Food, Rent, Taxes. You sure can't avoid Taxes and saving a few dollars on beer during the week won't do much. So. He goes down the "buy a home" path. While this used to be a good idea back in the day, buying a home without an investment return in mind doesn't make a lot of sense. Even professionals who work in real estate are not going to put 80% of their net worth into their primary residence (doesn't make any sense, all eggs are now stuck in one basket). Funny enough, if the person really messed up, he won't be able to afford the down payment in the first place and will only talk about the dream of buying! (which he shouldn't do)

The successful guy has already tasted blood at this point. If he spent 2-3 years building another income stream we have no doubt he is clearing at least $1-2K a month. This is peanuts but it's all he needs to see. Why? Well if this income stream is perpetual he just needs to repeat it a couple of times and suddenly he's looking at $3-6K… $6-12K… etc. Instead of worrying about leverage and his "rental payment" he's busy looking for ways to pay his rent without levering up (i.e scaling his small ideas). This leads to a big change in belief systems. The successful person believes in generating and creating to obtain more, while the regular person is focused on squeezing the expense line to create headroom. Unfortunately, the regular person doesn't realize that debt payments cannot be missed and if his income ever goes down he'll be under water quickly.

At this point we'll do a short recap. Both people are around 25 years old. If the person is levered up with $100K+ in student debt he's likely already in a big hole. If the person avoided this big initial trap, then he's spending too much time hanging out at low quality bars meeting other mediocre people. After that he looks at the amount he saved and tries to "squeeze" more juice out of it by levering up, only to lock himself into one region with no way to exit the contract easily. Contrast this to the successful person who is debt free and is now generating some solid side income.

#4 Building on Sand: At this point you can see that the regular person is building on sand at this point. Since the structure is not stable (debt, one form of income) a single minor shake up and the whole building collapses. Naturally, this is when most people feel the strain of potentially starting a family (typically several years too early). From what we've seen the standard move is to get married at around 30. These are relatively smart guys with high quality careers but minimal other items going on (not rich, not dead broke either). The problem? The infrastructure hasn't been built so they are essentially trying to put more items into the house that is built on sand.

At this point the successful person is rocking and rolling. His friends have changed quite a bit since he is able to go out whenever he wants. Monday night? Sure. Wednesday? Maybe, but Thursday is usually reserved for yoga class and XYZ sport in the morning. So on and so forth. The difference between these two people become quite enormous at around this age because of the income disparity (typically 2x income disparity). If someone is in a middle tier city they are clearing $200K while their old peer group is at $100K. In larger cities you could double both of these numbers as an example. With such a higher income disparity, buying that basic home/apartment now looks reasonable and the money isn't needed to reinvest in any business at this time. (goes ahead and buys).

To illustrate this look at how the income difference adds up assuming this is essentially what happens.

Now look at that difference! It is insane really. With one good decision of finding a way to create another stream of income that equals his current career, ***he is now $687K richer than his peer making a difference of 729%.*** There is no other word to use besides insane. They spend the exact same amount of money each year and yet one guy is well on his way while the other person followed the "save 10% every year rule" and got nothing out of it! Note, we didn't even include a 5% annual investment gain and if we did the numbers would be significantly worse.

#5 Scaling the Spending: At this point the lives of the two individuals couldn't be any more different. One is looking to get by with an eventual family to start while the other person is just now looking at his savings and saying *"buying a home would now net me return without investment gains"*. This couldn't be more different since the purchase for the successful person will have an immediate ROI positive impact and also improve his quality of life.

Now it gets really uncomfortable because the successful person has to avoid telling people how he lives his life. You don't want people to know you're spending half of your income (significantly more than you used to spend) partying, traveling and taking up new hobbies. Instead you're going to have a natural "glow" that says you're set and don't have any worries. Funny enough, this is around the point when you believe in "women's intuition" because they can sense it as well and recognize you're better off than most. For the younger readers when you hit 30-35 let us know if you see the same thing happen.

Everyone has a different reaction to this new life but we wrote a pretty solid post on this topic called "End of the Road". These are the common threads to be cognizant of. You end up having much *less* to talk about because there is nothing to complain about. Generally speaking 90%+ of conversations is just some guy complaining about something to you. You won't be able to relate so you'll avoid these people. In addition, your spending becomes very inconsistent. Sometimes you feel like partying hard and drop a lot of money on alcohol. Other months you don't feel like going out at all and spend your time in the gym and going for hikes/running on a beach/traveling to a new city. We really don't know what you'll do but we do know that it sure won't be "normal". As a dead giveaway, if a guy is over 30 and randomly decides to take a "quick trip" internationally, he is probably rich. The only people who do these things are people with money and a lot of free time.

#6 Health Trap: Now we're moving onto more serious issues. Many people will be filtered out by this point. They are already in the regular person camp. The bad news? The game isn't over! Some people do everything correctly and still fail in this category. When you're 20, your body can take a beating so you invest that energy into work/secondary income streams etc. If you try to do this at 30-39 you'll look horrible. We still get a good laugh out of people who think "all people who work 80 hours a week in their 20s will look terrible"…. Then why do rich people live longer? It just doesn't make sense and is a horrible argument to justify being lazy and broke.

Moving on here, at age 30-35 or so (rough range for making it), health becomes the #1 factor. Your hormone levels decline, your body needs more rest to recover from minor injuries etc. Many people let it fall apart here and pay for it with future hospital bills and doctor visits. They essentially missed the point. The point of getting rich was to 1) live a fun and healthy life and 2) use it as a tool to get anything you dreamed of. If you're simply getting rich to get rich, all you will have is a bunch of digits sitting in an account that don't add any utility to your life.

We've given away the health answer here many times but for completeness the answer is the following: 1) extensive flexibility training, 2) high quality vegetable and fruits, 3) low carbohydrates, no sugars except on special occasions, 4) decreased daily alcohol intake – besides, who would respect a blacked out person over the age of 23 anyway?, and 5) removing stressful relationships despite potential income stream – focus on lower maintenance higher quality clients.

#7 Personal Life Trap: It still doesn't end! Then there is the personal life trap. If you want a perfect example of this just go into any major investment bank or law firm. "The boss is calling" typically refers to a significant other they are no longer in love with. This is why many *financially rich* **but unsuccessful men** live lives of quiet desperation.

This will be a shorter section since you're reading this blog anyway. Anyone who can withstand more than a few short weeks of posts will likely understand the reality: never allow for governmental contracts in your personal life. Simply ignore all the hatred you get for living by this rule. You'll be better off for it and we have 100% conviction that it won't impact your life at all. In fact, it will make it better. You'll filter out every single person who was only interested in a family if the dollars were there as well. Before moving on, as usual, we're not again having a family as it's a personal decision. We're against getting the government involved (increases taxes and adds zero upside for you).

#8 The Argumentative Trap: This is another one we see (more common with people in their 40s for some reason). The need to "prove someone wrong". Despite already being successful and rich, there are a few people who avoid all seven major traps but feel the need to "sell" their idea to someone else. We don't understand it. We go with the smile, nod, agree and ignore route instead. This allows you to avoid conversations with people you strongly disagree with. Why? To an outsider you both look foolish and this doesn't help you at all.

We're not sure how to really fix this trap but it causes a lot of grey hairs from what we have seen. Arguing with people when you're already set is quite comical. The worst of the lot are the people who throw passive aggressive comments towards other people who are set. We don't even know what they get out of it but your best move is to agree and amplify the comment. The good news? Usually the people stick in this "need to prove they are right" camp have failed in #7 (typically have a bad personal life so they make up for it with condescending commentary). Instead, take the high road, have a good laugh. Agree with what they have to say. Delete their number and go back to meeting people you want to spend time with.

#9 The Attention Trap: We'll write our most controversial comment here which won't surprise anyone who has been reading for a while. The one thing you'll learn after succeeding is 90% of people are essentially worthless. That is of course a harsh comment but doesn't take way from reality. If you worked in a restaurant you know employees and customers steal food/items. If you make bets with people don't' expect them to pay up when they lose. If you hire someone, expect a sub-par job. If you incentivize someone to screw you for $100 when they would make $200 over the next year, expect them to screw you due to short term thinking. This is one of the realities of life. After all, these are the same people who think diet pills are going to make them skinny and buy well marketed caffeine pills with guarana.

With that paragraph out of the way, the last thing to be aware of is the trap of "needing" attention. If you find yourself trying to impress other people, the game has been lost. If you find that you're only showing your cards when needed… The game has been won. Since this is confusing for people who are not rich (yet) we'll provide an example. If you're going out dressed extremely sharp and don't talk about it, you're in the clear. While you are displaying wealth in some sense, you're not going out of your way to flash it. In another example, if people ask about money and you blurt out that XYZ is not enough or XYZ doesn't matter, you're going down the wrong road. All you're doing in that case is showcasing that money is all you have. It's a clear line to us at this point in time but is likely unclear to people who don't have much money. Putting it another way, if you have to make it obvious you're well off, you're doing it wrong. If people can figure it out without big signs (like a lambo) you're doing it right. Another good example would be being well known at a high-end restaurant. Any bright person would realize you're doing pretty good if you're eating an expensive place every week.

#10 Risking it All: The final trap is risking it all. When you make it, you get a rush of "immortality" and believe everything will go your way. Don't worry, lady luck will happily strike that idea down. Instead of trying to risk it all you should only take more risk up to a point where it is not relevant. We can't even count the number of people who have failed risking it all when they already beat the game.

To keep it simple, if you need $10,000 a month to survive forever, you'd never take that income out of boring assets: dividend stocks, bonds, CDs. This level of cash flow would essentially be set in stone and never moved. Never. No exceptions. The remaining money can then be used to blow on anything you'd like. It can be risky investments, parting, traveling, buying a boat/island in extreme cases etc. None of our business to be honest. The key is never risking it all because you don't want to replay the game.

Concluding Remarks: Putting it all together you see there are really about 10 major traps, they become less and less life changing as you get older but they are always there. A simple way to think about it is "Financial, Health, Personal, Mental". These are how the traps are laid out. First the system is set up for you to fail financially, then they target your health and personal life followed by mental traps to keep you grinding up the totem pole (for money you don't even need!). There is nothing wrong with the money making part just don't become those insecure guys with nothing else to live for but a few extra digits in a bank account that will go to charity.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality (***essentially the point of this post!***)… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). Explaining the Warren Buffet Bet, Passive vs. Active and What to Do About It

Explaining the Warren Buffet Bet, Passive vs. Active and What to Do About It

As you know we're positive on long-term dollar cost averaging in general since you'll essentially mirror market returns of 7-10% over a lifetime. The problem? The next downturn will be severe because people are emotional. The one item that *practically nobody talks about* is the lack of emotional stability during the next decline.

Understanding Passive and Active

Move To Passive: The move to passive has been enormous, approximately $200 billion has moved into passive ETFs while actively managed funds lost $150B in net fund flows (just last year!). What does this mean? It means that there are now *billions upon billions of dollars sitting in accounts where money can be pulled out with a few short clicks.*

We anticipate the next decline to be an absolute bloodbath. This won't change the long-term horizon of 7-10% returns in indexes, but it will likely lead to many people losing millions of dollars due to lack of emotional control.

Review of the Warren Buffet Bet: In 2009, Warren Buffet made a $500,000 wager that no investment professional could select a set of five hedge funds to match the performance of an un-managed S&P 500 index. It seems simple enough until we look at what happened.

"For Protégé Partners' side of our ten-year bet, Ted picked ***five funds-of-funds*** *whose results were to be averaged and compared against my Vanguard S&P index fund. The five he selected had invested their money in* ***more than 100 hedge funds****, which meant that the overall performance of the funds-of-funds would not be distorted by the good or poor results of a single manager."*

We cannot emphasize the bold and italics enough because it will prove our point even more.

Fund of Funds are Scams: We have absolutely no defense for "fund of fund" hedge funds. They are essentially scams. You're paying fees upon other management fees just to underperform over the long-term. As an example: If you buy a "fund of fund" (double fees), you're paying the manager of the fund picking a fee of about 1% and you still have to pay another 1-2% fee levied by each hedge fund so your total cost is about 2-3% out the gate! *In short, point one is that fund of funds are not intelligent investment vehicles. Period.*

Blanket Hedge Funds Can't Be Compared to the S&P 500: We have no idea why people compare the performance of a hedge fund to an S&P 500 index. They are not related at all. In fact, many hedge funds are set up to underperform the S&P otherwise the fund is not doing its job. We don't think this is well understood so we'll provide an example.

A large percentage of hedge fund money is run in what is called "market neutral" books. This means your dollars short are equal to your dollars long. To make that comment even simpler, it means that if you invest $100 into stock X you must short sell $100 in stock Y in the *same* sector.

We have simplified this concept to make it easier to understand but the point is clear. A market neutral book is set up to provide stock price appreciation with no exposure to the S&P 500. If you're doing 5% returns on an annual basis you're running a pretty solid book because you should in theory not have any exposure to the S&P 500 (which is appreciating by 7-10%).

If you don’t believe this then take a look at the same chart provided in Warren Buffet’s letter to investors (page 22).

Buffet.jpg

Look carefully. ***Notice that every single fund outperformed the S&P 500 during the last recession (2008)?***

Despite having excessive fees (again Fund of Funds are poor investment vehicles), every single one of the fund of funds declined *less* than the S&P even with a negative 3% headwind. Why is that the case? Well now you know. Large sums of hedge fund money are not set up to beat the market. The only way to make this bet fair? Compare the returns of the S&P 500 to hedge funds with a Beta of 1.

The point of this section is three fold. 1) we think the next decline will be severe. When more money is in passive it means individual investors are able to click sell (emotional) allowing for a flooding of the gates creating a massive buying opportunity on the dip, 2) comparing the S&P 500 to a basket of hedge funds is beyond foolish as it does not take into account the beta exposure of the fund and 3) we do agree that dollar cost averaging over the long-term will yield a ~7-10% return, however, if you’re already worth a lot of money we’re getting closer and closer to suggesting a basket of bonds!

Valuation Has Surpassed the Average

If you’re in it for the long-haul (40+ years) you can certainly ignore this section. Most are not at this point given our demographics have continued to change (most readers are in their 30s). If we look at all of the valuation metrics there is practically no item where we can cleanly say we’re below average

S&P 500 – Price to Sales (Last Twelve Months): Price to sales ratios are typically attractive somewhere below 1.5x. At this point were at approximately 2x and moving upward as the S&P continues to appreciate. While the companies are certainly more profitable, the sales multiples are not very attractive anymore. While we don’t think we’re at the top yet, there isn’t much room to run and if it ever hits a 2.3x it’s probably best to exit all together.

S&P 500 – Price to Sales (Next Twelve Months): Largely speaking you’re looking for a similar entry point at around 1.5x or lower on an NTM basis. If you’re extremely bullish then investing at 1.5-1.7x is also fine because it implies that numbers should be higher than current forecasts. That said, we’re creeping up towards that same 2x marker making it tougher to justify throwing in large sums of money.

S&P 500 – Price to Earnings (Last Twelve Months): A sign of life. Companies today are significantly more profitable due to advancements in technology (internet, software, automation). This means that the P/E is actually relatively reasonable in the low 20s on an LTM basis. That said, this is still above the average where you want to be seeing numbers closer to 19x.

Price to Earnings (Next Twelve Months): Finally, we come to our last metric, the forward P/E. This is the last reason why we're still okay dollar cost averaging ***some money*** for now. Despite the run-up and despite the valuation on a price to sales basis, the earnings per share on a forward looking basis remains reasonable in the high teens. It is certainly above average but we're not in excess of 20x and we do believe that there is more room to cut costs and achieve the earnings numbers.

What Does This All Mean? The stock market is above average on every single metric including the forward FTM multiple. It does not mean there will be a decline near-term (in fact *we think nothing will happen this year and it will be fine*). The problem is that bonds will become significantly more attractive once rates go up a couple of more times and there will be a better *risk to reward* buying opportunity. This is good news for everyone who has built up their financial independence fund.

What to Do

Now that it is becoming clear that we're at least beyond *average* valuation, what we're saying is that we should all look to new investment vehicles beyond just S&P dollar cost averaging. We are not saying that you should throw your money into a hedge fund (many require millions just to get in by the way!), instead we think you should operate *like* a hedge fund at this point.

This means, if you are over the age of 30 and you are financially independent, it is time to brush up on your risk profile. If you've been averaging into the S&P for the last decade you've made a ton of money and there is no reason to risk your principal.

– **We recommend starting a business ASAP.** Make no mistake, if you've had a good run career wise and things start to get softer, that stream of cash flow is going to be under pressure. Start learning online sales or at least consulting on the side. Getting comfortable now is what everyone else is doing and that is exactly what you *shouldn't* be doing.

– Take your market exposure from 1 to sub 1 by year end 2017. If nothing is learned from this post we suggest explicitly reducing your market exposure to under 1. For newbies this means if your entire portfolio was just the S&P 500 (that would be market exposure of 1), then we would reduce that to at least 0.7 or so (70% stocks, 30% bonds) somewhere around the end of the year when rates have gone up a couple of times.

– Do Not Risk Principal. Under no circumstances do you risk your actual principal wealth. This is the money that is stashed away to cover your cost of living forever. It is not worth it to have high exposure to the stock market with above average valuations across every single metric. If you're already rich lets keep it that way.

– Watch Tax Rates and the Muni Market: If rates do increase and the tax rate declines there will be an enormous buying opportunity for tax free returns! Everyone has been praying for "5% risk free" for a long-time and we may get *close* to there if rates do go up quite a bit and the tax rate comes down! We can always pray! But at minimum, it should be tracked diligently for the remainder of 2017.

– Don't Be Fooled by Indexes: Yes it works. As we stated in the past if you dollar cost over 50+ years it's going to work. The problem is listening to the media and allowing them to drive people into indexes (notice everyone talks about indexes now). Don't be fooled means… Don't expect this upward trend to go forever. When the declines come there will be a stampede out (people have no emotional control and never will) so expect a bigger buying opportunity. If your plan is to stomach the downturn just remember this post and it will likely be uglier than most people think!

For fun, notice that even Warren Buffet is willing to pay high fees for solid *Investment Bankers (M&A),* not related to equities.

"And, finally, let me offer an olive branch to Wall Streeters, many of them good friends of mine. Berkshire loves to pay fees – even outrageous fees – to investment bankers who bring us acquisitions. Moreover, we have paid substantial sums for over-performance to our two in-house investment managers – and we hope to make even larger payments to them in the future."

****

Extreme Prioritization When Traveling Like a Mad Man

To say that 2019 has been busy is nothing short of an understatement. This year relative to last year has caused far too much economic activity. It feels a lot like 2006/2007 hence why *new money* we're getting is not being spent buying stocks or bonds (no we never sell or trade since it just isn't worth the mental hassle). All that said, we figured there couldn't be a better time to talk about extreme levels of productivity. Our up-coming book is going to have information that will only resonate with people who eventually make it to the top (not people who are now upset with this blog since the average income has gone up 250%). With that we'll jump in.

Overview 2019, Too Much Money Sloshing Around

Money First: In times of high economic activity you want to do two key things: 1) focus your energy on the biggest opportunities and 2) start giving up those hobbies temporarily. While writing is fun and cool since we get to see the 1% make it and laugh at the people making $200K a year who will be out of jobs in less than a few years, it just isn't a priority. This becomes harder and harder as your hours ratchet up while you think "Do I even need the money?" As soon as this question comes up you know you're in a period of too much activity. Essentially, you're losing respect for the amount of effort it took to make it somewhere so you're thinking about taking the "easy" route which always ends in tears.

When we say money first we mean you're going to work like you're 23 again for at least a year. High economic activity means too many people have too much money to waste. This is going to put strain on a lot of your personal relationships. But. If they are close friends they'll understand that you're not going to be going out 3x a week anymore and it'll fall to the classic *"1x at most, see you Saturday"*.

Now we'll define "Money First": calculate how much each activity should yield on a daily income basis (holler at those affiliates who correctly learned to think like this earlier!). Even if you have to travel all over the place to close a few sales, you should go ahead and do the death march. It's all about probabilities to close and you're going to throw all of that "partying money" into a driver, late night flights if needed and of course the classic "driver pick up" where you pay the guy to get your food as you move to different locations (have no time at all). If the value of the sale is going to equal more than 1 week of income (based on your current daily intake)… you're working all week, all night, all year until that calculation breaks down.

No More "Heavy Nights": This is probably the worst part about high economic activity times. You actually can't pull those 4-5am party nights more than 1-2x a year. Seriously, it just isn't possible. You'll wake up and lose 48 hours worth of productivity which could have then (by the calculation above) bought you 2 weeks of income or 4 weeks of investment income at minimum (anyone reading this will be investing around 50% of their income). Even if you were 40 years old, it doesn't make any sense to lose 1 full month of investment income for one "fun night out". The only way it could possibly make sense is if your passive income was higher than $1M/year after taxes.

So the biggest way to prevent this productivity loss is to say no to all of those big parties. This will absolutely test your will power. Anyone who makes it in life knows that private events are the highest quality, highest return events as you don't have to worry about ridiculous things like "paying for a drink at the bar" or having to "look through the crowd" for someone decent enough to talk to. Either way. The unfortunate downside to "making it rain" for a year is that you're going to ditch a lot of the fun ***temporarily*** as you're essentially purchasing 4-years of fun during the next down turn.

Normalized Activity: Before moving on, all of the items we recommend below are for high economic activity years like 2019, 2013, 2006 and 2007. They apply to any type of economic environment… That said… We'll emphasize that these extreme measures are only needed for high economic times. If you're in a standard year (normal), continue to go out and have tons of fun 2-3x a week since the number of money making events will be limited and doable with 5 days of effort per week.

Extreme Prioritization

Workouts Take a Hit: It really can get this bad. If you are in a time of extreme stress you will not be able to work out properly. You're going to be forced to improvise and go into what we call "preventative workouts". This means you're trying to max out your workouts and minimize the declines. If you have a full month of money making, we predict your physical fitness will decline by about 10%. This is not terrible but it sure beats most people who would fall by 30% as their VO2Max would drop off a cliff (no running for a month causes a catastrophic drop). So here is the best way to workout in a hectic week where we assume you only have a total of 3 hours to work out.

3 Hours turns into four days of working out. That is about 45 minutes each. It is smarter to do this with 30 minutes, 30 minutes, 1 hour, 1 hour. During the 30 minute workout sessions you will be doing reps until failure. The whole "workout routine" is dead. Dead. It means that you just don't have time for a full workout for 7 straight days. So you're going to choose only four exercises: Cardio, back, chest, legs. Forget everything else.

The 30 minute days = lift weights until failure on each rep. This is for back, chest or legs. You're going to take a weight slightly lower than your normal weight (5% lower to prevent injury) and you'll do each set until failure. Rep after rep. If you can get through 4 different exercises, you're crushing it. Then depending on if you're a night or morning person you rack up the body weight exercises: sit-ups, pushups, dips until failure just before you jump into the shower. This is of course extreme but allows you to extend the workout without losing valuable time.

The 1 hour days. Essentially you want to do at least a 40 minute cardio activity. Once you go over 20 minutes the body realizes it's a real workout so when you push to 40 minutes twice a week you'll prevent a step down in cardio declines. For the remaining 20 minutes you do the other body exercises you missed. Since you have 3 hours in total, you're going to have to do back or chest before or after the run. Our own recommendation is to do the run up front (counter intuitive) since you're typically so exhausted it is easy to quit the run early and say "oh I have to go back to work".

That's a brutal 3 hour work out while traveling around managing a 100 different things at once. It doesn't even include your regular work but it's 100% possible to still crank out 3 hours or so even if you're living based on flight times. (extreme pro-tip, airports have yoga/meditation rooms where you can stretch if your flight gets delayed. You can also do basic workouts there in a corner and just hit the lounge for a shower).

Pack as Light as Possible Idle as Little as Possible: It isn't enough to pack the minimum. You want to pack the minimum in order. When you open up all your bags when going to meeting or the hotel, everything should be organized in the way it will be brought out. If you have clothing that will be used on day 4, it should be at the bottom. The older used clothes should be towards the bottom (or bottom compartment) so the rest of your items press down on the used clothing (doesn't matter if they get wrinkled since you're not using them again). Think about everything you'll pull out of the bag. Your bag will be different but once you think about this in detail once, organizing in the future will be like clock-work. Extreme situation, if you have specific liquids you need to carry, go on amazon and buy as many "travel sized" plastic containers as you need and they'll allow you to save space versus calculating everything for each trip.

On the idling side, this is where having a driver is critical. If it's a really jammed day where you have to move around fast, the difference between Uber Black and a driver is the ability to never sit around waiting for food. Have it ordered, eat and drink in the car and you've just saved yourself 1-2 hours. Uber's slogan is "everyone's private driver" but we all know that it really isn't the same if you're truly busy.

Low Quality at End of Day: You know those emails that make you cringe when you respond to them because they barely even clear your ROI? This is where you finally get to ignore them. That's right! The one benefit of being legitimately ultra busy is you can laugh at all those smaller non-needle moving events and answer them in 2-3 sentences dead last at the end of the day. Ideally, you'll actually win a few bigger accounts and you can delete them forever! Just thinking about this will make a huge smile cross your face, nothing like having someone you barely care about get upset and switch only to find out it's because you landed something better. It's kind of like running into an ex-girlfriend and she sees you with someone 100x more attractive (awful to say out loud but everyone knows that feeling)

Everything Gets Turned Off: You're going to run out of energy. There is just no way to expect to be "on point" every single time you are trying to ramp up production of something or make a new sale. A good way to combat this is the "zig zag" strategy. You want to have the first 3-4 hours of the day be important, the next 2 hours be less important (lower money opportunity) and the last 3-4 hours be highly important. This causes you to take a "break" as your brain gets a bit of a rest in the middle.

As a note, during this time you should actually avoid responding to personal life items. This sounds ruthless as well but unless it's an emergency just tell them you'll respond end of the day. Yes. We realize this makes it seem like personal relationships are on par with a mediocre customer… While true in terms of time dedication, your personal relationships should "get it" and not cry about your delayed responses to their random messages. Also if you give them a heads up they are 100x less likely to care, they know this happens and will be understanding.

Stagger the Caffeine: You're going to consume caffeine. Unless you're against it for religious reasons using caffeine is going to put you in the "right mood at the right time". If you up the Caffeine dose before the first 3 hours you will be in a fantastic "on mode" for the important meetings. This will lead to a moderate crash during the less important meeting (zig zag). So think about changing up your intake to match when you should be paying attention. As you know, we recommend coffee with butter if you're going to be in some sort of long form conversation. This would mean you're going into a single long meeting for 4-6 hours of focus for something extremely important vs. smaller shorter meetings. For those really in the know, we also mean stagger with two meanings here (covered in book so no don't ask what, if you know, you know)

Read Read Read: This is what travel is for, reading and preparing for what needs to be said the next day. This can either be actual information or it could be soft information. Is the guy an avid Democrat? Don't be stupid, leave the republican cufflinks in the bag. Did the guy get married early with limited life experience? Don't be stupid, wear the boring trustful color of blue. Did the person recently get divorced and wants to go out a lot? Don't be stupid, line that meeting up last so you may convince him to go out and party. Essentially, don't go into any meeting with the same material. You're just being unproductive with your time. Those low quality customers that you're responding to are actually causing you to lose money (substantial amounts of money). Oh and of course, always choose the window seat. It's always easier to sleep in versus getting bumped in the aisle seat by a random person walking around (aisle seats are just terrible).

Extreme Organization

Quick recap, you're going to have 1) no more meaningless personal life conversations unless it is serious, if it's serious all "work" needs to go on hold – death for example but we really doubt it will occur, 2) you're going to zig zag the important items, adjust your caffeine intake and do a painfully efficient three hours of working out and 3) you'll turn off all devices hit the window seat and either prepare or sleep.

Food and Drinks: You're going to be busy so you actually want to think about what you're consuming through the day. There is a zero percent shot you'll be able to eat something amazing mid-day so this means breakfast and dinner is where you'll line up something extremely healthy. Also. You want to drink a TON of water in the morning since you'll be dehydrated within a few short hours. It's fascinating to see how poorly the body operates when dehydrated and if you're not drinking at least 32-48 ounces of water the first 30 minutes in the morning. You'll pay for it quickly. Sounds extreme because it is. It also works. (Note: yes you pack chlorella and toss it into the water in the morning)

Paperwork: No one should be using paper. Always put everything on an iPad. Period. The way you prevent ever carrying worthless pieces of paper is asking if "soft copies" are fine. This is going to tell you how old the person is (decision maker). So not only are you decreasing the weight of the items you need to bring they are handing you valuable information. No one under 40 or so wants to deal with paper, it's all digital.

"Dead Clothing": If you know you're going to have to pick items up and perhaps carry things? Guess what just take some workout clothing/accessories that you're going to get rid of soon. Extreme yes… again that's why it is called extreme organization. You can one time use it and be on your way. You can take it to the ultimate extreme by throwing away old workout shoes if you need to (this of course would mean you're picking something up on the very last day).

Scatter Pack: Need to carry a lot of cash? Scatter pack it. If you are moving more than $100,000 around, you want to stack it up into groups of either 5,000 or 10,000 and scatter it around the carry on. This won't be registered by the equipment and you won't have to waste time with TSA for example if you're going through TSA instead of Clear.

Not So Extreme: Always have the following: Clear, TSA Pre-Check, Global services. Also have the following: travel sized liquid containers and combs/grooming kits that are thin (less space). Also have your phone set to vibrate and stacked alarms to give you an idea of when you need to get going. All of this is obvious but it's fun to see how many people break all of these rules and end up wasting time going to buy something at Walgreens last second.

That's our quick rant on extreme prioritization in a travel heavy environment. Yes. This article was written on a phone hence the limited time to organize a photo or backlinks. It has been insanely busy this year and on a positive note we will have a Q&A on a Monday (yes we've actually got a Monday off). So circle that day and then we'll do our status/class post on Tuesday. As many of you have noticed the $150K a year online crowd has finally turned negative on our blog, right in-line with our expectations. We finally made the jump to the next level so the content here will naturally change. For the better, the people at the top for some reason are always more attractive, younger looking and less focused on boring stuff like "dating" since no one has problems in that category!

Q&A May 20. Also probably a lot of typos so no need to remind us in the comments…. Also if you have extreme tips let us know immediately!

****

FAQ Update and Fast Answers

This will be a mixed post but good timing. Some of the questions we are getting continue to have some of the same answers so in the next Q&A we'll (try) to remember to link to this article. Also, it has been fun to see that the economy is doing so well that no one seems to be worried about "getting a career" or "getting a job" and the majority of the questions have morphed into Option A vs. Option B type situations.

Motivation! We continue to get these questions and there is never going to be an answer form us. Our opinion is not "fun" and is not for people who will never make it anyway. In our world view, you either want to be successful or you don't. It just doesn't make sense to waste life trying to do the "minimum" since the path of least resistance never works for anyone. Even billionaires will admit to awful hours at some point in their life where they work until their hands can barely move. For the people who started a Company and succeeded (or those crazy guys still in banking) you can remember the time you were staring at your screen and you quite literally lost control of your eyes (left eye looking different direction as right eye) causing you to give up and sleep.

No the above is not meant to say "work till you can't function" the point is that working in general is just like any other muscle. While one person can produce tons of value in just an hour, this is likely because he used to take 10+ hours to produce the same amount. He got better. Exact same thing as any sport… If you train every day, you get faster. Making money is not different. Our only point from the paragraph above is that you eventually have to "find out" how much your body can take. Also, please spare us the "oh my god your health is ruined" comments. People who make it always look younger than their age by the time they are 40 because… they didn't have to work long hours anymore! Funny how that works, it is almost as if you get rewarded for making mature decisions in life.

To conclude this topic, we will never have an answer for motivation. You either want something or you don't. There is no secret here. There is no Tony Robbins seminar or $100 online course that fixes you… it is simply up to you. If our readers want to know why we continued to push when things weren't going well it is simply because we couldn't look in the mirror. How can anyone wake up in the morning at 6am or 10am… and feel good looking in the mirror with a $10,000 bank account while working 25-30 hours a week? We couldn't do it and that's a personality trait. If someone is broke and only has $10,000 but they worked like a dog trying to get ahead (say 60-80 hours) it is actually *EASY* to look in the mirror. You can wake up look at yourself and say "look I am not there now but I sure am doing everything I possibly can to get there". Everyone else wakes up after watching Netflix and lies to themselves "I did everything I could"… simply a lie.

Increasing Productivity: Thisis similar to motivation but we'll go ahead and assume it was a legitimate question. If you're struggling to increase productivity we'll give out a few that have worked for us. We've made some changes so we'll do them in steps.

The first step is to find something to *complete* before moving onto your major task. In general, we used to put the first major task up front and never move on until it was done. Instead… we made a slight change. Now you find one *easy* task that absolutely needs to be done during the day. After that task is complete you move onto the most important task of the day. We're not sure why it works but it does. You feel more energized when you close the book on one of the tasks and get to move onto the next. Ever notice that when you're extremely busy that you get the most work done? This is probably some sort of human programming.

A good second step for productivity… delete all access to social media. We are either using it or are off of it. This is a strange way to operate in the world we live in. That said, we try to do it like this so you are forced to avoid it until you're done with the most important tasks. Similarly, it becomes more of a "hobby" versus an addiction. It is so easy to wake up and look at Twitter, Facebook, Instagram etc. Instead you should wake up, get ready, then go do that first easy task. After the first easy task is done you'll forget that you even had social media and get the major item done. Once complete… you'll feel even better and may take a break to look at entertainment options

The third step is to decide if you're a morning or night person. At this point in our lives we realized this is a real phenomenon. Decide if you're more creative at night or if you're more creative in the morning. This also explains why some people wake up extremely early and others are up extremely late. It's a legitimate body composition issue. We can't prove it with "facts" all we have is decades of experience watching this. So. Figure this out and push all your creative outlets into the night time or in the morning. This causes extreme growth in your ability to make better and better products. Of the three above this is probably the most underrated. As a bonus tip, if you're in tune with your body, ramp up the air conditioning before you do any creative work. For some reason being cooler helps (not sure why).

"Option A or Option B": These questions are starting to get redundant. Only you can answer them because we follow the exact same process regardless of who is asking. First question: do you want to be rich? Most say yes otherwise we have absolutely no idea why they would read this blog. Let's assume you say yes. The second question is "How rich?" If the answer is $5M+ in net worth, you must choose the option that allows the most time to start a business and if the answer is "$1-2M" you choose the one with higher earnings potential over 10-20 years.

Before any "clarifying" questions come in, please don't nit-pick. If you are choosing between investment banking and enterprise sales… then the answer is simply "do the one you'll be best at"… Again one we cannot answer. Same with "M&A or Tech Software Coder"… The answer is always "which one will you actually be good at". While it is true that you may make more in one versus the other in year 1-3… BUT and this is a big BUT…. You don't make real money until you're 5-7 years in. So… Always choose the one you're best at if you're choosing between one of the three careers we recommend.

The exceptions: The only time we really have exceptions is based on older people 30-35 and up or people with no degrees. In that case you're probably best off learning a trade related to real estate and then moving into flipping homes. Significantly better. To close this out… if you don't care about being rich then our advice isn't really going to help at all. To really kill this topic…. 1) will you be good at it, 2) choose that one, 3) if you're unsure choose the one with lower hours and 4) all of it is absolutely meaningless compared to equity in your own venture – you will absolutely out earn your peers who stay in careers (if your business succeeds of course!)

Investing/Trading Ideas: This is becoming funnier and funnier as we get older. It shows that most people who say they earn a lot of money… really don't. Why? No one needs to trade around all the time if they are rich. It's actually an obvious tell that someone is *not* rich. They probably hand out on Wall Street Bets on Reddit… making ridiculous trades and losing it all eventually.

Our view on investing is still the same. Read triangle investing and the way to diversify is by moving *cash flow* to another asset class. This seems ridiculous but is 100% possible if you're actually making a lot of money. Unless you're worth $10M+ you can move your exposure by several hundred basis points by simply buying a different asset class. The math works this way and you can see it below.

Assume you're "Joe" the successful 30-year old affiliate marketer. You have a net worth of $2.5 million dollars. Well to get to $2.5M the chances are you were making at least $300K after taxes (keeping it simple and that is likely low). If you really believe that real estate or stocks are going down… do you need to sell? NO. All you do is take that $300K and you invest it into something else entirely, even cash. If you do that now your cash just increased by $300K. $300K/$2.8M… that's 10.7%. This is exactly how we operate. If we think a certain asset class is "heated" we stop buying it and but the other one. This also allows you to never sell. Even if you're 40 years old and your portfolio goes down 40%… by the time you're 55 you'll be worth significantly more as recessions/downturns rarely last more than a year or two. Hey… Even in the wild wild west of crypto currencies, a year was all it took.

Unfortunately, we realize this type of thinking isn't applicable to everyone. So what is the solution? The solution goes back to the same thing we put in Efficiency. Spend all your time earning and creating cash flow streams until the above paragraph makes sense. Why would you burn your valuable time "trading" a $500,000 trading account when you could build a cash flow machine that generates $500,000… per *year*. You'd need a 100% return just to keep up which is unlikely doable on a consistent basis year after year. To conclude here… If you're really worth $20M+ or some other huge number, you're not stressed about money in the first place… that's why we know it is all nonsense and lies

Finding Suppliers and Demand: This has been covered so many times and maybe we'll add it to the FAQ. Two things: 1) before making any product you test demand with a check out screen that says "out of stock" and 2) you get manufacturing information by going to conventions in your market. Both of these things are not difficult concepts and highlights that most people really do not even try. Why would anyone mass produce something without knowing if there is demand? The cost of doing this would be tens of thousands and the cost of testing demand would be a couple of thousand (just buy traffic)

The second point is even more obvious. If you plan on selling canned beverages, wouldn't you attend a beverage conference? At a beverage conference the entire supply chain would be present from people who are selling the beverages to people who are helping make them and market them. These two questions are probably the most frustrating as it shows that people don't take success seriously. If someone thinks they are going to make a product by "happenstance" with no connections or fame or build in customer base… it just won't work

On that note, the internet has certainly made it possible to get rich quicker. The one thing people ignore now (this is a 2019 comment) is that every single smart person knows this as well. The competition is going *UP* and is only going to go *UP*. Since everyone has access to the same resources. A smart person will track down the right software tools and will find every angle to test demand before going into mass production. The rich get richer… this will continue.

Those are the big ones from yesterday, so we'll go back to normal posting by end of week. Has been a crazy year and hope yours has gone well!

****

February Q&A is CLOSED

Closed now thanks!

Financial Disasters in 10 Simple Equations

Financial Disasters in 10 Simple Equations

Even if you work a mediocre job and don't see much room for large earnings you're still going to save a large amount of money by simply avoiding disaster. Lets go ahead and take a walk through the math behind the vast majority of financial disasters people will make. If you can simply avoid catastrophe, you'll be far ahead of your peers.

1) College Debt

We already covered this topic at length in our post on college. If you missed it check it out. If the debt you take out to go to school is not immediately paid off by *additional* income due to the degree, it was a waste. Debt in general makes it incredibly difficult to gain financial leverage in the future. You're swimming up stream.

Equation to Remember: Additional 1 year annual income from education > debt load.

If you're taking on $10K in debt but your gross income is increasing by $10K, again **due to the degree** then it would likely make sense the payback period is roughly a year. Taking on $20K in debt to increase your income by only $5K? Not so much.

2) Taking Unearned Time Off

If you are in your 20s and you feel like life is difficult and you need to "find yourself"… All you are going to find is *a zero bank account, no employment opportunities and a couple of notches with 5s at best* from your hostel adventures. Don't be fooled, unless you're building tangible skills, this decision alone will financially bury you for a multitude of years.

Equation to Remember: 1 year taken off = 4 years of earnings depleted

If you run the math it works out. Lets assume you save 20% of your annual *net income*. This means 80% is spent, 20% is saved = 4:1 ratio of spending to earning. With that ratio you see that 1 year off now implies a negative impact of 4 years working. Gets ugly very fast doesn't it?

3) Getting Married

It is taboo to run numbers on anything emotional but it really doesn't make any financial sense.

Equation to Remember: 50% zero financial impact and 50% losing half your assets

Simply put, you are taking on financial risk for no apparent reason. Since we are applying logic to an emotional decision, you can also apply emotional reasoning to avoiding this trap. If she loved you in the first place, *she wouldn't need a government contract to prove it.* Getting the government involved never helps.

4) Excessive Drinking and Partying

Drinking and partying is great if you have a purpose. No one wants to be around the socially awkward guy who has worse game than an Atari. With that said, once you've gotten a good grasp of game (12 months maximum) it's time to re-evaluate the value of your time.

Equation to Remember: One drinking session costs 2x your daily income

This formula naturally compounds. When you're young, not making much and able to recover quickly, the cost of a hangover is relatively minimal. Once you start increasing your income… Even at the $150K annual mark, it becomes tough to justify. *You're losing $833 per session.*

5) Picking Individual Stocks

Practically everyone believes they are smarter than average. In addition, even if they understand beating the market is near impossible they **STILL** buy individual stocks! Nonsense. Instead of trying to convince people to avoid picking individual stocks, lets simply convince them to avoid picking individual stocks when it will damage their financial future. EG. When they are young.

Equation to Remember: 1 year of 10% losses = 3 years of investment gains

Relatively simple, if your portfolio declines by 10% in a single year while the market was up 9% (the long-term average). You have to hit market returns for 3 years to be back to parody. Continuing with the basic math.

Person 1 goes up 9% per year = $109 in year 2.

Person 2 *picks stocks* = $90 in year 2… and doesn't get to $109 until sometime in year 4-5.

Pretty simple, only invest what you can afford to lose. *If you're not financially independent you cannot afford to lose anything.*

6) Location Lock-in… Buying a Home

We'll never win over the real estate guys on this one. Unless you're absolutely certain you're going to stay in a single city for the rest of your life it makes no sense to purchase a piece of real estate. You're going to lose out on mobility (see switching firms) which can cause major headaches for you unless you're in the hub for your profession. We can even put this concept into an equation.

*Equation to Remember: 15% * annual income > value of your city to you*

This is much more fungible, but it helps. When you switch firms to a separate city the general rule is you're paid at least 15% higher than your previous income (otherwise you wouldn't switch in the first place). If you would switch cities for a 15%+ pay raise… Do not bother taking on mortgage debt. The 5% selling commission or managing a property remotely can be an enormous headache. Not to mention finding tenants

7) Compounding Cash Flow Management

No matter what anyone says, cash flow is king not "cash". We explained this in a previous post and the long-story short is that you need a flow chart for your finances. If you simply put money away in a bank you've already lost out on ~35% gains over the past two years. Given a high savings rate, it is certainly not uncommon to double your net worth every 2 years with those market gains.

Equation to Remember: The Rule of 72

Its an equation you learned in middle school (or even elementary school!). Take your rate 72 and divide it by the interest rate to get your doubling power. In short, it takes 72 years to double your money in a bank account. In a bull market of 10% gains? Only 7.2 years. The difference is quite literally, a life time.

8) Living Beyond Your Means

We have a short decent story on the use of credit cards and you'll see that credit cards are your friends. *2% returns in cash on every single purchase!* This is going to add up once your monthly bills exceed 4-5K a month. Now if you decide to live beyond your means… you're going to lose the game as your credit score will get hammered, your savings rate will be zero and you won't have a shot at becoming rich.

*Equation to Remember: (Credit debt * interest rate) (1/ savings rate)*

Any form of credit debt is an enormous problem. Even if you have $1,000… That number is growing by 15%+ per year and we have added an extra multiplier factor to give you additional reason to get rid of it. Long story short? **No credit card debt period.**

9) Being Paid by the Hour

In one of most popular posts, you'll see a deep look at careers. In short, don't work in industries paid entirely by the hour as you will never have leverage relative to time. So long as you're pegged to a ticking clock you're going to have a hard time accelerating earnings.

Equation to Remember: Earned income = hourly rate + (Event, Ownership or both)

For a simple understanding of this, your income must come in two forms (at minimum). If you're being paid to work at a firm by the hour, that is fine… however you MUST work in a profession where you are also compensated by an *event* (sale, closing of a transaction) or you must have the option to build ownership in the firm (equity). For a drawn out answer please refer to our post on careers, but the equation above if the simplest to understand. No secondary component = time for money = leave immediately.

10) Networking Flat

When was the last time a poor person got you a new career position? That is right, never.

With that back drop, keep this in your back pocket when you send your next text message or email.

Equation to Remember: 1 email to equal or lesser for every 2 emails to someone of higher value.

Makes it a lot harder to communicate doesn't it? That is the point. As you are well aware, you need to find ways to improve a person's life to have someone higher than you help you out. In addition, it requires that you take a hard look at who you communicate with. There is some subjectivity here, but the equation works for life in general, it is quite difficult to get someone more powerful to help you so for every 3-4 people you meet, maybe one will befriend you. Such is life. At the same time, the messages sent to an equal or younger person you are mentoring will have a lot more productive conversation filling the void.

Lets make this even harder for the go-getters, apply this to your weekend schedule as well. Friday, Saturday and Sunday… You get one day to party it out, but the other two you need to spend around people better than you.

"If you're the best person in the room, you're in the WRONG room"

___

If you think about it, these simple equations are easy to follow. Wall Street or not, every single person can follow the 10 equations above and see enormous results over the next 3, 6, 12 or even 24 months!

Are you above or in-line with these equations?

Our guess is the common pitfalls will be #4, #5, #7 and #10. These are certainly the more difficult ones to crack.

****

Financial Samurai Paid up and What We Think Trump Does

Financial Samurai Paid up and What We Think Trump Does

Well we recently had the chance to cash in on our Trump bet with Sam from Financial Samurai. He's a much nicer guy than any of us and we provide some highlights although there wasn't much to talk about when things are going good across the board. Maybe we'll find another item to bet on since we still disagree that people are "rational creatures" when we largely view humans as driven 99% by emotion (only 1% figure out how to be rational, hence the disparity in wealth).

Dinner with Sam

Wall Street is in Secular Decline: There is no doubt that Wall Street for now is in secular decline (unless something changes). Billions of dollars (around half of fund flows) are going into passive ETFs with extremely low fees (around 0.09%) and trading is becoming more automated by the second. Since Sam exited the industry total compensation is down around 15-20% give or take since we've now witnessed two years in a row of declines. Layoffs occurred across Wall Street last year (unless you've been living under a rock you've seen the press releases!)

We don't think this will change since we're going to roll with what we think the future looks like. Unless you're in a client facing role where your value is based on relationships (very difficult to automate in the future) then you're going to see a squeeze. Robotics and computer systems are going to be able to make trades and do basic find replace or data entry type items in the near future. In addition, these systems will be able to process much more information rapidly when new data is presented making maintenance type Wall Street work largely worthless. The value will be in the relationships, strategic thought and naturally a balance sheet for raising funds.

The Game of Lying Down Continues: As we've said in the past always lie *down*. This means if you're making $X or have $X in recurring income always give a number materially below that. There is no point in telling anyone what you make.

Generally speaking, everyone believes they are worth more than you are, some sort of competitive pre-programming, best to just talk about median industry pay since this is easier to confirm as there are many third parties that disclose income ranges (hint hint practically every head hunting firm will give you a range).

We Still Hate San Francisco: The place is a dump and every straight male should avoid the place unless they need to be there for money (temporarily). Sam loves the area but he's also married and ready to have his first kid. We won't convince him on this second topic either (first being people are generally irrational). The place looks like a complete dump with needles on the street next to homeless people, actual human feces and absurd rental prices to hang out with guys who have sex with ugly, fat, old, sea donkeys.

The negatives aside it could be a good place to invest given potential for major technology IPOs in the future (Uber and AirBnB for example). Luckily or unluckily, we hate the place so much we'll never own a piece of that nasty place. Finally, we think there are many places to own property that have similar rental markets to San Francisco, this includes New York and Los Angeles and many other places outside of the USA. We'll never have to pay for a piece of that trash city.

The Market Rally Post Trump: Predicting the economy is largely a waste of time. But. Two things are clear: 1) people believe trump will help the economy and 2) if the corporate tax rate is lowered business owners will benefit. With that backdrop the answer is clear, we're still better off investing time and energy building an actual company instead of trying to time the market. If you believe the market is overdone just keep dollar cost averaging but put in *less* on a monthly basis as you spend more on your actual company. A corporate tax rate reduction from the 30s to even 20% will impact you much more over the long-term.

So we are clear, we're still dollar cost averaging we're just going to do less since we believe he will likely make some positive US tax reforms.

Interest Rates are Going Up: Rates are going to go up based on commentary from the Fed. This means bond prices are going to come down and it may be smart to review bonds after the next couple of interest rate increases. If you have a large amount of money in the bank that you've spent 10+ years to accumulate it may be smarter to decrease the volatility in your portfolio. In addition, if the tax rate were to come down, the value of municipal bonds will decrease materially as well (tax free benefits no longer as meaningful). We think that would also be an interesting opportunity. If we see a decline in the tax rate that isn't sustainable or believe a new establishment will raise taxes once the Trump term is over… may be time to buy those as well.

Blend Into the Crowd: For day to day living, standing out as being rich doesn't make any sense. Unless you're trying to make a good first impression you can simply dress modestly to avoid being harassed by regular people. We have a more lax stance on luxury goods and believe there is a time and place for them (specific occasions). Dressing sharp on days when you're not meeting anyone new doesn't make much sense because your buddies shouldn't care if you're wearing that bling bling on a day to day basis.

Who Do You Owe? While the topic didn't come up much, we thought about it after Sam recently disclosed he will be starting a family. We think this is a good time to ask "who should you pay back?" and the first answer is *typically* your family. Remember, we encourage you to cut contact with family members who are holding you down/getting in your way. But, if there is someone who helped you then you should throw some money their way as a thank you. We've started a personal list of people who helped us get to where we are and will start helping them in order. Most of these people will be influential when you were young, some won't even want the money (or ness it) but we're going to start a tally for the excess money.

No we're not going to start some charity to try and save the world, we'll go first to people who were influential or helpful before the success started rolling in. Finally, if you're not financially independent these types of bigger moves can wait. If you're growing your income rapidly then you will add the most value to those around you by investing in yourself.

In short, Sam is a great guy and is much nicer than any of us ever will be. We still disagree on two things 1) that people are rational (we don't think so) and 2) that San Francisco is a great city (we hate the place more than we hate fat people… that's a lot of hate).

What Trump Will and Won't Do:

Hard to put this into discussion topics so we'll put it in bullets (Wall Street Playboys opinion not Sam):

– **America First:** He will prioritize American companies in a big way particularly with a potential import or border tax. This is clear based on the announcements from major car manufacturers who have talked to the future president. We go with actions and signs are pointing to bringing manufacturing back to the United States.
– **Taxes:** Personal income taxes and business taxes will be adjusted. We really doubt we see a 15% corporate tax rate and also doubt the current tax plan which raises taxes on the middle class will go through. Instead we think there will be a smaller adjustment to personal income taxes where the brackets are moved to give breaks to middle class earners and we think a tax rate in the 20s makes more logical sense for corporations.
– **Media Decline:** He will continue to damage the media. We think this is becoming clearer and clearer as well given that he seems to prefer social media and tweets over interviews. This is unlikely to change. Expect material negative changes to media add buying patterns and the future of marketing in general. Long-story short, media will continue to be in pain for the foreseeable future.
– **Immigration:** Illegal immigration reform will happen. We again do not know exactly how this will be done, either a tax on Mexico to cripple their economy until something is done with the illegal immigration problem. He will likely build the wall, we put a high probability on that given it would psychologically lock in a second term for him. While we already made a killing off of Mexico and the decline is likely already priced in now, we don't see Mexico as a good investment at this time (best to avoid instead of shorting now that it has come down some 20% since the day before the election)
– **Energy:** It is hard to see how he'll adjust the system to take away from clean energy type companies so we'd suggesting looking into oil and gas companies exposed to the USA. Meaning, we wouldn't try to play this idea (move away from clean energy) by investing in offshore companies given the potential taxes foreign companies will pay. We have a basic overview of the Oil and Gas sector and would look at American Based companies that fit into where you believe oil prices will go.
– **Health Care:** This is another convoluted topic and we think this is much more complex than "repeal Obamacare" while it sounds nice to say it from a marketing perspective (gathering republican support who hate liberals) the actual action will be different. We think it will take some time to come up with a better solution or to find a way to outright repeal Obama Care. We'll see what happens but think this one is the hardest to profit off of since we won't know who really benefits in an outsized way.

Focusing on You: As always we suggest all readers focus on what they can control. This means we would first focus on building a business since this would benefit you the most long-term even if taxes don't come down (taxes decreasing is just another reason to do so. After that we would review a financial portfolio and decide if you want to adjust your exposure based on his clear America First prioritization, recent auto manufacturing announcements and of course hatred of the Media.

****

Find a Mentor

Many of our readers have requested a post on finding and cultivating a strong mentor. We'll outline a step by step process on finding a worthwhile mentor. The bad news is that most people, particularly on internet forums, have not passed step one.

Search When You Want to Quit: Most people don't deserve to have solid mentors as they have not put in the work to deserve assistance. This is similar to why most people are broke. A solid mentor will only help people who have put themselves through pain and suffering. If you're struggling with women, money, sports or even something as simple as dancing, you should force yourself to try it yourself. Talk to 100 women before you ask for any help with game. Edit your resume 10 times before asking for professional help. Practice your jump shot on video camera before you ask for help with your form. This list goes on. When you've tried and failed many times, now you're in a position to ask for help as you're about to quit.

Filter Potential Mentors: Zero in on what you need help with. Maybe it is style, maybe it is conversational skills, maybe it is your form when doing heavy squats. Once you have the exact issue you are facing, find a person who is particularly skilled in the craft. For sports it may be smarter to hire a trainer and for style it may be smarter to hire a fashion consultant but ideally you have something to offer in return for the information they will provide. This means you will form a strong bond with your mentor as it is a mutually beneficial relationship. With that said, the title of this section is **filter.** Why? Finding a mentor who is only firing on one cylinder is always worse than someone who is firing on every cylinder.

Run them through these simple questions:

1. Did This Person Have Less to Work With? As an example, getting career advice from a trust fund baby is useless. If you're looking for advice, find out how many opportunities the person had and ask yourself if you've had more or less opportunities than them. If the person overcame a more adverse situation… You're on the right track.

2. Ask a Layup Question: This is very similar to our advice on Wall Street, where you want to lower expectations and over deliver. To make your life easier, ask a few fake novice questions about the topic. Why? This will allow you to quickly filter the fakers from the people who legitimately want to help and have been around the block. If you're eating healthy and are on a high protein diet to gain muscle and a person tells you to start eating more junk calories, you can quickly cross them off the list for advice (notice you already have the basics down as you've hit a plateau due to failure). Similarly, if a guy tells you his best opening line is "Hi" then you can be certain he is either a 9/10 or a troll, both are a waste of your time.

3. Mentors Are Congruent and Content: Once filters one and two have gone by, you want to find someone who is consistently helpful and does not sway. Humans are naturally emotional, however a clear character should be present. Even if the person isn't perfect in all aspects of life, you can find a few mentors to create the person you hope to become. The last step is crucial as a person who sways on a personality basis and seems upset or unhappy is likely harboring feelings of self loathing. The ideal mentor has lost his ego a long time ago, this does not mean a loss of confidence, but an acceptance of his past failures.

Not many people will pass the filter above which may cause you to search for professional advice, but once you find one you can move on with your mentoring process.

Don't Waste Their Time: This is the most important piece of the process, **establish trust with your mentor.** If you are asking for lifting advice and continue to stay with the same routine, don't be surprised if they quit on you. If you're using the same lines and wearing the same clothes when an expert is telling you otherwise… You're disrespecting their opinion. Instead listen to their advice to the T and they will be more than happy to guide you as they see errors in the process. Instead of attempting something once, when a mentor guides you he will likely trouble shoot your issues, this will often lead to exponential improvement.

Pay It Back: Once you've established a strong relationship, you should attempt to help your mentor and also pay the information back to a younger generation. While mentors are likely firing on all cylinders, giving small tokens of appreciation back should suffice. Now you have a strong bond to work with and you'll cultivate a relationship in the other direction by paying the information back to a younger man.

Concluding Remarks: Now that you have a guide to finding mentors, the more important question to ask is… Do you deserve help? You must pay the price first and it is always the same. Pain and failure.

****

Five Life Truths No One Has The Guts To Tell You

Five Life Truths No One Has The Guts To Tell You

When you are young or even old, you're told a bunch of lies. Lets fix this.

1. Money Buys Happiness: It does. You only hear about the wealthy people who get sucked into lifestyle inflation and locked down in multiple divorces. The rest? Couldn't be happier. Once you realize that money can save your life through advancements in medical procedures and that is buys you time and freedom you will never waste a penny again. That useless car or iPhone isn't why money buys you happiness it is the freedom and long-term health benefits.

Stress free, cortisol decreases, testosterone increases, healthier food, a better sex life, more time. No contest. Don't believe the lies you're being told.

2. Your Family Doesn't Matter: The harsh truth. Most people have poor fathers and mothers due to our defunct society. A friend of ours over at D&P has a similar life experience, many of our family members are complete and utter losers. Why should you be forced to spend time with someone who is a net loss on your life? In fact I'd say my dad dying in front of my eyes was probably the best thing that happened to me. He was an alcoholic with nothing positive to say and no longer had the opportunity to give me his useless negative and pessimistic life advice. His favorite coffee mug said "Life's a B**** and then you die", yeah that's true if you can't control your own mindset. You're a quitter and you deserve to fail.

If your family is bringing you up and helping you grow, then hold on to them tight, for most this is simply not true. Your family is a time suck. You can't choose your family, but you can certainly choose how they influence you. You don't need to completely axe people, they did raise you, but there is certainly no obligation to do as they wish throughout your entire life. If they are just dragging you down, cut the cord, this leads to point 3.

3. Don't Give Handouts to the Poor: Another crazy idea is that you should spend time doing volunteer work giving hand outs to those less fortunate than you. This is complete garbage. If you never learn to work for anything you're going to rely solely on the hand that feeds you, never leaving your comfort zone and never standing up for yourself. If you want to help someone less fortunate teach him a task that will help him grow as a person, do not simply give him a few dollars from your pocket. Back when I was living in a car I asked many repair guys how to fix watches. After I learned, I simply fixed watches for rich people. Yeah I got insulted and made fun of for having a total of 4 outfits to wear 7 days a week but by month six I had enough money for a new wardrobe. I never bought it. Notably, my clients never insulted my outfit as they respected my desire to earn my worth. My tattered t-shirts likely got me more business since their kids were spoiled brats spending daddy's money on Spring Break trips having sex with scum bags or striking out with 5's and 6's drinking AMFs to the dome.

4. Education Isn't Always the Answer: By the time you graduate college you have been grilled into believing that 17 PHDs is how you make money. Not true. You ever notice these professors are also typically jaded and unhappy? You make money by adding value to someone's life not by reciting poetry from the 1800's or memorizing a bunch of algorithms. If you can help people become better in anything from athletics to making money to getting women you will be well off in the future. I promise. Besides, education today is nothing more than regurgitating the opinion of some old guy or girl onto a 10 page document, double spaced with no hints of disagreement.

5. Get Rich by Helping People. For some reason everyone believes that Wall Street people steal for a living or that they should get ahead by backstabbing people left and right to move up one rung on the corporate ladder. You will lose. You make real money by constantly helping and improving the lives of people, particularly wealthy people (this is similar to point 3). Wealthy people have limited time to waste, they spend time jetting around trying to fit three 30 minute meetings into an hour. So if you can help well off individuals, they will be more than happy to give you a nice paycheck. If you're a billionaire an hour of your time is worth many thousands of dollars, so if you can save him an hour? You'll be doing just fine.

We have an elongated and cleaned up version here: Uncovering the Truth. This post has been infiltrated by regular people and we do not have time to clean it up. So. Please refer to the longer version where we are continuing to ban poor comments and questions.

Follow the Hate and You'll Find the Truth

Follow the Hate and You'll Find the Truth

After launching our first and (extremely likely) last book we saw an interesting trend. Multiple people who said our work was terrible, useless and "BS" all did exactly what was expected… They bought it. Surely a few will slam it as being fake (we know it isn't), a few will steal and try to emulate it (won't work never does) and the remaining will simply read it and obtain the full value. Overall, we hope the vast majority who dislike our work will do the third part (simply take the info and make money from it). Why? Well some people just won't like you and there is no reason to wish any problems on them. They'll ignore you if you ignore them. This bring us to the topic of the day: following hate.

The Main Points

The general rule is to find what someone hates and you'll get to the truth. If someone dislikes a person for having a lot of money? They are likely broke. If they hate someone for having a beautiful wife/girlfriend? They struggle at dating. If they believe they deserve something for nothing? They likely lived a privileged life where everything was historically given to them. If you follow the hate… you'll find exactly what is going on with the person on the inside. You know what we're going to say next. We're thrilled to say this website is hated.

Unfortunate Consequence of Hate: The unfortunate consequence of people with insecurity in any area of life… Is they will never fix their underlying issues. You'd be surprised to see the number of people in their 40s/50s with deep insecurity issues in certain areas (not well rounded). This could be dating, money, attention… anything. Essentially, they miss out on an enormous section of life and go through till the bitter end thinking that is "how life is" because it would kill their ego to know it wasn't so.

Use it to Your Advantage: With the two unfortunate parts out of the way, you know exactly what we're going to say… "Take advantage of this". If you know a person struggles in topic A your best course of action is *to agree with their struggles in topic A*. You're not going to win any points by telling him how to fix his situation. Why? Well everyone is a genius in every topic (make this an assumption every time you meet a new person).

This adjustment is quite difficult to make. The typical gut reaction is to say "oh I know this well let me help you" (assuming you do). By doing this the other person will feel even more insecure and dislike you immediately. You're better off doing the smile, nod and agree approach. You can then quickly change the subject to something more amicable and potentially change the interaction into something positive. If they specifically ask you for advice, then you can absolutely give it to them… Otherwise you've wasted your own time and started a new interaction off on the wrong foot.

Interesting Psychological Issues

With the main points out of the way we think it makes sense to highlight a lot of underlying psychological issues you'll find. Who knows if we get them all correct but we'll go ahead and try to highlight several we've seen.

Do This With Your Money: Generally speaking, you shouldn't tell anyone what to do with their hard earned money. Unless people are going to you for the idea (website, book, financial advisory service, etc.) it just doesn't make sense. The problem? People do this all the time! The most common example? Poor people telling rich people how to spend their money. It does not make any sense at all. *If someone is rich they can do whatever they want with their cash.* Now, when you see someone you know constantly "explaining" how they would do something totally different with their money… All you've learned is that they don't have as much as the person they are criticizing. That's the real tell.

You Must Have Had XXX Issue in the Past: This is another clean tell. When someone makes an assumption about your past and makes it a negative, it means they can't believe your current actions in that particular topic. For example, if you do well in the dating department a common criticism will be "oh someone must have really done a number on you in the past". Another example, if you buy a fast car/expensive watch etc. "oh you must be very insecure and have a napoleon complex". As you can see, the attempt to stereotype someone is a way to protect their ego. If you harbor no resentment and simply like buying an expensive watch… They can't understand that because it breaks down everything they believe (see rich people are evil).

Passive Aggressive Behavior: This is the most common as you go up the ranks financially. People will attempt to denigrate you with passive aggressive comments incessantly. The best part about the interaction is they are highlighting how insecure they are on the inside. They don't have the guts to say what they actually think which emphasizes how insecure they actually are. If someone has nothing to lose, they don't need to resort to passive aggressive behavior because… well… they have nothing to lose. Never trust a passive aggressive person, you're dealing with a snake so tread carefully. They have an innate need to boost their own egos and if you take their ego down even one notch, you'll be on their radar forever.

Once You See the Truth….

Once you see the truth *you cannot un-see it*. That is one of the best and worst things. It is the best thing for you long-term and will likely be a painful experience once you learn a new fact. Why is this an important concept? Well you'll have to become critical of the things you dislike. Do you actually dislike a specific person, activity or group or is it a reflection of something you lack on the inside. Once you've already learned the harsh truths you'll find that you no longer dislike the vast majority of people! As we've stated numerous times in the past, if someone can change your emotions… you've already lost because it means you value their opinion. If you really didn't care you'd ignore it.

Seeing the Truth: For those that have already read Efficiency, you can see many ugly truths come out page after page after page… (after page). We've been taught lies on the following topics: fitness, diet, education, internet income and more. It takes a lot of work to swallow the truth and we have no doubt that it isn't a "fun read". That said… Once you see it and begin to act on it, you realize it's an enormous competitive advantage. You're busy doing the exact opposite of what everyone else is doing. They think you are "extreme" and you're simply getting all the results. You go to sleep with a big smile on your face.

The process is clear, you learn a new truth and absolutely dislike every person who steered you in the wrong direction (*Hello Humanities Professors and the Supplement Industry!).* Once you learn the truth however, your income goes up, your spending becomes more efficient and you get to practice the "smile and nod" approach until it becomes second nature.

Quick Conclusion

If your beliefs are largely in-line with what the masses have taught you… it would be wise to add that on the list of ideas to challenge. Go into the weeds and see if it is really true (don't read about it, act on multiple different opinions from the media to people viewed as extreme). What you'll find is that the small less heard voices are typically the ones leading the way. No one gets ahead by doing what everyone else is doing.

As a fun bonus, we did end up hitting our sales number goal! We'll have an extra Q&A on Wednesday August 2 (beginning at 6PM EST). There will be a new post here at that time and *you'll need to put in your PayPal transaction ID to leave a question* (put this into the comments section and it'll be deleted before approved)… We'll go back to our more normalized posting schedule over the course of this month.

Efficiency: The feedback has been absolutely positive. The funny part is that it is exactly as we expected, most people felt the product was too dense and painful to read (that was the point) since books are usually filled with nothing but filler. Here's a cool comment left by someone that only talks about a single chapter in the book.

Follow Your Skills Not Your Dreams

[Follow Your Skills Not Your Dreams]

We tested a similar post title in a tweet *"Follow the $$$ Not Your Dreams"*. In short, following your dreams is usually a sure fire way to *fail*. The skills that a person has will unlikely match perfectly with his or her dream business/career. When people think about their dreams they are really thinking about the life they want to live. They do not think about all of the work and adaptation that it takes to get there.

A Successful Person Wants to Be the Best

Generally speaking, a successful person is *most interested in being the best*. It is humorous that people view successful people as arrogant and hard-headed because the only way they became successful is by focusing on what they are *good* at. Maybe they were more interested in Topic A but they realized they were phenomenal in Topic B (a close topic but not the same). They admit the following to themselves:

"Well, I would love to be in the top 1% in skill A but *realistically* I would only be in the top *20%*. If I remain *adaptable* and go for skill B *I will be* in the top 1%."

Get to the top 1% in practically any skill and you're going to be rich.

Extremely Basic Example: Lets assume someone is trying to attend the best possible college. Their goal is to get into a top university. Why? The top 25 schools are practically the only ones that will lead to an extremely high paying career.

This person realizes he may be able to obtain a scholarship for sports in either Water Polo or Tennis. Great. The problem is that he's in the top 5% among High School students in Tennis but in the top 20% in Water Polo. The answer? Even if his "dream" is playing Water Polo in College… He should **quit playing it.**

By focusing all of his energy into Tennis where he's clearly on the borderline of being "elite" he'll increase his odds of getting a scholarship and *in addition* he's thinking about his future (a top university).

Finally, he is still an elite athlete and he will be given even more resources to potentially become a professional (IE: the top colleges will have the top coaches as well). It is a no brainer to stop following his "dream" and adapt.

This is what a successful person will do.

Skills Are Not Created Equal

Now that a person is focusing on skills rather than dreams, one has to ask himself "what skills are actually valuable". Again. The answer is going to be based on the return on your *time*. We only get about 80 years to live and those last 10 years will be much less exciting than the first 40 years. A person's body is never going to beat time. Better use it efficiently.

Language Example: Lets say one of your interests lies in languages. It would be wise to choose one that has a high probability of being useful for you in the future. If you decide to learn a language that is spoken on one remote island… You're wasting your valuable time. Instead you can come up with a handful of languages that would be valuable for different purposes.

If you're interested in using it for business in the future… English and Mandarin are the best bets.

If you're interested in using it for outsourcing purposes… Hindustani makes sense

If you're interested in using it for political discussions with Putin… Russian is your best bet (half joke).

Payback Period on the Skill: At this point, hopefully we are in agreement. Our time is limited and freedom in our 30s is significantly more important than a life of mediocrity chasing "dreams" for 40 years. The biggest question to ask is "what skills will be a necessity for everyone?". Here is a list of 10 items that offer a tremendous payback:

1) Sales: We've beaten this one to death in a separate post but it needs to be mentioned again. Sales will be used every single day in your life so you better learn how to do it today.

2) Public Speaking: This is the number one fear for Americans. It makes no sense. If someone intends on being successful they will be forced to make presentations at some point in their life. They can remain in the background for a long time… But… Eventually they will be forced to make public speeches.

3) Writing: While our entertainment writing is mediocre at best (just look at the blog!) you're going to need solid writing skills for putting together contracts. At *minimum* everyone needs to understand the basics. In addition, you're going to be forced to communicate with people (a lot!) assigning tasks via email etc.

4) Reading: Yes. Reading is a skill. The ability to understand tone and context in written form is a lost art. And. It doesn't stop there. Everyone needs to learn how to read body language as well.

5) Math: Quick math is the real key. When people chat about numbers, you can do a spot check in your head. If someone claims to make $500K per year but later states that he makes just under $1,000 per day, you know he's lying somewhere in there.

6) Ability to Play Dumb: Yes this is a skill as well. When you meet someone you don't want to keep in contact with, it is best to smile, nod and agree. This is actually the hardest skill to learn.

In addition, when you hear people make comments that are completely wrong, ***let them run with it*.** Letting someone run with false information about you (or a specific topic) can give you an enormous edge. You'll have to pick your spots on when to call them out and when to let them run with bad information.

7) Dating: After our post on personal finance and dating we stopped arguing as broke people invaded the comments section like the Mexican border. They all had "rich friends" who don't do well (IE: ego protection since their wallets are light). While it is **true** that dating is a complex topic where you can do poorly even if you're rich (and well even if you're broke) it is best to learn every angle possible.

8) Health and Fitness: You only get one body. Again. You only get one body so if you don't treat it correctly you will lose time and money. Health > wealth every single time.

9) Technology: You would be surprised at how little people know (this includes us). You can make a living by simply setting up websites for people. Once you learn the skill, you pitch it as follows "I will set it up for you and do everything… but on an annual basis you will pay me x% on top of the hosting fees which I will cover". Then the person will write you a check every year.

How do we know this works? It's exactly how you're reading this blog (although we did it that way for an extremely obvious reason).

10) Style and Design: Most people do not know how to dress. They do not know how to make a presentation look good. They do not know what colors go where and why. In short, they are lost. Learning how to dress (at minimum) is extremely important as people will judge you in less than two seconds!

Time to Go Niche

If someone is proficient in all ten of the items above, he's going to have the correct *building blocks* to go niche. This means you have built the foundation. You didn't waste the most energetic portion of your life (18-25) building skills that don't have *broad appeal*. Your skills are extremely good and broad so you can target niche items you know extremely well. Examples below:

Style and Design: Lets say you know the basics but you suddenly realize you're getting complements left and right on your hats. This may sound boring to you… But… a $20 hat can carry margins in the teens. You can quickly target the specific niche and create a website selling products for other people or creating your own actual hat. Given that it would be your first stab we would go ahead and sell the hats you approve of and that would create an "authority" website on hats. Again. This may sound dumb but the hat industry makes billions per year. *(notice you're combining many of the 10 skills here)*

Motivational Speaker: While we would never be caught dead at a motivational seminar after seeing them back in our teens… They are cash cows. People *will pay* a lot of money to "feel like a winner" for a short period of time. Of course it is all a sham. But. This is also why people get emotional over their home sports team. People will pay thousands of dollars to be associated with a winner if they cannot win themselves. *(notice you're combining many of the 10 skills here)*

Private Gym Ownership: Becoming a physical trainer is generally a losing battle. You're trading your time for money. Starting an actual gym can be outstanding. Private trainers make $100+ per hour and if your knowledge exceeds theirs… You can monetize your physical health knowledge to create a business. *(notice you're combining many of the 10 skills here)*

Copywriting: In the case your main skill is writing and you have a solid understanding of sales… Learn to copywrite. If you become good enough… you can then charge a fee based on performance rather than an hourly rate. Even if your "dream" was playing in the NFL, you can go ancillary and sell NFL related items for a large margin. *(notice you're combining many of the 10 skills here)*

Your Skills Become Your "Dream"

So far we've done the following: 1) focus on skills, 2) what skills are valuable and 3) examples of niche skills becoming profitable. Now the obvious question is "what about my dreams?".

The problem with this question is simple, if you followed your skills you'll be **as close as possible** to your dream scenario. Want proof? Look at Mark Cuban.

Mark Cuban made his billions in the technology industry. What is his passion? Apparently basketball.

You can take one single look at Mark Cuban and know he would never play basketball in the NBA. He probably didn't even play in college (we don't know his story that well) but he certainly has a "passion" for basketball. Fast forward to today and what happened? **He owns the Dallas Mavericks.**

If you don't have the *skills* to do exactly what you want, being the owner of the exact industry is probably the best alternative.

Finally, the average person is going to say "What does software have to do with basketball! He could have worked in the basketball industry and been just as happy!". While the argument sounds good, it does not make any sense. If Mark Cuban lacked the *skills* to start and sell a software Company and his only skills were basic sales… He would probably take that path. Instead?

He was smart enough to find out exactly where his skills were. If you find your skills, you'll end up as **close as possible** to your dream scenario.

Recap

1) Following your skills will lead you as *close as possible* to your actual dream

2) People who argue that it is smarter to spend 40 years doing something you enjoy (for peanuts) do not understand the time value of life. Do not waste time arguing with them: Smile, nod and agree

3) A successful person is more interested in being the best. If you're the best (or close to it) you're going to have the *freedom* to do what you like. In addition, you're acknowledging your dreams *may change in the future.* (IE: a real open mind).

4) We have listed 10 life skills that everyone will need to use: Sales, public speaking, writing, reading, quick math, playing dumb, dating, health & fitness, technology and design.

5) Once you find your skills. Once you have a solid understanding of the ten life skills. And. Once you have comfort in which skill you will be *good* at… *You go niche.*

In short? Just because you're interested in something doesn't mean you're going to be the best at it. If you're the best at something, *you'll have your entire life* to explore all of your interests.

For New Readers – Please Read

For New Readers – Please Read

The Q&A this month wasn't great due to redundant questions. So we're going to have to review the basics and explain why we don't answer the same old tired questions "Hi i have $200K how do i invest" or "but i am better than average at investing" or "should i switch jobs for a $10K raise". All of these questions have been answered so many times and make zero sense to debate. If you put numbers into an excel sheet you'll see that it never works out. So lets go ahead and begin.

No Dating Advice: We left that arena about 5-years ago. We realized that the vast majority of men who struggle in this arena are in two groups: 1) extreme nerds with no personalities and 2) unsuccessful people. Since the first one is easily solved (you go out a lot and force yourself to be social more and more), this leaves us with the second group. The second group will not like any content on this blog. We don't sugar coat things, we don't sell dreams like Tony Robbins and we don't wait around trying to get people to take action. As we've said motivation is for losers.

If you need motivation, you will fail in your dating life anyway. It isn't hard to talk to people in any setting: bar, club, coffee shop, grocery store or at a park. All you have to do is get used to it. The people who feel uncomfortable talking to strangers are typically extremely introverted or scared of being rejected. The big issue here is that fear of rejection means you actually care about the opinion of a stranger (again not a good thing). So. In the end? You have to focus on becoming successful financially (and physically appealing by being in shape). After those two things are done, all you have to do is talk to tons of people every week until your social skills improve. It's really that simple and if someone is too lazy (or weird) to do this… their issues are too big for us to solve. It has been many years and people still claim that this is hard (it isn't). Making money is 100x harder unless the person is extremely unattractive or strange.

Onto Making Money: Unless you get to a million dollars you shouldn't bother with investing. This means you should not be "researching ideas". You either dollar cost average into index funds or you create a "forever portfolio" which is basically 20% gold/crypto, 20% bonds, 20% stocks, 20% cash, 20% real estate. There are other versions of this but you get the point. You essentially want to get an equal amount of every major asset class and rebalance every 2-3 years or so (until you have a million at minimum).

Why would you do this? You should be TOO BUSY to watch and manage an active portfolio. If you didn't even get to a million dollars it means you don't make enough money. People seem to forget this part. If you're making $100K a year, this just isn't enough to get rich. Never has been and never will be. Even if you make $10,000 after taxes per month, it's going to take you nearly a decade to get to a million (you will always have some living expenses).

Pause for a second. Run the math. If you only have $250K this means that you're probably only making around $10K after tax a month (or less). How exactly are you going to get rich this way? You can't. If you make $10K a month after tax that's around $220K gross income (job/career).

220K/year = $110/hour. You should never think in hourly wages but we're using it as an example. If you decided to work 50% more hours? That equals $110K per year. Guess what… That means your investment portfolio of $250K needs to generate at MINIMUM of 44% returns just to offset your opportunity cost. The chances are next to none that you will do this successfully. Only the top investors in the world could do this with a small capital base.

*Review: you should ALWAYS choose to start a biz or get another form of income. Why? The 50% in extra income is LESS RISKY. You can guarantee you hit market returns (say 10%) while also making 50% mor*e.

It gets better.

The final part is also always ignored. If you work a career making $220K and create a biz making $110K per year… You're probably a millionaire already! Why? **You can sell that business for $330K or so.** It is insane that people don't realize this when businesses are sold every hour of every day world wide. So not only do you have to beat the market by 40% you also have to beat the exit multiple upon selling a business. So if you are worth $110/hour or so… Guess what? You now have to generate 150%+ returns every year to justify spending your time investing. **Good luck with that.**

Life Stories: Life stories never add any value. This is how social interactions work. People use a lot of meaningless descriptive language when telling stories. This is great for a social interaction and is an utter failure for figuring out problems. If you can't convey your issue quickly, you don't know what the issue is.

When you're trying to find answers you want to delete ALL descriptions and delete ALL of your personal background. Why? You reduce all of the variables. The chances of a truly unique situation? Probably under 1%.

If you look at all our old Q&As it's the same thing and we started deleting them. "Looking to invest $300K, $400K, $350K" and none of them even have a second form of income. Go back to the above and you'll see that you're wasting your own time.

The second form of wasted time is "job changes". Two different jobs paying about the same +/- 5-10%. This doesn't matter either. Sorry. It doesn't matter at all. If you make $110K or $120K there is no difference. You want to choose the position that either 1) leads to faster promotions – step up in income or 2) the one that frees up your time – start a second income stream.

The strange part is that we've said this for 7-8 years now and the people who have listened to us are also getting tired of it and message us privately! It is a waste of your time and ours. If you're worried about an extra $5K you're not going to get rich. Period.

How Do You Get Rich? We gave an extremely clear way to get rich in Efficiency. It will work for anyone with ambition. If you want the basics it is this: 1) choose performance based income and 2) save as much as you can to start any business you are good at – we recommend online sales. This is an ever green strategy.

People come into the Q&A over and over and over again expecting their situation to be different. It isn't. If you expect to get rich off one position… those days are a relic of the past. Sure you might get ultra lucky and land as the #3 employee of the next Google. And. The chances are slim. So better to prepare for an evergreen strategy. Also. You can continue searching for the next Google as long as you spend your nights working on another project. If this is too hard for you? Then enjoy a lifetime of suffering.

It is better to put the pain up front, get rich ASAP and never worry about it again. The people who follow the evergreen strategy are rich by their 30s and get to enjoy 50 years of fun. People who try to short cut it usually end up falling behind every single year. They are never able to enjoy life (they peaked in high school/just after college and fell into a spiral of despair).

This Website Isn't for Everyone: Our guess is that a lot of people found this and won't like the content here as we don't sell magic pills. We don't sugar coat information. We say everything straight/direct/blunt so there is no misunderstanding. If this is "difficult" then the person is certainly not going to survive a negotiation or slog through long hours when everything seems hopeless.

This website is designed for people who have a chance in the first place. People who come on here and cry about being "behind" get no remorse from us. Either get onto the right track now (ie. today), or just quit and become a drain on society. It isn't our life. If someone gets the concept here they can dig themselves out at age 20, 30, 40 etc.

Look Around: If you look around right now, you're seeing who the real winners were in real time. The people who were making a killing are suddenly silent. Why? They only had one form of income. Again. ***This is a death sentence.***

Cannot put that message out there enough. If you have income from different business lines that chances of going to are unlikely. We can use our own items as an example: online sales way up, real estate income definitely down and investment portfolio is up. You can argue that we should look into brick and mortar but we're involved in three different online niches: two are booming right now and one is down 30-40%. Does this matter? No because the net is positive. Ie. diversification works.

To be clear here we empathize with the people getting killed by this and *we do not believe it was un-preventable.* That is a critical distinction. While we can feel bad for the people impacted by it, we cannot sit here and say it was "inevitable" because it wasn't. There was a 12-year bull market (longest in history) where you could have started at least one form of additional income between 2008 and 2020. Relying on a single source just because it was going well isn't the greatest strategy when you had a clear opportunity to develop multiple forms of income.

Conclusion: For the newer readers, please read this and understand that the major views will never change. If this is a problem then the blog is not for you. We only tailor to people who are self motivated and willing to run basic math into an excel sheet. Given that our angle is niche we generally only attract the top 5% or so of the population. With that out of the way we'll get back to regular posting soon.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending. **We hold Q&As 1-2x a month for purchasers only.**

****

Four Levels of Financial Independence for a Single Person

Four Levels of Financial Independence for a Single Person

As a general rule of thumb you'll want 25x your annual spending to call yourself financially independent. Instead of debating this rule since people like to argue on the internet, we'll use it as a basis for the post. Having 25x annual living expenses doesn't say much about how the person lives. But. Knowing the monthly net income definitely gives us a lot of ideas on how a person can spend his free time. In here we'll cover the USA and give a few ways to compare this to other countries as well.

Lifestyle Benefits By Income

Bare Minimum – $4,000 a Month: We're not interested in the frugality crowd. Their lifestyles are not attractive (double entendre). As a single person, it takes a bare minimum of $4,000 a month to live a decent life without coupon clipping. Remember, this is in the USA **and** does not include major cities like New York, San Francisco or Los Angeles where this is no longer enough to get by (many of these cities require ~$2,500-3,000 for a simple one-bedroom apartment). Luckily, no one needs to live in the most expensive cities and $4,000 a month is enough to live in a lot of good areas. You'll be single and have all of your basics covered.

Breakdown: Essentially, you'll afford a basic apartment ~$1,500 a month, $500 will cover your regular bills such as a cell phone, utilities and gym membership, $1,000 goes to food and the last $1,000 is for fun and random expenses/buffer. This is not an exciting life. The good news is that you don't have to worry about putting food on the table and you no longer have to "take it on the chin" because you can quit whenever you like. While everyone has a different level for independence since it's simply 25x annual spending, this is a good idea of what the bare minimum looks like. (*Roughly $1.2 million assuming you never work again*)

Normal/Solid – $6,500 a Month: At this level we'd say it's near impossible to say the person is not financially independent. Assuming you're a single person, your life is now comfortable. If you live in an expensive city, it isn't amazing. But. You can always move. Your lifestyle will allow you to take care of everything you need including vacation. It allows you to take care of your health. Your free time is now valuable and you have *flexibility.*

Breakdown: The same items as the bare minimum but you now have $2,500 a month extra. This is a meaningful amount of money since it is 62.5% higher than the monthly spending you used to have. This allows you to choose how you maximize your utility. If someone prefers to live near the beach, they can pay up and live there. If they prefer going out more… They can do that. If they prefer buying a one time item per year ($30,000) they can also do that! There is a lot of wiggle room. The downside here is that it is not safe to buy anything extravagant (expensive home with high maintenance costs, sports cars, etc.). (*Roughly $2 million assuming you never work again*)

Living the Good Life – $10,000 a Month: At this point you see a lot of opportunity. You're able to spend and avoid looking at your accounts since they are being replenished. Fast. This equates to ~$329 per day in spending. Unless you want to go out 5-7 days a week it's going to be near impossible to burn through this money. The only way you're going to do it is if you have an expensive recurring cost: home/sports car. In fact, you can afford one of those things assuming you don't go out and spend a large amount of money consistently.

Breakdown: Unlike the flexible lifestyle prior to this, you're living a "carefree" lifestyle. Again this is a little bit less so in high cost cities. But. It's still achievable in high cost cities assuming you have good social skills. At this range, many people have a hard time seeing a reason to generate more money. If you can spend $10,000 a month forever, there isn't much you're missing out on. You can still fly business class if you feel like. A few small changes and you get what you like. The only downside here is having a family could ruin the math. A typical $10K/month budget breaks down as follows: 1) nice apartment in an area you like $3.5-4K, 2) $2,000 food, utilities, gym etc. and 3) $4.0-4.5K a month for drinks, going on dates, events (sports/concerts), travel etc. with $4,000+ in disposable income for fun alone, it's difficult to run out of things to do. You could add in extreme sports, learning a musical instrument, dance and hundreds of other activities. To cap this all off, if you want a single luxury item you could do that as well (in exchange for some disposable income). This would be a high end apartment or a sports car. (*Roughly $3 million assuming you never work again*)

Unquestionably Set – $20,000 a Month: A common number thrown around for single people is "$500K/year". After taxes this is around $25K/month. We'd say you can go to $20K and won't see much of a difference. It takes a ton of spending to even attempt to burn through $20K/month consistently. On a one off (yes it is easy) on a consistent basis… Not so much. You're essentially pushed into "luxury". This means the only way you can consistently spend $20,000 a month is by going luxury with either a residence or "toys" (sports cars etc.). Unless you suffer from a drug addiction it is next to impossible to blow through this money!

Breakdown: Essentially you have everything you want. The only items that are out of the picture are jet setting and *multiple* material obsessions. If you're interested in having multiple sports cars, a private driver, a private cook and a mansion… That's the only way you're going to burn this type of money. You could easily live in a luxury apartment, drive a sports car and go out 3 days a week and be fine! Hard to argue that this is a "bad life". It's an amazing life and we hope everyone can experience this type of living for at least 5 years. *(Roughly $6 million assuming you never work again)*

Adjusting for Cities

We've given four basic tiers for "financial independence". The key here is adjusting these numbers based on how one lives. If you're concerned about "running out of money" you'd simply make one of these adjustments. Also. If you're looking to maximize the money, you can also move to one of these areas. We'll start with the hardest and work down.

Tier One Cities: While everyone knows our view on San Francisco, it is by far one of the most expensive cities in the world. We would say it isn't a "tier one city" from an opinion standpoint. That said, we'll refer to "Tier One" as expensive places. *Tier One Cities Would Include:* New York, Miami, San Francisco, Los Angeles, "Silicon Valley", Tokyo, Seoul, Zurich, Hong Kong, Singapore, Paris and a few more. Essentially, if it's a top 5 most expensive city in a western country… It's probably a Tier One. *We've got bad news here*. If someone wants to live in one of these cities we would say the levels of financial independence are adjusted *down.* Meaning ~$6,500/month would be needed to feel financially set in a tier one city. The good news is if you're not interested in living in any of these cities, you can leave since that $6,500 is location independent.

Tier Two Cities: This is where things get much more reasonable. You look for the next tier down within a specific state or region and you'll find livable cities that don't drain your bank account. These places include: Las Vegas, Fort Lauderdale, Houston/Dallas, Philadelphia, etc. These cities are solid but they don't kill the bank account (a good thing). Another way to identify a tier 2 city is find a place where people are migrating to today. Many people are leaving expensive cities for more reasonably priced areas and we see that with the list of cities in this paragraph. This is essentially the benchmark we used for the four tiers of Financial Independence.

Add 25-33% Areas (Relative to Tier 2 Cities): These cities are generally in Eastern Europe and Latin America. While people believe they can live like kings on "half" this is not true. Anyone with experience will tell you the same thing. You're forced to live in the nicest areas. You don't want to live in the mediocre neighborhoods. For high quality food and a high quality standard of living, you're pushed into the nicer areas. As an additional note, you won't be the only guy who came up with this idea. There will be a few foreigners living there with a heavy wallet as well. This leads to a total reduction in cost of about 25-33% for a similar lifestyle in the USA. Simply speaking, take the numbers you see above (the four levels) and add 33%. This will give you an idea of where you stand. If you're at ~$7,500 a month, this will "feel" like $10,000+ per month in these cities. The natural downside is living abroad but we won't argue about that part since it is a personal choice.

Add 40-50% Areas (Relative to Tier 2 Cities): This is where the backpackers usually go: South East Asia. At the time of this writing you can add 50% without blinking. Areas like Thailand are significantly cheaper and have a different geopolitical tradeoff. The upside is that the region is livable for the right person with the right personality (nope, not us). Unfortunately, we have not visited Africa and several other parts of the world so we can't decide if they would fall in this category. So we keep it simple with South East Asia.

Important Conclusion: As an example, if you are currently in the $6,500 a month camp and go through a recession, there is no reason to panic. Even if your cash flow drops to $4,000 a month… You can reduce your spending and stay. **Or.** You could move to a lower cost region and arbitrage the exchange rates. The ability to move to a different city is an important swing factor unless you're dead set on living in one city alone (*Hint: we will guess that you end up living in two cities instead of one*).

Making This All Seem Reasonable

It is unlikely that anyone agrees with this post so far. Since numbers move around so much based on the individual. That said… lets add another wrinkle into the story. If the numbers don't seem achievable we have to ask "how to set it up" so that it is achievable. The main assumption we've made so far is that you have $0 in active income (Explanation of Passive and Semi-Passive Income). The second assumption we've made is that you live forever and don't touch principal. These are two BIG assumptions. By making a small change to either the numbers get easy (fast).

Active Income: We don't consider online income as passive. Even if you work 2-4 hours a week, that is still 2-4 hours a week. Now if you can do this and generate $3,000-5,000 a month… maybe it really is worth it. 2-4 hours is not much time and it can push you from one category into the next (except the $10,000 to $20,000 move). We focus a ton on online income since it doesn't hurt your freedom. Unlike every other form of income, you can do it from anywhere in the world. This concept typically hurts the cubicle crowd since they cannot imagine being able to earn the same amount of money regardless of where they live and travel to.

Assuming you're in this boat, you've suddenly moved your monthly spending from $6,500 to $10,000+ and have room to save additional money as well. The other important item is the time frame. Continuing to work from age 30-50 is not a big deal. In fact, as we alluded to in a separate post we think a healthy amount of work per week is 15-25 hours.

Touching Principal: Unless you have a desperate need to leave all your money to charity there is no real reason to die with a boatload of cash. In fact, you want to die with $0 ideally. This is unreasonable but if we look at the expected life span we can see that going negative isn't a big deal if you have a long time frame. If you're spending $10,000 a month (using round numbers) but turn 65 this year… It's probably best to ratchet it up. The chances of living to 100 are slim and if you begin spending closer to $11,000-12,000 a month it is unlikely that you run out of money. The risk averse crowd will say it's not worth it. But. The numbers don't lie and the chances you burn out of money before dying (typical age is in the 80s) is unlikely. Besides, 25 + 65 = 90. Way above the average age and also assumes you have zero investment returns for 25 straight years.

Putting All of This Together in an Example: Lets say you're in the $10,000 per month camp. You've been at this same level for a while and turn 60. Well in this case you can let all your worries go away. Why? Well you can lock in in ~2% with no risk (money markets are already at 1.4% so feel free to run it with the exact if you like). We make a basic assumption that anyone reading this blog will not live past 90. This is highly unlikely and represents low single digits of the population (women live longer than men, smaller bodies and frames require less burden on cardiovascular system). Put this all together and you'll see that you can spend the exact same amount of money for *35 straight years assuming returns are terribly low and stuck at 2%… forever*. This also assumes you never change your location.

Important Conclusions

Putting all of these concepts together we would say the best way to feel comfortable financially is to "make it" in a big Tier 1 city first. There are many reasons for this: 1) if you make it financially in a Tier 1 city, any alternative city you choose will decrease your cost of living, 2) if you make it in a big city, you've successfully avoided playing the game of keeping up with your neighbors (trying to win the "money game" in any tier 1 city is crazy), 3) travelling is necessary to build a few escape options, all you need is one or two cities you like that are not tier 1, this allows you to have flexibility, 4) active income is likely a part of your life forever, you may quit for a couple of years but it is unlikely to continue for more than a year or two, instead you'll do something lower key at minimum to occupy around 20/hours per week or less, 5) we consider a person as set when they never have to touch their principal, this hasn't changed. But. If someone gets over the age of 60 or so… it becomes less important since no one lives forever!, 6) as a quick note, since the financial independence numbers are based on tier 2 cities, a general rule of thumb from the "rich" is that $500K/year pre-tax income is needed to feel set for life in a tier 1 city this is around $25K a month or 25% higher than the numbers in this post. ***For entertainment purposes we're running a poll on twitter to see how *little* people need to feel financially set.***

FAQ

Personal Finance

1) What is Your View on the Personal Finance Industry? This requires an extremely lengthy response (outlined by hundreds of posts on this blog). In short, the current personal finance industry is a scam in our view where each individual attempts to *seem just like you* in order to sell you advice that will only lead to $1,000 in extra *savings*. The standard pitch is "I was 25-35 years old with $XX in credit card debt and made it by…. ". In reality is no one gets rich by penny pinching, the same bloggers giving out such information make $500K+ from their personal finance blogs which is how they really make money. It is not mathematically possible to get rich with $30K per year in total savings. You need to move your income into the multi-six-figure range before you start accumulating real wealth. If you were to make $400K in a single year your total savings could be $300K+ which is ~60x larger than the median of just $5K assuming a 10% savings rate.

2) What Do You Think About the Stock Market Levels? Always the same answer, do not worry much about the stock market. In general you shouldn't care if the S&P is at 1,700 or 3,000… simply dollar cost average into cheap ETFs such as VOO, SPY, DIA, etc.

If you're trying to beat the stock market and you only have a half million dollars or so in the bank, your time will be better spent elsewhere (starting a biz!). $500K in the bank does not give you enough leverage to see out-sized returns. It means if you beat the bench mark by call it 5% that is only $25K. You may as well go and chase real revenue in a business. $25K for 10+hours a week is only $48/hour… That is *significantly lower* than what you're making in your career anyway.

If the economy collapses? It doesn't matter again. Generally recessions last about a year so you simply sit around and take the extra cash that was on the sidelines an buy any time there is a large correction. Your cash was on the sidelines because you want to continue buying through the dips so you get lower entry prices. Maybe you lost your job for a few months. No big deal. You had cash on the side to keep buying and get your next position.

If the market goes up 20%? Great already exposed getting richer!

What if inflation goes "crazy"? If you *own assets…* you're getting richer! If you own an asset such as a home, it typically goes up along with inflation.

3) I Make $50K and I am X Years Old What Do I Do? Some tough love, *we think you can do better*. If you look around **there is money everywhere.** A weekend in a high cost city driving an Uber will net you $30+ an hour. That is an extremely low estimate and yet that gets you an extra $60K per year. Why is it an *extra* 60K per year? Well, if you're not working at least 80 hours per week and you're not happy with your income… you have no one to blame but yourself. Anyone who believes they should be rich working 40 hours a week is going to be in for a rude awakening.

If anyone believes that anything over 40 hours is "too much work" then how exactly will that person catch up to someone with *more* talent putting in *more* time? If Person A is working 60 hours a week making $100K per year and you're working 40 hours a week making $50K… You're already making significantly less than Person A on an "hourly basis" and there is no way you're going to catch up by working less and learning less.

Get to the grind! We also strongly suggest **you read our post on careers.** Finally, if you really want to get rich, **you must start a business.**

4) I get it, Sales, Wall Street and Silicon Valley are the Only Careers to Get Rich, Which Position do I Take?

We are glad you see the light! As stated many times, the *fastest* way to get rich is with a scalable business where you are selling a product that adds value to everyday lives. Assuming you do not have an idea yet, it is wise to hedge your bets and build skills in one of those three positions. (*IE: may as well start a career until you have at least one revenue generating idea*)

We do not give out advice that is not based on real experience so for Silicon Valley we suggest you reach out to top tier Silicon Valley people. We are not the best people to ask. Search around, find people who are worth at least $1M (liquid, earned by themselves, $0 inherited) by the age of thirty or so and ask them for advice.

Sales is partially related to Wall Street (it relates to the sell side). With that said, if you don't want to go into sales, then we suggest looking up mentors (again) in the sector you wish to work in (again) and background check the mentor to make sure he earned it all himself (again). The one piece of advice we can give, is that recurring higher end sales will be much better than trying to sell in volume (*we recommend enterprise software sales*)

Wall Street, this one we can easily answer. Go to the position that is closest in relevant work experience. If you want to run a long-only portfolio in the future (long-term) it makes sense to have an internship at the bottom of the totem pole in Financial Advisory and work your way up to wealth management/asset management. If you want to work in private equity, then you need to build you experience in transaction based work. You go from a low end boutique in investment banking to a bulge bracket to a PE firm.

When it comes to Wall Street, always always always choose the job function over the bank name. If you can become an investment banking analyst at a mid sized bank this is going to be significantly better than working at Goldman Sachs wealth management. Again, always.

Finally, when you're deciding where to start you should always ask what your resume looks like. Ideally you have some connections and can get some relevant experience somewhere near the lower end of the totem pole (lets call it wealth management). In that case you then work up from there and improve your options. If you are starting from zero then you simply blast your resume to anyone and everyone who will listen. Remember, *if you don't have any offers, you don't have any options* so you may have to start from the bottom.

5) Where Do You Track Your Investments? For those that are serious about developing multiple streams of income and a high net worth, we can recommend **Personal Capital**. The Company offers *free* software tools with the following four key features: 1) ability to *avoid losing money* by tracking all fees associated with an investment product allowing you to choose the best possible fund for your future, 2) portfolio analysis where your risk profile is stacked up against your current age and retirement goals, 3) in addition to these free tools, you can also track your net worth and path to becoming a millionaire and 4) when you hit $100K in networth you'll receive a free one time consultation with an investment professional at Personal Capital. After linking up all of your accounts you'll be able to sit back and watch as your net worth goes up and your fees remain minimal over the next several years. We strongly believe that Personal Capital is the premier personal finance software tool when compared to its competitors such as Mint. If you're looking to avoid personal financial collapse, it makes sense to track everything in one place for *free*.

Wall Street

1) How Much do People on Wall Street Get Paid? Here is the breakdown. We have listed information beyond the entry level positions. If you don't believe the data, feel free to purchase a full compensation package from Glocap or another headhunter firm. You'll be wasting your money because we have the numbers right here for free. This is a *guideline*. The numbers below reflect the latest bonus cycle.

Investment Banking (2016 numbers)

Analyst – Base ~$80-100K (100% targeted bonus) 150-200K (age 22-25)

Associate – Base $125-180 (100% targeted bonus minimum) $230-365K if you are promoted to VP (age 26-33, wide range due to young talent and MBAs)

VP – Base $200-225K (100%+, call it 125% targeted bonus due to revenue generation, total $400-550K) (age 30+)

Director – Base ~$250K (Variable call it 1.5x base salary target due to revenue generation, somewhere around $600K) (age 32+)

Managing Director – Base ~$350K (Variable, call it 2x base salary as a target due to revenue generation, somewhere around $975K) (age 32+)

*Note: Yes base salaries at the junior level are moving up a tad, call it $5-10K depending on if you're an analyst or an associate. However, as the numbers show, your goal is to get promoted since the variable numbers become larger and larger as a % of your salary

2) Should I Take a Financial Modeling Courses? No. Absolutely not. We have given a free three statement model when **we first started blogging and that is all you need to be able to build**. Income Statement, Balance Sheet, Cash Flow and bottoms up by segment. It is older but this does not matter. Replace it with any company and you're set. You should be able to build this in 1-2 days maximum.

Spend the rest of your time developing people skills, sales skills etc.

Nail in Coffin. Every bank has different models and will train you for several weeks before you start your career. If you can build a three statement model (clean) you're going to be fine. If you *must* take "classes" then take excel courses that teach you short cuts (formatting short cuts – alt e-s- (letter), navigation short cuts – F5 and others).

Most won't listen and will become financial processing monkeys (career suicide). You will do much better than them in your career if you focus on what matters. ***Salesmanship, strategic thinking (reading about the sector/industry/structuring of deals) and relationships.***

3) What Bank/Group do I Join? This question misses the point by a country mile. *The question is, which bank/Group will allow you to get promoted the fastest.* Always choose the one with the highest promotion rate. If you have no idea which group is good and you are starting blind then you turn to prestige for long-term career development and the rank order is as follows. ***Elite Boutique:*** *(*Moelis, Qatalyst, Centerview, Evercore, Lazard, etc.) ***Bulge Bracket*** (Goldman, Morgan Stanley, Citi, etc.); ***Middle Market*** (Jefferies, Piper Jaffray, etc.) ***No-Name Banks*** (simply make sure it is the same job function).

Importantly, if you want to go into Private Equity and get a career offer in private equity you *take* it. If you want to go into banking and get an offer in banking…. you *take* it. There is no point in "learning something" to jump later. *Always jump straight into the position if possible.*

Remember after your first job none of this matters at all anymore. From that point forward you choose the firm that is going to promote you the fastest. Think smart. It is about responsibility not prestige. *Reiterate: Promotion and responsibility first, prestige last.* People who obsess over prestige will earn less than those who focus on getting promoted and obtaining more responsibility.

4) Industry Overview on XXX Sector? It depends on demand, these are for Wall Street folk and we'll do them if an industry gets hot. This means it's likely but no promises. We have done quite a few industry overviews and you can see them below. These take a lot of time since we don't want to constantly update valuation tables.

A Detailed Look at Financial Institutions Group

Overview of the Consumer Sector

Overview of the Healthcare Sector

Overview of the Oil and Gas Sector

A Detailed Look at Technology Media and Telecom (TMT)... also find Part 2 here

We will try to do more of these over time.

5) Will You Do Resume Reviews? No thanks, we do not trade time for money. In addition, everyone should learn how to best present themselves (ie: sales!). With all of the time in the world… you're learning how to communicate your value in a single page. Better to learn these important skills early. Once you have the email and resume templates, the rest is up to you to work on and master. We have clear outlines on how to write a better resume and how a one page resume should look. Yes we said one page for a reason, 2 page resumes will be thrown in the trash.

6) Can You Hire Me? No. We thought about using this as a recruiting tool but it took too much time. We have helped a large number of people obtain careers already and many of them were **from non-target schools.**

This blog was much much smaller back then and based on our 100% conversion rate we knew the blog had the correct tools to allow anyone interested to break in. If you follow the advice here and grind it out, you'll be much better off long-term. IE: getting into the Street with no hand holding will serve you well in your actual career.

7) I am XX Years Old What Do I Do to Break In? We also get this one far too many times, here's the general guideline.

Student: The same structure always applies. 1) Target School, 2) 3.5+ GPA with finance courses taken, 3) Work Experience – this can override a bad GPA and 4) start networking.

Major? Choose the closest to finance. Business + emphasis on finance classes. Engineering + finance is also great. Economics + finance also works. Finally, triple check at the career center to see where people end up. Accounting + corporate finance classes are *required* otherwise the recruiters/HR won't think you are prepared or serious about a Wall Street career.

If you have to choose between target and non-target. Bite the bullet, go to the target.

If your GPA is a 3.4? Take a couple easy classes bump it to a 3.5

If you have no work experience? Will be extremely difficult to get any interviews. Start networking and start at the bottom if you have to in a job such as asset management intern at a tiny firm.

If you don't have contacts? You are increasing your reliance on the filter system. Not a good idea.

Analyst: If you are 25 years old or younger, keep gunning for an entry level slot as an analyst. This means you pass CFA level 1 if you have absolutely no finance experience to prove you understand the basics and then you get straight to networking. If you're at a non-target then read our post on how to network/recruit. Now if you are from a no name school, no work experience and low GPA. You have next to no shot and are better off going to get an MBA later in life. This is the truth. As a non-target or older candidate with no experience, you need to have something to bring to the table otherwise you will lose time and time again to 22 year old candidates with banking internships, top GPAs and a great school.

Associate: If you are 26-33 years old this is your second chance to break in. If you have nothing related to finance, probably best to get an MBA.

Vice President and Above: Likely 33+ years old and you're making a switch from a **revenue generating career.** In this case you should already know if you're well qualified. Generally speaking, if you're in a sales role or run a product line at a firm and are paid $300K+… You're likely a good fit (this is general as most people who are in this slot know if they have the skills to move to the sell-side or not)

There you have it, it will answer 99% of questions. If you're young you simply network and spin your resume assuming you have some skills that are transferable. If you're in your late 20s you're likely better off with a top MBA.

8) Networking?

This is now the most common question, none of these answers will ever change.

Part 1: Networking Email for Work

The only reason to change the format is for extremely small boutique type shops (No name, we are not referring to solid firms such as Lazard/Moelis etc.).

1) Introduction of who you are (one short sentence)

2) Why you want to work for them and how you can contribute (2 short sentences)

3) How you can be reached (attach resume)

Thanks,

Name

Simple Example:

"Hi, my name is XXX I have worked at XXX bank for 1 year as an investment banking analyst in the Healthcare group. I am interested in joining the team at (Firm) and believe I would be a great fit due to XX and XX transactions. In addition, I understand the group specializes in XX and XX where I have experience due to XX and XX. If there are any opportunities to join the team, I can be reached at (xxx) xxx-xxxx and have attached my resume as well.

Thanks,

Name

That is it, no reason to boil the ocean, keep it simple. You can change the words around to be even more concise or appropriate to your specific situation but this will ensure you get to the point and show what you have to offer immediately.

The most insulting thing you can do is send them a long winded email. Why? You're wasting their valuable time.

Part 2: Networking for Career Events

This is even shorter than the email because you're going to get into a conversation as soon as you go through this introduction. Shake the person's hand when it is your turn to talk to the person at the booth and proceed as follows:

"Hi, I'm (name) a (junior/senior/sophomore) graduating in 20XX studying (major). I am interested in joining (group/division) because of (reason) and (relevant experience) which I think can add value to the firm. Do you mind giving me a quick overview of (specific question about group/division)?"

That is all, filling in the blanks is up to you.

Part 3: Networking to Meet Women

Again we are getting even shorter. The skills needed to meet women are hard to master but are easy to understand. There are only four currencies you barter with: 1) Looks, 2) personality/entertainment/social skills, 3) Money and 4) other women

Night Club: Your main currencies are other women (now you are friends with the staff), Money (tip heavy now you are good friends with the staff), Dress/look sharp (now it is easier to meet people everyone wants to talk to attractive men/women).

Day Game: Main currencies are 1) looks and 2) social skills. It is harder to show your net-worth in this environment beyond dressing sharp.

Social Circle: Main currencies again are entertainment/personality/social skills. This is followed by money which you can use to buy more entertainment/excitement. Looks are less of a factor since you're already part of the "in group".

It really is as simple as above. Ask yourself where you're weak and begin fixing those weaknesses. It will take a large amount of time to get good.

Part 4: Networking to Meet Business Partners

Even shorter!

Fill the Gap.

This means develop a skill and fill the void for people who need this skill. If you work in real estate and have an incredible ability to add ROI to a home through renovation but don't have the cash, then you should search out people who have broken down properties that need renovation (with ROI in mind of course)

Final Notes: If you have no skills, no money, no friends, and you're not interesting… You're not ready to network at all. You need to build a set of skills first. Go practice on everything that will help you network first (work skills, money, entertainment skills – living an interesting life)

Life

1) How Do I improve my Diet? We have [covered diet]() advice in a post. If you haven't taken a look then go ahead and read the post. If you're slogging 80 hours a week you need to be efficient and as we stated before, if you don't want to read the post, here's the basic outline:

Breakfast: Fruit + Protein. Worst case a protein shake in the AM and a banana/fruit bowl on your way to work

Lunch: If you have a high paying job, lunch is used to improve your political positioning so you always eat with people so suck up the $10-12 meals

Dinner: You can get $25+ from your company, do not waste it on unhealthy food. Most people will eat terribly which starts the downward spiral. There are hundreds of options online using seamless. If you don't have to work late… then make your meal at home after your day is done.

By doing this you guarantee 2/3 of your main meals are healthy. Lunch may be hit or miss, but if you're smart all 3 will be perfectly fine and you won't break the bank.

2) When Should I Work Out? Well do you even work out? If you're under 30 years old and you don't work out 5 days a week you've already lost in the first place. If you have been working out 6 days a week, you probably *already have a healthy routine! See how that works?* So the question is not when you should work out, it is if you even work out in the first place. We got this question many times and the answer when pushed is exactly the same.

"There is no science, there is simply consistency."

Consistency is how you keep yourself honest. If you can make it to the gym and lift correctly, you're going to see gains.

3) Does Money Attract Women? Yes. Anyone who says otherwise has never made a good amount of money. Here is a general guideline since the question is asked so frequently:

$50K or less: it will be a negative to your sex life because you are not making enough

$50K – $100K: in a regular city this will be perfectly fine, in a ***major city*** it is still a detriment to your sex life

$100K-$175K: in a regular city you're doing well, in a major city it now has no negative or positive impacts to your sex life

$175-$250K: Positive impact to your sex life in practically ***every city***

$250-500K: Significant positive, less because of your life but **because of the value of your time.** At this point you're extremely busy, you're traveling, *you're not available,* these are traits that will make you incredibly attractive. It won't be possible to fake these trips/traits.

$500K+: It is practically impossible to blow through this type of money with common sense and everything in the previous tier are truer.

$1M+: If you can make this income at any point in your life you're set. Your life changes because all of your actions value your time and comfort. You fly business/first class and do not care. You live a life that is **impossible** to fake.

Given the range and scope of this blog, it is certainly possible to get to $250-500K (before mid 30's of course). This is achievable for anyone who wants it. When you start pushing up on high 6 figures and 7 figure numbers, you're going to have to do something special.

4) Are You Writing a Book? *Maybe.* The answer has not changed much. At the end of the day we don't want to put in the effort to actually earn money from it at this time. Based on previous product launches in other business lines we know the sales number would equate to low to mid five figures, this is simply not worth the amount of time necessary to create the book. As of now, this blog will remain as a hobby and we're happy to help people with smart questions left in specific posts.

5) What College Should I Attend? You need to attend a top tier college or you need to attend a junior college and transfer to a top tier college. If you don't want to do this, then you must become an entrepreneur. Many people now suggest avoiding college all together. We disagree depending on the math. You will find that most successful people at least obtain entrance into top schools and then become successful later by dropping out or starting a company later.

With that said, college is a *major* life changing decision, you do not rack up $100K+ in debt just to get a piece of paper. If you can make say $30K a year without a degree or $80K with a degree, then we suggest that your college education is worth $50K of debt. **The point is that the degree you obtain needs to increase your earnings otherwise it is of no value.** Our full post on college is here.

****

Frugality is a Feminine Quality

Frugality is a Feminine Quality

Our last post explained why Personal Finance on the Internet is Bogus. This post is going to focus specifically on frugality. Frugality is 1) a feminine quality, 2) will make you soft over time and 3) it will prevent you from reaching your potential.

Why is it trending you ask?

It is trending because people are weak. Period. Everyone is slaving away earning less than they are worth (*they wouldn't hire you if they could not profit from you*) and instead of standing up and fighting the big battle they are scrimping by keeping the crumbs. Is it a coincidence that frugality is the newest trend and people are suffering from low testosterone?

Of course it isn't.

"Frugality is a Feminine Quality" – Wall Street Playboys

1) How is Frugality a Feminine Quality?

Restraint is a basic feminine quality and frugality is just that, an act of restraint. Let that sink in. When you think of a high quality sexy woman… what are some things most guys want if they are looking for an actual relationship?

They want her to be:

– Loyal, a form of restraint when presented with her desire to "trade up"

– Thrifty, a form of restraint against materialism

– Not an Alcoholic, a simple example of restraint

These are clear forms of restraint. They are great qualities in a girlfriend. Not a successful male.

Is it a "coincidence" that most men who are not in charge of their marriage/relationship constantly complain about their wife/girlfriend spending too much money?! **Of course it isn't.** Their wife/girlfriend is running the show! Or in old school language, *"she wears the pants in the relationship"*. She doesn't need to show any restraint!

Frugality can be a great quality for a potential girlfriend, not for living your dream.

No. Not one bit.

Frugality Teaches You to "Relax": This is a great concept. The catch? It is not a masculine quality. Successful men do not stop and "relax" for the rest of their lives. This is another feminine quality. Feminine girls want to sit on the beach drink Mai Thai's and do their nails. Awesome. Flip it around. Apply it to a man.

"Hey guys I want to sit on the beach and do nothing. I really need a vacation because life is hard and I don't want to live life anymore I'd rather just chill and relax. Instead of trying to see how good I can be I'm going to hang out on the beach"

How many of you would run to take his advice? None. He would simply be a cool guy to "chill and relax with". After that he is of no value because he has no reason to be alive anymore.

"Soft Like Charmin!" – Kobe Bryant

2) How Does Frugality Teach You to be Soft?

When our post dropped last Friday a reader quickly emailed… We didn't respond.

"You guys just need to flex your frugality muscles and get used to living with less."

In younger generation language… WTF is a frugality muscle?! Is this something hipsters have in their Skinny Jeans?… After a spike of annoyance we realized the reader was missing the point. What he was really confusing is the following:

Are you trying to be rich or are you settling for happiness *only.*

They are not the same.

You can absolutely be both, but they are not the same.

If you are able to teach yourself to live with less you will be happier because you are decreasing your expectations relative to your results. However. This is a big capitalized HOWEVER. You will not get rich.

If you go down the path of frugality you will live off a modest amount of money, call it $50-75K or so. **You will not get rich.**

This blog is about getting rich AND being happy. Not just being happy.

*"Frugality is Boring as F***." – Wall Street Playboys*

3) How Does Frugality Prevent You From Reaching Your Potential

This one is obvious. You are drowning in a risk averse sewer. If you remain frugal for life you will now suffer from the worst feeling in the world.

It won't happen now but it will happen when you least expect it. On your death bed. If you do not believe this, go work at a hospital. The hospital is going to be filled with people telling you they wish they *"lived for themselves"*. This is another way of saying, I wish I pursued my passion.

You should listen up when someone is about to die. They have no reason to lie.

—-

The Wall Street Playboys Solution

We are not telling you to start a business… yet. We are not telling you to quit your job… yet. Not everyone needs to do that or wants to do that…

Instead:

1) Build Skills: You will have a passion for something. If it is blogging, that is great. We don't think it's a good idea but there is a lot of money in setting up blogs for people.

2) Do Not Copy: Do it the hard way. Find your skills the hard way. Why? You will be unique. No one can replicate you anymore.

3) Reinvest Aggressively: Keep building your skills. Be selfish. Invest in You. Every morning stand in front of the mirror and say that the only company that matters is "ME Inc.".

4) Wait for the Calling: You are not good enough if you tell people you are good. You are not ready. You wait. Keep investing, learning and growing… *Wait until other people tell you that you're good.* You're now ready.

5) Network: You know you are good enough now. You will feel it. Reach out to people in your space/sector/passion. They will welcome you.

6) Pull the trigger.

7) An Event.

.

.

.

One last thing.

When you are ready, calculate the risks and **spend. Spend as much as you like.**

Laugh in the face of frugality as you continue to spend to earn.

Buy people's time.

Fund Flows and Financial Incentives for Anyone to Understand (Also Q&A Announcement)

Fund Flows and Financial Incentives for Anyone to Understand (Also Q&A Announcement)

Some of our posts are too technical and some of them are watered down. The goal here is to explain what is currently going on in markets from a high level and why you're seeing so much debate on Twitter. Some people believe that everything is going to crash and other people believe we're going to see hyperinflation. As usual, the S&P going down 70% or seeing hyper inflation of 30%+ per day are both unlikely. They could happen in theory but hopefully we can agree it is unlikely. So lets go ahead and talk about why you have to look at fund flows. Fund flows is fancy wording for where people want to put their money.

Fund Flows: Finance has a lot of jargon that can be simplified. "Equities" is just a stock. "Cap Tables" = list of who owns how much of the company. "Liquidation preferences" = who gets paid first and last if the Company goes bankrupt and must sell all of its assets. "Fund flows" is another one = where the money is going.

The first step/concept is a bit confusing… Money isn't really "lost". Meaning? If you see the price of bonds fall down… It means that someone sold that bond and collected cash. That cash is now sitting in his account. If you own 1,000 bottles of coca-cola and sold them for $1 each or $0.70 each you'd have $1,000 or $700. No matter how you slice it, the person who sold now has cash.

The second part is "where does this money go". IE. The fancy world of finance = Fund Flows. So if you just got $1,000 or $700… What are you doing with this money? You are going to have choices. Here are a few and we will definitely miss a lot: 1) leave in cash, 2) use it to buy goods/service, 3) use it to buy/invest in real estate, 4) use it to buy gold/crypto, 5) use it to buy bonds, 6) use it to buy stocks, 7) use it to fund a new business, 8) use it to buy inventory, 9) use it to pay bills… so on and so forth.

The third part is the piece where most retail investors lose their footing. If you are a billionaire and sold $1B worth of government bonds, are you really going to be able to use $1B to just pay for food? Of course not. You have to invest in something. This is important since most individuals deal with small amounts of money. If you are dealing with large amounts of money, say a billion dollars, it isn't responsible to leave 100% of it in cash under your mansion. So? What are your options. You can simplify it and say: 1) cash, 2) stocks, 3) bonds, 4) crypto/gold/silver and 5) real estate.

Now the fourth part, the decision making. Look at those five options. Over the past few months, interest rates were taken to zero. So your options in terms of returns are as follows: 1) cash at 0%, 2) stocks at ???, 3) bonds at 0%, 4) crypto/gold/silver – inflation hedge and 5) real estate at ???. Notice. Bonds typically offer a return since you're taking on risk (the bond you bought is tied to a particular company staying alive). And? If that bond now generates a 0% return (or near 0) why would you take the unnecessary risk of owning a bond vs. having it in a bank account earning interest?

Now we purposely used question marks since you have to make a judgement call on if the market is under or overvalued (we know long term returns in stocks is around 7%). That said, the point should be clear, by taking interest rates to zero you've force people to take on more risk. If you get no return from cash and no return from bonds… It means you have to be sure the market is going down. That's the only reason to remain in cash/0% yielding bonds.

Now the fifth and final conclusion point to explain what happened the last month. ***You saw a massive net bond outflow.*** So if we know that tens of billions of dollars have left the bond market we would return to point 2… this money has to go somewhere. It can go into cash at 0% or go back into bonds (unlikely since you just sold). So. You're left with very few options. Which one of those options offer a positive long-term return? You guessed it stocks. Many fund managers can't even buy some of the other stuff (crypto, real estate for example – topic for another day) so you're stock with stocks.

Does this mean that the stock market is going to continue to go up? Not necessarily, but if you watch the movement of money you can see why we had this rapid rally from 2,200 back to 2,780. We'd argue that we're back to overvalued again (have said this since 2,640 or so) but the recent rise makes sense off the bottom if you were watching fund flows. Remember, the movement of money is way more important than any economic indicator or retail investor because we really doubt anyone reading this is able to buy and sell $100+ billion worth of bonds. You can access this information for free by following this link: https://www.yardeni.com/

Moving onto Financial Incentives: With the fund flow part explained we can move onto incentives and bailouts. When companies go bankrupt, the employees are hit less than the CEOs (generally). Why? Well if a company goes under, it usually gets bought out by another group of people. The concept of bailouts creates a lot of bad incentives. If you were the CEO of Boeing and knew that you would never have risk of going under… Then you just take out a bunch of debt and remain levered up at all times. In fact, you'd be a fool to not lever up if you knew the government would hand you a check in the end at the interest of national security.

This is a slippery slope. You certainly don't want foreign companies purchasing your airlines (anything related to national security) but why would we allow poorly run companies to be run by the same people? It doesn't make any sense. If Boeing is taken over by a better management team, the USA wins over the long term as do the employees. Instead of focusing on poorly run companies that should be fixed, we should have been focused on sending money to the workers. Having the value of the stock decline doesn't hurt the vast majority of the workers since management teams & executives are the only ones who really own any stock (just look at who owns the company – the fancy Cap Table).

The excuse making has already begun and you'll see more of it. "The airlines didn't do anything wrong". "No one could have predicted this". These arguments are poor and are typically made to rationalize decisions. Said another way, if you bought a house and got fired because the Company you work for got bought out last week, does that mean you should get a bailout too? No one could have known the Company was being sold! It doesn't make any sense. If you are a well run company or financially responsible individual, you have savings for a rainy day. The amount of cash flow run-way you have is dependent on how much risk you took.

A smarter solution? If the government is forcing you to go out of business (shutting down your restaurants, hair salons, etc.) then they should cover the payroll with direct payments. No this isn't a great solution but that is who is impacted by this. You're forcing people to live without income, so you have to replace that income. Why would you spend the vast majority of the money on servicing a company that is levered up 5-10x? Doesn't make sense. The manager of the Company should have started a rainy day fund for unforeseen events. The worker is being forced out of a job… This is simply not the same.

This applies to AirBnB super hosts as well. If they bought 10 homes on leverage and didn't have any money in the bank to pay for a month of no income… They have to go under. This is how risk and reward operates. If you levered up and borrowed a bunch of money with no way to deal with a few bad months, you're simply out. The people who should be rewarded are the super hosts who were able to survive the storm. Some super hosts likely have cash to survive a year or more. If that's the case, they survive the downturn and are one of the rare survivors. When the dust settles they also get to buy more assets since they survived and were responsible hosts.

To summarize this, since the government is the one who forced businesses to close, they should look to help the people who are out of work. They should not bailout massive companies that shouldn't have been levered to the gills in the first place. We're as capitalist as it gets and yet it makes way more sense to send everyone money and simply tax it back based on their 2020 income. This way the money goes to people who needed it the most and you don't have to worry about massive defaults down the line. You don't restructure the debt of a poorly run company and let their employees struggle to pay rent and pay for food.

Fund Flows and Incentives: One comment we get on here is we're too blunt and cynical. This is for a reason. This website is written for people who are entering the work force and cut throat business environments. In that particular situation you should be much more cynical and focus on incentives. Why? Well people are going to work to make money, not hug each other and have fun at the clubs. To explain this further, this is also why we've recommended ordering catering and tipping people who work at grocery stores right now. The are getting unfairly treated relative to their value (in our opinion). If we wanted to be entirely heartless we'd recommend against that. It's important to take the situation into account.

If you want a cheat sheet for fund flows and incentives first ask what the environment is. If it's anything related to making money, veer on the side of incentives and people optimizing for that incentive. If you give your employees a reason to cheat you they will and if you give your customers a reason to look elsewhere they will. So be a bit more "cynical" and calculated. If it comes to your friends you should be more centric as you're not going to lose a friend over a $20 meal difference at dinner (unless the guy does it 100x in a row and shows he's trying to game the system). Finally, with anyone in your immediate family being more of a communist makes sense as you don't want any of them to feel "lower". As a reminder this website tailors to making money and succeeding in a cut throat environment so we veer to profiteering type ideals. (Hat Tip, yes we agree with Taleb who said something along the lines of capitalist with strangers, socialist with friends and communist with family).

Just like investing, fund flows and incentives apply to any online venture you start (or brick and mortar). You will avoid screwing your customers long term at any cost (example selling them something and price gouging later on something that wasn't included). You will also incentivize your workers to stay longer even if it means you're paying a high than market wage salary. As always it's a gradient. If you apply this gradient of colors to fund flows the answers will become more clear over time.

Q&A Announcement: *We'll hold our Q&A on April 12th Easter Sunday, purposefully to reduce redundant questions. Best of luck and enjoy the weekend!*

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending. **We hold Q&As 1-2x a month for purchasers only.**

Gambling Like a Boss: Always Bet On Black

Gambling Like a Boss: Always Bet On Black

Click Bait title! That said, we 're going to jump into a fun and controversial topic "Gambling". According to a quick google search there are two definitions: 1) *play games of chance* for money and 2) *take risky action* in the hope of a desired result. Between these two, we think the first one is a little bit better since the second one implies all of your bets are "risky"… which we'll argue is not the case at all times. Finally, before we begin, none of this is professional advice. We're simply outlining how we think about it.

Play Games of Chance: This is an important concept in the first four words of the definition. Chance implies "probabilities" and the "expected value" is unlikely perfect every single time. When we talk about games of chance, we are not talking about games like roulette or the lottery where there is a massive edge to "the house" If someone defines gambling as playing games like slot machines, roulette, the lottery etc. we'll agree and say you should never play. There is no fun in taking *unnecessary risk.* There are a multitude of other options with much better odds… Ones with emotion… sports/poker etc.

Step 1) Play Emotional Games of Chance: Here is where we would go ahead and say it is "okay" to gamble from time to time. In emotional games of chance such as Poker, Sports or Politics… it can make sense to take a *calculated* bet. ***The more emotions involved the better***. Without emotions it makes it quite difficult to get an edge. In other games, the house typically has an edge so they win over and over again in the long-term. When people get involved the odds are never "correct" since emotions will always swing it in one direction or another.

Step 2) Get an Edge: We'll use the last two public bets we announced on twitter. The NBA MVP race and the presidential election. Our edge is essentially two items: 1) stats and 2) reading emotions. Combining these two you should be able to get a decent feel for when certain events are heavily skewed in one direction or another. Do you need to be a mathematician? No. You just need access to the right software tools (MATLAB – Matrix Laboratory) works well for stats and the emotional reading is more of an art than science (we'd say it takes about 5 years to get decent at reading emotions of herds).

Step 3) Wait, Wait, Wait: As you can see we've only announced two bets over two years or so. We bet on both Westbrook and Harden for MVP (mid/late 2016) and Donald Trump (~11 months before election). Here is the "why" for both.

Westbrook/Harden: With the change in the NBA landscape, you knew that Kevin Durant, Stephen Curry and Lebron James were not going to win the MVP. This has nothing to do with stats and everything to do with emotion. When Lebron left for Miami, he didn't win the first year because people were "upset" even though he was still the best player in the league by far. Why? A lot of the voting process has to do with emotion… Once we eliminated three of the best players in the league you were left with essentially: Anthony Davis, Russell Westbrook, James Harden and Kawhi Leonard. All in the real risk was Kawhi Leonard given that his team would win a lot (we looked at the odds and didn't bet until a couple months into the season). Once the numbers started to show, the only risk was he'd have a breakout 2nd half which is extremely unlikely if you run the stats (offense stats Popovich vs. D'Antoni vs. Donovan). So the risk made sense.

Donald Trump: This one was much more “controversial”. To us it looked pretty similar to the same logic in a different fashion. There was more *emotion* against him… But the stats don’t lie. Run the stats on the history of back to back democratic wins (or back to back republican wins) after a two term presidency… And you’ll see they are bad. Even Democratic candidates knew Trump was going to be the republican ticket… and people were still offering 5:1 and even 10:1 odds against him… Insanity and 100% emotion.

Step 4) Calculate Your Own Probabilities: People on twitter are “shocked” we’re now betting on Floyd Mayweather because his odds are so “low”. That’s not how we see it. We entered already through various platform at a ~20% return ($5,000 bet gets you $1,000). ***This means it’s a 20% return in just 2 months.*** While it looks like a “worse odds bet” because the “dollar win is lower” we don’t look at it like that. Stick with running the stats and coming up with your own probabilities. Sure a $1,000 bet on Trump won a cool $5,000-10,000 but if someone gives you a ridiculous offer you should go ahead and play the game anyway.

Mayweather Risk: We’ll go ahead and give our odds. **We think it should be at 20 to 1.** That’s our own number and means $20 should win you $1… or… $20,000 should win you $1,000. That’s the more realistic line since we give him no “real” shot of winning. High security environment and high paychecks for both fighters should keep it clean. *Note: we chat time to time with a boxer Ed Latimore and have encouraged him to do a breakdown of fighting style given his background.*

FullSizeRender

Mayweather Match Gets Rigged: This is a real risk since we’re talking about sports here. Just like the NBA bet, where stats don’t always matter (emotions matter as well), if the match is rigged we’re screwed. Rigging includes: 1) Ref somehow allows a low-blow or some strange attack that goes “missed” and Mayweather gets KO’d, 2) Judges somehow give him the win if the fight goes 12 rounds and 3) somebody drugs Mayweather

Risk of DQ: Mayweather has fought the best people in the world for about 20 years with zero losses. Anyone with basic knowledge of boxing knows he didn’t “cheat” any of those wins including the controversial KO of Ortiz where… Ortiz was getting embarrassed and tried to head-butt him. For those with good memories – Mayweather 61/125 power punches *49%* and Ortiz at 22/117 or *22%* -. And. He won in Jabs at 14% vs. Ortiz at a whopping 0%. Therefore, the chances he gets DQ’d are RAZOR thin, but “anything could happen”.

Illegal Bet & Throwing the Fight: This isn’t a risk. We see it floated on social media but the reality is he would lose more even if he bet $100M+ on himself. His brand would be destroyed and he would lose out on revenue for 40+ years. By beating Conor (ideally badly in a few rounds), he’ll elevate the *status* of boxing and generate more money for the sport and himself over the next 40 years. We’re unsure if this will do any real brand damage to MMA (we’ll see) since people will realize

Outlandish Other Risks: The last set of crazy risks include things we could barely even comprehend. Such as: 1) illegal gloves being used – e.g. Antonio Margarito, Luis Resto, 2) Mayweather gets injured for some insane reason – tears a tendon during fight, breaks something in a strange way moving around the ring and 3) somebody jumps in the ring and KO’s Conor for no reason giving Mayweather a DQ win

Zero Disrespect to Conor: As a note, if this was an MMA fight, we would put every cent onto Conor in a brutal KO in probably 50 seconds or so. The reality is MMA and Boxing are not really related for those that are at least familiar with both sports (notice all the pro-boxers hint at it being a joke but don’t want to screw either of them out of *hundreds of millions of dollars)*. They are both fantastic to watch. But. They are not the same. Just look at the tactics used in boxing, if you tried to do a lot of these things in an MMA fight you’d be on the ground in seconds, KO’d or worse.

Step 5) Get Good at Math: We’ve talked more about sports/politics but you can also learn Poker and a few other games (potentially blackjack in special situations). With statistics alone you can gain an edge in both games and place bets based on expected values and more importantly *adjust* your bets as you go through different hands through a game. The more variables there are to choose from (ability to move around the bet size) along with your knowledge of the number of cards in the decks you can make *expected value positive* wagers over and over again.

Step 6) Expected Value Positive? Lets assume that you believe you have a 51% chance of winning. Does this mean you should bet everything you can? Of course not! It means you *could* bet on it but it’s not that attractive. This is something you’ll have to figure out on your own. Given the math set up you can see we likely bet *close to the same* amount on Westbrook/Harden combination as we are on Mayweather/Conor. In addition, you can see that we bet *more* on Donald Trump. Why? It all depends on your calculated expected value. **Example:** we would have taken even Odds on Trump but it was 5:1 to 10:1 very good spread, we would take Mayweather up to ~12:1 but at 14:1 or so it’s not worth it.. so on and so forth. *Note: we have no doubt there is some mathematical way to do it but we still view gambling as a fun *profitable* hobby and don’t take it too seriously.*

Step 7) Have Fun: As you can see… We don’t have a raw calculation for step 6. The reality is we should. That’s okay for us since we treat it as a fun hobby/game and as long as we’re making money over the course of 5-10 bets… It’s alright with us. We *do not bet more than we are willing to lose* based on our own calculations. This is also why “low dollar win spreads” like Mayweather are not attractive to some people, they just can’t afford to lose $10,000 for example in a single day. That’s fine and we’re “gambling” that’ll change once you make a bunch of money!

Concluding Remarks: As usual? Since everyone says Gambling is bad… You know what to do… the opposite. No one "needs" to gamble, we're simply pointing out how we think about the process. If someone is losing over the course of a year, it's time to call it quits for another year and revisit the strategy. If someone is winning on a consistent basis then it's certainly a fun hobby to have. Just remember, exactly like a work environment, *always trick the counter party into thinking he's smarter than you even if he has no experience in the topic*. Then make the bet.

On an extremely cheesy note… Thank you to all of our subscribers for the advanced pick-up of **Efficiency!** For those that received the email (check your junk mail as well), you'll have until July 21 to pre-order (as stated in the email). While we're definitely not going to make a financial return on it given that we put a good deal of time into making it as clean as possible (no junk words) it *was extremely fun to create it*. We're thinking of new ideas to gift out small tokens of appreciation for the purchase in the future (we already have a few ideas).

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life (July 23, 2017)***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality).

****

Game By Ethnicity

Game By Ethnicity

Disclaimer: *This article is direct and offensive to people unwilling to acknowledge the stereotypes in the world we live in. Instead of complaining about them we're offering solutions. If you find a stigma we missed, we'll attempt to find another player who breaks the mold… which of course is the goal in becoming more interesting and successful.*

For some reason the topic is taboo here in the US. This is likely due to the College system where we learn about things such as the preference of "whitening up", racial triangulation and the different mortgage rates given based on similar financial profiles (race adjusted). Of course all of these classes are taught by women or she-males who complain for a living.

So with that said, the bigger problem is all of these complainer majors (ethnic studies, sociology, insert ___ studies here) do not provide any solutions to improving your life. Instead, these "forward thinking" majors cause more anger between one another as people attempt to credit and discredit each other based on "privilege" or lack of "privilege".

To all of these people… good luck… winners don't have time for this because they are ***busy adapting to their environment***.

With that said below is a no non-sense look at the stereotypes presented to each ethnicity and more importantly, below the diagram is ***what you can do about it.***

If forced to choose the yellow cells highlight the first stereotype you should tackle.

rankings v2

The Basics:
White: As you've been taught in college you're "privileged"… Unfortunately life does not give handouts and you're going to be forced to deal with insecure lash-outs in college and beyond as people degrade many if not all of your accomplishments. Strong game or social competence would suggest that you agree with them on paper or in upfront confrontational situations, this involves a high amount of control to be told over and over "you achieved this because of XYZ privilege". It would be wise to re-frame situations at all times when confronted with a positive attitude, don't worry the amount of BS you'll receive from women remains. Finally, don't forget that you would benefit from dance skills, the last thing you want to be is the "stiff white guy" in a club.

Black: Here you're looking at a couple of positive and negative contributions, one being that you'll have a positive sex stigma ("large dick" stereotype) which is offset by a negative money stigma (poor and dangerous). In this case you can benefit dramatically by increasing the amount of money/safety you exude. In fact one of our writers wears fake glasses and dresses in a high end suit to be perceived as more intelligent at the office and in meetings. It works. Assuming you've obtained an Americanized accent you're going to avoid slipping into the foreign camp so you should use this to your benefit in the corporate ladder game.

Middle Eastern: This is a relatively neutral category excluding the un-American piece so your focus here will reside in continued increase in game, money and working on your tone of voice to prevent yourself from being seen as a foreigner. Additionally, Asian/Middle Eastern men tend to have smaller frames than most so you'll benefit much more from the weight room than your counterparts. It may take years to increase and develop but you can see substantial gains over time.

Latin: This is another blurry category as there are stereotypes surrounding a sex-symbol Latin guy combined with the immigration issue in the US. So if you want the most bang for your buck, you're going to increase income, neutralize your voice and learn to dance quickly. You're neutralizing your immigration standpoint by having a career and then focus intensely on giving off the sex-symbol Latin guy vibe which is best done with dancing abilities.

Asian/Indian: In this category you're looking to quickly neutralize the insecure portion, accent and cheap issues that you're being stereotyped with ("small dick" stereotype as well). The first and most important aspect is to destroy your insecurity stereotype by using self depreciating humor with a sly grin. Most people in this category (another generalization) will turn to anger, which will not work as it will be misinterpreted as insecure. You can use that when you're in a short-term relationship. The next skill you'll learn is to neutralize your foreign stigma by working on your tone of voice to slowly blend into the crowd.

Notable Takeaways: Eventually, when you're in this long-term, you'll naturally neutralize all the negative stereotypes and will not need to use specific types of humor etc. for most however, the above is a good starting point. For a smart reader, your goal is to capitalize on the positive stereotypes and neutralize your negative ones, relative to your environment. We encourage maxing out your looks… with that said you can read between the lines and realize a "light/weak" stereotype is going to benefit more from an attractive body (sexual) while a "poor" stereotype will benefit from an increase in well fitted threads (well off).

Focusing on Work: As always, the basics of work apply across the board which leads us to the following statement ***"perception is reality"***. With that in mind you're going to slightly adjust your work focus onto your negative work stigmas to create a better perception. In short we encourage the following.

• **White:** Show up earlier than most
• **Black:** Dress much sharper than most
• **Middle Eastern:** Show up earlier than most, focus on relationships
• **Latin:** Dress sharper than most and show up earlier
• **Asian/Indian:** Zero in on salesmanship and co-worker relationships, "socially adapted"

Focusing on Venues: It gets much more difficult here as your city, vibe, venues to choose from and income will determine many of your decisions. However, when you choose venues you're going to focus in on the positive stereotypes you can exude relative to the venue. Here are the basics.

• **High-end:** Full suit for everyone, no excuses (if you are in your low to mid 20's don't bother)
• **Dance Venue:** Fitted t-shirts leaving the slacks at home
• **Hipster Dive Bars:** Fitted clothing, leaving both slacks and collars at home
• **Yoga Sessions:** Hot yoga, you're in shape, an excuse to take off your shirt
• **Grocery Stores:** Whole foods only, in gym gear or dressed to impress

As noted here it is based on ethnicity.
• **High-end:** (Everyone with money)
• **Dance Venue:** (Everyone who can dance)
• **Hipster Dive Bars:** (Everyone who can give a welcoming vibe)
• **Yoga Sessions:** (Everyone who is in shape)
• **Grocery Stores:** (Everyone who is in shape and dresses sharp)

Whoops, guess you realized that every venue is open because you're already tailoring your life to each venue. Don't get us wrong, you're likely better off starting in a dance venue/yoga studio compared to a high end club, but don't be fooled into thinking you can't pull from any of these venues. Again, take a step back and quickly ask yourself ***"which negative or positive stereotypes are being amplified in this environment?"*, adapt and pull.**

Conclusion: While there are certainly places where your style won't be accepted, this is the case for every single ethnicity on earth, so it's time to stop making excuses and find a spot where you can be the man of the hour. The time you spend complaining about how it is tough for XYZ ethnicity to win at life is wasted time. You may as well get into a little ball and cry in the corner of your room with a Kleenex in your hand. Instead, acknowledge the stereotypes and break them down one by one over time, suddenly you're one of the guys who doesn't fit into the mold anymore… you're now part of the solution. Or you can go back to watching TV, hating on specific groups and contributing to the problem by providing zero solutions for every man out there. ***It's up to you.***

PS: For you Wall Street guys, or people looking to break in… We don't care one bit about diversity, so don't bring that up during the interview process. The only thing we care about is direct results, hopefully you're seeing a trend here. *(Unfortunately we actually read all those ethnic studies books, disgusting waste of time)*

****

Get Out of the Middle Class

Get Out of the Middle Class

We are unaware of a post that addresses the issues of the middle class mindset. We're going to try and tackle this.

The middle class mindset is essentially derived by mainstream propaganda, indoctrination during college and through branding and insecurity. The trick to keeping the middle class in the middle class? Focus their attention away from themselves. Force them to focus outward, base their lives on the opinions of others, and ignore their own intrinsic value. If that is not disturbing enough take a look at the points below and begin ridding yourself of each mindset/action.

1) Talk the Least: Just one week ago during a short business trip, an uber driver who makes $120K per year with his current job and his uber side hustle was explaining ***how to invest in equities.*** The conversation was interesting, not because of the underscored point above, but because he gave every single detail about his life… For free. If you're going to move up in life you have to be ***getting more information than you are giving.***

For simplicity, if you are obtaining more information than you are giving throughout the day, you're going to hold onto more information to give to higher powers than you. There is no point in giving any information out unless you see a mutually beneficial outcome. It really is that simple. Play it cool and let them do the talking, two ears one mouth. The ratio should always be the same.

To drive home the point, think through your most successful interview. Have you ever landed a job where you explained how great you were for 2/3 of the time while the other 1/3 of the time you allowed the interviewer to speak? The answer of course, is no. If you carefully choose your words and times to interject, the interviewer will come to the conclusion that you are bright. *If you're actually good at X task, other people will tell them. Not you.*

2) Don't Trade Time for Money: We got a lot of questions about what this means. Although, the repeated question is likely the same user logging into different IP addresses, we're going to knock this one out of the park right now.

If you are earning the ***majority*** of your income based on a Salary or Hourly wage you are trading time for money.

If you are earning the ***majority*** of your income based on performance based incentive compensation and passive income, you are NOT trading time for money.

It really is that simple. People don't understand that Sales, Wall Street, Equity in Silicon Valley and Businesses do not trade time for money. This is simply because they cannot rewire their brains. ***You want to trade your money for time.***

Yes if you work for a large corporation in sales, Wall Street or otherwise, you will be paid a salary as a ****Part**** of your total compensation. Make no mistake. If your salary > bonus, you don't matter to the firm… At all.

Finally, since everyone has asked for an example of how you can avoid trading time for money, below is the clearest and cleanest way to think about **buying time with money.**

Advertising.

If you spend $10,000,000 a year on advertising are you wasting money? The answer of course… is it depends. If you spend $10,000,000 a year on advertising that leads to $20,000,000 in net income… The answer is no. By advertising you are buying a person's time (getting them to look at your product/service) and ideally convince them to buy… Without you doing a thing. Correct? Correct. Below is a typical week of business advertising spend (no, not for this blog of course).

FB Sample 2

3) Compete With Yourself: Another growing trend for the middle class is to "compete with everyone". This is actually a poverty mindset more than it is a middle class mindset… Yet you see this belief growing in the middle class nowadays. Go to a middle or upper middle class area and people are sizing each other up like they are going to get into the ring for a 12 round boxing match. It is comical.

Why is it comical? It is comical because if you are competing with someone, you have some belief that the person you're seeing is better than you. If you believe the average person in the bar or club is better than you, it means you're not very successful yourself. *Only people who are broke believe they are in a competition with everyone or believe people are competing with them.* To say the least? It is a joke.

If you need further proof of this, simply look at the top performers in any industry. They do not compete with people who are below them. You won't see the #1 tennis player in the world getting on twitter to smack talk the #500 player in the world. If anything, he will try to find ways to give him pointers to improve his game.

Instead? They compete with themselves. If you are at the top of your game you are competing with your previous year. If it's money you're after, you're comparing your next year to the previous year's earnings and nothing else. Take a page from the elite and emulate them. You are only competing with yourself.

When you meet a new person you should search for information and ask yourself "can we both win by working together?". If the answer is not a yes, simply move on. There is no reason to compete with someone if they are not going to be in your lane.

4) Cut Alcoholism: If you are still blacking out from your drinking adventures and you are over the age of 22, you should be ashamed of yourself. In addition, you have a serious drinking problem. There is no exception to this rule.

Alcohol is a great substance for celebration and should be taken seriously. If you got your first $100K+ bonus check as a hedge fund associate, feel free to have some drinks and a nice dinner. However… You should not black out and get kicked out of a club/bar.

There is no glory in being able to "crush 10 drinks in a night". All you are saying is that you're trying to escape your normal life.

5) Prestige is a Trap: We talked about this on our FAQ page and it needs to be revisited. The only thing that prestige is good for, is if it is the beginning of your career. Here is how the prestige trap works.

Head Hunter: Hello associate at Barclays, we have a position open at *Goldman Sachs* that we are looking to fill. Are you interested?

Naive Junior Banker: Absolutely it's *Goldman Sachs!*

Head Hunter: Great send me your resume and we will be in touch (click – giggles on the other line because you are about to make $10K extra to restart the entire political process while the headhunter collects a nice fee)

The headhunters are getting more creative these days and are even convincing people to move from potential promotions to "the buy side" where they will make the exact same amount but work extra hours. **It is a trap.** Before you make a jump you should make sure that you are not making it due to prestige. We've said it before and we will say it again.

"F**K Prestige. Get MONEY"

This highlighted point brings us to the next part of the middle class mindset…

6) Chase Responsibility: This is where most people fail to jump out of the middle ranks. Many people prefer that steady $120-140K base salary and $100-120K bonus for life. ***This is career death.*** You need to take a risk and chase the pie, without the pie there is no income growth.

Most people in the middle class enjoy following rules and regulations because it is how they moved up to their cushy positions. This is not going to serve them well once they approach the age of 30. You're going to have to find a way to get a piece of the pie. If you want a cliff notes explanation of how following the rules won't work… Here you go.

Managing Director: Hey you've done a great job for us, if you want to stay on long-term we will take care of you no worries.

Sr. Associate/Jr. VP: Well you have taken care of me before, i believe this is a great slot and want to continue being part of the team.

—- *1 year passes, **record numbers*** —

Managing Director: Hey we had another great year here's your bonus of $100K (flat from last year)

Sr. Associate/Jr. VP: Well, numbers were up why is my income flat?

Managing Director: Well we don't know if you contributed **that** much so we felt that paying you at the top of the class would be fair.

Now you are wondering, well how do you get out of this situation?! How do you avoid being in the support role for the rest of your life? How do you avoid the flat line of $150-250K for the rest of your life?!

Just like everything else in life, the answer is simple. **Take risk.**

At this point, you need to analyze your firm. Find the weak spots and see if you can find a way to *increase the size of the pie* (also known as the bonus pool). Once you are able to prove you can increase the size of the pool through revenue generation (yes you may need to step on toes here) you're going to be able to haggle for a slice of the pie. **It is simple, yet incredibly difficult to pull off.**

7) Think BIG: Most people see that phrase and believe it means *"Think about making your ego huge"*. This is entirely wrong. What does think big mean? It means you need to think of ways to leverage your skills to maximize returns.

People keep emailing us about how to use their 401K's. We have the same answer. **Who cares.** Please stop emailing with these questions.

While you should max it out (tax purposes) and at a minimum get the Company match (free money), if you are even thinking about your 401K beyond a couple of clicks on the computer screen, you're wasting time. Not a single person in the history of mankind got rich off their 401K with time to enjoy it and no one ever will… **by definition.** If you're worried about perfect allocation of a few hundred thousand dollars, you don't see the point and you're wasting your own time.

Even if you contribute $17,500 per year for the next 30 years. That is $525K. Lets go ahead and 4x that just to make you feel richer. That's $2M. The catch? ***You're 60.***Oh and by the way? **Due to inflation that $2M is only worth $1M in today's dollars.**

If you do not believe that a million or two by 60 is not an accomplishment, go and volunteer at a hospital. It is a great experience. It is a disturbing experience. Every single "rich" person you meet will tell you they wish they lived their lives for themselves and not for other people… saving and waiting for the perfect time to enjoy life… **That never happened.** Try to keep that bubbly smile on your face as you realize these men and women have money but no way to enjoy it.

… What does this have to do with thinking big? Everything.

Once you realize that you only have 30 years to live. **Ages 25-55**, you're going to start building real skills. Time is not on your side. *Once you really* understand that this is the only time frame for fun and enjoyment, you're not going to worry about missing your friend's bachelors party or missing the next sporting event, you're worried about **maximizing you.** Finally, *once you realize* the clock is always ticking, you're going to start thinking in terms of scale and leverage instead of time and wages.

The paragraphs above will unlikely stick with anyone who reads it. They will simply nod and agree and go back to reading about the latest sporting event, celebrity gossip, or swiping on tinder. All this means for the people who get it? **There is no competition.**

8) Read for Information NOT Motivation: This is going to strike a cord with a lot of readers and people. Motivation based reading is the biggest ponzi-scheme in the world. Not only is it a ponzi-scheme but it is a LEGAL one at that. Don't make us laugh. Here is how it works in simple steps

Step 1: Write extremely emotional posts/texts on the internet to force a readers to "feel like they can be somebody"

Step 2: Write a book or sell a product that convinces people to "take action", anything you can do that gets them out of their comfort zone

Step 3: Once you sell 100+ units, 10-20 success stories roll in and they will foolishly claim ***"THE product changed their life"***(For some reason they don't realize they changed their own lives and the product did nothing)

Step 4: Author takes success stories (ignores failure stories of course, that would be bad marketing!) and then uses that to validate the product

Step 5: Slowly raise prices of product as people who were on the fence to buy it, see the prices rising and then decides to buy it as well! If the prices are going up it must be good! (See point 5 about prestige and branding being a trap)

Step 6: Take the success stories that roll in (a few will always be successful) and reiterate

There you go. Now you know how the motivation ponzi-scheme works. Smart people realize this scheme and only buy information based products, not feel good motivation based products. If the product is based on motivation or "go get em" type hype, you know it is a way to **create a recurring revenue stream based on emotion.**

To those that don't believe this, you're being scammed. If you are able to put yourself outside of your comfort zone ON YOUR OWN, you already had the skills necessary to succeed. Do not hold up some book and claim it was the holy bible to your success. It wasn't. Your success was based on your own internal motivation and don't let anyone else take claim for it. They are just going to use you for marketing.

—-

Hopefully this gives the readerbase a lot to think about.

1) Are you trying to prove to the world how good you are through your words to new acquaintances? **Stop.**

2) Are you trading all of your time for money? **Find a way to leverage your time.**

3) Do you think everyone is competition, or that people are trying to compete with you? **Neither will be of value.**

4) Are you still getting drunk every weekend? **Hope you just sealed a big transaction that night.**

5) Are you choosing prestige over money? **Foolish.**

6) Are you moving positions for the brand? **When responsibility leads to a piece of the pie, choose responsibility.**

7) Do you think you're going to live an amazing life at 60? **Go volunteer at a hospital.**

8) Are you buying motivational products? ***You're the product.***

****

Get Rich With Real Estate – An Overview

[Get Rich With Real Estate – An Overview]

There was an advanced discussion in our highly popular post on passive income. We've taken it and organized the content into a readable blog post (thank you to all the commenters "ownmyhood", "Nixon", "RE Guy", "YM" for creating this idea). In addition to adding highly valued comments, we have vetted a few of the named individuals to confirm they are millionaires from the real estate game (ambiguity for double protection of their identities!). As many are aware we prefer the online route, but lets get started on this path.

Step by Step to Making Big Money in Real Estate

There are a lot of books on real estate investing out there, problem is most are terrible (and written by get rich quick gurus rather than people who have been there). If anyone's actually interested here is an 8 step process to get started in real estate that actually works:

Step One – No Need for College: Skip college and go to a technology school for a building trade, preferably the one that pays the most in your area (plumber, electrician etc).

Step Two – Become a Contractor: Get a job with a reputable contractor in your field, preferably someone who offers overtime opportunities. *Work as many hours as possible*, learn all you can and get licensed as quickly as possible. Make friends with other tradespeople on job sites, preferably the more intelligent, young, hungry ones (these can be tough to find). Save every penny you can.

Step Three – Location, Location, Location: Locate an area that is run down, but shows some signs of turning around. Meaning multifamily buildings for sale that bring in double digit cap rates are common enough to where as there might be a few listed on the MLS and the population of the immediate area (or least the surrounding area) is not decreasing and preferably growing. Also, being within commuting distance to a desirable downtown area helps a lot.

There is quite a bit more than this when locating a suitable area, but there are some things that must be left out for others to figure out *(notice no one gives away their business, otherwise they would be out of it!)*. *If this area is local, good for you, if not, time to pack up and move.* There are a lot of places where you can buy double digit caps all day that aren't total war-zones. You don't want rodeo drive (entry cost too high/tough to make money) but make sure it isn't a demilitarized zone either.

– *Investor Note – RE Guy:* You can call these run down areas with signs of turning around "the borderlands" because they normally are on the border between a garbage area and a nice area. *You shouldn't count on anyone giving away all their trade secrets,* especially not for free, especially not on a public blog, the same way this blog won't give you specific stock picks or exactly the products they market online. However, all these resources combined make a great starting point for anyone looking to get into real estate, so if it is something you'd like to do, after us giving all this information in one place, you have no excuse not to start!

Step Four – "Campaigning" (no different than affiliate marketing): After locating the right area, use the MLS, targeted mailings, call campaign (anything else!) to locate a building with potential for a double digit cap and an owner willing to sell. *Bonus points if they are willing to hold paper.* Remember these properties are rarely pretty, be prepared to deal with some rough tenants and buildings. If either of these scare you, stop reading now.

– *Investor Note – RE Guy: He's* currently setting up a deal with a single digit cap on a multi that will convert into a double digit cap, based on the purchase price and what he put into it for the renovation and subsequent higher rental income. Not based off it's "true" cap, it's new after rehabbed value which he believes will remain single cap. Cap is more tied to the general area than the building, it's more *"how risky is it to rent properties in this neighborhood"* or "*what quality or income level of tenant will possibly be attracted here"* and cap will generally decrease as the quality of tenant increases (it's less risky to rent to a doctor than a bus driver, and the market recognizes this and makes doctor friendly buildings more expensive than bus driver friendly buildings, relative to cash flow). Currently the owner is warming up to the idea of holding paper.

Step Five – Cash Flow Positive: Buy the building using a method that *allows for at least some cash flow after all expenses* (lenders don't like negative cash flow). Meet the tenants, keep the decent ones, immediately evict the bad ones, raise all rents to market rates if they are not already (if you lose sleep over raising ol' miss McGillicudy's rent $50 per month or start shaking in your shoes when you realize you have to hand Chopper the Hells Angel an eviction notice, this ain't your gig). Renovate the lousy units into nice apartments using low cost but durable materials. You're not going for a luxury penthouse, just a nice clean apartment. Now is the time to call your buddies you met on the job to help you or at least learn enough to be proficient at a few other activities. Hanging drywall, painting, basic carpentry can be learned by anyone who's willing to put in a little time.

Investor Note – RE Guy: Decide ahead of time what the rules are and enforce them. Make them firm and strongly in YOUR favor. Add to that a moderate dose of *pragmatic compassion*; evictions are an expensive proposition and you may need to decide between a small and large loss. Make the decision to evict more on something like the person not answering phone calls than on them not being able to pay for a week or two IF there is an agreed upon payment plan that you believe they will stick to. If you conduct yourself ethically, you will have no problems with evictions.

Step Six – Learn from Competitors: Learn how local apartments are advertised, list your vacancies, learn how to take nice pictures and write coherent, appealing descriptions. Price them right, don't overprice or they will sit vacant and carrying costs will eat up any profit. And most importantly *SCREEN YOUR TENANTS THOROUGHLY*. Nice people will rarely tolerate living next door to dirtbags for any length of time.

Investor Note – RE Guy: If you get too few phone calls you know it's priced too high, too many and it's priced too low (art that turns into a science over time). Know your market, know the seasonal variance, know what to expect as reasonable so you can adjust accordingly. Sometimes trying to squeeze every dollar out of a place leads to having to compromise on the quality of the tenant… and that knowing this is also knowing what is a good tenant for that particular neighborhood.

Step Seven – To be the Best, Never Settle Like the Rest: Alright, you've got one building cash-flowing, good work. Time to sit back and let the rent checks fill up your bank account right? Wrong. Visit the property often, pick up litter, respond to maintenance calls promptly, evict non-payers and troublemakers and *ALWAYS PAY ALL OF YOUR BILLS ON TIME*. Credit will *make or break you* in this game.

Step – Eight Wash Rinse and Repeat: Now just repeat steps 4 through 7 over and over and over…

Key Notes

–*When you are starting out, nothing is beneath you:* Unclog toilets, keep your own books, do apartment showings, represent yourself in court. Learn these things now so you can teach and competently evaluate others to do them for you later.

–*Don't let emotions get the best of you.* From buying a property to resolving tenant disputes emotions run high in the real estate world. Dealing with a stubborn moron who you want to purchase a building from? Be nice. Handing a tenant an eviction notice? Be nice. Nothing to be gained from losing your cool.

–*Keep in touch with people that matter.* RE agent points you toward a good deal? Keep in touch. A seller holds paper for you? Keep his contact info and reach out to him later if you need a reference. A bank loan officer mentions they have some foreclosures in the works? Call him in a few weeks and see how their coming along. All pretty obvious stuff if you read this blog. The moneys out there, if you want it, it's yours.

– *Income Property Debate: Opinion one:* Don't be the guy who buys a duplex in order to "live in one unit and let the other unit pay my mortgage" as a side hustle. If you're going to get into this game plan on going big or not wasting your time (scale remember). Real estate is a complex endeavor that involves quite a few areas of expertise (sales, advertising, legal, building trades, tax accounting etc). You don't have to be a master of all of them, but must be at least competent enough to judge whether someone else who you're paying is doing a good job. Learning all this takes a lot of time and doing so just to "pay your mortgage" is foolish. *Opinion two:* If you buy it well enough to much more than cover the mortgage *(which is a standard you should absolutely set for yourself)* it is possible. In addition, you can go up to 4 units of pure residential while still qualifying for residential mortgages.

The main point of ownmyhood that I agree with 100% is not just buying a property to pay your mortgage, but buying a place to live in it and have it as an investment can be done all sorts of ways (including renting rooms, always legal if you live there to my knowledge a.k.a. Airbnb before there was an Airbnb), and for those who are really strapped for cash, that means you can even get a single FHA loan for a few % down.

How To Manage Once You Get the Hang of It

Once you've got the hang of it there is potential to see cash on cash returns of **at least** 10-20%, with minimal work (relatively speaking). If you don't want to manage tenants you don't want success bad enough (Real estate being your chosen path to riches). If this is the mindset someone has to be successful… well it is the most common red flag example. The second most common red flag? Are you willing to spend your Saturday checking out and analyzing deals rather than watching sports from 12pm to 12am? No? You don't want it bad enough.

Back to dealing with tenants…hire a property manager. Yes you will pay money for the service and it will hurt your returns, but if you buy a property correctly you will be able to afford it and still make plenty of money. Average rent per month on units can come in around $800 and managers typically charge between 5-10% depending on your scale. If you're just starting out and paying $80 ($800/rent x 10% mgmt. fee), that's the best $80 you'll ever spend because you don't have to deal with tenants, contractors, or accounting. As a note, don't choose a property manager solely based on the management fee. You can find a manager for 6% ($48/month in my example vs $80) and save a few bucks, but the wrong property manager can cost you ***much more*** than that in excess repairs or lost income. Find a manager who is going to look out for your best interests as an investor, not just someone looking to increase their revenue.

Deal Example – Nixon: Here's the deal he's working on today. 16 units priced around a 10% cap rate for $500K (that means around $50K of cash flow a year *after* paying a manager, but before debt service). The lending terms he went with on the last deal was 75% LTV at 4.5% using 25 year. That would cost about $25K of debt service a year on this deal, leaving $25K of the original $50K cash flow. He'd put up $125K of equity and end up with a 20% cash on cash return on a semi-passive basis.

Investor Note – ownmyhood: In most cases would recommend training and hiring your own property manager over a paying a management company. While the short term costs in time and money may be greater (training, setting them up with office, tools etc), in the long term you're not going to pay for someone else's overhead and the needs of your tenants/buildings will always take preference.

Basic Real Estate

You throw money at the property and hand the keys over to someone else to deal with it. This is not a risk-free situation given 1) potential debt load, 2) trust in property manager, 3) interest rate environment and 4) any one time hazard/maintenance issue that kills your yield for the year. We peg a solid return at *somewhere around 6-9%.* This includes a management company eating into your yield and of course the natural reserve fund for any maintenance issues.

Another option is working through a private equity firm such as a Blackstone, Lone Star or Brookfield. You're locking up your money for a longer period of time (typically) but the returns should be notably higher as well (double digits). Now there is certainly a wide range of private equity transactions from low to extremely high risk… But. Locking the money up for longer periods of time is generally the theme here. Unless you're in the Ultra Rich group, it's one of your best bets to get exposure to commercial real estate (apartment buildings, offices etc.).

Bigger Pockets: Biggerpockets can be a good resource for beginners, and possibly if you have some good knowledge already a resource for looking deeper into specific topics. For example there is a thread there on construction of a full home from a lot. The issue with it is that it's got a whole host of contributors of various levels of competency, different backgrounds, goals etc. It is easy to get confused or get misinformation in the form of biases you may not recognize as a beginner from there.

That said it is a a good beginner's guide to real estate, because the person who wrote it called the system of "buy, renovate, rent, refinance", he says "BRRR", which he correctly stated was something many investors have been doing for a while and he was just creating an acronym for easy understanding. In other words, if you treat it as a summary of various concepts and a jumping off point for either further study or just to give you a basic framework to use while you go out and start taking action then it is good.

Of course, your best education is your first deal. A single deal is worth an additional 10k-20k because you'll be getting your education out of it. Like as if you were paying a college for a semester of classes on real estate.

Example of Bias: There is a segment example where it discusses using someone to do certain repairs and spoke against it, while another contributor (who had many more units) said *"I could see if you already have your portfolio and are just trying to maintain cash flow, then it is good, but if you want to keep building it, you're better off paying someone to do it and looking for your next property."* Also, if you are just starting out and don't have a background in the trades, it could also possibly be useful (this is another point of dispute among some people).

Basic REITs Exposure

A Real Estate Investment Trust is a company that owns and operates income producing real estate (yes there are other types like healthcare but we'll keep it simple). While they do offer high yields (distributing 90% of earnings to shareholders), the REIT is exposed to 1) tax rate changes – you're taxed based on your personal income bracket vs. dividend distribution rate, 2) reliance on debt, meaning more leverage is needed to boost returns, 3) real estate can be extremely location dependent and is prone to cycles just like we saw in 2008 and 4) since it's an equity product and as a shareholder, we have to realize they can only re-invest 10% of net income since the rest is being distributed. Take a look at REITs and you'll see they move around in ways un-related to the stock market.

Your best bet is to DCA into VNQ for REIT exposure (0.12% expense ratio as of this writing), although be mindful at the moment as REITs tend to underperform in a rising interest rate environment thanks to the bond-like income. Dividends will be taxed at your ordinary rate vs. qualified rate, but netting 66% of VNQ at 4.7% is higher than 85% of VYM at 2.8%. Check out PFF as well for another high yielding (5.7%) ETF that isn't related to real estate

Get Rid of Jealousy, Hatred and Stress by Thinking in Multiple Dimensions

[Get Rid of Jealousy, Hatred and Stress by Thinking in Multiple Dimensions]

One thing we have realized over the years is that the vast majority of the population (**see regular people**) think one-dimensionally. We had a joke tweet stating there is no such thing as a successful person with an unattractive wife. Immediately, we got low quality responses citing "Mark Zuckerberg" as a counter example. This of course proved our point. They admit that she is not attractive but then say he is a good example. This of course defeats the entire argument. Why? How can you view someone as successful if you'd never choose his life partner? As we said, one dimensional. To prevent one-dimensional thinking we'll provide several ways to decrease any form of jealousy/resentment in the future. Once we think about life in multiple dimensions you'll also pick up on the "sub-conscious" mind of your peers.

Thinking in Multiple Dimensions

Multi-Dimensions Gets Rid of Jealousy: Most people have jealousy/resentment but never look at the whole picture. If you take a single person, using Zuckerberg again, people will envy his life. We on the other hand have absolutely no interest in ever being him. No. This is not a "hater" post since he is living his own life. If he got to billions of dollars and wants to continue down his current path. good on him. It's not for us. Jealousy gets erased once you look at life multi-dimension-ally. If you look at a single dimension we can guarantee you'll find someone who is superior to you in at least one aspect of life after meeting less than five people. Instead, ask yourself *"would i really want to take everything the person has?"*.

A good way to see if people understand this topic is to see if they would trade places with Warren Buffet. Mark Zuckerberg is a harder example since most people cannot comprehend being unable to change his personal life (remember when you trade you also take their personality and future life choices). If we use Warren Buffet we can see if the person gets the picture. No one reading this (unless there is someone in their 80s reading this) would ever considering trading their lives for his. Sure he has billions upon billions of dollars. But. He is 80+ after all. Would you trade places with Buffet? No. You're going to be gone in short order.

Multi-Dimensions Create Role Models: Now lets say you do find someone you would trade with. As a basic example lets create an imaginary guy exactly the same age as you with more money, better fitness, better looking girlfriends, low stress levels and a fun personality. Instead of being jealous, what is the natural reaction? Befriend the person. In our souls we know that the people we spend time with end up being similar to ourselves. This is why attractive people generally hang out with attractive people. Fit people generally have fit friends… so on and so forth. By looking at things multi-dimension-ally you'll weed out your frequent contact list extremely quickly. The people on the list should have a similar value chain as you. Otherwise you're surrounding yourself with people you don't want to become.

Taking a step back, we find that this makes it *impossible to be jealous of other people*. In just four paragraphs we have eradicated all forms of jealousy. If you find yourself being jealous of someone then we suggest looking at it multi-dimension-ally first. Just because someone is good at Item A doesn't mean they are any good at the rest (basic herd mentality automatically assumes an expert in Topic A is an expert in Topic B… Even if unrelated – Lord knows we would never ask a 100lbs overweight billionaire for fitness advice). The second step is to then ask why you're jealous. If someone really has a life you want, then you should actively find ways to spend more *free* time with them. After all, they have what you want and you're willingly admitting it. Hating on them isn't going to help!

Multi-Dimensions Allows for Diversification: Now that we've gotten rid of all jealousy, it is also time to kill the hating part as well! On a personal note we don't hate anyone. Seriously, we don't. If we don't enjoy someone's company, we go dead silent and simply ignore. Hating the person just gives them more attention and burns valuable time. This simple point will save hours of time. When you dislike someone, remember that the easiest way to get them out of your life is by ignoring them. It really is that simple. Then if you run into them in the future, since you haven't had to waste your time with them for the past year or so, you'll be able to put up with the short interaction.

Now comes the fun part. While we want to completely ignore people we don't jive with, we can use the multi-dimensional strategy to help us choose "leaders". Leader is just a cheesy word for someone better than another person at a certain task. As a basic example when you think about sports, you automatically assume the best player on the team needs to be the "leader". Lets apply the same logic to parts of your life. If you want to get in shape, you should find someone with a physique that you're working towards. If the guy is not bright and can't do much else but work out… that's fine! Just make sure you follow his ideas on working out. Similarly, if a guy is making 4x what you're making per year, that is also fantastic. If he has an overbearing wife that you'd never talk to in a million years… Just don't bring it up. Follow that money making advice and use it to your personal advantage.

Before moving on we have a critical note to write here. ***Under no circumstances do you offer help to the person you're taking advice from.*** This is counter intuitive but works much better. Most people have the logical assumption of "well he is not good with women so i should help him there". Absolutely not. People have large egos. If a guy is better at making money than you are **and** you're asking him for advice… He will never listen to your dating tips. This is because he already thinks he is better than you at everything. This doesn't make logical sense since it should be clear based on your lifestyles but it is reality. ***People are extremely invested into their egos so never give advice unless asked.*** This is a serious warning and if this rule is broken don't be surprised if that workout partner/business partner etc suddenly drops off the face of the planet.

Multi-Dimensions Help With "Life Math": Life math is nothing more than deciding where you want to be in 5, 10, 15 years or so. There is no way to plan 10 years perfectly. But. You can take a framework and use it to decide where you need to be. As a simple example, maybe you're interested in having a family. Maybe you want to be single forever. Maybe you only want to work 20 hours a week. Maybe you want to party hard for a few years. Maybe you want to a take year off to travel the world. So on and so forth.

Multi-dimensional looks are extremely valuable with the internet. Now that you have no hatred and no jealousy after reading this post, you can look forward to the future. Find someone who is 10 years older than you and is currently living a life you want to live. Seriously. They do exist and it is possible to meet them. Most are just too lazy to look. Once you find them you can then map out a rough idea of how they got there, what went wrong and what they would do differently. A simple example is "quitting work". Many years ago we used to believe in "retirement" where you hit your number at age 35-40 and simply did nothing forever. *We were dead wrong there*. Every single person we met that was over the age of 40 and "retired" said the same thing. You'll get tired of drinking and partying within 3 months. They were right. This simple adjustment changes the way you map out where you want to be from where you currently sit today.

Take a look at an example. If you find a guy you admire that is 10 years older than you (meaning you'd love to be in their shoes in 10 years), ask them what they would do differently. This can range from money to life experiences. If you're already on the path financially maybe it ends up being related to travel. We have no doubt they will have several recommendations for you. It is not possible to go through life and live for 10 years straight with no mistakes. Mistakes are always made, you just need to find the right person to admit to a few of them.

For fun, the most common one we hear from people these days is "fitness". Most older people let themselves go in the 30-40 age range and it becomes increasingly difficult to "get it back". With this in mind, have a good idea of how your health regimen will evolve as you age and your metabolism slows down. To cap this all off, one guy had an interesting one which was the following: "I wish I upgraded my gym and took Yoga earlier". Why? He now meets all of his current girlfriends at the gym/yoga studios after battling some muscle tension for years (two birds one stone, double entendre).

Multi-Dimensions Give You Flexibility: As mentioned above, 5-year and 10-year plans rarely go accordingly for every single thing a person is trying to achieve. Going from $0 in the bank to 1) a million dollars, 2) great social circle, 3) tip top fitness and 4) freedom to travel takes a good amount of time (we estimate 10 years as achievable). The good news is that you can make adjustments. Generally speaking, when you're looking to pad your net-worth… freedom or fitness typically take a hit. When someone tries to increase their social skills, this usually hurts the fitness line the most. If someone tries to increase fitness, their social life takes a slight step back. So on and so forth. So if you end up getting to year five and miss slightly on two of the "big four" don't sweat it, the multi-dimensional outlook gives you a better holistic view on how you've progressed.

For what it is worth we have found that the last item is actually the hardest of the four. While money gets the lime light, it is actually freedom that is much more rare. In fact, many people with money are not free at all. They could make half a million dollars a year and not save much if they have kids to feed and live in an expensive city (yes it is possible, just look at the rents and add in three more people to support!).

Multi-Dimensions Make it Difficult to Trade Places: Putting the Multi-dimensional pieces together, the key item here is remembering that you must live with that person's choices. All of them. This is hard to do mentally since your average person only sees the surface. If someone decides to trade places with Warren Buffet then they also get to live for ~10 years. Similarly, if someone idolizes a guy worth $100M+ that is out of shape and lives a personal life that is in shambles… He too gets to live with all of those decisions with no ability to change them (you're forced to make all the decisions that person would make). Once we can put this lens on you'll find that there are maybe 0.01% of people you're interested in trading places with. These people are guys you look up to. So you wouldn't dislike them in the first place.

The Amazing Long-term Benefits of Multiple Dimensions

Before listing all of them there is one downside. People will attempt to "bring you down" by comparing you on a single item every single time they run into you. This is how passive aggressive people work since they've only beaten **one of the five rigged games in life**. Get used to it. The options are the same: 1) smile, nod and agree and 2) put them in their place by amplifying. As many of you know we prefer the first option since it kills the conversation. The amplification part makes people feel much more uncomfortable because only a secure person would admit another man/woman is better than them in a specific task. Try both, they both work. *Pro-Tip: extremely insecure and passive aggressive people will usually try to put you in the one situation in which you would lose to them over and over again. If they have horrible social skills and are old they will do their best to put you into a room with old people to call you an "entitled young guy". If they are good at science then they would attempt to compare you to them in that topic only. It is the only thing they have so they have to highlight it to feel better about themselves.*

Easier to Plan: Multiple dimensions allow you to plan a lot better. If you're focused on a single piece of life you'll likely go down the wrong path. Besides, who wants to be a deca-millionaire with type II diabetes? Who wants to have fame and money but live less than thirty years? Who wants to date beautiful women only to lose it all and live like a bum smoking marijuana at age thirty five? So on and so forth. Multiple dimensions help you find real people you look up to. We're not going to tell anyone how to live, if you've found this blog you're likely in agreement with some of the points but not all of them. The key here is making sure you develop the correct well rounded personality that you always wanted. *In short, success is defined by what you want not what you're told to want.* We have an ingrained belief of what success is and yet we'd unlikely want any of it (not interested in fame, not interested in a house in suburbia and most certainly not interested in "settling down" at the standard age of 30).

Easier to Walk Away: There is no reason to keep in contact with the same people for a long period of time just because there is "history" there. The reason why many successful people have friends for over 10 years is they are quick to identify people on the same path. The path to success in their eyes. While a few will likely make it with you, the vast majority will come and go. It isn't even a big deal. If someone does extremely well and moves onto bigger and better things, shake their hand and say good luck! If you don't burn their time, they will happily help you in the future anyway. Just don't be a burden on people who make a leap. The same applies backward. If you make a big leap, as long as no one is sucking up your time, you should be happy to respond. While "walk away" has a negative connotation, you could also replace this with "pruning" a rose garden. In order to make sure you have high quality you have to maintain the rose garden. If one of the "buds" spring up and have improved dramatically, you let it grow and it's back into the garden.

Significant Emotional Control: You will see a 100% improvement in emotional control if these items are taken seriously. Why? If it becomes difficult to be jealous or hateful towards someone… why would you be emotionally rattled? You wouldn't be! Emotional control is a fascinating topic because a lot of people confuse introversion with emotional control. Just because someone doesn't act out verbally, they will act out in terms of body language and behavior. Emotional control is your ability to remain in the same state despite the surroundings. This is why we put so much more value into "clutch" players in sports and into "calm take downs" in an argument. In fact these things are so valued by simply talking slowly and calmly you can be more convincing even if you're incorrect (important negotiation tip there).

Easier to Improve! That is right. Since your view of life will be less one dimensional, you can improve your life quickly. If you only focus on one item it is unlikely that you'll see significant strides in a few months. It could be fitness, social life, money, etc. Enter any topic and if you only have one item you're interested in it is much more likely that you'll hit the "wall". Each wall will take a longer amount of time to break down so it is best to see improvements in other areas of life beyond this. We can't even count how many people focus on single course of action and end up losing it all. Focusing on money is probably the most common where chasing an extra $1M when you're already worth $10M defeats the purpose of money in the first place. This is particularly true when you don't have anything you thought the money would bring. And with that we're done, perhaps 1% of the world will understand the point of this post (we're being generous)!

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality (***essentially the point of this post!***)… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). ****

Getting Financially Rich Alone – The Most Common Path?

Getting Financially Rich Alone – The Most Common Path?

While we have a different definition of "rich" (money not being enough, not by a long shot), we'll go ahead and focus on the money part here. The most important word in the title is the word "alone". While successful people will tell you they never made it alone, we've found that this is usually false. What they are saying is that they didn't make a lot of money until they had a bigger organization. The original time when they became rich (say a million or two for a single person) was more likely done alone than with some "life coach" or "partner". This is because you need to be extremely good at something first before you can have a chance at getting rich.

Mentor / Partnership Myth: We've noticed many people ask for a "mentor or partner". Our view of a mentor/partner is an extremely successful guy you talk to for *maybe* 15 minutes twice a year (10 minutes would be more accurate). That is all. Why would a successful person sit down and hold a person's hand from start to finish (unless you're his son/daughter)? It's irrational. Instead your mentor/partner could also be "books". Which of course is the most common resource for getting rich. No surprise.This is also what a large percentage of the rich population will recommend as well.

A Few People Get Rich Through Nepotism: Now that we have dispelled this hand holding idea, another good one is the nepotism idea. Sure, some people who are ultra rich will be able to pass down the wealth to their kids. The reality? The vast majority of people who become millionaires in any given year are first generation millionaires. This has been proven true year after year for decades now. Since most people have a distain for capitalism and the rich, they will fight this fact to death. Ensuring that they will never get rich in the process. The reality is that generational hand downs usually lead to one or two capitulations. One person gets rich, his kids end up being "okay" and by the next turn of the century it's gone as all of the personality traits have been lost.

What Do You Do? So. We know that walking around "networking" is a waste of time (an incredible waste for both parties especially if you have no skills). This leads people with a black hole. Wheel spinning usually occurs where they say things like "where do i start" and then go to a "entrepreneur class". This is again inefficient. No one can teach someone to be an entrepreneur.

The answer is in practical skills. The first and most important thing you have to do is figure out what you are good at. This is something that needs to be done at a young age. We'd argue it should be known by age 15-17 at the latest (probably too late). While this sounds bad it is likely accurate. If someone knows they are exceptional in topic A at age 15-17 they will easily widdle down the list of jobs/careers/businesses that need his or her special abilities.

Before we get negative comments about how early you must start, the best time to start is always today. If you have a general idea of what you're good at, you have a starting point. Similarly, if you know you're terrible at certain activities, avoid them like the plague (crossing all of them off the list). We used 15-17 because this is when the really rich people know they have a talent, most figure it out in their 20s and end up being "rich" but not ultra rich. Rich being $5-15 million, ultra rich being $100M+.

The one item to be ***extremely*** careful of here is "being bad at something" and "not liking something".

That last item in quotes is usually where we see people mess up. Some people are "scared" to sell, but we can tell in seconds that they would be amazing at the position if they tried. This is why we tell people ***passion and interests are largely useless for making money***. Money is only made when you're good at something and there is a demand for that skill. If you're great at sales but don't want to learn, you've essentially lost the game from day one. So before moving on remember that quote. ***Hating something doesn't mean you're bad at it***. Ask yourself if it makes money first, if you're rich you can do what you like for the rest of your life anyway.

Read Aggressively About the Topic: At this point you should have at least a few ideas about your talents. No one can do that for you. Now you have to read to "learn" the trade. Reading is interesting since we've essentially stopped the last 3-5 years after succeeding (1-3 books a year now). Why? *Reading essentially tells you things to avoid.* This is a critical part of understanding books.

If everyone gets the same information on things to avoid, the only thing left is *execution*. Similar to any sport, business is essentially the same. You can give the same guy the same technique and coaching but executing is going to vary enormously from person to person. Then your second hurdle is quick and fast decision making (when there are situations that appear to be a 50/50 or 45/55 and you make the right move based on "feel/gut instinct").

So to recap, Your first step is figuring out what you're actually talented at (passion is for losers chasing dreams), then you're going to read aggressively about these topics to avoid the major flaws. The major flaws (techniques) will then force you to execute on what is supposed to be done. When you reach this stage you're now ideally down to a handful of skills.

What do you do with these handful of skills? You figure out which one is the most bearable. That is right. If you are good at say five different things but can't stand two of them that's actually fine. Stick with the three items that are either "okay" and more ideally "fun". Remember, we already assume that all of these skills payout roughly the same. If you have two talents: 1) that makes no real money that you love and 2) one that would make millions that you hate… Guess what? You get to choose number 2. When you get rich you can then go back to number 1. But. We doubt you'll be sick of winning and will eventually love the task you hated to begin with.

Make the Value as High as Possible: Now that you have your skill, you have to ask "how do i maximize this". The answer is always the same: 1) ownership followed by 2) performance. If you can't create ownership, then you're better off going into performance. Ownership always wins because the business can be sold at a *multiple* of what is being earned. If you earn $200K in a performance based career using the skill that's awesome. What is more awesome? Making $200K a year by owning an actual company because that can now be sold for ~$1M in addition to the $200K you're already making. As usual, we cannot tell a random person if he should start a business or go into a performance based position. It is up to the individual to think creatively and decide which route is possible.

What is "creative"? Creative is when you realize you can outsource or find someone to fill in the gap. Why? Well if you can outsource or fill in the gap with someone else, you might be able to go down an ownership route instead of a performance route immediately. As a basic example, if you can sell homes at above market rates and someone else is able to fix homes below market rate… there is a clear path to success where both people win. ***Ideally, you only pay the person (trade their time for money) while you take on the equity***.

No Such Thing as 50/50: Similar to the partnership idea that we killed in the first paragraph, there is practically no situation where the value being added is 50/50. So, don't put yourself in that situation. We just gave away a big hint. If you have two skills where you're extremely talented, decide which one commands the most value relative to the task. Why? Now it is not possible to lose ownership.

If you have two tasks that need to be done and 100 people can do task 1 and 1,000 people could do task 2… The answer is to choose task 1. The market rate for task two is likely a lot lower and there is no way you'll be stuck in a situation where you own less than 51% of the asset. Which of course means you should never take less than 51% of anything you get involved in with your valuable time (stock ownership is not the same since you're not contributing any time to the company).

Usually One Sale: A quick recap of what usually happens: 1) person realizes most millionaires are first generation and rarely inherited wealth, 2) person throws a ton of spaghetti against the wall to figure out where his skills are, 3) person then reads on his own time – free!, 4) narrows the list and figures out only two of the skills will be valuable in the future and make him money, 5) figures out a way to create an ownership scenario, 6) finds a way to make sure he is always above 51% equity so he can be the decision maker in the end and 7) never wastes his time looking for 50/50 situations since he knows people don't contribute equally.

The result? Most people sell at least one asset. That's really all there is to it. You actually don't need to have an incredibly successful business. If you got up to $200K in profits per year, you're essentially a millionaire (assumes 5x exit value). The tricky part? Knowing what you're going to do next. It's rare for someone to exit their first successful idea until they know with certainty what they will do next. We are going to emphasize that this paragraph and post is a general framework and there are always exceptions to the rule (no need to barrage the comments section with "stories that break the mold", these stories are likely due to a different decision based on a gut instinct).

To Get Wealthy You Have to Scale: While this is a good framework for being well off (a single person with a couple million is certainly well off), scale is needed to become truly wealthy. This is also why many people think they need "business partners". They see wealthy people give credit to their teams and tell them that without the team they wouldn't have made it. While true, people rarely go back to their starting point (their first million or two) – usually made largely alone due to a specific skill. They give credit to their team because they are working for a wage and don't receive equity. Exactly what you want from an employee.

If you're interested in really getting wealthy now the game comes down to *scaling a product*. A product, by the definition here, *is anything that can be constantly sold without any of your time being spent on the sale*.

We suggest reading that sentence carefully because you can slice the answer in many ways. If you are in the real estate business selling houses, we would argue that the only "product" sale, is when *someone else* sells a home for your company/corporation. Why? Well the asset was sold, you made money off of an employee selling the asset and didn't do anything (except the paperwork that is under the Company name). Similarly, if you sell a product that has a recurring revenue stream attached to it, we would say the initial sale was not a product sale and all the revenue after the initial sale *is* a product sale.

We realize this definition will not sit well with most people. If you sold a car to someone people would fight for days saying that it was a product sale. We use the above definition because it forces people to think of ways to earn without using any of their time. Anyone who works online knows the feeling the best. They wake up and see they sold 20+ units while they were asleep. They literally did nothing. They click refresh and see higher numbers in the account. This is not the same feeling compared to a hard sale when you work to close something. The feeling of selling something using your time is strenuous and feels like relief while the money being made in your sleep is relaxing.

What Allows You to Sell In Your Sleep: There are many ways to do this (as usual many ways to get rich!). That said the common ways are 1) recurring revenue, 2) brands and 3) employees. In the past, the employee route was the most common. This is slowly becoming a relic as many processes done by people are going away (the Internet has helped solve a lot of overhead issues). That said it still works. Any time you can pay someone to do something you can calculate the return in an excel sheet. Paying someone $50K when they generate a profit of $100K is an easy decision.

Since we stated that this was an old way to get rich, you can guess our opinion. We don't like the model. Dealing with people is difficult. No we are not referring to people being bad. We're referring to the management of it. We think the employee route causes a lot more stress because *you're essentially taking responsibility for the livelihood of someone you barely know*. It does not feel good to fire someone who needs the money. We'll never understand why people enjoy seeing others fail (a common theme in the USA) but it exists today (zero sum mentality).

Instead, we recommend the recurring revenue and outsourcing model instead. This way you can pay someone for a task (ideally pay them a little more than they usually make) and keep the business model recurring. This way you know you can go back to the outsourced work (assuming they did a good job) and you can earn money in your sleep. A large win to say the least.

The final item is a real brand. This is an extremely slippery slope. A real brand is something that has zero products that are sub-par. This means a real brand should not offer a wide range of offerings. It should remain within a specific price band and deviate slightly (unless you're running a billion dollar company which we know nothing about!). The reason for this is simple (LTV of customer). As soon as the quality breaks a certain range it is difficult to make it back into the game. Use clothing as an example. High end clothing brands have a limited range. If their products end up at Nordstroms rack… they are out of luck. You don't want luxury items to suddenly appear in every outlet, otherwise it wouldn't be rare/luxurious anymore, brand is damaged margins get ruined.

Steps to Think About

Can it Become a Product: With the broad steps out of the way, most people don't ask this question. People who live the "digital nomad life" have essentially created jobs for themselves that are higher risk in nature. If you run a blog for example, the value is actually in the content. Since the value is in the content, the only way it can be valued is based on any product that is already available. You have to discount the value of the users, the ad revenue etc. because the number of people would change dramatically if the author changed. Similarly, if someone offered consulting that would also be a job because the consulting is done by one person. Think this question through deeply before deciding if a skill you have will occupy a lot of your time.

What is Most Valuable for the Product: This is a loaded question. If the product is a commodity, then the value is probably in the brand/marketing. Those are two very different things. Marketing is something that someone can do quickly while a real brand (Patek for example) takes years to build. We're guessing that most of the people reading this (unless they are rich already) will likely find something that is more commodity. If they have no marketing skills and no brand, then they are probably out of luck for quite some time. The alternative would be "market research" where you essentially take a franchise of a well known brand and place it into an area where it will be popular (essentially the brick and mortar model).

How Much of This Will Automate: Walk through all of the necessary items. Can it actually be automated? If so you've found something extremely good. Selling diet pills is probably the most obvious of the group (glorified caffeine pills). The stuff is all the same. Re-packaged and re-branded as something new with the same ingredients + a new tasty flavor (or something just as ridiculous). The good news is that almost all of it is automated. It's actually harder to have custom Hats/T-shirts made than have diet pills made when you look at the total cost of the goods (harder to return partially used diet pills compared to a return on a shirt!). Since the packaging can be made pretty as well (for cheap) the ability to mass produce and have lower headaches is clear as day. As usual, any cream, perfume, cologne, small pill, ointment etc… is extremely high margin.

What is The Cost of the Skills I Don't Have: Since you might have to bring someone else in, calculate how much you're going to need per month/week etc to make sure you have it done correctly. As a basic example, if you plan to target high-end clients, design and brand are critical. This means you will be spending a lot more and it will influence your success quite a bit. The upside is higher margins. If you start with the affiliate route (something we have recommended an incredible number of times), you'll care a lot less about design and be focused on sales/marketing since terribly designed websites still have incredible conversion numbers.

What is the Probability of Success: Take the amount you expect to make and multiply it by this probability. This is all there is to it. Even if you think it has a 20% chance of success it could be worth it. Why? Well if it costs $50K to start but the payout is $1M… Then you should probably do it. It means your expected payout is $200K for a $50K investment. Something many people would take hand over fist. Similar to getting better than 50/50 odds on a coin flip, you should probably say yes.

This is exactly why we laugh when people say most businesses fail. Yes that is true but they don't ask the better question. *How many of these "failed" businesses should *not* have been attempted.* That is the real question. if 95% of businesses fail that doesn't mean anything. If the payout of the 5% was over the total cost it should have been attempted *every single time.*

That wraps it up for now, let us know in the comments if your rich friends had a similar experience. We have no doubt that many will vary but the trend is likely similar. Getting rich alone is *perhaps* the easiest way to get rich.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality (***essentially the point of this post!***)… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. Getting in the Zone: How to Create an "On" Day

Getting in the Zone: How to Create an "On" Day

It's hard to create an "on" day. For those that have played sports, you know that an "on" day is just not like any other day. Say what you will about statistics. But. The feeling doesn't lie and even a non-athlete knows what it is like to be in the zone. While "checking in" and focusing on a daily basis does yield results, being "on" is something that only happens a few times a quarter or so (generally you have more "on" days when you're younger due to higher energy levels). So. We're going to take a stab at a long step by step process to try and create an "on" day. Our process is tuned for people who are already in good physical shape… time to jump in!

Two Days Before: Trying to create an "on" day typically starts two days before. While this is likely obvious we will point it out here: no alcohol/drug use. If you drink alcohol or use party substances you have to wait a full week before trying this out. Even though it is two days before, when you go out hard or alter your sleeping patterns… it takes at least a week to recover. So we'd say it is possible to have an on day if you haven't gone out to drink in about a week and try this.

During the day you won't need to change much, try to eat healthy and have a normal daily gym routine. At the gym and for your exercise, focus on something lighter such as arms/abs/light cardio. This way you can push hard on arms/abs but you really won't be all that tired the next day. Try to drink a slighter higher than normal amount of water and keep caffeine intake equal to your daily dosage (no more no less). Other than that, you should be good to go for the day.

Now we move to the most important step in day two: nighttime. To create an on day you want to wake up at exactly the same time. So if you're going to wake up at 7am you want to be asleep (that means already knocked out) by 11pm or a tad earlier. Generally speaking, it takes about 7 minutes to fall asleep so you'll want to be in bed by 10:50pm using this example. In addition, you want to prepare for sleep by reading and consuming a small amount of melatonin which could be obtained through milk or by a 1/2 dose of melatonin from any over the counter pharmacy. This is done to make sure you are out cold at 11pm at the latest. The dosage is also small so it won't impact your tolerance levels in the future.

The Day Before: Now it's time to take every single measure possible to create an "on" day tomorrow. As usual there are no guarantees that this will work for someone else but it's essentially a formula that has worked numerous times in the past.

Morning: To re-emphasize, the exact time you wake up isn't relevant, you just want to be consistent. If you normally wake up at 6 you would go to sleep at 10 and if you were going to wake up at 8 you'd be asleep by midnight. The goal is to keep your rhythm in tact. Continuing with our 7am example, you'll wake up right at that time. Sure it will likely feel like a normal day where you feel "okay" and that's the point.

As soon as you wake up we would do two things: 1) squeeze a whole lemon into 16 ounces of cold water – drink it and 2) jump into the shower. Drinking some lemon in the morning has become popular… because it works. You can also use Apple juice + lemons (100% made at home, not apple juice from the store) to get an extra boost in the morning. Apple cider vinegar has also become popular but it hasn't worked as well as natural apple and lemon juice in the morning (notice consistent theme of being fresh).

At this point we would recommend doing a few sit-ups and push-ups *after* taking a shower. No, you're not going to get sweaty from a few pushups and sit-ups, the whole goal is to create some basic blood flow after your muscles have been warmed up by the shower.

With your blood flow working, a standard morning routine is fine. Go with berries & nuts for breakfast (no cereal or breads like the masses) and get ready to start your day. As a quick note, we would *avoid* espresso and coffee in general. Instead if you're a coffee person we would replace this with green tea. This is an important stopping point since we've noticed that coffee is "harder" on the body. Probably because it has more caffeine content, is generally "dirtier" when compared to tea leaves and it could be overly concentrated if you grab a coffee from a store (sitting in a pot for a few hours). While coffee is fine as a daily drink, we would replace the content you normally get with green tea. Quick math is that you need about 12-16 ounces of green tea for 8oz of coffee (depending on strength of the tea).

Work Activities: We will assume that you start work right after the morning routine and in this case you're going to do about 75% the amount of work you normally do. You'll conserve around 25% extra energy for your workout that will occur later in the day.

The next thing we assume is that you work at a desk. If that's the case "sitting is the new smoking". Which means you want to break up this sitting nonsense a bit more today. Since you'll work a tad less, spend extra time stretching and drinking more water. Putting some numbers around this, every hour on the hour try to get up and move around stretching for 5 minutes or so and try to drink an extra 2 glasses of water (more than usual).

Noon: Around this time (doesn't have to be perfect) you want to go outside and get additional sunlight. Most people who work at a desk all day suffer from vitamin D deficiency. Even if you're already rich, chances are you still work inside for most of your work activities. Either way, you'll go out to catch a few extra sun rays. To attempt to put numbers around this as well, we'd say around 15-20 minutes extra. The key is doing this during the day when the sunlight is stronger (hence the mid-day break). To close this out, a good way to get the extra sunlight is to do a brisk walk outside, there is no need to do extreme cardio today.

Lunch: Since one of the goals is to go to sleep "lighter" you want to eat a heavier lunch. This is a little bit harder to gauge since the reader could be 5'6" or 6'6", we don't have a clue. What we can recommend is the type of food though. Here we would go with a quinoa salad with vegetables and either chicken or pork (steak is a bit too heavy). Pretty specific there but the point is to consume something vegetable heavy with some light carbs (quinoa, brown rice etc) and a good chunk of protein. This should be a bit larger than what you normally eat for lunch but not overkill.

In terms of drinks we're sticking with the same three: 1) water, 2) green tea and 3) fresh vegetable juice. As a note, we've found that doubling juice consumption is one of the keys to having an "on" next day. This is certainly dependent on your body so if you typically drink 12 ounces today it would be 24 ounces (if 16oz then 32oz etc.). Lunch is typically a good time to get approximately half of this intake before going to the gym later in the day.

If you're forced to work a little bit more than expected, feel free to combine lunch and the additional sunlight. The 15 minutes of extra walking around isn't going to change much. We're simply emphasizing that you want to be more relaxed. Working long hours and all night is not going to allow your body to recover in a meaningful way.

Finish Up Work: The timelines get a bit blurry here but you'll simply finish up work. Don't skip anything you *must* do since it'll weigh on your mind as something you neglected. That said. Don't go the extra mile today and try to close up the day a tad earlier. By the time you leave work/business should no longer be on your mind and you'll shift your focus onto a workout.

Work Out: The items in Efficiency still apply but we'll get more specific here. You're going to a little bit less cardio to warm up and do more active stretching. Simply do your normal cardio routine minus 25% or so and spend a few extra minutes stretching and making sure you are loose. For the workout you're going to do heavy weights at the *end* of the workout. Most of your exercises should be normal (sets of 8-10 or so). The trick is to end your workout with a heavy leg exercise (say squats or deadlifts).

Essentially, your workout will either be back/chest (we recommend back) with a strong set of either deadlifts of squats at the very end. Interestingly, you can either do 1) heavier weight or 2) you can do the weight until failure on your 2nd and third sets (typically 15+ reps in a row). We would recommend the second strategy (reps until failure) as it's a bit safer when compared to ramping up heavier weights. You should be tired and have that *slight* wobbly feeling at the end of the 3rd set.

Stretching/Massage: With your workout complete you should feel a slight high from being more energetic than usual. There is no need to pay for a massage if you're able to do solid stretches…. that said? Massages do much more work than basic stretching. We'd recommend around 45 minutes or so (an hour is overkill).

When you go for either the massage or stretching, just focus on the high tension areas in your body. We don't know what those areas are for you. And. To help, we would say it's typically where you are strongest. If you have strong legs it is usually your IT bands, if you have a strong bench, you probably have flexibility issues around your delts/shoulders. Generally, if you're strong in one area, it overworks the "helper" muscles that don't have the same genetic gifts. To wrap it up, most high end gyms have a massage person nearby so it shouldn't be an issue, any major city typically has a massage place within 15 minutes.

If you decide to stretch yourself? Simply add a massage ball. This can be the strange ones that look like they have spikes or they could be as basic as a golf ball/tennis ball. After doing your major stretching you'll shift gears to mirror a massage experience. Focus additional pressure on the tense areas (as mentioned above). You'll be good to go when you physically notice an improvement in your flexibility (larger range of motion)

Time to Stay Loose: At this point you should already feel pretty good. This is because your body is tired but loose so blood flow is usually high. Around this time we would typically finish up the juice consumption (should be nearby the gym anyway) and toss in a shot of ginger with cayenne (if you like this type of drink). You don't need to do anything special as you go home, just try to keep your body open and loose. As an example getting a massage but then going onto a crowded train and curling up into a fetal position essentially defeats the purpose.

Dinner: At this point your consumption of blue lights should end. No more cell phones and no more computer screens/television. The only exception will be music… if you need to turn it on for meditation later in the night.

For dinner you're going to go with the normal healthy options. Fish, vegetables, fruit and maybe some nuts as well. The difference is you'll try to eat a little bit slower so you end up consuming a little less than you normally do. If you're concerned about the protein intake and recovery you can toss in a small low calorie protein shake or toss in the extra protein "boost" when you had your juice after the massage/workout.

For what it is worth we've found that berries and cucumbers are the best items to eat if you're looking to feel a bit fuller (earlier) without the heaviness on your stomach. You definitely don't want to go and eat a greasy hamburger since it'll make you feel way to heavy when you're heading to bed soon.

Meditation/Relax: We're at the home stretch now. You're going to simply meditate. For those that have never done this before all it means is to "rest all thoughts" which is harder than you'd expect! If you can get this part down you end up falling asleep naturally. We'll assume that isn't the case and help map it out.

Since we're using a 7am wake up time, you want to be sound asleep at around 10:15am. You don't want to over do it and sleep for 12 hours, so you should meditate at around 9:30pm or so. 30 minutes of mediation followed by going to sleep should allow you to catch the extra 45 minutes of rest without incurring the downside of accidentally sleeping for 12 hours. Definitely set an alarm, that said, if you've done this right you should wake up naturally at or just before the buzzer goes off. For those that have already made it and don't set an alarm in general, just try to add the extra 45 minutes of rest.

Wake Up: Congrats (we hope!). At this point you should feel like you're operating in a different playing field, feeling 110%. This should last the entire day and if you feel yourself slipping feel free drink higher intensity caffeine (coffee, espresso, Yerba mate etc.). The only cautionary item is to drink these items after around 1pm, if you drink it early you could have a crash during the day. Besides, if it worked, you'll feel great 5-10 minutes after you wake up and will likely skip the caffeine anyway.

Items to Avoid: With the step by step out of the way we'll do a quick list of the things to avoid. Some of this should be obvious but we'll do it anyway: 1) no alcohol/drugs, 2) no flights during the 2-3 day period, 3) do not attempt this routine if you've been doing nothing for a week, your body is already rested, 4) this typically won't work during emotional turmoil – death in family, recent trip to hospital or other extreme events and 5) also won't work if still suffering from jet lag. While these are probably obvious we'll now highlight the less obvious ones as well: 1) minimal carbs – no pasta/bread, 2) no fake ingredients such as sugar free soda and fabricated butter, 3) avoid heavy foods like flank steak, burgers, pastries and high content caffeine, 4) avoid extremely hot temperatures, for what it is worth anything above 90 degrees is probably overkill. For some reason cold weather is fine. and 5) avoid standing or sitting for long periods of time. Try to keep your feet elevated while sitting and walk around for extremely short periods of time (3-5 minutes).

Getting the Most Out of the Day: This is going to vary for each person but our best guess is that you want to use the energy for work and knowledge. This means 1) earning money and 2) reading. Focus all of your energy on item number one and when you lose focus you can switch to reading. While this is our guess, you can also use the higher amount of energy for social purposss or physical gains (breaking through a plateau). When you feel 110% you're going to naturally focus your energy on the task most important to you (so we hope!) and maximize the additional focus and intensity. As a note, you'll usually feel on for at least 12 hours so you'll have a ton of time to get extra work done. If you want to ratchet it up even more just limit your cell phone use to about an hour to focus more on work.

How Many Times Can You Do This: The boring answer is "it depends" but we'll go ahead and throw a basic range out there. You can definitely do this at least once a quarter (every 3 months) and once a month is generally the maximum. If you're younger the numbers are higher and if you're older the numbers are lower. This makes logical sense as energy levels level off as we get older and no amount of hormone replacement therapy or other such protocols will make it exactly like being 20 years old (if all those therapies offset everything, athletes would never retire!). Don't get it twisted though, hormone therapy works we're simply adding the note that it won't turn back Father Time… nothing currently does.

Manic Episodes vs Focus: One of the main differences between being "on" and having a manic episode is control. Generally, manic episodes as defined by those with legitimate personality disorders lack focus and control. This is how we would draw the line between a manic episode and being "on" or "in the zone". A manic episode for people with personality disorders are usually triggered by alcohol/drug use. They are overly excited and typically lose a bit of control. It really isn't possible to get wasted and write an advertisment at the same time (or play a sport at a high level). This is why we used sports to help define being "on" since it is a different level of focus and flow.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality … You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by **Clicking Here**.

Getting Rich and Laying Low

Getting Rich and Laying Low

One of the main items we preach here is getting rich and pretending to have nothing. We write the way we do because if we state something as "fact" it makes it a lot more likely that people will try it. In school most people are taught to be "open minded" as their liberal teachers force feed them horrible advice on how to succeed. So if we talk in reverse fashion, it only attracts people who were smart enough to realize they were being fed lies in school ("team spirit", "team work", "go the extra mile for someone else" and other such nonsense). The idea of getting rich and laying low is pretty important so we'll give you a step by step on how to do it.

Two Rules Before You Get Rich…

#1 Remember to Avoid Fame: As we've said in the past, fame is just harassment from regular people. If you're famous, people already know you have money. And. On top of that, the people you attract will be "angling" for something. If you're simply a happy go lucky guy or a calm person, you'll attract much less attention. This is a good thing since you will only display wealth on *an "as needed" basis*. This is extremely important. An as needed basis means that you choose to let people in on the secret (that you're well off). In short, get rich first, then decide if you want to be famous.

… And #2 Avoid Personal Life Details: When people poke around for personal life details, stick with broad topics and tell people you are *"80% as good as they are"*. If they make $200K a year, you'll make $160K. If they live in a 3 bedroom house, you live in a 2 bedroom condominium. So on and so forth. (As a side note, most people lie *up* so remember to adjust for the lie when giving your 80% number). If you follow these two simple rules you will be miles and miles ahead of your peers. You won't have to answer hundreds of text messages asking for a "job" or "hey man we should work together". No one will waste your valuable time as you scale since they won't know you're rich in the first place.

Get Richer While Remaining Under the Radar

For what it is worth, somewhere around $25 million and it becomes almost impossible to be under the radar (from what we've seen). The reason why? Well if you get to this level… around $2.5M (at least) will likely be attributed to your home. If your primary residence is worth nearly $3 million you're likely well off so your cover is blown. Sure you could try and hide but as more and more people visit you, word will get out and you're essentially a target (at least to people who are two handshakes away). The good news? If you stuck with the two rules above, the people who know you're well off will be contained. Since $25 million is rich by practically any standard out there, you now know it is possible to scale without drawing a ton of attention.

Distributed Cash Flows: The easiest way to blow your cover is to concentrate all of your wealth into a single cash flow item. If you own all of the real estate in your neighborhood or you show up in company filings as owning 10% of a public company's stock… you're going to be well known in a hurry. The best way to avoid this is by having multiple streams of semi-passive and passive cash flows. If you build out multiple internet businesses that generate $120K a year, then build out a bunch of real estate assets that generate $120K a year… No one is going to think you're rich. Why? Well you tell the real estate people that is your primary business and you tell the internet side that is your primary business. Now both sides of the fence think you're only making $10K a month.

Now we realize on first glance that these numbers may seem low or high (depending on the age of the reader) but it is certainly possible to get two streams of cash flow to $10K a month and have no one think you're rich. As a clear example, if you read Efficiency, once you sell your first business you could make ~$1M. With $1M and some leverage you can essentially own cash flowing properties and work online to get to $10K a month very rapidly ($10K for each line item).

Avoid a Car: Cars are clear giveaways for wealth. The more important item? *When you're driving, you can't actually use your time for anything*. You're busy driving. If you work online, this is not a good set up since you could spend your time responding to emails, making small updates or researching in general. Making money while you're in transit is a lot better than spending your time avoiding incompetent drivers on the road. We have no doubt there are special situations where people will need a car… that said… if you live in an urban city the chances you really need one are slim.

Never Give Financial Advice: Yep, that's right… If you give financial advice to people who are new, there is a high chance that they put the pieces together. Don't do it. If someone is in a network closer to you, then the rule loosens a bit to *"don't tell them how much you make or how you make it"*. If you go through concepts such as leverage, cash on cash return, derivatives and outsourcing a workforce… they will figure it out quickly. Instead if you're forced into some sort of financial conversation, stick with the boring advice of "save 20% a year and invest in stocks". This alone will make you appear as cookie cutter as they come.

Don't Talk About Scaling a Business: That's right, when you start to scale your business or your investments… don't talk about it to anyone. Most people are busy trying to cut costs to increase their savings rate. Practically none of them reach the realization that scale leads to a 1,000x higher return. While you're busy scaling and earning more, they are busy trying to squeeze the margin line. When you're in a normal social setting always have a few "cost saving tips" in the back of your head, this will make it seem like you're in the same conversation as they are. This can be random facts such as "you can refinance your home for X% lower now!" to "XYZ came out with a cool promotion to lower your cell phone bill", naturally the example you choose depends on who you're talking to.

Complain About a "Boss": This is the best way to blend in. Even if you don't have a boss, just pretend you do and complain about it. This is probably the most common complaint after age 22 *"yada yada boss sucks or someone else is a jerk"*. The worst thing you can possibly do is complain about *customers* because then your cover is blown (and you've given away a key detail that you don't have a real boss). Just replace all your actual problems with the word "boss". You don't have production issues, you have "a boss who can't prioritize". You don't have a customer service issue, you have "a boss who can't give directions". So on and so forth.

Putting it All Together and a Why

For the first time we'll actually explain why you want to do this. If you've read the paragraphs above, you'll see the key items are: 1) lying down, 2) pretending to not be in charge of your own life, 3) avoiding dead giveaway expensive items such as a car, 4) avoiding leaks and 5) avoiding unsolicited advice.

Why? Well if you're serious about getting rich what you'll find is that people will try to prod into your life. Even if you get a measly promotion at some soul crushing job, people will poke around to see how much money you make. Think about this further… if you succeed with an actual business then people *will beg for jobs.* This is a guarantee. Now you have people emailing you with terrible ideas that don't work and asking horrible questions that don't make any sense. **This eats into your time.** If you're not where you want to be financially (yet) don't create more work for yourself. This is equivalent to running up a sand hill, when there is a hard dirt path five feet to the right. You're already in a tough game, don't make it tougher.

The other reason for this is filtering your own social circle. If you complain about a "boss" for example then you know the other person is not on the right path. Why? You'll see it in their body language. The same applies to driving cars. If you see a guy with an expensive car he's typically newly rich so you simply stroke his ego and eventually you'll figure out if he's worth adding to your network. The key is information and giving out the least while obtaining the most.

The last item for "why" is avoiding leaks. If you don't have a distributed cash flow system and all of it is concentrated under one person, the chances he or she blabs to other people is quite high. If you've got $20 million in real estate alone, the chances that you're under the radar is around zero percent. While this is a fantastic problem to have (later), it's best to delay the problem so you can continue choosing who you meet with. *In short, the reason for all of this is to choose your own network!* Most people are busy trying to "angle and sneak into" someone else's network. Instead you're cherry picking people you keep in touch with by giving out the least amount of information.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality

Getting to $10M+ is Inevitable.. $100M? Need Help.

Getting to $10M+ is Inevitable.. $100M? Need Help.

After writing on this blog for years, the one concept that seems to separate the rich from the middle class is the concept of convexity. If you tell someone they can become a millionaire in 10-years they think this means you save $100,000 per year for 10 years straight. Anyone who has made it to a million dollars knows this is not the case at all. Just like a regular job (which you should leave ASAP), earnings do not stay flat and earnings do not go up in a linear fashion. Everything has a “curve” to it and this is why a person who gets to $1M will likely make it to $10M unless they make significant mistakes along the way.

Getting to $10M the Easy Way

Getting to the First Million: No, compounding is not how you’re going to get to the other $10M. While it certainly helps a ton the last couple of years, the reason you’ll get there is because of increasing earnings or at minimum stable earnings. There is practically no chance that your 10th year of earnings will be lower than your second, third or fourth year. To make an illustrative example the below chart is a common way that people make it to their first million dollars.

As you can see here, you’re not going to get rich in your first 2-3 years. Unless you hit it big with crypto currencies, started and sold a Company extremely early in life or had some extreme one-time event occur, the gains are heavily towards the tail end. This is the same with practically everything in life. While you were only able to save around $55-60K in your first two years, if you become a millionaire, you will get this same amount by simply doing nothing (5.5-6.0% returns!).

At this point we’ve already separated the future rich people from the forever middle class people. Middle class people think that earning is “linear” so they need to put away $100K every single year. If that was true it would mean that their 11th year of work would only see an increase of $100K. This makes no sense at all. Even if you work a regular salaried career with *no* commission payment… we can bet that you’re earning well over 50% more in year-10 compared to Year 1 (more likely you’ve doubled your income or more). To drive home this point, even if your earnings flat-line for the next decade (Unlikely unless you never earn more than year 10 for the rest of your entire life), you still end up being worth around ~$5.4M (age 40 assuming 8% returns).

In a more realistic scenario, you’re able to grow at about 20%. This seems like a large number since everyone takes the “5% guaranteed returns”. Instead we’re referring to your regular 5-7% returns from investing and then an additional 15-16% from your business + career. If you somehow got to a million dollars without a business, then see the prior paragraph and you’re probably on track to be worth $5M or so by 40. Someone who started an actual business is more likely to get to $10M (relative ease).

Avoiding the Negativity: For those that still “don’t believe” then how about the actual value of the asset you’re building. If you are making $200K after taxes as a worker or $200K after taxes as a business owner, who is worth more? The answer of course is the business owner. We don’t know of a single business that sells at less than 2-5x net income so the person who makes $200K after taxes through his own business is worth at least 2-5x times as much as the person who earns the exact same amount of money as the salaried worker. Now people may say that terrible websites sell at 18-24months net income… But those do not make $200K a year. If they did, please email them our way and we’ll buy them out.

This part is probably the second most common mistake between "middle class" thinking and "rich thinking". If you're middle class you just look at the cash flows and think that it's the same value. It couldn't be further from the truth. The people who follow the plan we outlined, end up being worth $2-3M very quickly. Why? No rich person values his business until he is interested in selling it. If you're considering selling it… it means it was successful! Funny how the success cycle works. By way of example, once you clear your first $100K online or through another business venture you begin valuing the equity. You realize that you own 100% of an asset generating $100K a year. This is worth half a million dollars alone and does not include the money you saved as you built this from scratch.

Don't Screw It Up: Since the math does not lie from the basic items we wrote above, the amazing part is how many people screw this up… Badly. From what we've seen the people who make it to around $2-3M in their early thirties typically screw it up through lifestyle inflation, a heart breaking divorce or a grip of leverage. These are all controllable mistakes. If you get to $2-3M in your early 30s and can avoid those three items we'll say your chances of getting to $10M+ is 95%. The only exception here is if you inherited the money or you got "dumb luck" which is essentially equivalent to hitting the lottery or falling into money while *learning no skills*.

This is probably the most important part of the post. We've met a few people who executed on the plan and are around this range at this point (after all it has been about 6 years of blogging now!). The key things to be aware of are as follows:

Lifestyle Inflation: The funny thing about lifestyle inflation is that being a cheapskate actually costs you more money. We're referring to items that depreciate in value: clothing in particular. If you're actually serious about looking sharp, you're going to buy high quality shoes (~$500-600 range minimum) and high quality suits (~$2K range minimum) and then offset this cost by buying basic cheap items for the gym. Wearing brand name tank tops for workouts is essentially a waste of time as you should be focused on the workout not looking sharp. The second item in lifestyle inflation is buying "too much home". We covered this in a prior post which made people angry for no reason (because they are barely making their payments and are "house rich"). Don't be house rich. Everyone tries to be house rich and we know what happens when you do what everyone else does.

Heart Breaking Divorce: Pretty simple here, don't cave into your emotions. If you're really going to have a family etc. always lock away the money you made pre-marriage. This guarantees you have at least a few million to your name growing at 5-7%. Ideally, you can avoid it altogether. That said there are always "situations" since we get the same question a lot. So. The absolute bare minimum is stated in here.

Tons of Leverage: This is probably the hardest one of the three to avoid. If you've made it this far and are not an emotionally attached person, it means you're probably a higher risk individual (exact opposite of your typical investment banker). If you're a higher risk loving individual it means that you're constantly searching for a new high. Once you get to a couple of million, the typical move (that goes south) is over leverage into some business deal, asset or investment. For some reason, any time you give yourself a chance to lose it all… Life usually forces you to lose it all (part of the simulation). A good rule of thumb is to avoid levering up past your passive income (ultra conservative). And. We're not against debt (it's a good way to get rich), we're against debt to the point of stress.

A Tangent Note on Risk Taking: *One item you'll notice in the prior paragraph is the comment about high finance and low risk. Despite what is written in the news, high finance people are usually *not* risk taking (with their own money of course!). Anyone who has worked in the industry knows this is a fact. The typical banker actually tries to "save money" by maxing out their dinner expenses and even tries to cheat on taxi receipts. They are penny pinchers. Almost none of them take on real risk which is why there is a running sarcastic joke that when anyone says they will start something the response is "Yeah because you're a high risk taking entrepreneur". Bankers are typically a lot more negative and if you ever announce you're doing your own thing they'll laugh at you… Since your success will verify that they made a bad decision. This is a small tangent but needed to be said since we've seen a lot of bad info in the comments about this over the past few months.*

Getting to $100M, Time for Some Lady Luck

We already outlined a way to increase luck and here we're going to talk about the different types of luck and why you'll need some to get to the incredible 9 figure level. No we're not there instead, we'll explain why it requires some good fortune (mathematically). People may argue that some of this isn't luck and that's fine, we'll go ahead and guess they aren't actually worth 9 figures as the vast majority in this range will admit some luck was definitely part of it. Besides. If Warren Buffet was born before allocation of capital could make you rich… we don't think he would do very well in other money making activities hundreds of years ago (physical hunting, gathering and farming etc.).

Low 7-Figures, No Real Luck: We're a dangerously optimistic group of people. Based on pure optimism we think anyone in the United States who finds our blog can become a low 7-figure millionaire by simply following the most logic steps possible. No luck needed. The only requirement is 1) smart career choice, 2) effort in creating a second basic income stream and 3) a ton of effort in your early 20s. After that it's difficult to fail. From the prior segment on why we think this person will be worth $10M, we assume they end up quitting their career. But. Even if your side income is only moderate, at least you're still going to get to around $5M relatively quickly.

8-Figures, Some Luck: Essentially the luck needed is either gaining market share in a massive industry (cosmetics, skin care, diet, fitness etc.) or latching on to a fast growing space early (vapes, grey area drug market, a personal brand – the last requiring fame which is a personal decision we'd avoid). This type of luck is incredibly easy to obtain. The only real luck you need here is to catch the attention of a few influencers. This type of "luck" can be manufactured by essentially going to every single conference and meeting related to your field. If the product you're selling is legitimate (I.E. it works for just one big name in the space) then you're going to sell a lot of units out of the gate and create a new "base line" revenue level that pushes you into 8-figures relatively quickly. And. If it ends up being a one time wonder like figet spinners, well you'll get to mid-7 figures extremely quickly and that's not a bad place to be.

Bad Types of Luck: Before moving on you may get luck that appears "good" and just back fires on you. This is typically something that makes you a lot of money and then goes to zero. Lottery winners and large customer orders that end in returns are two big examples of this. Of the two winning the lottery is better since anyone reading this blog is likely more intense than the average person and wouldn't squander it. The last one is more delicate, essentially if you win a big contract try your best to make sure there are clauses that allow you to remain profitable. Sometimes people get overly excited about a new win that ends up making no money at the end of the day. Discounts hurt margins so be careful is the message.

Ultra Rich Some Serious Good Luck: The was an article from Baron's magazine some time ago that shows how concentrated the triangle gets as you move up the stack. We lost the link but here is the main useful picture.

Each wealth segment is harder and harder to break into. Doing the quick math you see about a million people worth $5-20M but only 270,000 worth $20-100M. Then it goes all the way down to 11,914.

Why is this? *It's because companies grow and die.* Most ultra wealthy people claim that they simply worked hard but how many companies and products stick around for a long period of time? The typical household looks completely different and brands that were incredibly profitable and popular such as Toys R' Us don't even exist anymore. The type of luck we're referring to here is *longevity*. Picking trends is not easy. Just 10 years ago investing in taxi medallions was a "good idea" since you got a high single digit yield and then Uber came through breaking every regulation known to man kind (killing them off).

So what is the point here? It means several forms of luck can be forced onto yourself: 1) learning the right skills like coding/sales is not impossible luck, 2) forcing yourself to meet people in a profitable industry is not impossible luck and 3) having differentiated skills relative to the competition is also not impossible luck. What is serious good luck? Being completely right on the sector and having a "mania" around it. If you can hit all of those once you'll get to the 9 figure area since you'll have a quasi monopoly on the product you're selling for a special point in time. Take advantage of it by moving fast and you'll be ultra rich. It's low probability but hey at least by following the road to ~$10M you've got a chance for $100M. As Felix Dennis said… You won't get rich working for your boss!

****

Goals Cause Depression

[Goals Cause Depression]

Many people have asked us to create another New Years post, but there is no reason to do so. New Years resolutions are likely the cause of depression across the United States (no there is no way to scientifically prove it, only basing this on experience). Unlike regular people, we don't make resolutions, we don't make goals and we don't even have a system (although many people have recommended we start a system). We simply spend our time [becoming more efficient]. With that said, here are several reasons why goals cause depression and why you should eliminate them in general.

How Goals Lead to Depression

Goal Oriented People are Type A and Boring: Make no mistake, we used to create a lot of goals. Every single educational institution will tell you to create goals and "stick to them". The problem is that this will make you miserable for the foreseeable future as you'll only focus on that "one goal"… for about three weeks… since you made it a recent resolution. Sure doing an activity to achieve that goal near-term is healthy, however, you'll find yourself thinking about it incessantly and talking about it as well. (Hint: no one cares about your goals they only care about themselves!)

Therefore, when you're creating your first new goal, you're going to be laser focused on it and talk to people about it who won't have any interest in you achieving the goal. In fact, they won't even believe you will achieve it because every single person you meet will believe they are better than you. This means your goal must be reasonable in "their world view" otherwise they will shut you down. Why? Well if they can't do it certainly you can't! Congrats. Since your goal *seems* to live on another planet from most people you speak with, you'll be labeled as "boring" or "crazy" as well.

Goals Don't Lead to Happiness: If your goal is to become a millionaire we can tell you that the day your net worth turns from $999,999 to $1,000,000 won't make a difference. You will not get some sort of bump in happiness because if you were at $900,000 or something like that, you'll feel that you're practically there already. In addition, nothing changes. If you were in shape and a millionaire then you're a fit millionaire. If you were overweight and out of shape, then you're the same person with a heavier wallet than before.

Looking beyond that basic piece, you will even suffer from some sort of apathy after achieving your goal. You worked for months or years to get to where you are now and yet you feel exactly the same as you did before (perhaps the actual day was great but certainly not a month after). Now you have to reset some sort of new benchmark which is just a restriction on *potentially blowing past it* if you didn't have that mental hurdle in the first place! If you wanted a million bucks but changed it to "as much as possible" you're probably going to think bigger and less restricted (sticking with basic money examples).

Goals Create Frustration: Many goals start off with big gains at first and then fall off as the gains become less linear. *All improvement is non-linear (lots of nothing before a big gap up).* If you're going from $0 to $1,500 the speed can certainly be linear. But. As we work up to higher numbers you'll find that *event* driven income will drive your net worth once you're in the seven figure territory.

Expecting that your improvement is going to be linear (for practically anything) makes it mentally more difficult to keep going. So not only are you focusing several hours a day to achieve that goal, you're also using your will power muscles (yes will power is a muscle) just to keep going. If you didn't have the goal in the first place and simply allocated a specific amount of time to becoming "more efficient" at that category, you'd never have to use your valuable will power muscles in the first place!

Any Goal Worth Having Isn't Worth Sharing: If you tell someone your goal and they think its achievable (vast majority agree – see regular people) your goal is too small anyway and shouldn't be talked about. If your goal is unachievable to 99% of people (vast majority disagree), then you shouldn't bother telling anyone because they will think you're crazy or boring. Funny how that works, huh?

If you have a real problem you want to solve, you should allocate time to it and let your effort drive the process forward. We don't know of a single "goal" that doesn't require time on your part. Even if your goal is to work less and make more, then you're going to have to sit down and solve that problem by outsourcing tasks and free up time for something else. The planning itself takes time as well.

The crux of the problem is simple. ***If you want to get better at something you shouldn't need to tell anyone… it should be a lifelong commitment otherwise you didn't want it anyway.***

If You Miss a Big Goal You'll Be an Even Bigger Mess: We all know those guys back in school who thought they were going to be professional athletes or become famous musicians. Many of them failed (maybe you know a few famous ones!). Then they proceed to complain about not making it and living in the past… explaining how they were extremely good compared to their home town… (Which is not a good benchmark by the way). Oh. Eventually they will exaggerate how good they were to make themselves feel better about being well past their prime.

Announcing a Goal is just as Bad as Motivational Seminars: You're doing the same thing as the people who watch motivational videos. Sending a quick jolt of adrenaline (that won't last) about all the cool stuff you're going to do and how you just needed to *"chew through that brick wall man!"*. Avoid these guys like the plague. Anyone who needs to read about someone else's success to feel better about themselves should go back home to mommy and get a big hug.

Allocation of Time Not Goals

We already know what the primary rebuttal is going to be. "But everyone should have goal posts and deadlines otherwise they won't stay on track". We disagree. All this really means is time allocated to an activity. We'll break down several examples:

How Can I Sell More Product (Not I want to Sell $100K more): Okay, in this case you have to quickly review how much you were able to generate last year. How many man hours did you personally spend on it and how many hours did you pay for help? Then calculate how much more time you'd need to do it to at minimum accomplish this (a annual increase). Then take a step back and say *"How can I reduce that amount of time"…* now you'll spend a few minutes a day ruminating about this as you try to solve it (calmly), while adjusting your schedule. You now have the *maximum* amount of time needed to achieve this "goal" and instead… You have framed this as a *problem* related to time. Solve the problem.

How Can I Lose Weight (Not I want to lose 10 pounds): Another easy one solved by time. Calculate how many hours you're spending at the gym and how many calories you're consuming. Keep it simple and tally them up and just reduce and increase from there. Since you've now framed this into a *problem* (I need to reduce weight) you can now adjust how much time you spend attacking this problem. Another easy one solved by a calculation and you won't even have to adjust the amount of time per day you're spending on this problem.

How Can I Have More Friends (Not I need one new best friend): As a quick reminder, there is no need for some huge crew of friends, you'll find that you have a handful of real friends and the rest are pretty much hoping you'll fail. That said, this problem is solved without a goal as well. All you're really saying is you want to allocate more time to your social life. Stop and think about what type of person you want to be around, a basic frame work. Once that's done you simply spend more of your social hours in those locations. Again, you've framed this as a problem instead of a goal because you'll increase the number of friends you have over a period of time if you simply spend time in the right markets.

How Can I Speak a New Language (Not I want to be fluent in a language): Instead of assuming that you'll be fluent in a specific time frame (very difficult to predict fluency), you can say you want to speak a new language. This can mean basic Russian, conversational Russian, Fluent Russian or Native Russian (where you know the slang as well). We don't know where you are in the language curve and it doesn't matter… this is now a *problem* that needs to be solved. You now sit down and review where you are and what tools you need. If you know nothing, you allocate time to free courses online, if you have a basic understanding you should probably make a couple of trips to the country and buy some books at your reading level (and practice)… so on and so forth. You'll find the same dynamic at play, this is a function of time.

Conclusion: To recap this, instead of having Goals you're going to frame your life into problem solving. Problem solving just means the allocation of time to specific topic and potentially resource constraints (then you need to throw money at it to help solve it). Now remember, we've stated that goals are not useful because you should never speak about them. Problems are the same way. You don't talk about your problems to people (they don't care anyway) so we've reduced the chances you'll even talk about it. (Yes, yes, if the person you're speaking to is someone you need to help solve your problem then of course you have to tell them what you're looking for).

Actionable Steps

– Figure out what problems are most important to you and allocate time to sit down and solve them

– Never tell anyone what your problem is (again, they do not care)

– Find a minimum amount of additional time needed to help solve your problem (see improvement long-term)

– Do not create goal posts as they will be a negative reminder of "not making it yet"

– If you can't find time, you didn't care about it anyway

There you have it. A short rant on goals and instead we've outlined a game plan that won't require a "New Years Resolution" ever again. We'd like to thank all those guys clogging up the gym that are now starting to give up. We noticed the dismay as they didn't get what they wanted immediately and suffered depression within 11 full days! New Years resolutions cause depression by around February 14 every single year (not for our readers though!).

Great Businesses: From Expensive to Cheap

[Great Businesses: From Expensive to Cheap]

When we think about "great businesses" everyone talks about Google, Amazon and Facebook. Not to mention the top tier brands like Nike, Apple and Coca-Cola. While these are all great businesses beyond a shadow of a doubt, the chances of creating these mega corporations is quite small. In fact, there are millions of other ideas that generate very high cash flow, revenue growth and stability that most people wouldn't bother looking into because they are "boring" or "unsexy". Instead of trying to become billionaires we focus on making a few million ($5-10M or so) and then calling it off (hitting cruise control to enjoy life versus playing the "who has the biggest wallet" game). Everyone has their own set of principles and ours are outlined in that sentence alone. No point in being rich if you're busy working all the time (money is just a tool). So below, we'll go through several good businesses.

Higher Cost Items

Financial Modeling Classes: We always laugh at the high price tags. People really do pay $3-5K or more for "financial modeling" classes before joining Investment Banking and other high finance sub-segments. *This is highway robbery*. Any major bank already has pre-made templates for every single type of transaction: Merger of Equals, Acquisitions (Cash vs. Stock), comparable company analysis, Leveraged Buyouts, Financing… So on and so forth. Learning how to use excel (something a macro can do by the way) is not going to set you apart. Now here is the fun part… Will anyone listen to this paragraph? Nope.

Why? Well the vast majority of high achievers will do practically anything to get an "edge". Financial modeling courses target severe insecurity (failing at first position out of college). Now that you've seen the phrase "severe insecurity" you know what that means! Great business. Once you get them to learn something new they will think it was worth the money. Besides, spending $3,000+ on something that added no value would be something a "dumb" person would do and no one who is getting a high paying job is "dumb"… right? Now you see the entire full circle of the business model. They are not targeting dumb people. They are targeting the "need to succeed" and doing so in a way that requires very little operating expenses (only cost is a person and a room in a central location).

Motivation & Self Help: Another great business model. While we have a controversial view on "motivation" in general it does not mean the business is bad. In fact, it is a great business. If you can successfully get 100 people or so (rough math) hyped up about your ideas, then one of them will succeed (1% is reasonable and likely low de to large numbers). You then build off of this with success stories and how the presentation/seminar changed their lives! You can wash rinse and repeat this because it essentially "stacks". If you get one devoted person, they will then likely get at least one more for you.

This is another one we would classify as "targeting insecurity". You're essentially telling people they can be "more than they are today". In some form of rah rah scenario. Now it is true that taking a positive view on life and killing yourself (working extremely hard) will result in a lot of benefits… paying $3,000+ to hear this message is a bit of a stretch to say the least. No successful person needs to pay for these seminars, instead they work hard and improve constantly. The last item before signing off on this great business is you don't even need to succeed. That is right. All you have to do is "inspire others" to succeed and you'll succeed. By getting other to believe your message you'll be successful by default "perception is reality" as they say.

High End Fashion: Brand names are the highest margin businesses on a "like for like basis". If you have the exact same products, you can charge another 50% margin on top of the product (likely more) just because you slap on a name such as Gucci on top of it. This is 100x as true for jewelry and any item that essentially has fixed costs (no variable costs). We could list off a hundred brand names but jewelry and clothing are the two most obvious ones since they deal with particularly high volume.

The one downside of going down this path is your market size. Since your goal is to be exclusive you can't do brand damage by suddenly allowing your products to show up at Nordstrom Rack for example. This would take the clientele down a notch since it would no longer be seen as a luxury item and more of a "upper tier" brand. Even though the product could be exactly the same quality wise, the brand damage would not be worth it for these high-end products.

Lower Cost Items

Dive Bars and Pizza: If you have a better idea of what the average person wants, focusing on these two low end businesses are profitable. Sure online sales is still 100% the best way to go if we're asked. But. Both late night pizza shops and dive bars pull in large amounts of money. It's interesting because the higher end clubs rely quite a bit on bottle service and heavy spenders (hence the big turnover) while the dive bar crowd has much lower costs and doesn't have to pull in $10,000+ tables every weekend to make a living. A large number of people buying an $8 glass of wine that costs about $1 or less is going to create high cash flow assuming that the overhead cost is minimal (typically is since we're talking about smaller venues).

The second item is what most people do after partying all night. They go to some nearby venue that serves pizza or another unhealthy basic food option. Sure it's not a glamorous business… But the cash flow is very good yet again. Dominos Pizza can turn a profit off of their cheap $5-6 medium pizzas so those $3 slices of pizza sold at your standard shop are high margin. Think about how many slices of pizza would be required to generate a full medium sized pizza and you'll get an idea for the math behind it. Naturally, most people won't think about this since they spent the night partying and a few bucks is nothing. This is great for you if you're interested in a basic brick and mortar.

Magic Pills: We've covered this many times in the past so we'll keep it short. Anything that is supposed to help: 1) focus/intelligence, 2) weight loss or 3) magic skin care will be an amazing product. The testosterone replacement pills were a great idea but the market is just a drop in the bucket compared to the other three. Weight loss or skin care are billions of times larger than any of these other smaller secondary markets. If we fast forward to the year 2150, we have no doubt that the same markets will exist. People don't want to work hard, they don't want to think, they just want to wake up and suddenly have their problems solved. You can even put terrible stuff into the pill such as Guarana and it will be bought (diet in this example).

Scents: We'll take a broad phrase here. Anything that has to do with improving the smell of an environment typically commands extremely high margins. Cologne, perfume, air fresheners etc. All of these items cost almost nothing to make. A bottle of good smelling liquid costs fractions of pennies more than pure water (except maybe Fiji water, they've successfully branded that thing to extreme prices!). These are high volume products but a popular scent can create large amounts of money. If you're familiar with the brand "Axe" they did a phenomenal job targeting men who had trouble dating women. This was so successful you can even google the phenomenon. We suggest the following article: How Axe Built A Highly Scientific, Totally Irresistible Marketing Machine Built On Lust

"For here, at this very lab, the same scientists, with the same equipment, often with the same ingredients, are designing elegant $200 colognes and $3.99 bottles of Axe body spray"… We're not exactly sure how the Company was able to do this. Yes we know that it was marketing, but the level of execution was incredible to watch.

Services

Blue Collar Work: Using this as a vague term to encapsulate plumbing to cleaning to landscaping (and many more). While this is unlikely a path for most of our readers it is by far the most lucrative path for someone who has a limited skill-set. Even if you're not the best with numbers and you're not going to be creating high quality internet ads/products, you can always work hard. Blue collar positions will still be around for the next several years. Sure automation will begin to replace pieces of it, but you're going to have a client base that unlikely sees a big benefit from a few dollars saved. Besides… You can always buy the robots in the future to do the work (hedge yourself out). This line of business is a "must have" meaning that everyone will need someone to help fix up a house, fix a broken faucet or improve the landscaping of their backyard. In short, this is much more time consuming up front but has a clear path to winning (long hours and scale). After you can hire your own employees and build a rolodex of repeat clients its a solid business (just isn't sexy to call yourself an electrician for example).

High End Services: The wives of rich men are not going to have their hair done and live without spa treatments are they? Of course not. The cost of massage oils and other items used at Spas is somewhere around a few pennies so the only real cost here is the therapists and a cool "atmosphere". You'll hear the word phrase "wanting to be pampered" frequently and this just means higher margins for you! If you can create a high quality "relaxation" spa, chiropractor or otherwise… You're going to be swimming in money. These are great businesses because many people enjoy the experience which can result in a much higher premium on the cost. The small increase in physical well being is more than worth it for a wealthy person so the trade off ends up being a "win win".

Terrible Businesses

With some of the best ideas out of the way we'll go ahead and highlight "terrible businesses". *This does not mean you will fail at them.* We are simply pointing out that there is high competition, slimmer margins and a lower chance of success.

Brick and Mortar in General: At the end of the day, having a business with a lease + monthly payments is going to make it a lot harder to succeed. People attempt to justify this cost by saying "built in customer base" but that is extremely weak. **Online you can buy the customer base with a much lower cost and they can be located anywhere in the world (this is what we recommend for beginners)**. If we've learned anything from the latest Facebook privacy issue it is that these companies know exactly who to target with their ads. This is your benefit and at a much lower cost than a monthly lease payments.

Restaurants: Excluding the late night and dive bar examples we gave, the restaurant space is extremely competitive. Sure you can go down the higher margin path with drinks/frozen yogurt etc. But. The competition for restaurant money is quite high. They are all over the place and if you're in a major city you're likely competing with 5-10 other solid restaurants in the exact same niche.

Being a Private Driver: The math behind driving an Uber or Lyft is just not good. Unless you're driving an extremely fuel efficient vehicle, it's going to kill your margin line. When it comes to businesses we'd avoid trying to compete against these tech giants in general. You're better off becoming a dog walker because at least you can have a 0% operating expense line and you can build a client base to then consistently walk 100s of dogs a week.

Low-end House Services: This is specifically the low-end. High-end moving/home services are quite good as you're likely dealing with the aging population and you're dealing with bigger changes. Low-end cleaning/services is tougher to scale because each employee is going to make a much lower wage relative to the higher-end. If you find a niche within the housing services space make sure you can take some sort of item and scale it up (carpet cleaning with a large piece of equipment that usually needs to be rented, the mentioned plumbing/electrical work etc.). Just don't go out there trying to scale a business with a mop and some soap. Find heavier machinery that cuts on time and is too costly for your average person to purchase for their home.

Guest Blog Post: Controlling Your Habits

Guest Blog Post: Controlling Your Habits

This is a guest blog post from a frequent commenter under the user name "recent graduate" he may change his name in the future and has noted he will answer questions on his post.

There is a reason why motivation won't turn a regular person into a winner. Or why a regular person won't suddenly turn into a winner. The reason is habits. Habits are what your body automatically does without much thinking.

Habits occur in our "lizard brain". It is not until relatively recently in our existence as human beings did we develop the ability to think and reason. The thinking part of the brain – called the Neocortex – is a separate part of the brain where our habits lie – the Basal ganglia.

This means that you can't entirely control your habits by logical thinking. Habits, negative and positive, are actions performed automatically by your lizard brain.

Habits are started by triggers – objects or feelings that remind our lizard brain how to act. Since the habit performing part of the brain is not the same as the thinking part of the brain, often times we will perform a certain action without much thinking. For example, when we get bored – we check our phone automatically, without much deliberation.

Therefore, the best solution to controlling negative habits isn't simple willpower or logic. Rather, it is simply blocking their triggers.

Use block lists for short term negative habits

A block list consists of triggers that activate your negative habits. Every time you catch yourself in the middle of a negative habit, write down the trigger that started it so that you are aware of that particular trigger next time around. Here are a few practical examples:

1) Web browsing

To curb mindless web browsing, I installed a program that blocks any websites that distract me from doing work. It's called "FocalFilter" and it's free (no affiliation). Every time I go to a useless website when I'm suppose to be doing work, I'd add that website's url to the block list on FocalFilter. This way, I can't access the websites that will make me browse mindlessly. I even block Google.com sometimes.

2) Excuses

Whenever you try to do new things, you'll probably come up with excuses for why you shouldn't start. Making excuses is a negative habit that you don't even think about most of the time. For example, you want to start a new website, but then every time you sit down to start, you make excuses, such as, "I don't have time", "I don't feel like it", "I'll do it tomorrow", "It's not as important as xyz, blah blah blah."

Excuses block list: get a Post-It note to write down your excuses. Write out the excuse every time you make one, and force yourself to never use the same excuse twice. Pretty soon you'll run out of excuses and you'll have to use your thinking brain to come up with an excuse. Once you activate your thinking brain, you'll realize that believing in your stupid excuses is a negative habit, and you're more likely start.

Another example of excuse block list: In trying to be more confident, you are trying to approach girls. You see a girl walking by and you didn't do anything. Excuse #1: "She's out of my league." Okay. You see another girl and you choked. Excuse #2: "She seems busy." Okay. You see another girl and you froze. Excuse #3: "She's too tall". Okay. Now you see a girl and this time, you looked over your excuse block list and saw how stupid excuses have been. Well, you just activated your logical brain and now you're more likely to approach her. Keep writing down excuses in your excuse block list until you realize you can't think of a new excuse and then start.

3) Location

Sometimes your surrounding is your negative habit trigger.

This one is especially true for me for waking up early and getting ready to do work. Back then, I'd wake up half asleep, read on the iPad or blog post that I don't need to read, then get out of bed after lying there for 1 or 2 hrs after realizing it's time to go. I realize that the bedroom itself triggers "bedroom" behavior, i.e., I would be in sleep and relaxation mode.

Solution: I now have two alarm clocks – one close to the door and one outside the bedroom, half way to the bathroom. The alarm that's outside my bedroom is set 1 minute past the one inside my bedroom. This way, when I wake up to turn off alarm 1, alarm 2 rings outside my bedroom and I'd have to open the door to close alarm 2. Thus, I'd be outside my bedroom already so I'd just walk a few steps to the bathroom where I'd brush my teeth to wake up completely – saving myself an hour or two everyday.

The main idea is that the bedroom is a symbol for sleep and relaxation. The location itself is a trigger.

Do you have a location that is counter productive for you? Sometimes it isn't yourself to blame but your location. Maybe you're more productive in one location than another. Find out what's wrong with the particular location and get rid of triggers or move away.

Summary: The main idea is to add resistance to your negative habits by blocking its trigger and activating your thinking brain. Your thinking brain will then be able to decide logically and rationally and stop yourself from deliberately pursing your negative habits.

Long-term Habits

Say a 10 yr old has a choice between playing video games and learning a skill. He tries both but at the end, he plays video games. His brain enjoys playing video games because there's very little resistance to the reward that video games give – pure fun. But when the boy is learning a skill, he doesn't always have fun so it is a much harder habit to stick for him.

Our brain is very adaptive and always try to go with the most efficient way of getting a certain reward.

To tackle this problem logically, you simply increase resistance to negative habits while decreasing resistance to positive habits. The first part of the post talks about ways to increase resistance to negative habits, mainly, by removing negative habit triggers. But that will only take you so far because the time you gained from not performing these negative habits needs to be filled up with a positive habit – or else your body will find another negative habit to stick to.

How to Decrease Resistance to Positive Habits.

Our brain's efficient nature means it prefers instant gratification. If you were trying to exercise to lose 10 lbs, but exercising isn't your habit, chances are it is very hard to start an exercising habit in this particular context. Your brain wants it now and if exercise doesn't show immediate results, your brain isn't going to remember it.

Therefore if you want to lose 10 lbs, for example, it's best not the care about the 10 lbs, but to care about the journey to losing it – that is, how to enjoy exercising and/or how to make exercising instantly gratifying.

The Two Type of Positive Habits

So you are committed to performing positive habits to improve your life. However, you may have realized that some habits stick but some don't. You can blame your willpower and discipline all you want, but taking a closer look at these habits and you'll realize that there are two different types of habits: vitamins and painkiller habits.

Vitamin habits are those where the reward isn't felt immediately. Painkiller habits are those where the reward is felt immediately.

If your habit is a vitamin, chances are, it isn't going to stick very long. If your habit is a painkiller, chances are, your brain will remember the good feelings and you will stick to it.

The problem is that most positive habits are vitamin habits and thus, you will forget and give up easily.

If you want a vitamin habit to turn into a painkiller habit, there are a two ways:

1) adding the vitamin habit into an existing habit routine
2) changing the way you think about the vitamin habit

Since vitamin habits don't offer instant gratification, the best way to make them stick is to add these vitamin habits into a routine of an existing habit.

Take for example, juicing. (Hat-tip Mike Cernovich)

Juicing is the ultimate vitamin habit (pun intended) – you know it's really good for you but it takes a lot of time to juice and clean up plus after you drink it you often don't feel a huge different (vs. a cup of coffee for example). You can set up a calendar, force yourself to juice 4x a week or whatever, but you'll probably abandon the pursuit after a few weeks, since it doesn't offer an instantly gratifying reward.

To turn juicing into a painkiller habit, simply pair juicing with another habit routine with the result being that juicing will enhance the routine. The best one is exercise. Whenever you exercise, try to think about your heart pumping immense amounts of blood throughout your body. Then tell yourself this: "There is no better time to drink juice than now because when your heart rate is up, blood is pumped more efficiently and your body can benefit the most from the nutrients in the juice. You don't want to waste this opportunity, do you?"

What happens when you think like that is that you just added a pain point (not wanting to waste the best opportunity to nourish your body), effectively turning the vitamin habits into a painkiller habit.

Another great example is exercise itself – a vitamin habit until you find a pain point.

There are many ways to pair exercise with a current routine. For me, I pair exercise with morning work sessions. Before I started exercising regularly, I often find myself easily distracted and my mind unable to focus on the work I'm trying to accomplish. After realizing that exercise increases the heart and breathing rate which increases the amount of oxygen and nutrients to the brain, I exercise hard enough to get my heart rate up before I sit down and work. Immediately, I would notice a difference. My focus is sharp and intense plus I'm now able to get more work done for a longer period of time.

The other way to turn a vitamin habit into a painkiller habit is to change the way you think of the vitamin habit, specifically, change enough of your thinking until the vitamin habit turns into a painkiller habit. Usually the most effective way to change your thinking is to find alarming facts about something that can be cured with the vitamin habit. Here are two quick examples:

1. Sunscreen is a vitamin habit – until you learn the truth. You probably know that UV rays from the sun causes skin damage. Did you know that 90% of our wrinkles are caused by UV rays? Whether or not that statement is correct is not important. What's important is whether or not you want to implement the sunscreen habit. If you do, then never try to disprove that statement – just every time you see the sun, wear sunscreen out of fear that the sun will give you irreversible wrinkles.

2. Maybe eating healthy is the vitamin habit that you're trying to turn into a painkiller habit. Find facts that will change the way you think about eating healthy. Did you know that acne is caused by a diet high in processed carbohydrates? If you want to stick to eating healthy, don't try to disprove that statement and simply eat healthy out of the feat that you'll get acne if you don't eat healthy.

Summary

1) Habits and thinking do not come from the same part of the brain so use your logical thinking brain to control the triggers that start the habit, not the habit itself.

2) You don't need extreme determination and motivation to stop a negative habit. For short term, simply intentionally add resistance to stop negative habits by blocking or removing its trigger. For long term, you have to replace negative habits with a positive habit.

3) For positive habits, there are two types of habits: pain killer and vitamin habits. Be honest if the positive habit you want to implement is a vitamin or painkiller habit. Vitamin habits are hard to stick because the rewards are not immediately felt. Painkiller habits are easy to stick to because the reward is immediate.

4) To be consistent with vitamin habits, integrate them into common habit routines or change the way you feel about vitamin habits. Fear or insecurity is an excellent trigger to turn vitamin habits into painkiller habits.

Thanks for reading! Hope this helps. Since this is my first article ever, clarifying questions are ok and comments are absolutely welcomed.

Guest Post: Ed Latimore's Financial Journey

Guest Post: Ed Latimore's Financial Journey

I'm gonna clear the air on something right away: I grew up as poor as you can in America. I was intermittently on welfare growing up, lived in public housing projects until I was 18, and had to start working at age 11 if I wanted extra money for anything. I'm a product of inner city public schools and I experienced all the distraction and violence that comes with it.

I tell you this so you kill any notions that I had advantages growing up. There were no role-models, parental guidance was non-existent, and there wasn't money for everything needed–let alone anything I wanted. But I'm still here, doing great, and making more money than anyone I ever grew up with thought.

If you have any excuses for why you can't make more money, I'm not the one you want to talk to. Save it for your entry into the victim olympics. If you wanna learn something that can make a difference to your life and your bottom line, read on.

Mindset:I debated writing about mindset. It's not that I don't think it's important, but too many guys get focused on the mindset without taking any supporting action. I put it in because the one thing that took me from broke as hell in my 20s to where I am now was a MAJOR shift in my thinking. Writing anything about personal finance and improving your ability to make money would be incomplete without address the cultivation of the proper mindset.

You need to be pissed off at how your life is going. I clearly remember the day that I got so pissed at my life I almost cried. I was getting ready to close the cell phone store I worked in before I headed home to the room in my friend's house I was renting for $200/month. Someone came in to buy a phone with 2 minutes left until closing. I couldn't kick them out because of company policy. Instead, I had to put on the fake customer service personality until they left an hour later without even buying anything. At that moment, I had enough.

I felt like I should have better in my life. I barely had enough money to do anything besides work, go to the gym, and drink. I didn't feel proud of the person I was. I was 27 and had to be on some customer's time schedule for $10/hr. I sat angrily in my car for almost an hour. Then I decided I was going to start doing whatever it took to make more money.

This was before I knew anything about making money online, so I enlisted in the Army so they'd pay for school. I was willing to suffer and risk the possibility of being sent to a combat theatre so I could be worth more. This is when I stopped drinking because I wanted to give myself the best shot of getting my shit together. When I got back from basic training and AIT, I lived across the street from my gym so I didn't risk falling into any BS that screwed my life up.

Realize this: The only mindset that matters is wanting it bad enough. My only motivation was not being the same person at age 33 that I was at age 27. I didn't care how long it took to get my money right. That's the only real mindset you need.

The Most Important Thing: Value. If you don't have any, get some. If you aren't sure exactly what constitutes "value", it's simple: anything that people are willing to exchange money or time for. When I was broke, the reason was simple: I couldn't do anything that people were willing to spend money or time on.

As long as people are willing to give you their time or money, you've got value. Views on your blog, followers on Twitter or IG, or youtube subscribers is an investment of time. Last year, my social media easily made me over $100k. This is because people are willing to invest time and read what I say.

This gives me the opportunity to make recommendations and potentially earn commissions from them. Some people have a beef with affiliate marketing, but it has changed my life. I hate to borrow something I was told back when I sat through MLM pitches, but it's highly relevant here: you already make recommendations via word-of-mouth, so why not get paid if someone makes a purchase because of it.

Affiliate marketing is just a tactical idea that specifically applied to my circumstance. It demonstrates a strategic idea that you can use to increase your value.

People trust my recommendations on a thing because I demonstrate how said thing ***has increased my value.*** Whether it's a nootropic to help me learn, a training program to get me fit, or a course to make money, my life stands as a testament to the power of what I'm recommending to increase value.

This is another display of value. Because the results of my life are stellar, people give anything I say more value and consideration. This is goes beyond affiliate marketing and into the effects of the halo effect on both yourself and those around you. It's a lot easier to increase your value when you've already demonstrated your worth in some way.

If you can do one thing, you can do anything. Each small challenge you conquer convinces you and others that you're worth a damn. Truly believing this is the difference between working to barely survive and making more money than you need in a way that you love.

Problems: If you can solve problems, you'll never be broke. This is the truest statement you'll ever read in regards to making money. This lays out another surefire way to increase the amount of money in your pocket. Solve other people's problems. It's really that simple.

People hear the idea of solving problems to make money, and they immediately imagine they need to invent something completely new. Don't do that. You'll just make this thing more complicated than it needs to be. From now on, think of problems like this: anything that causes people discomfort.

Now tell me how many problems you see? Neighborhood kids take advantage of this in the winter shoveling snow and the summer with a lemonade stand. People don't want to get cold or they're need refreshment from the heat. Problem solved, money made.

Entertainment relieves the discomfort of your boredom. Copywriters relieve the discomfort of low income. The discomfort doesn't even need to be clear and present. The business of insurance is providing relief from the financial discomfort of an event which may not even occur.

The strategic idea here is that you need to solve people's problems. What I've found is that the problem solver's mindset is intellectually simple for people to grasp, but challenging to put into action. This is may seem like an obvious statement, but people have a much harder time understanding the concept of "value" than "problems".

Specifically, I've executed this idea through the selling of my twitter products and services. I wrote a 37-page ebook about how to write for Twitter in a way that will make people follow you and engage with you more. I also give exclusive attention to accounts who want me to retweet them more to help them grow. This solves their problem of how to get exposure on social media.

I personally think that Twitter is the greatest thing since the internet itself, but I want to remind you that it is just social media. It's not something that people need. It's not even something that everyone wants. But there are people who do want to have greater success on the platform. To them, lack of social media success is a problem.

I'm able to make a decent amount of money per month because I'm the one who can solve their problem.

It's Recursive: Valuable people solve problems. Solving problems makes you valuable. This is probably the most basic way for people to understand how to make more money. People who can't find a job after college refuse to face a simple fact: they actually can't do anything of value or solve any problems. They can't solve any problems that people find uncomfortable enough to pay them enough money to live on.

When I was in my early 20's, I worked at a Starbucks coffee. Out of a staff of 10, I was one of two people who didn't have a college degree. Let that sink in. These were people with heavy college debt and the best they could do is make lattes.

The point of this section isn't to bash people who study low-demand subjects; they're reminded of their foolish decision every time the rent's due on a Wednesday and payday isn't until Friday. The point is to cover something obvious but important: not all problems are created equal.

We aren't all worth the same because we all solve different problems. The baristas I worked with at Starbucks solved the problem of "manpower". A heart surgeon solves the problem of "cardiac arrest". A movie solves the problem of "boredom". You get the idea. Generally speaking, your income will be decided by the following formula:

*Income = (Number of people you can simultaneously solve the problems of) * (Level of discomfort relieved)*

This formula should make everyone's income level make a little more sense. If you want to make more money, you need to either increase the number of people you can simultaneously help or increase the level of discomfort you can relieve. First let's start with the common path most people take to making more money: increasing the level of discomfort they can relieve.

Increasing Difficulty of Problem Solved: This is why the STEM degrees (in particularly, the "T" and the "E") pay so well. This is why doctors and lawyers are paid well. This is why trades can take a person out of the ghetto and into the upper middle class.

These professions allow you to solve big problems for humanity and alleviate huge amounts of discomfort for people. This thinking is ultimately why I went back to college when I was in my late 20's and majored in physics. I figured this was my route to making more than $1k/month. While I don't have a job where I use the degree, I now charge $50 for private tutoring in math and science.

I could probably charge higher because people who can tutor higher level mathematics and sciences are so rare that I actually have to turn down work so it doesn't turn into a full-time job. There isn't much demand for tutors of any other discipline outside of foreign language skills.

4 years ago, I didn't have the ability to solve this type of problem. As a result, I was only making $10/hr at a full-time job. Now my wage is $50/hr for part-work side-hustle work that's a labor of love. This is the power of solving difficult problems that cause client a high level distress.

This also applies to areas of sales where your compensation is mostly commission. Anyone in this type of sales is tasked with double the discomfort to alleviate; they have to make money for who they're selling for and figure out how to find and close people who need their discomfort alleviated.

Good salespeople are so valuable because they alone keep the lifeblood flowing through a business. They not only alleviate discomfort, but they prevent it as well.

Increasing Number of People Helped At Once:I hate listening to people complain that it's unfair that entertainers get paid more than people who serve society. They don't understand the basic formula that I gave you above. The police officer who puts his life on the line is limited by space; he can only save or help one group at a time. Professional athletes and actors entertain millions of people at once.

Athletes, actors, comedians, musicians, etc. Anyone who has the ability to have their skill or service be enjoyed by more than one person at a time has the opportunity to make a decent amount of money. I've self-published 2 books on Amazon as well a few e-books. This allows many people to simultaneously consume my knowledge.

Rather than only get for paid for a 1 hour consultation session at a time for $150/hr (my consultation fee), I can sell 30 books on Amazon at a $6 royalty + 10 e-books on about twitter for $37 + earn $100 in affiliate commision. These aren't big numbers, they reflect a minimum of 9-12 hours of my week. Some hours are more. Some hours are less. All hours are profitable because I have the ability to deal with many people at once.

Non-Locality and The Internet: Everyone needs to learn how to make money online. In 2019, almost every service can be performed on the internet. You must figure out how to make money online, preferably by selling something. When you make money online, you do something that makes it virtually impossible to stay poor: *you divorce your location from how you make money.*

I remember last Christmas waking up to a few sales and royalty payments from my books at the end of December. I was on vacation in Portugal. This was the first time in dawned on me that I didn't need to be anywhere specific to make money. As an extension, I can make money when I sleep because people on the other side of the planet, where it's daytime, can find me and spend money on what I have to offer.

This set up allows me to impact even more people per unit of time. Understanding and taking advantage of this has changed my life and my income level faster than any other tool and piece of knowledge.

In Summary: Making more money comes down to deciding that you're going to do it, becoming more valuable via solving uncomfortable problems, and doing it in a way that allows you to reach many people simultaneously. I don't think this a difficult task, nor does it have to take particularly long (18-24 months). Anyone can make more money. If I can, then so can you.

WSPs Notes: As a side note, we've seen Ed's twitter feed pop up over the last few years. Over time, somewhere around early 2018, it was consistently showing up in the feed. We had a guess that he was about to move into making 6-figures or had recently made the jump to some higher echelon. Fast forward to middle of 2018 and suddenly he made an interesting comment along the lines of "the stuff you guys tweet out no longer seems as crazy". We figured he was making good money and called it out in a DM. We were right! So as a side note from this side of the web, congrats and we have no doubt that making money won't be an issue in the future. Will it be easy? No. Will it happen with effort. Yes. Absolutely. To add to this discussion, later this week we'll outline several way to make money online since people constant say they "don't know where to start". Naturally we know this isn't true so we'll do a step by step.

Guest Post Eric Finman New Launch

This is a guest post written by Eric who is a hands on investor in his new launch. Emphasis is that none of the below is related to our opinions (all written by Eric) thanks!

Is Bitcoin the Next Myspace?

Unless you've been living under a rock, you've heard about Bitcoin. As the first cryptocurrency to truly scratch the surface of "going mainstream," Bitcoin gained household recognition and entered most people's minds at some point. Unfortunately, there's a problem: Bitcoin's adoption has stalled, and the barrier to its continued growth appears too tough to crack.

This isn't necessarily about Bitcoin's value as an investment – being treated like "digital gold" is fine for a cryptocurrency that is seen as a way of getting rich – but more about Bitcoin's use as an actual currency. To better understand this, let's outline what has caused Bitcoin adoption to slow to a crawl.

1. Regulatory Nightmares

Is Bitcoin a commodity or is it a currency? Answering this question is crucial for lawmakers to know how to treat it. Right now, Bitcoin seems to occupy this weird middle ground – able to be used to make purchases, but often treated as a store-of-value. This isn't making the IRS and other tax agencies very happy, which has led them to send out threatening letters to anyone who didn't declare their Bitcoin holdings on their taxes. As long as regulations are a mess, Bitcoin's growth won't move much; if you want institutional investors to get on board, you need to make this less murky.

2. Ridiculous Fees/Transaction Times

The Lightning Network attempted to speed things up and lower costs, but it's not doing a good enough job. As long as users are still being charged to send Bitcoin, why even bother? Visa doesn't charge much, and at least fiat money doesn't require awkward conversions. And don't even get started talking about how long it can take just to send a transaction – there's nothing exciting about waiting for your block to process. If Bitcoin wants to be seen as a usable currency the wait times for transactions, and the associated costs, need to plummet significantly. Unfortunately, that looks unlikely to happen, due to our third point.

3. Fragmented Community

What's the difference between Bitcoin, Bitcoin Gold, Bitcoin Cash, Bitcoin SV, and countless other forks? Which is the "real" Bitcoin? These are questions that people have, and the answers vary depending on who you ask. This chaos is hurting Bitcoin's ability to solve problems and become better; every time fixes are proposed to enhance Bitcoin's performance, there's a risk that it will just create another fork and further fragment the community. Bitcoin is decentralized in the worst way – competing factions, unstable forks, and misinformation all around.

All of this threatens to make Bitcoin a thing of the past – replaced by a faster, more usable, widely adopted cryptocurrency. Much like Myspace was replaced by Facebook, it looks like Facebook's Libra "cryptocurrency" is trying to do the same to Bitcoin. If you're someone who believes in cryptocurrency and what it represents, Libra is your worst nightmare.

Libra is a play by Facebook to directly compete with the US Dollar in the most undemocratic way possible – no voting, no elections, just a bunch of big Silicon Valley organizations making decisions and "promising" to do what's right. Facebook has already proven that they can't be trusted with your data, but now they want you to trust them with your finances, too. The overall goal of Libra is to break the knees of cryptocurrency; decentralized coins would be destroyed or absorbed by a centralized, shady, and corrupt corporate version of cryptocurrency. Facebook has already done this to countless tech startups, and now they're gearing up to treat cryptocurrency projects the same way.

Fortunately, one cryptocurrency start-up has a head start on Libra. Metal Pay is the first ever all-in-one digital banking platform for cryptocurrency – exactly what Libra wants to be but could never become. In fact, Facebook originally invited Metal Pay's CEO to come speak to them about cryptocurrency, and subsequently tried to imitate exactly what Metal has done. Unfortunately for them, they just can't figure out how to do it, and they've run out of time to squash Metal.

Metal Pay already has a working app, a thriving marketplace, and a loyal userbase. This is the first real competitor to Libra, and represents what cryptocurrency was destined to become – easily accessible, highly usable, and truly decentralized.

Bitcoin is flawed in the way that the Ford Model T was flawed – good for its time, but not the future of its industry. The concept of the car was constantly built on and improved, it could never remain stuck in the past. Likewise, Bitcoin has been built on and improved; lessons were learned, mistakes were corrected, and changes were made. Metal is the logical evolution of cryptocurrency: leaner, faster, and more accessible.

Like Myspace, Bitcoin is being replaced. But this time Facebook doesn't get to be the one to do it – they missed their shot.

Guest Post: Game and Business Intersections

Guest Post: Game and Business Intersections

We have not had time to post and do not think the issue will be solved near term. That said, frequent commenter ***RE Guy may have an interest in blogging and we're letting him run with his own guest post today. We have not edited any of the content and will read the post at the same time as our readers! Please leave any questions/comments for him and he'll likely respond.

Finally, our intern will continue to monitor comments and we are no longer answering questions on the blog. We will sporadically have FAQs on twitter and the blog in the future (likely a few months later)***

Game and Business Intersections

The purpose of this post is to explain some ways in which business and the seduction of women overlaps both as subjects and gaming women as a business (rich) man. A lot of these issues have been discussed here in one way or another and what I'll do is offer my unique perspective as well as my personal experience. Also my main business is real estate so I'll use examples from that mostly since I know it best.

Don't fall in love with a house.

Overvaluing any one girl you haven't slept with.

When it comes to making a profitable investment in real estate I have a well-reasoned and repeatable (in fact repeated) model for how to do it. Because of this I know that if I'm not finding deals, I'm not looking at enough houses and making enough offers, that is I'm not filling my pipeline and following up on leads. It's easy when I start looking at a property and start negotiating to imagine how much money I'm going to be making and to start losing sight of the real goal which is to get in there at a good price. That is there is a temptation to rationalize paying more in the moment, especially with an adversarial party interested in extracting additional cash from me. This is the same mechanism at work with overvaluing women before you've had sex, and time spent trying to figure her out (if you're spending time and energy thinking about her, you're investing in her, what's your ROI?). And she is (generally) trying to maximally extract time, attention, emotional energy and money before sex.

If I told you I needed to have this one house, no matter what the seller wanted to pay, and I was spending my time analyzing and angling with very little progress, you'd (rightly) think I was a poor investor; same with women.

90% of problems in game past the beginner stage (no basic model) are a lack of prospects. If you just grind out the sets and analyze your failures against the model (thus building a better model over time), you'll get the lays and figure it out. Approach women regularly, gain experience over time and be totally detached from getting any one girl.

Have multiple sources of income.

Date multiple women.

Dating multiple women seems a common goal and question here. I've done this the right way, so I'll offer some insights.

Similar to the above point about feeding your pipeline to create a realistic sense of value, if you only date one woman and have no workable model for finding others there is a much greater risk you will over time tend to overvalue her and enter into a bad deal (i.e. marriage).

So starting with basics, why even have multiple sources of income, and when would it make sense to (temporarily) ignore this advice? My understanding is that multiple sources of income are to mitigate risk that any one source goes south, and expose you to more possible upside that any one source has exceptional opportunities. This is same rationale for multiple women, any one relationship can fail, and any one girl may prove an exceptional opportunity (should you be looking for that). You can also mix active and passive income to have flexibility in how to spend your time with a baseline income even if focusing elsewhere, similarly having a main girl or girls and the ability to go out shooting for one night stands.

The temporary exception may happen when you have a solid early career opportunity where you would work 70-80+ hours a week and make real money in short order. In this case it may make sense to just forget about working on multiple sources for now and focus on the one (while you become established). Similarly the standard way of thinking about multiple women is date 2 or possibly 3 7's and then commit when you get an 8 or 9. But this is wrong. The problem is you're tempted to start rationalizing every new girl who's a little better looking or has a little better personality, instead of setting a firm goal that exists outside of any individual girl. That goal is to only commit when you have the opportunity and desire to have children, hence creating a "real" relationship (it's going to last for the rest of your life). This has been discussed with the marriage post, but it seems by how some people are looking at dating multiple women that they haven't made the connection all the way to

Not planning to have children now (or ever) = No real commitment to any single woman

This doesn't mean don't see girls for the long term, or invest in them and be supportive of each other, it just means until you want to create something permanent with her (a new person), there's no good reason to remove yourself from the dating market (potential upsides). Generally speaking the women who will be most open to this will be in their late teens to their early to mid-twenties. Further if you're better than 90% of guys out there because of all the work you've put into self-improvement, she will naturally become monogamous with you. The regular mindset works in reverse too; you're the "9" to all the other "7's". As a side note you might drift into unofficial monogamy with any one, particularly if you have great opportunities at work and consequently ignore your pipeline/other girls. There's nothing wrong with that, just don't make the mistake of turning it official or seeing her more than 3X a week (seeing her more than 3X a week by the way, will very quickly turn it effectively official in her mind and you are almost guaranteed to have her put pressure on you to commit).

Also dating younger women is a value proposition like renovating real estate. For instance when I have to fix up houses, I'm finding them in various states of distress. I take on the headaches and enjoy the spoils. This is the same with dating younger women only with psychological and emotional distress (even with bubbly and mostly happy women a lack of wisdom = irrational thoughts/behavior = drama until teaching them). Now I could also find houses at market price, try to make them work, and some would be overall good packages while some would just look nice on the outside and have a ton of hidden problems (usually from deferred maintenance); older women are the same. Either way I'd need to alter my model drastically to make it a good deal.

The way to look at the situation is the same as when you have a job making 70k/y. You're not going to get rich with that, you need to actively build out other options or you need to switch to a career with a lot more opportunity. You're not going to have children with this girl (at least not now) so you need to focus on You Inc. to keep your options open (and she should do the same, growing, improving etc.), and as long as you have this proper focus the proper thoughts and behaviors will follow.

A final point, the reason of "not having kids" is what many modern American women use to justify continuing to be in casual relationships only (and often to the emotionally distorted point of "hating" kids). Good for them if they are rational about it (i.e. "I don't want kids now but I do around when I'm 30"), although it makes her less likely to drift into monogamy with you. However, the ones to watch out for are the ones who "hate kids" when they are young (and often compensate by sublimating the maternal drive into small animals), because often that maternal drive will return with a vengeance around 27-29 and then they will want kids with reckless abandon.

Capitalism as a capitalist means creatively combining resources to produce value; Money, Labor, Land, Knowledge, Technology, Network etc.

Seduction as a man means creatively combining resources to produce value; Money, Looks, Status, Game.

Now we can look at the "Rich guy can't get laid" trope and see where it comes from and how to avoid it.

Being rich only works against you if you rely on it via leading in with it i.e. "Can I buy you (and your friends) a drink?" or if you become a charmless type A person in pursuit of becoming rich.

If you try to get a girl to evaluate you based on your resume, don't be surprised when she takes it as a boyfriend application.

I'm speaking from experience here because I fell into this trap which is easy when spending a large portion of time making money and having a well above average income. It's just easier to buy girls drinks when a $200-$300 night doesn't even register, but it's cancer to your game. I also found my way out.

So the main problem with "Rich Guy Game" is that a girl sees the guy as high value, but that value has to be extracted over time and it's not of the sexual kind. This can lead to girls trying to slow down the seduction process either in general or as last minute resistance (leaves the bar with you, sees your car/house, turns into a "good girl"). But here's the important point:

With wealth or any high value trait you have the girl's attention, what you do with that attention is a function of sales.

Here's how to deal with it, and this applies to any high value trait other than looks (i.e. intelligence):

Patient gentle persuasion that sex with me will count for, not against her. ("I see, I've always noticed i get along well and fast with all my previous ***long-term*** girlfriends")

As an aside, this should be true anyway. Why would you value someone more who doesn't give you want you want and less if they give you what you want? That's neurosis. And to be clear I'm not referring to banging a six one night because it's easy and quick but not even bothering to take her number (or taking her number, texting her you had fun, and never attempting to meet her again), or the gradual dulling of pleasure from banging the same girl for months (or years).

I explain that I will prioritize my time with a girl who I'm having sex with over one who I'm not, all things being equal. The same is true with all people, someone who intellectually engages me, and is giving me constructive emotions will be someone whose company I enjoy, now add that we're going to be making bank together and I've got a potential new lifelong friend. Occasionally rich guys without game if they get this far at all use the wrong methods, like looking at it as they need to value their time (true) and actually verbalizing something like that (bad idea, she'll feel objectified).

I'll add here an observation and an anecdote.

Simple example that is gratuitous and easy to see: Dan Bilzerian. He's fit, has decent fashion, has game (saw him eating with mystery, at a minimum he's learned the formal theory) and he not only has money but he spends it. He appears to be with a parade of 8's, 9's and 10's. He also has status in the form of fame and otherwise. So he's an example of a rich guy who gets laid like crazy (it seems).

An example of a rich guy who doesn't get laid (or pays far too much for it):

I was once at a big name festival where I met an attractive young girl. She was being taken care of by a rich guy, her and 9 other girls. They each were given a VIP ticket, hotel accommodations, travel was paid for, and they got spending money. This had to run him at least 2k-3k per girl. But he was fat, had bad fashion and little game. When I met one of these girls I along with two of my friends each paired off with her and two of her friends and we all got laid. The end result was that this guy paid 10k for three random guys to bang three girls (thanks for the room service!). Now all the girls claimed they didn't hookup with this guy and just took his money (I believe they associated with him on an ongoing basis), and that's probably not true. I would be surprised if he kept paying for their expenses and never got anything out of it. But they were all embarrassed to be associated with him sexually, and they were eager to each find a fit, cool guy to hook up with instead if they could do so without him finding out (they ditched him to come with us).

Two guys, both rich, drastically different results depending on all the other factors besides money (and I'm sure if the guy could spend 30k+ for a weekend he could afford a nutritionist, personal trainer and social skills coach).

If a man can't tell the difference between a rich guy without fitness/fashion/game and a rich guy with fitness/fashion/game, then that man does not possess good fitness/fashion/game. Thus any guy claiming rich guys can't /don't get laid lacks good fitness/fashion/game.

Now is there a school of thought that says be her "Alpha bad boy" or something and make it clear you can only offer her sex etc.? Yes. Does this get good results? I don't know; I haven't seriously pretended to be poor (although I will joke about it, which is funny because I'm clearly not). I don't hide my success or flaunt it upfront; I use it like a tool when it's appropriate. I'm fairly certain that this other technique is a way for guys with less financial success to occupy a niche and grind out better results than they could get in more regular markets. Good for them. I don't begrudge anyone in a capitalist pursuit; if anything I intend to learn what I can from their experience and discard what doesn't apply to me. Logically however, if the choice is between being the "Total Package" or having to angle to make up for deficiencies, having it all will always be better than not. This leads me to my next point:

Become a millionaire through real estate investing with no money down.

Bang hot models with game and without looks, money or status.

I have several friends who have done exactly that, millionaire in three to five years, real estate investing with no money down (none of their money that is). Here's the common traits:

1) Relentless hustle

2) Singular focus

3) Willingness to let other areas of their lives slide

4) Very good or great at sales / persuasion

On the other hand I don't know anyone who bangs hot models without looks, money or status (guess we don't run in the same circles). However I'm inclined to believe he could exist if he had all four of those traits (and lived in an environment where they were abundant, i.e. New York, Maimi, LA). But why do that? If you're going to sacrifice other areas of your life (3) then you're far better off having an abundance of the most readily convertible form of social value at the end of it (that is the literal purpose of money, they're "social checks"). And before the claim is made to use game to make money etc. refer to number 4, I know there are a lot of definitions of "game" around but (4) + sexual intent/skills is one most reasonable people would agree on (perhaps add the ability to relax, have fun, joke around, have an off switch if you don't include that in (4) etc.).

So if you wanted a clear explanation of why to focus on business first and game second, that's it.

And if you wanted an example of someone who focused on business first, became financially independent, and then focused on game, that's me. I'm not saying do what I did and neglect your social skills in favor of making money, but I am saying it's a lot easier to fix that or any problem when you're able to remove any financial constraints from your time.

****

Guideline for a Healthy Relationship… with a Sexy Woman

Guideline for a Healthy Relationship… with a Sexy Woman

This is a blog that is dedicated to never settling down, however… even a driven individual takes a break from time to time and picks up a temporary girlfriend. In other words, a "temporary relationship" or a "mini-relationship". Most guys learn game to get into serious relationships, so you can apply the same rules to your longer term relationships.

Ground Rules: Assuming you've found a girl you would like to spend time with, it is smart to lay ground rules early. You don't need to hand her a list like you're talking to Santa Claus but… the general guidelines should be laid out. Everyone is going to have a slightly different set of rules but here is a good starting point.

General Guidelines for You

– Will only see each other 2-3x per week at maximum. 2x per week will be the norm, 3x in a week if you have been out of town on business trips/other ventures

– Short hair, flip flops, tattoos and bad hygiene are all grounds for a break up

– Weight management should be intact, ie: if she's a size 1 and somehow tries to go to a size 4 there is an unwritten rule that you'll be moving on

– There will be no wiggle room for being a cheat/liar. If she is not loyal then you leave

– She should have a high sex drive, this is dependent on you but if you're not having sex every time you see each other… There is a problem.

Before all the negative comments come in about "what is in it for her!" or "You're selfish!" we can go ahead and line up some clear positives for her.

General Positives for Her

– She is not going to pitch in for food/going out expenses. Going dutch is for broke people and hippies. If you can't afford the extra $50-100 for an outing at night (skinny girls don't eat much) then you shouldn't spend your time maintaining a girlfriend

– Feel free to chip in on appearance improvements. IE: if she needs to go to the salon or buy some new lingerie, you shouldn't be sweating the extra $50-100 here and there. Again, you both win here. She looks + feels sexier and of course you're going to find her more attractive.

– Improved health, you're not going to let her eat potato chips and Kentucky Fried Chicken all day. Instead she'll be exposed to a healthier diet chock full of seafood (salmon, crab, lobster etc.), fruits and vegetables.

With the ground rules out of the way, lets take a look at additional ideas on how to find a girl that will work for you.

1) A Common Healthy Hobby: This is going to be important for both of you. While sex is great, you should have at least one activity that you both enjoy doing. This does not include getting black out drunk. Some of these ideas can be simple: Tennis (mixed doubles), a Musical Instrument, Dancing, Surfing or Art. By having at least one common hobby you'll avoid the constant need for alcohol.

A running joke… Every relationship after the age of 21 is spent drunk 24/7 with your partner. Don't be that guy.

2) A Common Healthy Entertainment Option: This one is similar to comment one, the two of you should have a non-alcoholic entertainment option as well. This does not include sitting at home watching TV as that can be done at any time. Some quick ideas include: A specific concert/music group, Theatre, Opera, a Sporting Event, Comedy Shows.

Now that you have both a common activity and entertainment option, you will have two forms of entertainment to fall back on.

3) Distinct Personality Type for You: This is going to differ for each guy, but you should have a clear preference for personality type X. For fun, here is a personality type that is great to be around (opinion):

Flirty, Bubbly (ie: happy/ball of energy), Dainty, Warm Hearted, Sensitive, Sexual

Naturally, no where in this personality type does "intelligent" or "smart" appear since both of these qualities are usually accompanied by a dramatic decline in looks. Not worth it and certainly not fun to date a smart/sassy (see b****y) girl. Finally? God bless your bank account if you're dumb enough to date a feminist.

4) A Separate Goal: This will differ from girl to girl but she should be working towards something she wants/desires that is unrelated to your work/life. As an example a girl could be interested in cosmetics and spend her time getting an extra credential to work as a make-up artist at a high-end boutique (naturally this is not the correct way to state it but you get the idea). Alternatively, she could be interested in selling clothes or being a promoter. Regardless of the goal, it is something you won't have to help her with, you'll simply be supportive and tell her to "go for it" and encourage her through the ups and downs.

What is the trick here? If it is in the exact same field then you're going to be in trouble. You'll be competing (more or less) and it won't end pleasantly. By the way… this is reason number 7,528 to never date a girl on Wall Street.

5) The Right "Look": This is similar to the personality type. The girl you're with should have the look that you "go for". For some people this is the blonde hair & blue eyed look, for others it could be olive skin, jet black hair & green eyes… etc. Essentially, your type should not be compromised. If you compromise? You'll lose attraction for her in a meaningful way… and in short order.

As a side note, no one has a type that is "plus sized model" that is a myth and is just a gross fetish that should be punished with a *fat tax* (pun intended). Both the plus sized model and for the guy willing to date such a monster… should be taxed.

6) A Decent Family: Now we're getting into the tail end of the relationship. You should have a firm grasp of her lineage. If her family was healthy and happy then chances are, your girlfriend is going to have a healthy attitude towards a relationship. Do not jump into any sort of commitment if the girl is part of a broken family where both parents are in jail and she is constantly being put into uncomfortable and painful situations.

There are always exceptions, but you should have a firm grasp of where her morals/beliefs stem from.

7) Socially Aware: The last item on our quick 7 point list is a girl who is socially aware of how to behave/dress for an occasion. The last thing you want to do is bring a girl with you to Vegas or Miami Beach wearing a thong and cut-off T-shirt that says "Come Party with Sluts".

As a hilarious side note, a t-shirt that says "Come Party with Sluts" or "Slutty Saturdays" is not uncommon in the party scene. Just don't commit to these girls (heaven forbid marry one of these things), hook up and move on.

****

Happiness is Utilitarianism – Our Stoic Framework

Happiness is Utilitarianism – Our Stoic Framework

In economic theory we learn that every single one of us is trying to maximize our "Utility". Utility is defined in various ways however, the underlying concept for utility is that we as humans do whatever it takes to maximize our utility. This could be in the form of happiness gained from having more money, a family, good health etc. Since we've focused primarily on income for the past few posts lets look at how to maximize your lifetime utility.

Our Framework for Utilitarianism

First Pillar – Health & Energy: This is the first pillar to any type of *long-term* utility maximization framework. This is also extremely complex because health does not simply mean you get to walk around. If you're 25 years old and you can barely run or bench press your own weight, your health is actually sub-par. Health means that you're in the top 10% for your age bracket. If you're forty years old and you can still crank out sprints, squat a large amount of weight and look significantly younger than your true age… You're winning in this category without a doubt. Without your health you cannot help your family, your friends, your bank account or anyone else in your life that is important to you.

Second Pillar – Time: If your health is in check, the next item you're fighting is time. *Time is not valued equally*. We're not talking about the "future value of a dollar" but the future value of your time. If you're 20 years old, we have no doubt your ability to both crank out long hours of work and party all night is sky high. Try this at 50 and it'll be tough! No one likes to talk about this but life is also a game of time maximization or efficiency. "*If you could spend $10M between the ages of 20 and 40 or if you could spend $100M between the ages of 60 and 80… which one would you choose?"* We'd choose option number 1 in a heartbeat! Remember… Getting rich is easy. *Getting rich young enough to enjoy it is a different story.*

Third Pillar – Freedom: Once your health is in check and you've recognized the importance of succeeding quickly, you'll find that your freedom is the third most important item to check off. If you're making good money and are healthy, the next "dopamine rush" will come from overall freedom. In our case, freedom is living a private life without needing to answer to anyone. For others, it may be the freedom to simply work anywhere in the world. Typically, "freedom" is earned by having a large net worth.

Fourth Pillar – Your Family: Many people derive a material amount of happiness or "utility" from having a family. Two people gave up 18 years of their lives to give all of us a chance at the game of life. Not being able to pay it back or help them when they are close to their deathbeds is beyond repulsive in our opinion. Finally, if they are pulling you down, yes you should walk away. Just remember they did give you the shot in the first place so holding a grudge will not help you long-term.

Fifth Pillar – Self to Self Comparisons: There is no point in comparing yourself to anyone else. That person likely has a host of largely different problems than you have. We all know the multi-millionaires out there that crawl up into a ball when their wives come around… or the happy go lucky vagabond that can't afford to pay for sushi. Comparisons to other people do not contribute anything to your utility. If you're making the right risk adjusted decisions on a consistent basis there is no reason to worry about comparisons because you made the right decision at that *point* in time. Overall, we would take a look at the table below to get a solid understanding of how we view the Five Pillars. **(Click to enlarge map)**

Reading the Table: The chart is simplistic however it can be understood as follows: **#1 Health and Energy:** no matter what we do the available energy we have declines over time, knowing this you'll want to use money as a tool to offset the energy reductions. The conclusion is to accumulate assets in your 20s and by the 30-50 time frame you're spending more without going negative, **#2 Time:** No one can pay to get their time back. Each day (by definition) we're closer to the curtain call so your time should become more valuable over the years (even Bill Gates can't go back in time!), **#3 Freedom:** with correct decision makings, your amount of freedom should increase every single decade with a goal of being set sometime between 30 and 50 at minimum, **#4 Family:** in an ideal world this will remain as a constant positive. If you have a good relationship with your family and decide for or against having a family, the amount of utility should always be maximized because it is within your control and **#5 Self Comparisons:** Similar to freedom, we should all learn to only compare ourselves to our past selves. Look back a year and if you have the same beliefs, that's not a good sign! This is a skill that will be learned over time and ideally executed upon in the 30-40 range.

Reverse Engineer Utilitarianism

Another concept we've been flirting with is reverse engineering Utilitarianism. Given the number of punches that life that will throw your way, by simply avoiding the pitfalls you'll reverse engineer utilitarianism.

#1 Avoid Getting Burned Twice: This can be in the form of being burned from a business, consumer purchases or even health. Being foolish once (touching the hot stove) is acceptable, continuously touching it is not. As an example, the vast majority of our readers are aware of affiliate marketing (cloaking) and the sketchy underworld of online sales. Maybe you were fooled once by a purchase that wasn't even pre-loaded with aggressive copy, we'll say that's okay…. Once.

Next time, take a step back and ask "What is the person selling and *can I check the claims"*. If someone is selling testosterone boosters but readily takes anabolic steroids and injects exogenous testosterone… Why in the world do they have to use the steroids and TRT therapy if the product is so good? Another example would be diet pills where a proclaimed doctor is 50 pounds overweight but shells out "weight loss pills"… if they worked why is the seller overweight? So on and so forth. To avoid getting burned twice learn the lesson of *what to look for* next time instead of getting upset about it. Most will just get angry and upset which achieves nothing. Find the systematic approach to solve the issue instead.

#2 Make Statistically Intelligent Decisions: We know. The live it up today crowd is going to say you might get hit by a bus tomorrow so you better burn through everything you got! This is simply crazy talk as most people are not going to be hit by a bus and you can reverse engineer your life expectancy as well. Instead of commuting by car (extremely dangerous proposition), try to structure your life around walking and airlines instead. By making broad intelligent decisions you'll likely live until the average age (somewhere around 80) and you can go ahead and take risks (without risk life is boring) since you've structured your life around statistically bad decisions that don't add value to your life.

#3 Jump a Decade: We've used this trick maybe 100 times. Every 3-5 years sit down and ask "what can I do in this decade that I won't be able to do later". This question will bring up both small and large items such as attending a rap concert or deciding to have a family. If you find that you've never had a specific life experience that is eroding away (tougher to do in the future) go ahead and pencil it in for this year. You'll reduce the amount of regrets you'll have on your death bed some 400 fold! In addition, you can also do this on a 5 year basis as well (shorter mental jumps).

#4 Look Back Three Years: Every three years take a look back and decide if you missed anything. If you do this in your 20s you'll get a resounding no. This becomes significantly more complex as you get older since you put a large amount of time into increasing your net worth. A broad stroke look at the past three years prevents an "event gap". If we only do this once eery 5-10 years it will be very easy to look back and say "I wish i didn't take life so seriously" a common complaint amongst individuals on their deathbeds.

#5 Reverse Engineer Your Happiness: The last thing we've added to the list is reverse engineering happiness. We've explained many times that it is 100% normal to be unhappy in your 20s. Most successful people are filled with intensity at age 20 as they have a lot to prove (see the chart – Pillar 5) which does not lead to consistent happiness. Happiness is earned (a mental choice) and tracking your overall happiness with life (if it's improving or not) is critical to reverse engineering long-term utility. If you've gone from being easily angered to only "sometimes" angered, call that a win over the course of a couple of years. Make sure this is going up every single year.

Reverse Engineer Utilitarianism

This has been a much more "philosophical" post than we have done in the past. Importantly, there is no way that this framework will align for everyone. For example it certainly is possible to have kids in your 40s and it is possible to hit financial independence in a single year! Anything is possible. We have simply outlined a broad stroke idea for key turning points. The key turning points in our view include: 1) energy declines starting sometime between 30-40, 2) consistent decrease in time making each day more "valuable" from an energy perspective, 3) freedom as a necessity to increase utility as we believe people would be happier with autonomy over an extra $20-30K in income, 4) a decision point is eventually crossed when it comes to having a family and one cannot turn back on this due to point number 2 and 5) comparing yourself to only your previous self is a skill that is acquired over time. Finally, if you're interested in maximizing your utility we have no doubt that **Efficiency** will help you do so.

****

Happy New Year, Hope You Stayed In!

Happy New Year, Hope You Stayed In!

Happy New Year! Hopefully you didn't waste your night partying in areas with no barriers to entry/filter and a bunch of blacked out people who dropped $100+ to go to the same place they always go to. If you did, well that's unfortunate but still not the end of the world. You can always go out on January 4 to a nicer expensive place that will automatically attract successful people. Lots of people get upset by the comments in this paragraph but they are realistic. From a numbers perspective and from a time usage perspective, it is harder to find the top 5% or so if a place is absolutely packed with people from all over the general area. Below is a good example of what you can do next time you're thinking about the new year (feel free to do this January 5 to make up for the partying on January 1).

Tax Estimation: Since the vast majority of clients/customers are out of the office from late December to January 1, this is a good opportunity to create a calculator for your tax burden in April 15. April 15 is of course the worst day in human history and people in the United States should go to great lengths to avoid having a child with a birthday of April 15. That said… You can come up with a good calculation for the tax amount by yourself in a day.

If you're young this isn't that important. In some cases it's actually better to get a refund because it forces you to save more money (psychological). When you're older, ideally you hit the number on the head and were neutral. The reality? It won't be possible. You'll end up owing a notable amount of money in April every single year. Better to get a rough calculation now and manage your cash flow statement from January to March to account for this payment.

Thinking about this further, it's probably one of the reasons why a lot of high earning individuals are not out on New Years. They are busy planning for the start of Q1 sales after an incredibly draining Q4. If you're selling consumer goods, your Q4 is always the biggest year from a seasonal sales perspective and the last month was incredibly hard on your body. You have to organize, rest and get ready for the next quarter.

Read, Write and Review: Since you're already going to take the time to see your tax burden, you'll also have your results in front of you. This is the perfect time to look through what went wrong and what went right over the past year (or more). Which segments of the market grew faster than you thought? Which grew slower? Why? Which products failed and what was learned from it? You get the idea.

During this review process put all of your emotions aside and figure out the pieces you can fix and the pieces you should be investing into. They are not the same. Investing means you're taking additional risk in the direction that is outperforming and fixing refers to your personal time (IE. you must use forced appreciation methods to generate better results). This part is ideally exciting but can be painful as you have to take an ego hit and admit that certain areas did not work out.

At this point you should have several bullet points to get you started for 2020. In addition, since there is nothing particularly "special" about a new year, you should have books in front of you that are helping you solve the issues. Take the list and put the top 3 biggest issues up front and spend the night reading to fix one of the problems by January 1. Yes, this means you should be able to read a book in a single day.

Have a Singular Direction (Three Areas of Life): Multi-tasking doesn't exist. It never has and never will. While people (particularly poor managers) believe you can do several things at once, they are simply crazy. It is almost impossible to have an important phone conversation while simultaneously responding to basic emails. So we really doubt high performing people multi-task. High performing people focus on one difficult task at a time and then get to work. When it's done they move to the next difficult task (so on and so forth).

Your singular direction should relate to three items, choose one for money, one for your health and one for your interests. For example in 2020 a simple one could be: 1) buy and ramp up an ecommerce business related to pets, 2) improve flexibility by doing yoga X times a week and 3) learn how to draw. By having three separate categories you avoid hyper fixating on a single task for the entire year and force yourself to diversify your skills. People may laugh at the singular direction comment and three items but those individuals are nit pickers as you're never going to spend 16 hours straight (per day) improving one item unless something has gone terribly wrong or incredibly well. If there is a reason to put everything on hold and just do one item then of course you change gears and get it done.

Clear all of the Decks: On January 1 you want to have zero dollars floating on your credit cards, zero checks to write and zero pending sales. This is related to your personal financial situation and not related to a mortgage for example.

Sure it isn't ideal for working capital as you can float a payment for a month, it feels good to start with a fresh deck for 2020. You will have extra cash from the Q4 seasonal income anyway and the clear out payments for your cards won't move the needle. This is something we'd recommend doing by the time you're around 28 or so. At that age you are making good money and clearing the decks isn't going to hurt your cash flow statement at all. In fact, it has a weird psychological impact on your January month as you spend less (focused on fixing the list of items you have to deal with in the second and third section of this post).

Clearing all the decks also refers to your contact list. Every year you're going to lose contact with at least one acquaintance and meet at least one acquaintance who is helping you improve your life faster than you expected. This is a normal part of life. People who have the exact same contacts for decades at a time are rarely getting better/moving forward. They are scared to cut ties and this causes them to run in place forever.

At this point cutting ties shouldn't be difficult (if you plan on becoming a successful adult) as time wasters are draining you of the most important asset you have. Also. If they are content with their current life and you are not… This balance needs to tip at some point.

If you want a "fun trick" that helps you weed out the list, simply turn your phone off for 24-48 hours and alert a few people (family members) that this is occurring. When you turn it back on you'll have a bunch of messages that naturally flow through your cell phone. These basic messages should tell you a lot about what the person is doing. Also it's good to take a break from your phone for at least a day or two anyway.

Choose a Contact: To end on a positive point, after the "due diligence process" above you should have a person or two that is well ahead of you. Figure out if there is a way to increase your interactions with them. This has a natural benefit to you as they become higher on the list of the "five people you talk to most".

People laugh at the kooky phrases "energy" "vibes" etc. but well off people always give off a different vibe. You can simply sense it when you're around successful people. You want to surround yourself with people who are in this stratosphere and ideally it is well ahead of where you are today.

Book Launch Date: For those that were asking about our book launch we're putting a hard stop at January 31. We have sent a couple of copies to long-time readers of the blog and the consistent feedback was that we should include some more charts and graphs similar to how we did Efficiency as it is easier to bookmark and remember in the future. So we're doing just that. 2020 should be a fun year and we wish everyone the best of luck!

****

Happy Thanksgiving and Some Notes for the Holidays

[Happy Thanksgiving and Some Notes for the Holidays]

Happy Thanksgiving everyone! What a great year it has been. You know it has been a good year when the beginning of the year feels like it was 5-10 years ago. It feels like the things we were doing in January were occurring in a different generation. This is a good sign of progress and we're thrilled about the progress in 2019. The second biggest thing to be thankful for is health. No issues in 2019 and that's a huge positive. As we've said many times in the past, being healthy is certainly more important than being wealthy (can't enjoy money if your health is a mess).

Get Ready to Run Hard: This post is directed to the future winners in society. If you're a future winner, you know that the holiday season is one of busiest times for you. While everyone else is purchasing… You're the one selling those products. While everyone else is out drinking and watching football on TV, you're in a room getting set for the 2020 plan. Long story short, you're not alone in these decisions processes and we want to thank you for your hard work. Whatever product you're making we hope it sells well as you're a productive member of society and deserve every penny that goes your way.

As a good rule of thumb, an easy way to get work done during the holidays (if you're forced to go to a few events) is to step out when "entertainment begins". Generally speaking, whenever the entertainment portion is occurring, no one will mind if you're missing. In fact, most won't even notice as they are busy watching the game or show. This will give you several hours of dead time and you can do one of the following even remotely: 1) catch up on reading – documents/contracts/a specific book you need to understand a problem, 2) create a plan for 2020 in terms of what your focus items will be and 3) schedule out all of your travel for the start of the year – always incredibly busy.

The other benefit we want to highlight is that you're free to turn off all of your electronics. You don't need to be responsive to your cell phone. Surprisingly this even includes customers. That's one huge benefit. During the holiday season you can think clearer since your reaction time does not need to be on point. Of course… This does not include particular product launches or sale days (customers expect quick responses), we're referring to the speed of your replies during the expected down times (Thanksgiving, Christmas week, New Years etc.)

Best Time to Increase Fitness: Unsurprisingly, the gym is near empty during the holidays. If you're looking to improve your fitness, now is the time to strike (January is a terrible time to start as the gym is incredibly crowded). It's strange but we've actually adapted to this and January 1 generally marks peak fitness followed by what we'd call "stable fitness" levels. It is not possible to maintain peak fitness levels year round (anyone with sports training knows this), and November-December is the ideal time to strike. No one is around, all equipment is available and you have significantly lower amounts of "social responsibility".

Surprisingly, you can actually eat healthy during the holidays as well. This is shocking to most as the average person gains a significant amount of weight. Even if you go to family gatherings with large amounts of food, you can simply decide to eat the vegetables and meat (avoiding all of the pies and unhealthy items). For some reason, sugary foods are considering "uplifting foods" even though they make you feel groggy within 24 hours. If you eat the healthy food, you'll be in a better mood the next day and during the events you plan on attending as well.

Topics to Avoid: If you've been through enough holiday seasons, you know the same old stuff occurs. Arguments about politics, sports and internal family items (so and so who dislikes so and so). The best way to avoid all of it is to simply never talk about it. Off limit items include: 1) work, 2) politics and 3) your latest success. You'd think that success would be celebrated at holiday events but there is always someone within earshot who will be upset that you're doing well (don't ask us why it just happens). Instead focus on things that everyone will agree on: how good XYZ food is that is being served, how happy you are for (insert older person who is officially done working) and if possible anything related to the weather if you're in a warm climate for the gathering.

The general idea from the above is that you want to bring up topics that make people look like monsters if they disagree. If someone is retiring (above 60) it's practically impossible to say they are undeserving. If you focus on food, at minimum the other people are forced to be polite and if it's related to weather this is a commodity everyone gets to enjoy and you're not "standing out from the crowd". In normal settings, when you're trying to build yourself up, commanding attention is the name of the game. Simply reverse this game and focus on anything positive that is inclusive (everyone in the room is getting the benefits). And…. Remember to leave those fancy clothing items at home… No name brands.

Things We're Thankful For: Luckily this isn't a family gathering so we'll go ahead and list the things that many of you are likely thankful for as well.

- Extremely good health. This has been a blessing. You cannot change genetics and being born with good genetics + a healthy diet is practically equal to winning the lottery. At minimum everyone can have a great diet. On that note, one area where we lean liberal? We think healthy food should be subsidized while unhealthy food is taxed heavily to help improve the well being of the population. But. That's a topic for another day
- Good Economy. 2008 was absolutely awful. Anyone who graduated after 2010 or so does not know what it is like to see a recession (2009 saw some of this as it was hard to find job openings). We're throwing every cent into cash and crypto as mentioned before and it has been a good decision as our stress levels have come down dramatically
- Software. The industry continues to get better and it is becoming lifesaving. If anyone has a new cool software tool that is helping them save money or save time… Feel free to leave it in the comments. Being able to reduce mundane tasks to practically nothing is a miracle
- Avoiding bad weather. This is actually an important aspect when it comes to quality of life. While underrated when you're young and living a rough life (long hours, cramped apartments), good weather causes your mood to be higher at all times (negative degree weather is practically never fun)
- High quality friends. This is extremely rare in a society that is now all about hooking up and taking a lot of drugs. If you have five people you can really trust you're extremely rich from a social perspective. In this regard, being rich is yet another miracle
- Advances in Healthcare Technology. The entire idea of aging naturally is now dead, by the time you're in your late 30s jumping onto hormone replacement therapy is a smart move. You can also get basic dysport/botox injections to improve your skin as well. Beyond this, your parents/grandparents also enjoy a much high quality of life due to improved healthcare systems and improved monitoring in case something terrible happens (faster response time). Overall, we're unsure which one of these may apply to you. But. They are incredibly valuable
- Low Survival Stress. We can only describe this one. There is are various types of stress. The good type of stress includes: 1) deadlines, 2) high pressure performance situations and 3) effort in the gym. The bad types of stress include: 1) worrying about losing your job/career because it could financially ruin you, 2) being constantly micromanaged by a high intensity manager and 3) any time you are physically sick/ill. The second category is under what we call "survivor stress" and the sooner you can get rid of it the better off you'll be. Rich people don't seem to age largely because they have lower levels of stress. We will never prove this. But. We believe stress is the #1 killer in the United States. It is simply not healthy.
- The Internet. While competition continues to go up rapidly, the internet has been a great equalizer. Without it, opportunities would be limited. With the internet, assuming you're talented in at least one activity, there is a way for you to get rich if you are willing to try and fail numerous times in a row.

On that note we'll go ahead and get back to writing our next product. Generally speaking we won't release anything for a couple of years as this continues to be a hobby. But. It has been fun so far and we hope everyone who reads this gets a chance to hit the gym hard this month! Best time of the year to get ahead from a physical perspective.

****

Happy Thanksgiving, Some Notes for 2021 and Q&A Announcement

[Happy Thanksgiving, Some Notes for 2021 and Q&A Announcement]

Currently the USA is entering into a second lock-down in major areas and crypto currencies are growing rapidly in value. Easy to say that this means wealth inequality will increase. Meanwhile, high-tech stocks are flying and [Tesla bears still exist] (half joke). All of this adds up to the same high-level concepts explained earlier this year: divide between rich and poor grows, slimming of middle class and acceleration of technology/healthcare. Now that we've seen those concepts play out it's time to prepare for 2021.

Crypto Currencies: We remain positive on the industry long-term, the recent price rise is likely a bit overheated and when Bitcoin and other crypto assets get back to their previous highs, the prices may drop rapidly for a short period. If we look back to 2016-2017, the same phenomenon occurred. When the price of Bitcoin got to just over $1,000 it went down to $800-850 or so before starting its large upward movement to a peak of just under $20,000.

That aside, we have to zoom out. Right now the value of gold is approximately $10 trillion while the value of Bitcoin is around $350B, this represents 3.5% or so. If you look at this from the eyes of an institutional investor (or even lowly accredited investors), 10% is a reasonable target if major firms believe in the asset class. This would take you to a price of ~$55,000-60,000 or so (depending on where the market cap of gold is at the time).

Also, the reason why we've stated that everyone should own at least a small portion of it (not legal/financial advice) is the devaluation of currencies world wide. If you've seen all the free loans and all the direct stimulus checks… this has to come from somewhere. That "somewhere" is the government printing money. Crypto currencies act as a hedge against items priced in fiat currency terms. ***It is also the only asset class with no carrying cost*** (ie. if you attempted to hold onto $10M of real estate or $10M of physical gold, you'd have to pay money in taxes/upkeep/storage fees for that type of scale). With crypto currencies, you simply need to memorize a few words and purchase a cold storage wallet.

Heading into 2021 this space should see additional interest. It is unlikely going to go away and the software (other crypto assets that act as platforms) is being upgraded to make decentralized finance a real possibility (no need for middle men when it comes to obtaining or giving out loans). In the future a deeper post will be needed but if you look up Ethereum proof-of-stake you'll get good feel for the scale/speed improvements (no we're not saying all other platforms will fail, we're simply saying that Ethereum is going through an upgrade that may be successful).

Before moving on, if you search for gold inflows and outflows, you'll see that the commodity is experiencing large amounts of outflows lately. While we think they are trading this in to purchase crypto, no one can be 100% certain. Gold has been used as a form of money for hundreds of years and we don't think it goes away or goes to zero any time soon, we're simply pointing out that crypto has a lot more upside in our opinion.

Invest in Your Home Set Up (even more): In 2020, there was a massive separation between knowledge workers and standard brick and mortar/retail workers. If you were in a knowledge based field, your quality of life probably improved. Being allowed to work from home let you spend time with your families, reduced long-distance work/travel trips and gave you a chance to catch up on reading while simultaneously opening up more time for your health. Insanity. (Note: for those at entry level positions in knowledge work fields, your quality of life may have actually declined as your micro-managing bosses were able to squeeze more out of you by monopolizing your time).

The point of this paragraph isn't to dwell on the difference in outcomes but to offer a clear solution for 2021. Invest in your own home technology set up. If you were "considering" an online business, it is now time to "put up or shut up". If you already have a small/medium/large internet based business, you should upgrade all of your hardware/software. You're not going to spend much money in 2021 partying/going out since the USA is stuck in a work from home environment for at least half of 2021 (feel free to disagree, that is where we're drawing the line for now).

Beyond hardware and software, you should take a serious look at two basic items as well: 1) a real work chair and 2) an upgraded bed/mattress. Sitting in a chair that is not designed for long-periods of idle time will cause real back issues. In addition, we're guessing that many of you are taking naps during the day or laying down to read documents. This is also going to cause back issues if your mattress is older.

The last item doesn't apply to the vast majority of our readers (young working professionals) but if you happen to live in a home you should really consider building an at home gym. Gyms are suffering and many will likely go bankrupt/be forced to shut down by government regulations/laws. The good news here is that you can accomplish the vast majority of your exercises with an adjustable dumbbell set and a barbell with some clips – if you're in a small apartment simply take the adjustable dumbbells to a park. All of these items were hard to find when the pandemic started but now you can acquire everything you need.

Consolidation of Restaurants/Bars/Clubs: There is just no way around this. When you force small businesses to shut down, they end up being purchased by bigger players most of the time. When Los Angeles announced a curfew and killed in-person dining (even outdoors) they shut the door on the lower-middle and middle class. Not fun to talk about, also a true statement. Businesses with 5-10% operating margins with "25% capacity" are not going to function due to high fixed expenses.

For 2021 as an "investment" outside of technology and healthcare, it would be wise to look up the largest and most defensive brick and mortar companies. We're doing that research right now. For example, REITs with exposure primarily to hospitals should not trade at the same valuation as a REIT with exposure to commercial real estate. Similarly, massive restaurant chains with an ability to survive 2-3 years of pain, will be the ones profiting (only place to go when the economy reopens some time in 2021).

As a note, it's important to take a long-term view of retail, brick and mortar etc. It's unlikely that technology and healthcare go "up and to the right" every single year. There will be a rebound when the economy opens up at some point in time. And. You should not be interested in investing for the "long-term". We won't enter the age old "trading vs investing" debate. Our point here is that the brick and mortar business model won't be dead any time soon and there will be a recovery at some point (even if it only lasts a few years before returning to long-term slow declines).

Government Employment to Increase: Considering that the government is in charge of a lot of the issues today (hard to debate this) we'd expect a large infrastructure bill or another program to help the structurally unemployed. While nothing has been announced, it would offer a solution for the government. Create jobs that offer a steady paycheck – rebuilding roads, education, police/military etc.

In fact, this may be a useful avenue for readers of this blog. While we focus on young working professionals, the age band is on the lower end (20s primarily). So if you're looking for a way to fund your business ideas (or simply need a job), the government may be a real and sustainable opportunity over the next 5-years or so. No this won't be a fun way to make money, but… it will offer steady income while you work on your actual dreams/projects. The environment is slower and you may not enjoy the people you're around (for now) but it is a real opportunity for you if you're in desperate need for cash flow. In fact, government jobs are ideal in many cases as you won't be stressed out with hard deadlines and overbearing workloads. (If they are processing unemployment checks for dead people… You can safely assume that the systems are not efficient).

The above is absolutely crazy. 10 years ago if someone told us the government would be forced to create a chunk of decent paying jobs to help unemployed people, we would have laughed. Yet… here we are. It makes complete sense and offers the newly unemployed an avenue to get back on the right track.

China/Asia Wins: We know the political debate is still out there so we won't comment on it. One thing is for sure, you cannot simply "pause" a major economy like the USA for 9 months or more. Asia has been open for a long period of time and this is causing them to capture more and more market share. European companies are shutting down (due to COVID restrictions) which means China has to pick up the manufacturing slack… the USA already relies on Chinese manufacturing and the general economy (in Asia) is simply better there due to limited COVID-19 cases. They successfully contained the virus.

Now we know that there are a lot of theories for the "why". And. Those theories don't matter much. The reality is that Asia is largely open and the USA/Europe is half open at best. This means accelerating *relative* GDP growth in the East.

For those that have followed the blog for a long time, we're not happy about this. The USA has been the best place on earth to get ahead: opportunities are boundless, limited regulation and a high standard of living. That said, Asia certainly wins in a scenario where the other two major world economies are halted/half-halted while they are not impacted.

US Opportunity: To end on a positive note, there is certainly an opportunity in logistics. If you've tried to send packages/products lately, you know that costs are sky high. If you agree with our premise (move to online sales vs. retail), this will drive up demand for storage/warehousing. If you can find a way to offer storage/warehousing at a low cost, you have a long-term viable business model. If sales are online, the "brick and mortar" play would be warehouses (particularly in low-tax jurisdictions).

Similar to our opinion on working from home being more permanent, this should drive up demand for home renovation/improvements. We're sure you've seen all of the new HVAC installations, roof repairs and paint jobs in a middle-upper middle class neighborhood. The problem? Those companies are already soaking up all the demand and it's not smart to jump in after people have installed a product with a 10-year replacement cycle. Instead, think about the next steps. The next steps involve car purchases, gym equipment, home cooking items and furniture. We're sure we've missed a million other ideas. The point is the same.

If we can agree that a huge portion of the population will work from home, they will invest more money in 2021 (albeit in a different way if they recently upgraded their HVAC system and gardens).

We'll go ahead and end with that and announce a Q&A on Friday the 27th for questions on two topics: Crypto Currencies and 2021 business ideas. While we originally said we'd wait until the election is officially over, that seems unlikely near-term

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life. **We hold Q&As 1x a month for purchasers only.**

****

High Level View of How to Find Your Skills & Transition

High Level View of How to Find Your Skills & Transition

What a busy week! Talk about record setting, we could barely even tweet except to troll. That's when you know things are going well over here. Anyway. This post has been a long time coming and will give a good overview of how to transition in life. Not many people think about this particularly when they are younger. When you're 10 years old you think you're going to be a sports star or a movie star or something that is possible but highly unlikely from a percentages stand point. So we'll explain how we make decisions over here from a high level. Can't do much more than that as we don't know your skills, talents or work ethic level.

The Beginning: At the beginning one of the smartest things a teenager can do is write out a tree digram. Everyone knows what this is. You have a starting point and then have two directions left and right… Then another left and right decision over and over again. You should do this with the primary three things that are of value at a young age: 1) intelligence, 2) your peers and 3) your obscure talents – athletics, music etc.

Once you do this your decision making process becomes clear and you'll know when to quit outright and when to continue grinding away. As you get older the "branches" that are alive are the ones you focus on. Thinking like this is a good holistic overview of how to build up the right directions. It is quite literally no different than a tree/shrub. You clip certain fruits to make sure more nutrients go to the ones that are going to be bigger winners. If you allow all the fruits or flowers to blossom all you are left with is a bunch of tiny fruits and mediocre/bad looking flowers. Yes we purposely chose a gardening example since lots of people are doing this during the pandemic.

The first step is to figure out what type of intelligence you have. The link there explains how to do this. The unfortunate part is that you need to develop high self awareness at an early age. This is extremely difficult. People with high self awareness are typically better *improving* at things that are single player in nature. That would be golf, tennis, reading comprehension, single player video games, weight lifting etc. That does not mean they are bad in team environments, it means they are able to recognize their own flaws faster and adapt to those issues faster. In short? If you're interested in improving your own self awareness you need to try new things (early and often) and *predict* the criticism you'll get from an expert. If you're able to figure out what is wrong with your design, your public speaking abilities, your coordination (billions of other examples)… you're on the right path.

The second step is observational awareness. This is why it relates to peers while individual awareness relates to your intelligence. Observational awareness is something that most people are actually good at. They are a lot better at figuring out who is good at what and why. The problem? They don't actually take actions on what they have learned. For example, you probably know the people in your peer group who are going to succeed. If you know this… why aren't you moving your time preference in that direction. In college you can get a "feel" for who is going to make it. It's *almost* never the person who is only studying and it's *almost* never the guy with the 2.0 partying every single day (we excluded the rare 2.0 student who already started a business in his dorm room). Which leads us to the third step of obscure talents…

The third step is taking your obscure talents and seeing how much "value" you can get out of them. When you're young it's pretty easy to figure out how far the diagram goes out. If you're one of the nations best baseball players, perhaps that's legitimately an area to focus since you could make a ton. If you're one of the top water polo players? Probably best to maximize it for a top college for free and stop there. This should be a basic decision for any rational person to make. The economies for both are quite different so you should keep this in mind. This applies to other obscure skills from cooking to musical instruments as well.

Now before we move on, we're going to delete all ridiculous comments about "limiting beliefs" and "exceptions" to the rule. The initial framework is accurate and you're going to have to make smart choices about where you spend your time. If you're 6' 6" tall but are able to run an 800M at incredible speeds you might be an exception (just like Usain Bolt, who is an exception to the standard 100M and 200M body type, he is taller and thinner when most are usually shorter but carry higher amounts of muscle). There are always exceptions to the rule and by pointing this out most people are really just grasping for straws. Even someone like Usain Bolt knew he could do it because the stop watch was showing him it was possible, he wasn't coming in 50th place still trying for the gold medal. He was at/near the top *already* and bet on his body type being different.

The Next Stage: Now that we've established a general framework, you should have a lot of branches. These branches at least give you an idea of what you're good at, making you more unique than you were before the beginning process was completed. Someone should be able to ask you what you're good and bad at with unemotional responses. You're better at XYZ tasks and worse at XYZ tasks. Most people don't have this type of emotional and mental maturity to say "i'm not great at XYZ relative to XYZ" most normal people say they are solid/good at everything even though they are typically awful at it and simply enjoy it. Notice the wording here. You can improve at anything in the world, the question is if it is worth your time.

You'd think we'd tell you to specialize at this point. And. We wouldn't.

Instead we'd write a list of the basics. The basics are: ability to sell, ability to correctly identify talent, ability to self evaluate and ability to either recognize or create good design (visual is ideal). Now why should you focus here first? The reason is that these are absolutely necessary in practically every avenue of life. Sales is for life long training. You sell yourself for careers, girls to be interested in you, convincing someone to buy/sell a home… etc. Time invested in learning sales is practically never wasted. Identifying talent, continuously self evaluating your skills and developing a knack for design will always come up in the future. If you go into real estate you have to learn how to fix/improve it, if you go into an online business you have to learn copy writing and design basics, if you want to make sure sales keep going up you also have to evaluate what you can personally fix and what you need to outsource. In short, the basics are 1) sales, 2) identifying talent, 3) self evaluation and 4) understanding of visual aesthetics.

After the beginning stage you already have an idea of what you're good at anyway so there is no reason to specialize yet. Why? You have to be good enough at the fundamentals… to a point where it is not a detriment. Perhaps you're better at sales and self evaluation but fail at identifying talent and have poor visual aesthetics. It is fine to be *naturally* better at some of the tasks… it is not fine to be incompetent at any of them. It is quite easy to get into the top 10% in anything (including the fundamentals) as it requires little talent and a lot of time. People are incredibly lazy and more interested in being entertained. So. There you have it. Stage two of decision making requires learning fundamentals no matter how much you hate it.

The Third Stage: Beginning of specialization. If you know all of the fundamentals (enough to be be seen as good by other people in these areas) it is time to specialize. You go back to the tree diagram which now has hundreds of branches. And. Many of them have officially hit their peak and no longer need to be looked at. When you take a look at all the branches you then ask "where do all of them intersect".

At this point we turn back to a physical example as it's easiest to understand. If you're extremely fast but lack endurance maybe your best bet is to just go into sprints (swimming or running sprints). If you're extremely coordinated with fast hands (terrible foot speed) it could be something as niche as ping pong. So on and so forth.

Now for the real money making part. ***You have to figure out *how* you're going to compete***. Are you going to compete based more on ability to recognize talent while you do the sales portion? Are you going to compete by personally creating the best product while spending tons to hire the best sales/marketing person? Have you created some sort of new production that puts you ahead of the curve? We can go on and on.

It gets better! The reason why life is a rigged game, is that you've officially reached the snowball point if you can specialize correctly. Once you have one successful venture you now have a blue print to recognizing issues in *other* companies. This is why we continue to laugh and brush off insane ideas. Example? Buying a random internet business while having no previous success.

The only way we can see this being a logical idea is if ***you're willing to take a loss on the purchase***. This still seems crazy as the logic of "learning faster" isn't really accurate. If you start something from scratch since you built all of it you can then recognize all the errors. If you start with something that is half baked, you don't know where the mistake was made *unless you've done it before*. By buying something without previous success you're essentially trying to short cut the process… We all know what happens when short cuts are made. Lots of un-learning and re-doing.

The Fourth Stage: Generally speaking, most people don't even get to the third stage. In the third stage, success breeds itself. You're a millionaire. Some things will go bad (for example if you own some real estate chances are some of it is in the red due to the pandemic), similarly, when you dollar cost average into various investments a few are not going to go up. This is simple probabilities as it's impossible to shoot 100% even if everyone on Twitter tells you it is possible. Anything above 70% is solid/incredible over the long term.

So what is the fourth stage? The fourth stage is longevity. Longevity is recognizing when you're not going to have the same amount of energy/time. You have to do a few things: 1) sell, 2) delegate, 3) transition to lower impact.

Once again we'll use a physical example. If you were an excellent football player, at age 45 you probably shouldn't be getting hit in the head over and over again. This applies to things like boxing as well (Floyd Mayweather, the only risk free return, is the poster child here). Instead you have to transition into something else you can do that is enjoyable. Unfortunately, no matter how many drugs you take, at this time you cannot maintain your levels. This means you're limited to several sports, golf, biking, swimming, water polo etc. (we don't want to think of all of them). If you don't transition you're going to lose all the "left over benefits" of being in shape which is potentially millions of dollars of health care costs and higher quality of life (a huge benefit).

In terms of money we'll steal a page from our life mentor (never met) Felix Dennis. When you've lost interest in a business you have to sell it. Even if you don't get a perfect price, by exiting you'll decrease your commitments and avoid future headaches as you focus on what you really do well. For the ones that you still enjoy… delegation is the best option. Why? You can quickly choose the right people to run it and if you're still interested in it – haven't sold it – fixing issues that arise will be fun for you. And. To wrap it up, going forward, you're not going to try and hit it out of the park anymore. You try and hit singles and look at "lower impact" options to increase income. As usual, the goal is to focus on income generation and much less on investments as you should be living off of less than your annual returns at this point anyway.

The Fifth Stage: The fifth and final stage, is the transfer of all your work. Setting up a will/trust and making sure the money and assets go into the right hands. The right hands = where you think they should go. No one is allowed to tell you what to do with your money so simply send out the assets as you please. Not much to describe here as you're nearing death (inevitable). As a fun note, perhaps we will come up with reverse aging technologies in the future. But. The point remains.

Summary: If you look at this in phases it's essentially, trial and error, self reflection, mass accumulation, accumulation relative to time and finally giving it away. There are *always* exceptions to the rule. The framework is going to apply to some 99.5% of people. Perhaps the top 0.001% end up continuously working harder and never taking their foot off the gas. But. Again. This is the exception not the rule.

Using a tree diagram is something you could even add to your daily routine if you'd like. This is quite useful for someone who is under the age of 30 but can be done at any stage of life. What you do is physically write down what you did and where it falls on the tree diagram. You end up feeling quite disgusted with yourself if you have to constantly write down that you're going in the wrong direction over and over and over again. Once the branches are moving in the right direction you'll eventually find a good intersection point.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending. **We hold Q&As 1-2x a month for purchasers only.**

****

High Risk Investments

High Risk Investments

We don't feel like this post needs to go up but we have been asked about the topic numerous times and stated we would cover the topic as part of a series. Most people, including those with a relatively high net worth ($1-2 million), have no reason to dabble in such ventures. With that backdrop, we would not recommend any of the following ideas to your typical reader but below is an outline, by increasing risk tolerance.

Single Security: We assume you already have a large portfolio, it is growing (no matter what the doom prophets say – they have been wrong the last 3 years) and you have excess cash on the sidelines that you would like to use to invest into a single security.

"Diversification is protection against ignorance, it makes little sense for those who know what they're doing." – Warren Buffet

If you have niche knowledge perhaps you can obtain a medium sized position in a single security. **Be prepared to watch that sucker go to zero.**

Assuming you are prepared to watch the entire value go to zero then we would recommend the following bare minimum requirements.

1) You can build and understand a three statement financial model (should be easily understood). If you can't… you don't deserve to buy a single stock since it takes at maximum three months to understand a financial model

2) You have read at least three equity research reports on the Company. Do not let equity research analysts determine your stock purchases but the reports give you a high level view of what is driving the stock. Get a negative analyst, a neutral analyst and a positive analyst if possible. If you can't even obtain access to research… Again you don't deserve to buy the stock

3) Understand the management team. You should know who is leading the Company what their strategy is and how they intend to grow the business. If they have a history of success… We know the general rule is that success begets success

Simply put, if you can't do these three simple tasks, you don't understand the stock at all and simply got lucky if it goes up. It is always better to be lucky than smart, but don't bank on it.

We provided a rudimentary example of understanding a security with an overview of Facebook.

Leveraged Portfolio: Here we are getting into much more dangerous territory. Leverage cuts both ways, meaning you'll see your value go to zero quickly if you are wrong. Leveraged portfolios include Margin Accounts, Real Estate and of course options (100x leverage).

What is the difference between leverage and single ownership? Timing.

In either case when you lever up to purchase an asset you are saying that the bottom is here. Unlike an unlevered purchase where you're assuming you're relatively close to the bottom you cannot take a large hit to your bottom line. If the asset drops 50% you're down 100%. You're at zero. Even worse? You could be under water if it had 3x+ leverage.

So why would you lever up? **You are practically certain that there is near term upside.** You need to be extremely confident. Confidence at the 50% level is simply not going to cut it.

1) Margin Account: This is the same as a single security with the added pressure of timing (and of course the rate on the margin).

2) Housing: Higher leverage. Usually 5:1 if you're trying to keep your interest rate low and we have recommend a rough 3x Cap Rate/Interest Rate for safety

3) Options: Extremely high leverage and extremely precise timing. We don't like using the work extreme in a back to back fashion but it is important here. Options are significantly more dangerous than a margin account due to timing and the leverage ratio. If you are certain? Well this is your best bet.

Silent Investor: Assuming you're trying to tie up a larger amount of capital (6 figures plus) you can begin looking into equity or debt stakes in a wide variety of options: Real Estate, Companies, Rebuilding Projects, Commercial Projects (restaurants, malls, etc.) and others. **Most importantly? You're handing over the keys to an established professional.**

Why would you do this? You are establishing trust with a new high level contact and you expect higher than average long-term returns that you won't need access to for 5+ years. Anyone who is well off knows the best way to make good friends is by making money together. Money can be thicker than blood.

While we recommend having liquidity and managing your own money you eventually reach a certain level of net worth where most wealthy people begin locking up cash. They lock up a portion of their cash to prevent emotional sales and they expand their network by investing with a high end professional and at the same time they learn about a new business.

So how do you go about private investing?

1) Find the right driver. Repeat this over and over again. Find the right driver. When you go into a silent investment you have no say in the operations so you need to be certain that you trust the individual who will be running the project.

2) Only invest an amount you wont touch for 5+ years. Generally silent investments last anywhere from 3-5 years (some are large in scale and can last for a decade or longer). If you're new to silent investments there is no reason to go big, shave off a percentage you're willing to never see again and stick with a project with a 3-5 year turnaround.

3) Don't be a nuisance. Most people will constantly email asking for updates 24/7/365. Let the other investors do this for you since you will be given access to a data room where updates are posted anyway. Literally become a silent investor. Why? When a new project comes up you'll be first in line for investing since you have not annoyed the driver. If he is good… well you now have first dibs.

4) Make sure they have skin in the game. Depending on the investment type, you will be given a percentage of the initial profits (preferred) and there should be a water mark where the Company will obtain a profit if they outperform. In addition, you want the driver to be responsible for the sale of the asset where he/she will only be paid with excess returns.

Private Equity: Not to be confused with private investing as stated above. Here you're looking to make a 20%+ returns… you are playing with serious debt. You are purchasing an entire asset with a large amount of debt. If you want to take a look at the most recent blockbuster deal look no further than the Leveraged Buyout of DELL.

Who is well positioned to invest in such transactions? As we stated in this post… money begets money… a person with experience in private equity or a person who has helped structure pitch and sell multiple LBO transactions. In addition, if you are extremely fortunate you may join a Private Equity group where you can participate in some of the transactions (don't get your hopes up too high if you are an entry level hire).

This is likely old news for many that actually work on the Street but here are the basics for an LBO

1) The exit strategy is actually the most commonly failed part of a case study/interview. If you have no exit strategy the LBO is entirely worthless. When you flip the Company you're looking to either take it public (for the first time or again) or sell it. If the Company is going to get an unattractive valuation during an IPO process and there are no logical buyers, you've simply made a bad decision

2) Rate of return, for the Wall Street folk we know there is no reason to ever take on an LBO with a 10% return because you may as well invest in the S&P 500. 20%+ is a napkin calculation, it can be lower but it is a good number to have in your head.

3) Synergy: If your firm cannot add revenue synergies or quickly adjust the cost side then you will be hard pressed to fix the Company. This is an obvious one.

4) Debt Structure: Ideally you will have a simple debt structure with minimal tranches all at low rates. This will never happen.

Venture Capital and Angel Investing: This is the last item on our list. The Mecca of high risk. If you have any interest in the field begin reading up on Marc Andreessen and Ben Horowitz.

Here you are assuming again that your investment is going to zero and **your best bet is to create a team.** You need to have a large rolodex of venture capitalists who can keep your pulse on the latest and greatest companies looking for funding. If you're not plugged in we would recommend wiping venture capital off the list.

We are working under the assumption that you will be attempting such an investment from an individual basis which means you're locked into extremely high risk angel investing. You are going to spend around $25-100K (minimum) and put it all into the hands of a single high risk start up.

We would outline basic steps to doing this successfully but unfortunately these projects take many years. While it is fun to have some skin in the game on maybe 1 or 2 companies in your life time, it is certainly not for the faint of heart. Again we recommend reading up on successful venture capital companies such as Accel Partners and Andreessen Horowitz.

Concluding Remarks: We repeat, we would not recommend any of these options for the average person or average reader. We wouldn't even recommend these options to an intelligent reader. We are simply outlining various high risk investments. To sum up the level of risk you can think about it in terms of 1) timing, 2) leverage, 3) control and 4) liquidity.

Single security: Minimal timing, no leverage, some control and liquid

Margin: Needed timing, 2x+ leverage, some control and liquid

Housing: Some timing, 5x+ leverage, some control and illiquid

Options: Excellent timing, 100x leverage, no control and liquid

Silent Investor: Some timing, generally some leverage, no control and illiquid

Private equity: Timing, leveraged, next to no control and illiquid

Angel Funding: Timing, no leverage, no control and illiquid

****

Hoaxed Movie Review

Hoaxed Movie Review

Putting the bias up front we know Mike so naturally have a positive bias towards the movie (you can watch it here). The interesting thing here is we didn't really realize how bad things had gotten in terms of tensions between the left and right with significant violence. Unlike many who believe we're right wingers (we don't care about politics at all), once you make money off someone (our trump wager) you are associated by default. Naturally, this was 1,000x worse for Mike and he got a front row seat to the impending culture war. The first section is the review part and the second section has a few of our long-term thoughts which may or may not occur.

Overview / Review Chronological

Embracing the Heel Role: While mentioned only briefly, Mike talks about embracing the role if you're labeled. This is similar to the age old "agree and amplify" advice practically everyone knows. It's interesting since most people would cave under this type of social pressure but when you have F-you money, the media is forced to fight you versus pressure you. Never looks pretty. The main idea here is similar to our own advice "never try to change someone's opinion of you". If you're labeled negatively or someone thinks they are better than you (despite having already seen their side before), just amp it up and create a show. This only attracts more attention which essentially was the goal.

Strike First: Another part of the movie suggests that the first person to create a sticky image wins. This is incredibly true. If you were a "frat guy" in college who used to party hard, become a multi-millionaire and are later seen drinking champagne in a limo… People will think you're being fake. The reality is that you changed.

Prior to Mike's election stuff and higher level of fame, he used to post on various topics from drugs to weight lifting to whatever it may be. Unsurprisingly, when he re-branded and moved in this direction many of his "old friends" dropped off or started hating on him publicly/privately. Can't imagine how many friends he lost by being a public Trump figure. This is tied into the same concept of first impressions and striking first. When you're going to make a mark or move to another "brand/image" you will absolutely get killed in terms of criticism. While we haven't had the chance to meet Mike in a couple years or so, we'd wager the text messages and DMs being exchanged have drastically changed. After all, if you want to move up in life you can't believe that your friends and contacts will remain the same.

If you think someone is on your side you believe something different: This is another fun concept and works both ways. Lets use a basic example. If you tell someone "Nice shirt it looks good"… If the person *dislikes* you… They will automatically think you're being a condescending sarcastic douche. If the person likes you, he will think "Oh thanks man, what a nice guy he noticed my new shirt".

While this is a simple example, just scale it up and you'll see the ramifications portrayed in the film. By "showing the other side" Cassie Jaye was immediately rebranded due to her involvement in a Red Pill movie. Since you cannot be on both sides you have to be on one versus the other. People are herd/tribe creatures and "bridging the gap" is going to be seen as a bad thing. Nobody wants to give a platform to someone looking to bridge the current "battle of the sexes" in the United States. This would be a disaster for consumption in the United States. So if you're going to be a media/public figure get used to this branding issue and be certain of which image you want to dangle out there.

Picking and choosing the words: This one we knew pretty well, anyone who has seen the news knows that the whole goal is to get a "sound-bite". No one actually cares about context or reading. If people cared about the real story, context or details they would actually read books (hint, people don't read books).

Instead if you're in a position where you're being recorded, make sure you 1) have your own personal recording to defend yourself against clipped footage and 2) be smart about the sound-bite. It's a delicate balance in the "war for attention" as a sound-bite needs to be good enough to get a lot of views but not audacious/awful enough that you're quickly branded in the wrong direction. Ideally, you have a specific image you want to portray and can some up with an insanely viral sound-bite that tattoos an image into the brains of each individual who hears it.

Kuwait: We admit it. We don't know jack about the majority of history. Being practical and future oriented, our knowledge of history is weak. Had no clue that the Kuwait clip in the movie was fabricated. We knew that the "weapons of mass destruction" idea was a bunch of baloney but the Kuwait item was new. Trying to be vague here to not ruin part of the movie.

Journalists Fed Headlines: Another part we're keeping vague is an excerpt of a Journalist talking about how his headlines were written for him. Another one that's not really surprising. At the end of the day, news organizations nowadays are not profitable and are used as propaganda machines. We'll leave it there and emphasize that this is why we don't own a television.

"**It's a business"**: Age old wisdom: follow the money. When looking at any opinion from anyone, ask how they make money first. Would you take "car cost as a percent of net worth" advice from a car dealer trying to sell you a new Mercedes? Of course not. His finance advice would lead to a much higher car buying number. Applying this to life in general is always a good rule of thumb: make sure incentives are aligned.

Media and Wars: We're on the fence on this point. Yes Media makes a lot more money when there is a war. That's true. Our counterpoint to Mike (we know he's reading this) *is that Trump is a headline making machine.* If Clinton won the election the news cycle would likely be less profitable unless we entered into a serious war. So this one was a tough sell for us. The media (in our opinion) actually benefitted by having Trump win (near-term). They have tons of stuff to talk about from taxes to north korea to China to his businesses etc. Just walk around, we see more people than usual glued to the TV wondering "what in the world did Trump do this time!". It's almost a 24/7 news cycle and we have no doubt the media in general is getting a tailwind here.

What you remember is what you saw: This is another great point, your visuals are the most memorable (dress sharp!). Instead of focusing on the negatives of this (how the media tried to warp your brain with images) we're going to focus on the positive. Think about who you want to be in 5-10 years and imagine what that guy looks like. Picture it. Think about this a lot. In 5-10 years you better not be visualizing a guy doing the same thing he's doing today because that is not realistic. If you're currently hooking up in clubs and dive bars, what do you want to be when you're 40? 50? What would that guy be doing today to set himself up for success? Would he really be buying the same stuff, going to the same places, hanging out with the same crowd… the same people. Absolutely not. Since your mind remembers visuals the most, you have to visualize what you will be doing in 5-10 years. Try to make it as detailed as possible.

What you aren't seeing: One of the most interesting parts of the Election was when Mike filmed the Bernie Sanders supporters protesting the DNC. He physically flew to both the RNC and the DNC and no one cared about the DNC protest. Even to us this was surprising given the sheer number of people on the camera. Mike's way better at this than anyone we know, where he'll ask "what aren't you seeing". There was no coverage of the DNC so he took it as a hint that maybe something was happening there and was right. Another strategy appears to be "lack of video". Other events only had still photos of what was happening and he'd go to those locations and find out the media was just surrounding one "photo op" of the same old thing and not showing the whole picture. For better or worse we don't use this approach enough and stick with the classic "how are these guys benefitting" before deciding if it's a legitimate source or not. (Hint another reason we've essentially deleted all people from our phone who are not rich, this is because rich people are *less* likely to screw you despite common mis-conceptions).

Republican killed and a Car Death: Apparently, an actual republican congress person (something like that) was killed by some radical leftist. Also. Some lunatic white supremacist hit someone with a car. Call us ignorant (it's true) we had no clue either of these crazy events happened. We always knew that people who had hardcore political/group affiliations were losers and this just confirms it. It also confirms how little we know about "society" as we legitimately don't remember any of this.

Naturally, our basic view here remains the same, just ignore people who really dislike you as being killed/hit by a car is definitely not worth it. Always avoid people looking to antagonize you unless you can somehow benefit from it (99.9999% of the time it's a no as antagonizer are usually poor with nothing to lose). Conflict is only worth it when the risk outweighs the reward and if people really care about this whole politics stuff that much we'd recommend avoiding the entire disaster. It seems like this is actually getting worse (although we're biased since we just saw the movie) and politics is becoming more violent and extreme. Knowing that there is this level of emotion also explains the rise of socialism and other extreme beliefs. Crazy stuff, but after seeing the movie it makes a ton more sense.

What is Real? One of the questions posed is "what is real". We did come to our own conclusion here which is "real" is defined by your life experiences. This is also why we ignore all people explaining how "life is" when they've never made it. You wouldn't ask a homeless person what life is like as a rich man and you should never ask a socially inept dork what clubs and spring break are like. They are different worlds entirely and if you've never seen it you won't believe it.

Believing in fake versus real is also damaging. If someone believes all rich people are "losers" they've mentally screwed themselves as they are fighting off the belief that rich people are losers while simultaneously trying to get money. Also. If a "nice guy" thinks buying chocolates and roses will get him laid, he'll ignore all the stories of guys hooking up with married women and girls with boyfriends within a few short hours. The best way to view reality is there there is always a "new dimension". Sure there is an awful dimensions where you're poor broke and ugly. There is also a dimension where you're rich, happy and athletic. There are also middle dimensions where you're poor but happy and good looking or rich and unhappy but good looking. So on and so forth. Each "movie" is real it's just a personal decision on which movie you want to be playing in the future. The movie everyone wants is the rich, good looking and happy one. This one gets the most hate as it's the top 0.1% (only 10% of guys have good social skills and only 1% of guys are multi-millionaires early enough to enjoy it).

Every Group Has a Rational Person: People in general are not bad. So in every single group be it a socialist group, republican group, a feminist group or a "mens rights" group… There is at least one guy/girl who is willing to see the other movie. Unfortunately, as you can see from the film there is a VERY SMALL number of these people. Unless you're making a film or trying to create something artistic, we'd recommended avoiding the hassle of finding these people. Yes we know, this is "negative". It's just running the numbers. Sure you could spend your time trying to find the handful of people who will change their views on an emotionally charged topic, or you could spend that time trying to help yourself, your family or your close friends. To us the decision is clear, stick with "smile, nod and agree".

Things are Getting More Radical: Towards the end one of the beliefs is that all of this chaos is making more radical differences. People are able to block each other and create tribes/herds. This is actually a good thing for a few years. Why? Well it makes the audience easier to sell to (you guys HAD to know that was coming). If everyone believes the same thing all you have to do is convince the tribe leader to buy and you have a recurring niche revenue model!

Jokes aside (well not really a joke since we were serious), it doesn't seem like the polarization is going to get better any time soon. We'll go ahead and predict increasing popularity of socialism on one side and more extreme capitalism on the other side. Not sure how this shakes out in the end. The good news is that it shouldn't really matter if you're interested in being successful over the next ~5 years or so. We're in the *platinum* age of opportunity.

Long Term Thoughts

All Media is Biased: This is essentially a fact now. Opinions are now dominating the news so just assume that everything you hear is biased. Both from the mainstream media and your local celebrities. Everyone is trying to convince you of something so go ahead and learn to come to your own conclusions. Be careful here though. Your conclusions are going to be based on life experiences which is a slippery slope. Just because something appears true to you will appear false for someone else.

What a Disaster it is Out There: Can't say it enough, politics is a complete jungle of nonsense. Piles and piles of nonsense and angling. There is no real way to solve this massive issue any time soon so we're going to stick with avoidance. Just not worth it. Mike's a public figure at this point despite what his haters my say and we don't even want to know what his day to day life is like in terms of crazy messages, phone calls and in person annoyances.

Be Careful With Association: Luckily we're already past this part and no longer have any serious interest in meeting new people (unless higher on the totem pole). For anyone else looking to climb or improve their life, take a serious look at who you're hanging out with since that "brand/image" is going to impact your life meaningfully. People think about their diet and workout routine more than they think about their cell phone and that's the wrong approach on numerous levels. When you go into one group, recognize that the success of that constant contact list is going to be your success. Life isn't a zero sum game, it is a positive sum game. If you're associating with the wrong group, your beliefs are going to morph in the wrong direction. This applies to both the extreme right and the extreme left as depicted in the movie. Honestly, wouldn't want to hang out with either of these groups for any amount of time.

Don't Get Emotional: An anonymous person made a salient point, you can only really be honest when you have "F-you money". We agree with this. Unless you have F-you money just stay far far far away from politics and other such nonsense. It just isn't worth it. Get rich first. After you get rich and have F-you money, then you can go ahead and decide if you actually care about this stuff. Mike actually cares about free speech and getting a specific message (as evidenced by the amount of work he put into this movie + his constant work online). We don't care at all about this stuff. Nothing really good or bad here, just emphasizing that getting your life in order is first priority. Let the two extreme political views battle it out and ignore it all.

A Ton Can Change in a Couple Years: If you've followed Mike for more than 5 years or so you've seen him move through numerous different endeavors. In 2012 if you told him he'd be all over the news due to politics we bet he would have laughed at you himself. Now he's considering running for congress or something like that. Life is funny that way. The good news is that even if you disagree or dislike the movie just think about how much his life changed in just a few years and the excuses start to melt away. While we're more concerned with the future of the US from a political view, we're more convinced than ever that we're in the *platinum* age for turning your life into whatever you like. Unless you're just lazy.

****

How Do You Get Rich? Two Rules

How Do You Get Rich? Two Rules

Everyone in their 20s wants to be rich (note: we're defining "rich" as $1M+, Felix Dennis will disagree). Ask any male who is in the 20-29 year old age bracket and you'll find becoming rich is the number one goal in their life 9/10 times. The reason why they won't get rich is simply because they *lack patience and believe they are smart*. Here is the trick to becoming a millionaire by 30 (+/- a couple years for safety).

"Spend 12-16 hours of every single day making money and dollar cost average into VOO (ticker)"

1) Make Money 12+hrs a Day: If you really spend 12-14 hours a day making money you're going to be hard pressed to burn it aren't you? **Your savings rate will increase dramatically by default.** We don't do many posts on becoming frugal because it is a scarcity mindset where you are thinking in terms of cutting costs (saving $100 a month, really?) rather than making money (if you make $100 you didn't spend $100 during that time frame). In short, even with the demographic that reads this blog, 99% of people will not be able to earn money for 12 hours a day for 5-7 years. This is not a knock on anyone reading the post, it is simply the truth. They will get "tired" they will "need to blow off some steam", in short, they will need to spend their money to maintain their happiness levels. They've already lost.

2) Don't Predict the Market: Everyone thinks they are smart. Once you realize this, you stop trying to predict the entire global economy and simply dollar cost average. You will *generally* see 5-9% returns over the long run (nothing is guaranteed), but in simple terms *"are things going to become more expensive?"* if you answer yes (you should answer yes based on 100+ years of history) then all you need to do is buy inflating assets (stocks).

Until you no longer have to work for a living, you cannot break either of these two rules. If you are Financially Independent (FI as the nerds like to call it) then you can dabble in higher risk items. **The end.**

.

.

.

In 100% honesty it is taking the will of a thousand marine soldiers to avoid clicking "publish" after the end of the previous paragraph. Why? ***It really is that simple.*** Instead of clicking publish lets go ahead and look at all the foolish people who will try and break these rules. No apologies if you're in this camp because you're going to pay the price of losing money which would be much worse than accepting the two strategies above.

Market Timing: Any seminar that explains how you can time entry points into stocks, bonds, houses, options, foreign exchange, derivatives, or otherwise are all the same. ***Get rich quick schemes to steal money.*** By reading the previous two sentences you've eliminated 95% of the marketing gags on the internet. There is no system, no person and no calculation that can predict price movements in advance. Period.

"But so and so has done it 20 times in a row!"

Great. Go up to this Oracle and ask him "Can you show me all of your transaction records for the last 5 years". Anyone can show 20 clean breaks and no one will hand you their information. Move on.

Finally, how can you be certain? So sure no one can predict market timing?

Easy. ***The value of knowing market timing for certain is north of $10 Trillion dollars.*** That is not an exaggeration. If you can predict the timing of any market, on a daily, weekly or even monthly basis… The first thing you do is shut your mouth. You quit your job and you hide in a tax free jurisdiction to trade an account. You borrow at any rate imaginable (10%+? who cares! give me the debt!) Why? If you can predict the turn of a security in that short of a time duration you're going to make 10x the return immediately on an option (Puts or calls). In fact if you know a single security is going to move by 10%+ within a day, you should quit everything you're doing lever up, and go all in. If it's really that easy you're rich by the end of the day, not month, not even a year.

You're certainly not teaching seminars. You're in hiding to protect your algorithm and backside. Don't skip on the high end body guards.

Work Life Balance Personalities: These people never get rich. This breaks rule number one where you believe that you're entitled to $500K+ a year without working more than 40+ hours a week (Gotta be able to make happy hour!). In addition? The fact that the person believes his career isn't fun and is "hard work" tells you he won't be any good at it in the first place.

If you decide to take the work life balance approach you should get a job at a start up. Why? You're putting your fate in the hands of luck and this is the only space where you will have a shot at event driven income without putting in the time. Blind luck!

If it works? Great and more power to you, just don't become delusional and believe you can earn a high income without the aspect of luck and a mediocre 40 hour a week work ethic.

The Rich Think Alike: If you don't believe that rich people think alike, and would largely agree with the two premises listed above… You need new friends. Why? They are broke.

The odd thing about life is that the law of attraction does work when it comes to money. If you find one man who made it to a million dollars by 30ish, you're going to find a startling fact… In his phone is the phone number of every other student in his class who cleared $1M+ in net worth by the same age. To get rich you're going to operate like a rich person, which means your friends are going to be rich as well. Simple as that.

Unable to Earn: The classic lazy person. They will claim that their only source of income is their job/career. Unwilling to reinvest in themselves and find skills that will pay immediately they try to squeeze pennies out of a flat-lining income stream. Similar to your friends who are unwilling to work over 40 hours a week and dollar cost average… You need new friends again.

Before the comments become filled with "bragging" type complaints here is a short list of skills you can learn that will pay immediately if you simply put in the time (you can even do some of these at work when your boss is not looking)

1) Copy writing (can be done in an office)

2) Affiliate Marketing (can be done in an office)

3) Fix electronic devices (if you're slick you can do this at work as well – eventually hire outsource)

4) Paid for services on Fiver/task rabbit (eventually outsource).

These tasks can be completed off the clock with ease.

Pretty simple, lets assume you only make $20 an hour? If you add 20 hours a week times 52 weeks a year… that's $400*52 = **$21K in cash savings.**

Guess what? If any of the above take off, they are scalable. You can simply spend more ad dollars and scale your marketing business or you can change your rates to higher end consumers etc. You're building another stream of income. It's not passive income yet, but the $21K sitting in stocks/bonds certainly is.

Avoiding Bad Information: Lets assume you believe this entire post, entire blog and entire opinion is BS. That is fine. In that case make your life a million times easier by using simple logic.

*"Is this person actually rich **and** happy?"*

This logic makes complete sense. If the person has what you want, listen to them. If they don't have what you want, they should be ignored. You're going to meet many people who are older and supposedly wiser than you are (if you're 30 this is the 40+ gang, if you're 20 this is the 30+ gang) but don't take what they have to say at face value. Do your research. Is this person rich? Did he succeed? If not his advice should go directly into the trash. **Smile and nod. Smile and nod.**

.

.

.

As a signing off point, this was a painful post to write. It was not meant to come off as demeaning angry or unhappy yet if you read the post it still does.

Why is that? **It is depressingly true.** The only way to get rich (relatively rich!) is to ***GRIND.***

Look around you. Anyone who is 18-20 years old can simply read this post **act on it** and become financially independent within a decade!!!!!

Yet… 99% of people won't do it. Lets repeat that… **99% of people won't do it.**

Hopefully for every 100 people who read this post at least two people will get the message. **This would double the number of rich people!**

****

How Does a Young Man Make Better Decisions? 10 Laws to Remember

How Does a Young Man Make Better Decisions? 10 Laws to Remember

Here are some laws to abide by. Laws are meant to be bent and broken from time to time, but break these consistently and you'll pay a hefty price.

1) Law of Attrition: As a man you should realize that most people will make nothing but poor decisions. They will do this over and over throughout their life. If you want proof of this, simply look at the statistics for retirement savings. According to major brokerage firms (Vanguard/Fidelity) and the like, your average person who is 55+ years old **only has $150K in savings.** This amount is less than what you should have saved during your 20s.

Lets use this law to our advantage. Knowing that the vast majority simply won't make it, the people who have succeeded will stand out like sore thumbs. Ignore the unhappy rich folk (there are a lot) and simply spend some time finding happy and stress free rich people. While everyone will say "these people are hard to find"… nothing is easy and they should stand out from the crowd. Use the law of attrition to help you find mentors that will take you down the correct path. If they didn't drop off the radar, they can help you remain on the radar as well.

2) Law of Momentum: Physics applies to decision making as well. Objects in motion stay in motion. This is why rich people get richer and why responsibility continues to go to intelligent decision makers. If you make a smart decision people give you more of them to make, then they introduce you to other people as a "smart guy to know". This will repeat over and over again. Eventually you won't have time to help everyone. Now you've won.

There is a clear undertone to this law. If you make smart decisions when young you will see a snowball effect that will gain traction over a long period of time. The reverse is also true. Bad decisions when young will ripple over the next 20+ years.

3) Law of Association: Based on your phone people will judge your worth. Sounds simple doesn't it? It is true. If you can simply spend time around high worth individuals, people will assume you are of high worth as well. Many of our readers are bright, so lets combined Law 2 with Law three. If you consistently spend time with wealthy people and consistently show them you make good decisions… they are going to introduce you to more high worth individuals.

Before you make a decision ask yourself, what type of people will I be spending my time with? If the answer is of low quality, probably best to move on.

4) Law of Negativity: There is no reason to spend time with unhappy and unlucky people. Apply this to your life. The law of negativity works in conjunction with all three laws stacked above. You are likely to quit (attrition), you are likely to continue on a downward spiral (momentum) and misery loves company so you will attract other miserable people (association).

[Force yourself to be positive](#) in every environment since the alternative always leads to poorer results. If you are truly in a wasteland, the answer is to leave.

5) Law of Similarity: People surround themselves with other like-minded individuals. Use this to meet successful people. Once you are surrounded by successful people you should adopt their line of thinking, dress code, vocabulary and tone of voice.

6) Law of Risk: Every single decision you make is going to have risk associated with it. There is no such thing as risk free. Therefore you should always make the **best risk adjusted decision** that you can possibly make. Make a list of the downsides of the decision and balance them with the upsides of the position. It will become increasingly clear if it makes sense once you appropriately assess the risks.

A simple Wall Street example? If you have to choose between a major investment bank or an unknown investment bank, there are practically no reasons to choose the unknown bank.

7) Law of Pain: Generally speaking, **the path with the least amount of suffering is the wrong decision**. This law becomes more fluid as you get older since you're no longer building your life, BUT when you are young if you choose the easier path you are likely giving up decades of your life. This is not an exaggeration. The last thing you want to do is tell someone a decade older than you that you "were not willing to work hard". This will be a nail in the coffin.

8) Law of Common Sense: These days, this law is being overlooked. "Does this make sense?" ask yourself every single time. "Does this make sense?" Before getting into juicing because of [Danger and Play](#) and following his blog over at [Fit-Juice](#), the belief was that a calorie was a calorie. While this may be the case for weight loss it makes no sense for health.

Lets combine Law 7 with Law 8… When in the world has it made sense for a man to take the easiest road possible? That's right, never.

9) Law of Fairness: In short, life is ***generally*** fair but not equal. What does this mean? If you continue to generate value over a long duration you'll likely improve in your given task. Life however, is not equal. There are people with trust funds, there are people with better genetics, therefore people are never going to be equal. The best you can do is remember that life is generally fair, [the more you add the more you get.](#)

10) Law of Opportunity Cost: At the end of the day, every decision you make will impact another decision. There is no way around this. There is no way to have your cake and eat it too. The goal is to simply give yourself as many options as possible. When you don't know what to do? Choose the path that gives you more opportunities.

Concluding Remarks: You can feel free to break a lot of these laws but… it will likely cost you millions of dollars, better friends and an improved life over the long-term. If you remember these laws, you'll likely become a significantly better decision maker

****

How Does this Blog Operate

[How Does this Blog Operate](#)

We continue to receive questions on how we run this blog, twitter account, facebook and find time to write these posts. With that said we'll provide a detailed and *actionable* <– as usual… post on this topic. This will be more informative in nature than entertaining. Outline below:

- How Do You Operate the Blog?
- How Do You Operate on Social Media?
- What Do Email Subscribers Receive?
- How Do You Find Time to Write Posts?

We're keeping this one a bit shorter than our previous posts (lots of work last week) but it will be jammed full of actionable advice for anyone who wants to run a website.

<u>1) How Do You Operate the Blog?</u>

We get a lot of questions here since the blog has been around for a while now (since 2012). Instead of adding more of a backdrop, we'll jump right in with the primary questions.

How Do You Stay Private? This is the primary question we receive, how do we maintain privacy on the Internet? Many of you have already figured out how we do this (smart readers!). We simply purchased accounts for Facebook, Google, Twitter and one IP address. Anyone with a speck of knowledge with regards to affiliate marketing is going to know that it doesn't cost much money to set this up (about $5K, or less than 3 days work).

How do you make posts? Okay, so you purchased the accounts… now how do you operate as a group? Simple, one word: *Teamviewer*. All you have to do is download the program and you can now login to a single IP from anywhere in the world. You can use other applications such as LogMeIn and that will give you the same benefits as Teamviewer. Notably, you don't need an expensive computer or anything like that. You just need a single IP hooked up to a direct line that does not go down. Set your computer so that it never hibernates, shut the laptop and slip it into a drawer. Done deal. You can now post remotely but work off of the exact same IP address.

How Do You Determine the Post You'll Write? This is primarily driven by "whatever we feel like". But. We do look at analytics once a month and see what people are clicking on ([approved products](#)) to see what people are most interested in. That said, we try to keep the following balance in mind… 15% Game specific posts, 45% life related posts, 20% Wall Street related posts and 20% personal finance related posts. We are certain the mix of posts will change over time. Overall, the readership is primarily men in their 20s (our target market) so wasting time posting 50%+ on "game" would ruin the lives of all of our readers. We have no interest in that.

How Do You Create New Content? This is easy. We're sandbagging everyone. We have many post ideas that are sitting in the queue waiting to be published. But. We simply won't hit submit until the audience is ready. We have 10+ posts in the draft folder that are already complete (each about 4000+ words!) but we sit on them until the time is right. If you want to create good content you need to be *proactive*. This means you're creating content consistently and are not *reacting* to random news. You can have some reactive content but the only way to really gain readership and create differentiated information is to be *proactive*. This is extremely important. Write it down. ***<u>Proactive > Reactive.</u>***

Are You Worried People Will Not Read an Anonymous Blog? Nope. We have a huge advantage in this case. Wall Street information is impossible to fake. People are nit-picky and will try to poke tiny holes into any Wall Street related post. If we were "fake" this blog wouldn't be growing. It is growing rapidly.

This is a front office only blog. No useless posts on wealth management or operations.

This is also why we avoid stock picking information like the PLAGUE. It would create too much drama and we prefer high level sector overviews. High level overviews can give out actionable information without being forced to make stock calls. The last thing we want is a blog full of retail commenters.

Why Do You Mark People as Spam? Simple. Having a "tolerance" policy implies that there are no standards. The only people who are tolerant of *everybody* are those with ridiculously low standards or low senses of self-worth (insecure). We have no interest in regular or mediocre people. Never have, never will. Marking poor commenters as spam is a good long-term move and a bad short-term move. Luckily we don't have any interest in short-term gains .

Conclusion: The blog outline is quite simple: 1) buy accounts, this will cost about $5K, 2) make posts that are a good mix of what you think is important and what readers want, 3) create blog posts *proactively*, you do not need to submit them all at once, 4) anonymous blogging only works if you walk the talk and you have information that is *impossible* to fake and 5) keep the regulars out. On the internet, the only way to prove you're not living in your mom's basement is to deliver *actionable* value and provide legitimate *information* that can be used immediately.

2) How Do You Operate on Social Media?

Not even sure why we get this question. Our social media profile is muted at best. We have a simple Facebook page but operate relatively frequently on Twitter. That is about it. In fact… Most of our traffic comes from Reddit and SumbleUpon which are two things we don't even use! But we'll answer the question anyway.

How Do You Use Facebook? This is the easiest one. We operate our Facebook account solely to show new posts. In addition? We post to Facebook as our *first* media outlet. So, if you like us on Facebook you will be alerted by a new post immediately. All of our new content is added to Facebook and we respond to comments on our page once a week (when the post goes up). As usual, make sure your logo and banner are consistent and you load up photos with each new blog post.

How Do You Use Twitter? This is a much more complicated one so we'll break down our logic into bits and pieces. We are much more active on twitter so we will explain how we use each function.

We do not see "eye to eye" on every single topic with all of these people but it creates a good mosaic of what our blog is about. The people we follow may change but the themes will not (IE: you won't see us following idiotic frugality blogs any time soon!). Finally, if you don't follow a lot of people, then all of your followers are going to be *real*. Meaning? They are not following you because you are following them.

Favorites: We use the favorite feature to promote our blog. Anyone who mentions a post of ours will receive a favorite. We think it is poor form to retweet every single mention of your blog since it looks too promotional. We believe twitter should be run as a micro-blog so the main takeaway should be *content*. It should give viewers a sneak peek into what the blog is about. If you automate the process of favoriting every tweet, you're going to end up favoriting a lot of negative tweets as well. This will come off as "passive aggressive". Does not matter**.** These people lose their cool and call even ***more attention*** to your blog! Let them flip out since passive aggressive behavior is for two year olds. We strongly suggest automating your "favoriting" process because it helps you grow your platform at ***zero cost***.

Retweets: You should always be on the lookout for good information. If you find a really good tweet or blog post then go ahead and retweet it even if you're not following them. Not a big deal. It will add to your high quality *content*. Since Twitter is meant for short-term signaling, you should "undo" all of your retweets after about 3-6 days. It will clog up your twitter feed. So retweet the content, and then undo the retweet once all of your followers have seen it.

Connect: The connect function is primarily filled with idiots and retards. You should only respond to two people on the connect feature: 1) your followers and 2) people who dislike you but have more followers than you. The rest should be ignored.

You will certainly miss a lot of @mentions but the two guidelines above are going to serve you well. If some idiot with 200 followers tries to argue with you… Don't favorite any of it and just ignore it. He'll go away and fight some other useless "internet battle". Move along.

Finally, if you respond to one of your followers, once they have seen the tweet again… **delete it**. Why? We treat our twitter profile like a *blog* and you don't want it clogged up with one conversation with one follower that no one cares about. If one guy is asking you about a resume review… Then it unlikely applies to everyone… Also? Most of your followers won't care either.

Mix of Content: Overall we think a good guideline is to have ~10% posts, 90% content. This means you're promoting your blog or linking to new posts 10% of the time but the remaining 90% is content. This means your twitter profile is really just another blog which explains why you delete all of the useless @ conversations and undo stale retweets. This keeps a *clean* twitter profile. New people find your handle and can quickly decide if they want to follow since it is primarily content instead of marketing mumbo jumbo.

Conclusion: We use Facebook to give the latest updates and use twitter to micro blog. Everyone has their own strategy. Specifically for Twitter we 1) maintain a clean content based blog, 2) avoid clutter in the twitter stream and 3) only follow people who have added value to our lives in some way.

3) What Do Email Subscribers Receive?

We have not finished our product. But. The main value add for our email subscribers is simple… We offer sporadic *free* Q&A's. As you can imagine, we do not have the time to answer every single question on this blog. We try… But. It is not numerically possible if you're committed to using the power of 1% for your blogging endeavors.

Since this section is short and sweet we'll give some freebies away for our current and future subscribers.

- We will continue to offer *free* and random ask us anything events. Some of them may be on the blog. Some may be on social media. You will be alerted.
- All of our subscribers will receive a discount upon product launch. This is not going to be the case for followers on Twitter, Facebook etc.
- We *may* create Infographics that help "map out" decision trees for specific situations. If we do this… It will only go to our email subscriber list.

4) How Do You Find Time to Write Posts?

Ahh yes! The most common question from *primarily* retards. The argument goes like this.

"If you work 80 hours a week on Wall Street and remain in shape it is impossible to write 3000+ word posts every single week. You're full of it!"

Sigh.

Pretty simple really. None of our writers work 80 hours a week doing *solely* Wall Street work. In fact, anyone who works 80+ hours a week after the age of 25 on Wall Street really needs to get a new career because **he isn't any good at it.**

Here is how it works.

As you go up the chain on Wall Street and as you operate an Internet Business… You are going to travel *a lot*. You will not have WiFi access all the time and you're not going to spend 3 hours a day reading (1 hour is more than enough) so what do we do instead? We write on a tablet or mobile phone.

90% of our posts are written on a tablet and smartphone. This is also why we developed the *star* labeling system since we couldn't figure out how to bold some content on the older form mobile devices. We have since stuck with it. It has also caught on as others now use the *star* format on social media and in our comments!

So there you have it. This is pure utilization of the power of 1%. Only blog when you're in transit. Blogging should be a hobby. Not a serious form of income since it would only generate ~$150K a year on ~15 hours of weekly work (not worth it at all).

10 Summary Bullets: Here are the actionable items from this "short" blog post of "only" 2500+ words.

1) Buy IP addresses to maintain privacy and download Teamviewer for *free* remote access

2) Make posts that are relevant to both what you know and what readers want

3) Proactively create content to backfill your posts

4) People only read anonymous blogs that can be *proven* as valid

5) Actively keep the idiots out – hint most idiots are the late commenters

6) Have multiple social media accounts with a purpose for each one

7) Have a clear strategy for each social media account – we gave you ours (micro-blog)

8) Give email subscribers a reason to add themselves to the list – do not spam them

9) Blogging in transit is a great way to slowly improve over time

10) Spend the rest of your time (not blogging) on *serious* business/career activities. Anything that will generate *at least* $400-600K+ (now or in the future) otherwise it is a huge waste of your time. Now if you want to generate a ton from blogging, go and tell people you'll set up their blog for them. Don't look for gold, sell the shovels.

****

How Much is Your Time Worth

How Much is Your Time Worth

A fun game we've been playing is deciding how much "work" you should do depending on how it'll move your net worth. We can all agree that working 4 hours a day to earn $200 doesn't make sense if someone is a billionaire. Similarly, if someone is poor, working 4 hours extra to make $200 is a smart move if their bank account shows $2,000 and they have nothing else to do during that same time slot. There is no clear answer here but its an important concept to grapple before getting rich. No one wants to end up like the majority of boring rich folk. So lets take a look at some of the numbers.

Working for Percentage Points

All Items Reflect Percentages: There is no point in doing dollars because it doesn't show the incremental value. If you say $10,000, or $1 million… It doesn't tell us how much the person is worth. $10,000 is a lot for someone with a $20K net worth and $1 million is absolutely nothing to a billionaire. Hard to grasp for a non-billionaire (including us of course) but makes logical sense since it represents 0.1% of his net worth. Peanuts really. So we'll walk through some of the numbers and see if it makes sense to continue pursing an activity for money or not.

Assumptions: 1) We assume you are financially independent, meaning you don't have to work. 2) We assume you would be working a full year to move your net worth. 3) We assume no gains from investments, the annual work would be the only money that counts to moving the net worth figure.

One or Two Percent: This doesn't make any sense. If you work for a full year in any activity and all it does is increase your net worth by 1-2% you should quit. Your time is worth much more than this because your annual returns should at minimum be around 5%. Essentially the net worth you have originally built up is worth more than losing a year of your life to increase the number by 1-2%. Unless you're doing it for fun (like this blog which doesn't add any material amount of money – not even a percent), an activity that moves your net worth by 1-2% should be dropped… Instantly.

Three or Four Percent: We'd say this is yet another number where you shouldn't bother. It sounds like it might be worth it but if we assume the typical person only has 40 good years (age 20-60 roughly), you're giving up 2.5% of your life for 3-4% in incremental net worth. This is not a good ROI unless you could give up ages 60-65 for the extra money (when there is less to do). Hopefully we're all on the same page here and 3-4 percent still doesn't make any logical sense.

Five to Seven Percent: Here it gets interesting and we'd argue that it depends on how much fun you've had in your life. If you've lived a fun life leading up to financial independence (you should have if you lived Efficiently!) this may be worth it. Now the question is how many hours you must commit to it. The days of working 80 hours a week are long gone anyway. If you have to work around 25 hours a week to get an extra 5-7 percent we'd say you should do it. If you have to crank out 40 hours a week, it no longer makes any sense at all.

Eight to Twelve Percent: Now we're talking about a "decent move". Essentially this is equivalent to two years of investment returns. Since a single year of investment returns should at minimum lead to your cost of living, *you're looking at two years worth of living expenses for a year of work*. You're giving away one year to get two full years or one crazy year of high expenses. At this point we'd say it's worth it if you can pull of 35 hours of work. That is about it. Forty hours a week is just not worth it once you're financially independent and 35 hours is enough where you'll feel a little bit annoyed but won't be pulling your hair out.

Thirteen Percent to Twenty Five Percent: At this level, it could be worth it to work 40 hours. Maybe maybe not. It really does take a lot of motivation to go back to working a full work week so we'll leave this as the "grey zone". People with nothing else to do will jump at it. People who have other things they would like to do will likely pass unless they can get the hours down to the 30s.

A Big Jump – 50%: At this point you're looking at something meaningful. Now we know why rich people get richer! They only look for meaningful jumps past a certain point. if you're able to increase your total net worth by 50% or more, you may be motivated. It depends on your personality but increasing your future spending by 50% forever is a big deal. Going from $10K a month to $15K a month is a noticeable change in life style. At this level we'd suggest sitting down and thinking hard. The project is probably worth a look. The only downside here is the hours are unlikely consistent and will require a lot of your brain power. The good news is that the numbers are fantastic. *In short: in terms of percentages your time i worth at least 5-10% of your net worth at all times.*

Working to Pass the Time

Typically, young people believe the rich are constantly working around the clock. This isn't true and the answer is right in front of them with Chairman flights and the person in HR who simply tells everyone they are "doing a great job" while they fly around in first class. If you've made it, then you have a system that frees up a lot of your time. That said… You're going to get bored. This is why a second framework for effort is based on your total working hours.

Zero Hours: You need to do something! Working zero hours a week is beyond boring. Even if you're a billionaire you'll want to do something. This is why the billionaires you see on TV never end up quitting. Even the financially independent bloggers end up doing something for work. Zero hours is simply too little and you'll go stir crazy. Sitting at home and going to the beach for 3 hours a day is going to get old.

0-10 hours: This is for a hobby, not for real work. You can fill this with volunteer work, charity etc. Sure you're not making any money (maybe you get a tax break) but it doesn't move your net worth by 0.1% (unlikely that much). This is a good avenue to pursue if you recently quit working. After that it gets dull in a hurry. For what it is worth we'd say that working 0-10 hours a week just isn't enough since you're left with about 14 hours of idle time during a typical day.

10-20 Hours: This begins to get interesting. If you can find a task that takes up 10-20 hours and is fulfilling in some way, you may have just enough work time to prevent yourself from going stir crazy. We've found it isn't enough but we also know people who operate at around the 15 hours per week marker and are 100% content.

20-25 Hours: This is the "money" range. Somewhere in this range seems to be ideal if you can maximize your profits for the hours you put in. You can essentially set your own schedule since a 20-25 hour per work week is not going to have a "check in time". It also requires some commitment so you don't end up drinking 3-5 days a week! Clear businesses that offer this flexibility are: 1) online sales (duh!), 2) real estate – depending on how much is outsourced, 3) any brick and mortar if you're an owner and 4) bloggers. We're sure there are many more but those four can certainly see automation to a point where 20 hours a week is reasonable with a high payout. In fact, we'd say it's possible to move your net worth 5%+ on 20 hours per week. It's possible to move it 25% to be completely honest.

26-40 Hours a Week: Here we're taking about full time commitment range. This is hard. You need to be incentivized. Anyone who has worked hard knows that after 40 hours or so you begin to make trade offs. Your workouts in the gym are not as good. You eat less healthy. You may not sleep as well. You miss out on specific events. There are trade offs. The good news is that if you've made it to financial independence you have high value that commands high pay. We'd use consulting as a way to pus yourself into the 25+ hour range if you need extra $$. (Yes we gave away our suggestion which is online income + consulting when you're bored and need more money).

40+ hours: We'll pass. Seriously. There is no point to working full time once you're done. The only time you'll do this is if the money is really good and you have had an easy year or two. Think of yourself as a sprinter. There is no need to go all out unless the circumstances are perfectly set up for you to do so.

Working For A Specific Item

When you're set there isn't much else for you to do. You can either make more money or go on more dates and party. That's really it. The only item left after that is materialism which can be fun as a project but doesn't increase happiness at all. Funny enough materialism usually leads to insecurity which is funny to watch in grown men talking about their cars/watches (hint: no one actually cares they are just trying to be passive aggressive). Now that we've covered the bad side lets take a look at the good part of materialism. Note: we are only suggesting this if you're willing to obtain the possession *and tell no one*. As soon as you work harder for something to impress other people, you've lost the war.

A Home: This is the most common upgrade. Homes offer "displayed wealth" and they generally don't collapse in value. Beach front property is rare and there won't be any new beach front property in the future. So we'd say this is probably the best place to start. If you've already made it but want a reason to work hard, go for a nice place. This doesn't hurt your net worth since the property should stay at similar values or rise slightly over time. It also won't add expenses unless you decide to go way over your skis with a mansion. This is unlikely you.

A Car/Watch: We've never been into either one. We're not against either one. The only downside of these items is they decline in value so you're essentially adding a "negative" to the net worth line. What you would do is increase your working hours. Lets say you work 20-25 hours a week, then you need to work say 30 hours a week until the cost of the item is paid for. This makes it impossible to go backward in terms of net worth. It also makes you reassess if you wanted the item in the first place. You just worked 10 hours extra fro 50 weeks to pay for an expensive item…. Will you end up buying it? We don't know, but the answer is probably yes if you really want to buy it for yourself.

Events: Now we can go to what we end up doing. Events. Preparing for an expensive trip: skiing, professional sports events etc. We don't know what your interests are but lets say you want to go to the French Open in Paris for tennis. Or you want to see the Winter Olympics. If you're going to go to a major event, your better off going all out for it. There is no point in going to the olympics to sit in the nose bleeds and there is no point in going across the globe to watch the #64 seed play the #1 seed in a single game. You get the point. Instead you line up each year with a few events you want to go to and work slightly more to clear out that number. It'll typically cost several thousand dollars but it'll be worth it and you won't see a dent in your net worth because of it.

"Vacations": We're putting this in quotes. If you work online you don't really have vacations since you can work wherever you like. Thats the whole point of the internet! That said, we have no doubt that many people won't be able to do this. If that's the case, then we would include nice vacations in the same group. If your skill set requires you to live in a specific area, then you'd put money away to leave a few times a year to places you always wanted to visit. Remember, you could die at any time so each year you should knock out 1-2 places at all times. This is also why we recommend working online, it's location independent and offers the same amount of financial income.

Now a fun question, how do you calculate the value of your time?

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by **Clicking Here.**

How Much Should You Be Worth? Many Paths to Becoming a Multi-Millionaire!

How Much Should You Be Worth? Many Paths to Becoming a Multi-Millionaire!

As our readers know, we don't tailor our writing to regular people and instead focus on ambitious individuals interested in living an exciting life. Everyone has a different lifestyle they are looking to maintain and we'll go ahead and provide a framework for how we think each year should stack up ***at minimum***. We give up at 35 years old since no one should be giving life advice to someone in that age bracket (they've already made their decisions).

Assumptions

1) The first assumption we make is that you're going to generate at least $100K a year out of the gate. If you're working on Wall Street, within Enterprise Sales or in Silicon Valley, this is absolutely attainable. This is what we have recommended for a long-time in terms of a starting career.

2) Next, we assume that your net worth is calculated on POST tax money. We think it is a fraud to include $1 million in a 401K as $1 million to your net worth (it's likely closer to $700K if we assume a 30% tax rate). To keep this estimate conservative, we assume all money in your 401K is worth 60% of the face value (40% tax rate).

2) We also assume that you will get a 5% 401K match. This is a rough estimate and we assume you're not going to invest in excess of the match because you have better things to do with the money (primarily starting a business)

3) We use basic tax brackets since we don't know where you live. Specifically we'll assume everything up to $200,000 is taxed at 28%, everything between $200,001-$400,000 is taxed at 33% and everything above $400K is taxed at 40%. As an example if you made $400K exactly, we assume your tax bill is $122K (this is $200K times 28% and the other $200K times 33%). Again, this does not perfectly match the tax brackets to avoid perfect calculation and keep it simple.

4) We assume that your living costs increase at a rate of 5% per year and you're going to live with roommates when you graduate in the first place. There is no reason to be a big spender when you're young since we live by the saying *"learn in your 20s, earn in your 30s, burn in your 40s"*.

5) We assume your after tax investment returns will be 5%. This means the money you have on the sidelines will create 5% in annualized returns every single year. If you're dollar cost averaging into the S&P 500 you should be able to generate around 7-10% over the long-run so our 5% assumption is quite conservative.

Example 1: Mixed Income Stream (Most Common)

From what we've seen, the most common path is this one. You start a high paying career, get burned one year on compensation, start a side hustle and… voila! Well over $2 million dollars by 35. Below is how it typically works out.

Age 21: To keep the math simple we're going to assume you begin working at 21 years old. This means you're likely graduating from college (despite costs rocketing higher!). In addition, we're going to assume you have $0 in total net worth. If you're reading this and are on track to rack up $100-200K in student loan debt, we suggest quitting entirely and reassessing why you're going down the path of shackles. Since you're going down an ambitious path we assume you'll start with a *Base Salary of at least $100K.* This is going to be conservative given the compensation numbers for high earning careers on Wall Street, Silicon Valley and Enterprise Sales.

This is going to be a terrible year. You'll realize that the cost of living alone is likely around $54,000 at minimum even when you live cheaply. Your after tax savings will likely be a smidge higher than 20%.

Age 22: To keep you motivated most companies offer a pretty nice income hike from year 1 to year 2. This is not because the company likes you. This is because they likely lost money on your participation in the labor force (training costs etc.) and if you leave after year one, they have to write it off as a loss or a bad hire! Ever wonder why employers care so much about time at a firm? Well now you know. They really earn money off of you once you're up and running, not when you're green.

We assume you get a 20% hike and because of this you're still motivated to work. You put away just over 25% of your gross income a big step up when you look at the year-over-year change in total after tax savings (59% increase!).

Age 23: At this point most companies give a similar pay raise on a dollar basis. This is enough to keep employees motivated and they are now in the green on their investment in human capital (you!). Since you're still seeing some career progression and you've got another wage hike you're feeling pretty safe in your position making it easy to continue slogging along. The one thing you do notice is that the people who have been there for about 5 years seem to be more bitter than the younger employees.

Since the dollar amount increase was the same, your total compensation is up 16.67%. You end up putting away ~31% of your total gross income and your net worth should clear $100K. Unfortunately, around this time year 3 to year 5 time frame, you're going to get hit by "the system".

Age 24: You get one of the following excuses: 1) we had a bad year as a firm or group, 2) you've been getting solid raises so you should take one for the team or 3) we don't know if you're ready for the next change in role. It does not matter what the excuse is. Your compensation is going to be flat. It could be up (barely) but the point is the same, you realize that you're a COG in a system that doesn't care about you at all.

Hopefully this terrible conversation happens earlier rather than later in your career. This is because you'll have the energy and motivation to do something on your own. You'll strike out and do something small (typically free lance consulting) and make a few bucks with minimal effort. Total savings is still in the low 30% range.

Age 25: You get a small hike, but the move is not great, you're realizing that you're solidly in the center of the "triangle" within the firm where it is hardest to move up. Everyone wants you to quit or fail because it will lead to less competition for them over the long-term. You stick it out anyway and realize that it will be a while before your next "step function" upward in compensation. The silver lining is you can continue to freelance.

Your time is spent either freelance consulting or you've figured out that you can start a full business selling products! The result is largely the same, you focus more on your business and generate well over $1,000 a month. Not bad! *Total net worth goes to $200K!*

Age 26: You're solidly stuck in the middle of the Company/organization. You look around and everyone in this bracket between 26 and 32 or so years old makes the same. It's depressing to see and you realize if you jump firms… well it's going to be the same story! May as well remain in the same Company if you're plugged in from a political perspective. Besides, working on your business makes the most sense given the returns you've seen over the last two years.

You begin shirking a tad at work, cutting corners when needed and grow your small side business to $25K in total profit. It's now generating a *near* living wage! You don't have time to burn your cash since you had to work hard to get here. *Net worth $300K*

Age 27-31: This is probably the most painful bracket. You're going to be doing the same mundane work for the vast majority of the time. The guys you want to replace won't quit and there is no slot for you to fill. Your only upside is from your company. It's tough to stay focused because the business you're running cannot be scaled easily due to your current necessary career schedule! You're going to feel like you're chewing through a concrete wall.

The good news is that you'll be able to chew through the walls without killing yourself. You'll grow the business to an official near living cost profit pool of $50K by the time you're 31. Lucky for you, since you have a career still it's pure profit! *Net worth $850K+*

Age 32: For some reason this happens. When you're about to quit because you see the light at the end of the tunnel you're given some change in role. Think about it like this… If you were smart enough to realize you're being underpaid… and were smart enough to start something… you're probably a better worker than those guys slogging in long hours with nothing else going on! *You're hard working or you're smart. You can't be both.*

For fun, we'll assume you get promoted to a new role and your business takes off at the same time. This creates a tough situation for you because you're not about to walk away from that high income boost and you can cover your living costs off of your business! You typically stick around *"just one more year… just* *one more year…".*

Age 33-35: Your business cannot move anymore. It's growing at a minimal rate of just 10%. Your income from your career is still the majority of your earnings. The problem is that working for someone else is becoming a hassle. You can't stand taking any orders. Everything at work makes you annoyed and you're going to take your foot off the gas more and more. They typically try to motivate you with more money but at the end of the day, you get blown out once they realize you're not tied to them.

Reminder. Under no circumstances does anyone know what you're doing. You simply get blown out around 34. The best part? Your business ends up benefitting because you never really focused on it. Typical net worth? ***Multi-millionaire at $2M bucks (Click to Enlarge Image)***

Example 2: The Career Man

Some people just never see a reason to start their own Company. The reason why? Their careers never see a bump or hiccup. Specifically, a lot of luck goes their way and they have the skills to fill in each leg up of responsibility. We'll use our Investment Banker as the best example since we know a few people who have pulled this off.

Age 21: Top –tier investment banking analyst. You're the best in the class in the right group/sector and you're going to get paid at the top. Roughly speaking this is around $150K for a first year and you're going to have the same living costs as everyone else ($54,000 out the gate). You are able to save your entire bonus so your savings rate is pretty solid at $57,600 in post-tax money in year-one.

Your savings rate is already over 33% when compared to your gross income and you had to work hard to get the top-bucket. No vacation for you, just deal related activity and a smile on your face even when getting crushed.

Age 22: It is rare to fall from top-tier in year-one to year-two. You end up being in the right "circle" from a political perspective and people in Wall Street rarely change their minds. You continue to get all of the right deal related projects and since you're still focused, it is easy to get into the top-bucket again. Overall, you clear $175K in your second year without skipping a beat

It has only been 2 years and you've cleared $133K in net worth! Pretty impressive. While everyone else is wasting money getting drunk at the club you've built a strong baseline for a career that could lead to an associate promotion!

Age 23: After a somewhat easier year 2 you decide to begin training all the first year analysts. You also attempt to participate in more drafting sessions (proactively) dropping hints to the higher ups that you do have what it takes to be in an associate role. You're able to manage the younger analysts and you have ideas for updating slide decks and S-1's without any push to do so.

It has now been three years and you get the head nod for the promotion. Your net worth is nearly $250K (not quite) and it has only been three short years..

Age 24: We are throwing in a low number as a transition year. Why? Typically, you'll either get a meaningless stub bonus or you will not get paid the exact top tier bonus from Analyst 1 through Analyst 3. This is a precautionary measure to make sure the math still adds up. In addition, many analysts typically upgrade their housing when they are moved to an associate role.

Overall, we take a small step back to keep all estimates conservative.

Age 25: Your first year as an associate requires more proactive work from you, you're updating projects before you're being told to do so. This means you know what your MDs and Directors want to see and simply save everyone time by putting all the items in there before it is requested. In addition, you're consistently training the junior staff. Nothing special in this year but you're clearing $230K (at least!).

Age 26-27: These two years are quite similar to age 25, the difference is that you're continuing to show leadership in the form of training and initiative with pitch books and live deals. In addition, you spend some time at industry conferences to build a small set rolodex of contacts in your industry. More importantly, they give you the role of "staffer" right at the end of your third year as an Associate. This is typically given to VPs (most firms) so the writing is clear. If you can manage the team well, you are in-line for a VP promotion.

Age 28-29: Around this frame they give you a promotion to Vice President. You did the necessary work and luckily you built a small contact list within your sector. You get a material "step-function" up in your total compensation to $400K with a green light to $500K the next year. By the time you're solidly in a VP role *you're also solidly in the 7 figure net worth range.*

Age 30-34: It gets extremely difficult to predict in this range. However the general set-up is as follows: 1) you execute several deals – didn't source them, 2) you sign up a few small mandates, 3) you eventually win a couple of extra small M&A deals or lead an IPO sourced by an MD, 4) you sign up more retainers for other ideas such as registered direct transactions, poison pills etc (small stuff), 5) you eventually close a couple of nice M&A deals or get lucky and are the banker for a specific IPO. The long-story short is you generate enough revenue to warrant a director promotion but not quite good enough to get to MD! You clear $500-600K each year. By the time you're all set and ready to quit, *you've got $3M in the bank* and you start a hobby to make some side income. *(Click to Enlarge Image)*

Finally, most people don't quit. If you were this good you're likely a career banker.

Note: for the 401K contributions below, we assume you are never able to contribute more than $18K which is the current max, hence the $36K cap at age 28 and beyond

Example 3: The Entrepreneur

This is where the real money is, we've seen several people quit their careers rapidly once their companies begin to gain traction. It is tough to work for someone else when your business is making more money than your career!

Age 21: You start your career and begin acting like an entrepreneur out the gate. Instead of wasting time with politics (big career mistake!) you simply get your work done and go home immediately. This does not look good to the higher ups but you don't care as you're already working on something on the side. You save a decent chunk (just over$25K).

Age 22: You get an "okay" pay raise that is in-line with everyone else at about 5%. You realize pretty quickly that there is more than performance that matters at work. There is something called political capital where you have to be liked by the "right" people in order to get the better payouts. Fortunately, for you you're still seeing 200% growth from your business so it remains as a focus point for you and you triple it to $15K net of tax.

Age 23: You're solidly a "median" employee. There is no hiding from this fact. You can't really get laid off or fired because your work is solid and good, you just don't play any of the political games within the firm. Luckily your business doubles again, because this is why you don't have time to play the politics in the first place!

Age 24: The step function occurs! No not for the career you hate but for your business. You clear $75K in post tax money which is roughly equivalent to what you made at your career. You're thinking about quitting immediately but the firm has no reason to cut you. You're a top tier performer from a work perspective but you take no initiative because there is no reason to anymore and on top of that there is no incentive either! Funny situation around this age as you're not willing to give up all that money and you're not willing to go all in on your business either.

Age 25: Your business now starts making more money than your career and you hear of a Reduction in Force (RIF) that is occurring over the next year or so. You raise your hand for the RIF since you don't care about the career anymore. Once you raise your hand, they add your name to the chopping block (so you think!) and your business is doing great almost at $100K!

Age 26: They don't let you go! Unfortunately, when it comes to cutting people its actually harder to get rid of the top-work performers even if they are not motivated! You end up getting a long-winded pep talk about working harder and are handed a ton of work that will double your hours at the firm. You quit. Forget about it you say and you walk away. Your business ends up generating $135K that year.

Age 27-35: For those skilled enough to build a 6 figure income while at a career, they usually end up scaling to around $1M in net profit. For some reason this is around where it all shakes out. You can certainly exceed this number or watch the number flat line. Overall, getting to a million dollar business is possible and this is where we assume it all shakes out. You're growing your business in non-linear fashion and end up getting to a $5M net worth at age 35! *(Click to Enlarge Image)*

Concluding Remarks

We'd like to take the time to highlight a few key psychological factors for people looking to become multi-millionaires.

First, you will get screwed at least one or two times. There is no escaping it unless you've go the luck of the Irish. You're going to get burned pay wise or work wise somewhere (typically 1-2x) over a decade time frame.

Second, once your business income exceeds your work income your motivation falls off a cliff. You don't care about doing anything beyond the minimum and quickly fall out of the "circle" politically.

Third, If you're spending your time building income streams you can get to multiple millions of dollars by age 35 and the numbers clearly prove this out (even with 5% cost of living increases!)

Fourth, if you don't focus in on building yourself up early, there is practically no way to catch up.

Fifth, we don't have much time. There is a 20 year time frame at maximum to really make money. No one wants to be killing themselves working around the clock at age 40+**.**

How to Avoid Negative Life Style Inflation

How to Avoid Negative Life Style Inflation

As you start to make more and more money, something typically happens… You spend a grip more. Practically everyone will make mistakes once they start to feel rich (including every single one of us as well!). It typically doesn't feel like you're increasing your lifestyle by a large margin until you look at the year-over-year change in net worth and are unpleasantly surprised!

Not Financially Independent

If someone is not financially independent: *negative lifestyle inflation is when your savings rate declines.* Without financial independence, every single year needs to see an increase in your overall savings rate. You'll establish a lifestyle that you enjoy and once that is set you're going to throw every single cent into new businesses, investments and basic savings as well.

The Most Important – Generate More Income Every Year: This is and always will be the focus of the blog. While many continue to say that "you're still saving XX% so its all about cutting costs!!!" they don't understand that a high income is *needed* to generate a savings rate in excess of 50% or so. *Trying to save 50% of income on a $50K pre-tax salary is absolutely not going to work.* Your standard of living would be so low that your retirement would not be very fun at all! Can you imagine retiring in 17-20 years and living off of $20-25K a year? We can't either. Step one is always going to be "generate more income each year" this will help you avoid negative life style inflation.

Every Single Pay Raise is Reinvested: If you're not independent, then you're still in hell. Knowing you are relying on someone else to help pay your bills is not a comfortable place to be psychologically. Again, you're in hell. This means every single pay-raise must increase your savings rate. If you're stuck in a position where you have an "ok" salary and a "mediocre bonus" you have to first work on moving into high paying careers and second save every cent you can in the meantime (potential to leverage into business/investment opportunity). If your investing rate is below 50% in your 20s, something is going terribly wrong. You *have* to put away 50%+ as soon as possible if you want to invest in a new business, get into real estate or otherwise.

90 Day Psychology: Any time you get a new windfall (bonus check hits, you have a great month of sales or another one time windfall), then *you're going to put that money into a 3 month CD*. This is boring. The reason why you're doing this is to allow your dopamine levels to settle at its normal baseline (you'll have a temporary spike after receiving the windfall). We've found that 90 days is enough time to allow your body to reset (get used to the money). If you spend a single cent of the windfall within the first 90 days it usually leads to "buyers remorse" which is just another way of saying regretful purchases. We've deployed this tactic many times and continue to do so despite being financially independent (no one likes regretting purchases).

3 Months of Cash Flow: The second rule of thumb is to invest 100% of new cash flow for the first 3 months. This is specific to online properties. If you have a passive business that is generating $1,000-2,000 a month, then you're not going to spend a cent of the first $6,000. Go back to point 2 and remember to throw it into CDs. This forces you to have a savings rate of 3/12 or 25% at minimum for year 1. It's hard to predict variable revenue like an online property, so in a worst case scenario it goes to zero and you made a few bucks off of it. For people who are not yet financially independent, trying to operate at a loss for long periods of time just doesn't work unless you're planning on building a major technology company that operates at a loss (if so you're probably not reading a finance focused blog!).

Avoid Brand Name Items: If you're 25 and walking around with a Patek watch or $800 loafers, you're only hurting yourself. There is no reason to try and impress anyone if you haven't made it to financial independence yet. Think about the cost of a single luxury item and you'll see that the return profile doesn't work for a 20-something year old. Most will view a 20-year old with money as a trust fund baby who never had to work for anything in his life (don't be that guy). Instead, keep all of your items as basic as possible, only buy more expensive material items if the return is higher than the additional cost (quality shoes without the brand name are good examples of this). Buying a Patek Watch when your iPhone tells the time perfectly well is beyond crazy. You can buy those items when you don't need the money.

Spend to Free Up Time for Work: This is a critical part of success. You can absolutely spend for services (laundry, apartment cleaning, food delivery, etc.) if and only if you're going to use the free time to generate more income. If you don't have time to do laundry and it'll cost you $50-100… But… You're going to spend that hour or so *generating more than $100*, make the trade all day! If you're idea was to spend $100 in order to free up time for catching the latest football game, you just don't want it badly enough. Now we'll give another basic hint. Re-read the underlined portion of the sentence. This doesn't mean you *have* to earn $100 in that specific hour! *If you spend an hour to improve a business that will lead to $1,000 once the change is made (over the course of a year) it is clear you should make that trade!*

Completely Financially Independent

The second group of people are the financially independent. Our definition of independent is a bit more difficult, you must be *rich*. This means your passive income will allow you to live a life you enjoy into perpetuity. If this is the case then the outline changes a lot. In fact you can ignore our entire outline if you're not eating into the principal but we'll go ahead and give our view anyway.

Continue to Do Something: Anyone who *paid the life toll required to take the fast lane* to financial independence is a hard working individual. If you started from *zero* and somehow made it to financial independence in your 30s (or earlier!) you've done an absolutely incredible job. The problem? You'll be bored quite easily. As we stated you're only rich if you're happy with your life and we can all but guarantee you won't enjoy living in Thailand collecting checks and spending them on beer. Watching the numbers go up in your bank account, trading account or other accounts is a fun dopamine rush.

Increase the Distance Adjusted for Inflation: Lets say you have $10K a month in monthly recurring passive income (your number needed may be higher or lower, this is simply an example). Then your goal is to create a spread between your ideal income adjusted for the rate of inflation every single year. 1) Calculate the inflation rate, 2) multiply it by at least 2x and 3) increase your monthly passive income needs by that much. Using the same example, if inflation is at 2.5%: it would be $10K x (1 + (2.5%*2) = $10.500.

An extra $500 a month is certainly not much *if* you were able to get to the $10K number in the first place. In addition, your goal is to actually increase the distance so you want to have $10,500+ in recurring passive income when the year is all said and done. This makes it impossible to lose your livelihood due to "inflation" as you're doubling the level and beating it every single year. We use this as the minimum framework so you're always improving in terms of cash flow.

Find a New Source of Cash Flow: Lets say you're a real estate expert and made your riches through that route. It makes sense to develop a few other ways to earn passive/semi-passive income. Make no mistake, you'll have a bread and butter skill-set driving your net worth, the goal is to simply learn a new form with a few hours a week invested into the activity. This will help diversify skill sets and add some entertainment as well (boredom is a common issue when it comes to work when you don't need the money).

Spend More Time on Your Health/Hobbies: After paying your dues, it's probably best to spend more time on your health. This can be in many forms: meditation, sleep, hours of exercise, flexibility, etc. You can also start checking off items on your "life to do list". We don't like bucket lists, but it serves as a good example. No reason to miss out on things you always wanted to do because we'll never get our time back and health issues can rise out of nowhere. The extra money you're making (you'll never "retire" since you'll have too much energy) can fund your to do list with no worries.

Avoid New Recurring Costs: This only applies to year one when you're seeing if you can live off of your passive income. Try to avoid adding new recurring cost items (we don't use Netflix but something like that won't move the needle). Recurring costs would include a new major debt payment, a new luxury car or a life style upgrade that rips out 10%+ of your monthly income. If you can avoid the new costs you'll be able to answer the passive income question pretty easily.

Concluding Remarks

Not Financially Independent

– If you're not financially independent your savings rate (percent of net income made) *must go up every year*

– You will focus the vast majority of energy on creating more income

– Only spend money that saves time *if* you'll expend that saved time on generating more income (not to go get wasted in the club with no one you'd spend your free time with)

– If you get a new windfall, spend none of it for 90 days

– If you create a new income stream you save every cent for the first 3 months (not enough experience to know if it will last)

Financially Independent

– No point in going from 70 hours a week of effort to 0. You'll get bored so find a way to work less but still be actively earning a income

– Passive income needs to outgrow inflation

– Find new sources of cash flow outside of the primary skill-set to avoid a repetitive life

– Spend significantly more time on health and even traveling since we don't get our time back

– In year 1, avoid recurring costs since it'll make the math difficult to calculate

****

How to Break the Golden Handcuffs

For those of you that have been in the industry for a few years this post needs to be read.

When you first joined the Street out of college you likely thought that $100K a year was more than enough money for you to be happy. You got your first bonus check and if you were good it was in the range of $50-60K. You made well over $100K and you're just a young 22 year old guy out of college. At this point your expectations begin to rise and the following cycle traps you into a career on Wall Street.

You make ~10% more. You get pigeon holed into more niche segments within the Street. You get promoted which gives you a ~25%+ pay increase with each promotion. You begin making 10% more annually. You get pigeon holed into more niche segments. **Now you're trapped.** Every year you survive is another step down the rabbit hole as your decision to leave the Street will come at a significant economic cost. This is certainly a first world problem but here is how you break free of the golden handcuffs.

1) Save Your Bonus: The best advice any legitimate Wall Street professional will give you is this "Always save your bonus". You can spend your entire base salary on drugs, alcohol, clothes, trips and strippers but you must save your bonus. Every penny. Roughly speaking, your bonus will represent ~40-50% of your total compensation package so your savings rate is immediately near half of your income. Even if you were a lowly analyst for ten years straight you'd have $500-600K in your bank account by your early thirties.

2) Avoid A Zero Year: Seeing that you're likely spending the vast majority of your base salary to remain sane, you should be extremely careful when jumping shops. You might get goosed. A single year of zero dollars for a bonus can set you back significantly as compounding will get the best of you. To avoid this situation stick to the following: a) recruit heavily one month prior to bonuses being paid out, b) if you jump ship mid-year have a written agreement regarding your full year bonus and c) avoid declining platforms such as UBS.

3) Be a Minimalist: We have written about this before however, one of the worst things you can do is spend your money on depreciating assets in your 20's this includes cars, marriage and unnecessary name brand merchandise. If you're able to live a simple lifestyle, your cost will remain relatively flat as you never upgrade to an unnecessary penthouse loft.

4) Learn Game: This is a necessity. There are many successful men who will lose most if not all of their assets as they are unable to realize that marriage is not a viable option in our current culture. Once you realize the true nature of women in western societies (at present moment) you'll never rack your brain over a relationship ever again. You will also spend minimal amounts of money, since all you need is a few bucks for drinks and a cab ride. For better or worse, learn game today or you will be forced to endure many years of deprogramming and undue stress in the future.

5) Have a Walk Away Number: Once you have lived for a year or two in a major city, take out a sheet of paper and write down your walk away number. **Do not budge.** If you've taken a look around you, you'll quickly realize that most people in the industry have a $10M+ walk away number… this is an obscene amount of money and is the product of increasing expectations, particularly when an individual reaches a revenue generating role. Once you have your walk away number, you shut down your outlook, Bloomberg terminal and company macros and head straight for the glowing green exit sign

Concluding Remarks: The vast majority of Wall Street professionals will unlikely last more than a few years, but for those that do you'll want to be crystal clear about your walk away number. Assuming you take advice from this blog, you'll remain single and won't have any major commitments in your life. With the trajectory laid out here, there is **no need** to work for more than 10 years on the Street. If you enjoy the job feel free to stay, just remember to always ask yourself if your wrists are feeling heavy.

****

As a side note, we received many emails regarding investment banking analyst bonuses. Overall the Street was flat to slightly up year over year: $50-60K first year, $65-75K second year, $85-95K third year. More important numbers (all other groups from Associate to Managing Directors) will be available in February.

****

How to Build a Basic Discounted Cash Flow Model

How to Build a Basic Discounted Cash Flow Model

One of our readers kindly asked us for a simple discounted cash flow model and of course we are going to deliver.

Below is the output of a basic DCF template lets take a look:

Cost of Capital:

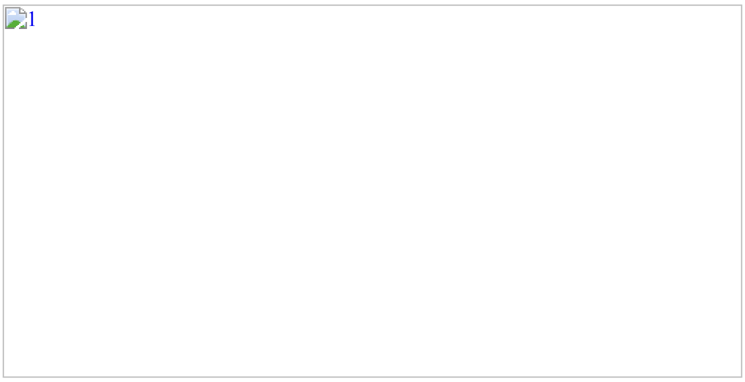
1. Enter in your BETA (not this kind of beta) by scurrying over to Bloomberg
2. Add in your Risk premium, Risk Free, Cost of debt and Tax rates

Summary Valuation:

1. Enter in your Cash on hand, debt numbers and diluted shares outstanding

Terminal Value:

1. Calculate a long-term growth rate (usually linked to GDP)
2. Enter in your percentage debt and equity

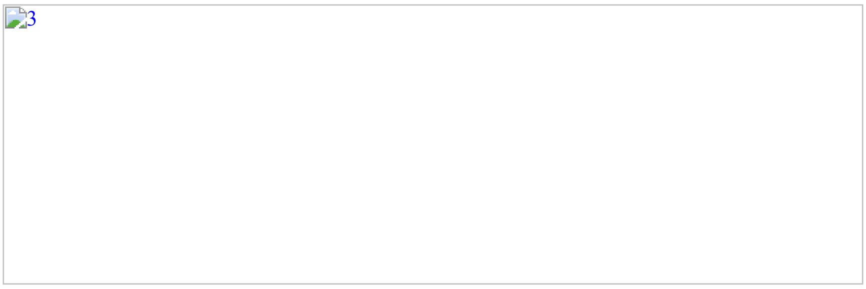


Free Cash Flow:

1. Code in your EBIT or link this to your three statement working model
2. Run your CAPEX,, working capital (off built balance sheet) and D&A numbers through

Results:

1. The sensitivity table runs off of your WACC in your assumptions tab
2. You run a multiple to spot check your analysis, notably these numbers are not real so they seem quit high



That's really it guys. Remember to keep it simple.

****

How to Create a Robot

[How to Create a Robot]

With all of the hype, noise and emotion around AI and robotics, we thought it would be good to highlight a way to create a "human robot". Since we're still several years away from robotics, we may as well create human robots in the near-term. Besides, a human robot can still be underpaid and deliver results that are beneficial for any business/government. There are still risks to robotics at this time and by creating human robots we'll maintain our higher margin businesses for the foreseeable future

Step 1 – Learn to Break Them Down Mentally: By going after someone from a physical perspective, we can see a lot of risks in the future. Physical pain can result in strength gains and the ones who survive physical abuse will likely live the longest making the future generations stronger and stronger. This is a bad thing as we don't want to have "human robots" with more and more strength. Instead… By slowly breaking the human down from a mental perspective he will 1) think that this is "just the way things are", 2) will be trapped in the "I deserve something for doing nothing" mental model and 3) is more likely to preach the same ideas to future generations since everyone believes they are above average intelligence. The third part is likely the most important as we have never met a single person who says "I am below average on the intelligence spectrum".

Step 2 – Linear Path Model: Now that everyone is on the same page: "breaking down a human mentally is the smartest route" we have to create system that is contained. Lets go with a "linear progression model" in a standardized school system. We'll let the extremely intelligent humans take slightly more advanced classes (maybe a grade above) so they feel like they are progressing at a faster rate than the average students. By placing some barriers around learning (making it difficult for them to take calculus at age 10 for example) we can prevent them from learning at advanced rates of speed. We'll keep them in this system for as long as possible, 13 years for starters and encourage them to continue down the linear model for as long as possible (college). Slowly but surely they will move up to the next level of learning in very stable and boring functions (linear) which gives us more time to "teach them" how to progress.

Step 3 – Make Them Commit to the System: As you can see the system is pretty brilliant. Everyone appears to be progressing at their own rate (we've made it appear as if the smarter students are progressing faster, even if it is miniscule). During this time we'll give them the phrases "You're perfect the way you are" and "Any issues you have are genetic and cannot be changed (*whisper – we also have pills to fix any problems)*". Now that everyone believes the world works in a linear fashion we encourage them to ***buy in*** to the system by going to college. They will attend a college that is in-line with their performance within the linear learning system. By making the individual pay to attend the University/College they are even more committed to the system (classic sales trick where once someone pays a *large amount of money* for an item they rationalize that it was worth it!)

Step 4 – Indoctrinate and Separate: Ah yes, now they are committed we have to separate the groups a little bit. We have to make sure that the ones with more influential parents (rich ones) are the ones who get the better paying jobs so they also believe in the system. The best way to do this? *Unpaid internships!* By creating unpaid internship programs, the only people who will have the luxury to get work experience for free will be those who… you guessed it… aren't loaded up with debt. The remaining students with debt are already trapped so we're fine with them progressing and getting that mediocre job post college (job not career). By the time this process is up and running (around their 2nd year in college) the separation between the Have's and Have Not's has already started!

Step 5 – Pit Them Against Each Other: During the four years, we'll have to create a "fake excuse". The fake excuse will be that the rich people are purposely out to screw the poor and that the poor people are not "smart enough" to get rich. This takes the limelight away from the original system (the human robot system of linear progression). This will make it even harder for the two groups to ever get along, which is essentially the difference between keeping the rich parents happy (their kid got better experience) and the poor people remain relatively content (their kid got a mediocre job but better than working for a wage that doesn't require a "prestigious degree"

Pause and Review Steps 1-5: At this point, the human robots are primed and ready to go. Lets review the nuances and important points: 1) they believe progression is linear, it doesn't get more straight line than first, second, third… 2) they believe that their *skill/talent level is genetic* and they are perfect the way they are, 3) if they have any sort of mental/physical issue we'll tell them it is fixable with a *pill* since we don't fix any issue naturally they will become dependent on a substance, 4) we have to keep the richer groups of people happy by making sure their kids succeed, the unpaid internship will feel as if they have "paid their dues", 5) during the indoctrination program the wealthier students will be painted as evil "money is the root of all evil" which will naturally cause a riff between the richer students and the poorer ones. The result so far? *You have created a group of people who think linearly, believe they cannot change without medications and the rich and poor and now angry at one another.* The poor believe life isn't fair and they can't succeed without some medications and the rich believe the poor hate them. Perfect cocktail… Lets move on.

Step 6 – Encourage Long Hours: Long hours are to be praised aggressively. It should be seen as a badge of honor. Encourage all high paying people to work long hours and even if they are not working long hours, they should tell the public "I work 100 hours a week!" Of course the majority of this time will be spent doing nothing (social media, website surfing and idling) but we have to make sure everyone believes long hours *working for someone else* is the most standard way to become successful. Since they are spending most of their time indoors, their ability to go out and meet people of different backgrounds diminishes (easier to control a herd in a ringed fence) and their health will likely suffer a slow death by a thousand paper cuts. By the end of this step, the discrepancy in income is being tied to "long-hours at a company" which rationalizes the difference in skills between those who did well in "the system" and those that did not.

Step 7 – Create A Few More Systems: While we're almost certain that our human robots will be content *enough* in the system we've created, we'll go an extra step to make sure they do not jump off the treadmill. We'll make the herd believe that people who are physically stronger are typically mentally weaker (something they will never want). We'll take shell companies that are started every second and claim those are failed start-ups to inflate the number of companies that fail every year. We'll encourage marriage and children at around the age of 28-33 right when we increase their wages by a notable amount (shackling them into more responsibility). All of these steps act as the final curtain call as they enter adult hood to perpetuate the same advice later on. Right as they have paid off all of their debts from the University System, they'll need to spend money to create a family on our designated timeline.

Step 8 – Tweak the System: With the big picture in place we can now make periodic adjustments to make sure everything is going well. If we find that our robots are saving too much money after completing the indoctrination program, we'll increase the costs a bit. If they try to teach themselves the same material for a job we'll add a "university degree required" stipulation to all employment contracts (if it gets bad enough we'll require degrees for low-end positions). To cap it all off, we'll glorify alcoholism, drugs, hook up culture and more if we need to create distractions during the 20-30 years of age time frame.

Step 9 – Control Speech: This is another big one. While it is difficult to control speech outright, we can create ramifications for *public* displays of "bad comments". If we don't like what you're saying publicly under your own name, we'll gut your livelihood by taking out your income stream (Job/Career/Business). While we can't do anything about the strange ones who talk privately, it is unlikely that they will ever grow to meaningful size since people need "social approval" to trust a source of information. If someone gets rich and wants to speak out with differentiated thoughts publicly, we'll hold the keys to hurt his business and career at all times.

Step 10 – Encourage Them to Slip: Unfortunately, human robots will always have defects. Some of them will still find a way out of this web, so the ideal solution is to get them to feel "shame" for communicating as private individuals. We don't want any soft of uprising, so we'll encourage them to show their cards at all times. Once they do, we go in for the kill and go after their business/career/job with no regard for their livelihood. Since the majority will agree that we are allowed to do as stated in an ambiguous employment/government contract most will cheer in approval.

Steps 6-10 Summarized: At this point, we've made it quite difficult to break out of the system. Unfortunately, human robots cannot be programmed as well as our future robots, but it will do for now. We'll provide the correct medications, encourage the defects to step into traps and work them to death as it will be seen as a badge of honor (most of their time will be spent staring at random screens). They are now reliant on the system and we're glad to have them… At least until the real robots come.

Do You Want to Be a Robot? We have no doubt that every single person reading this page knows a human robot. The human robot shows flashes of interest in breaking out of the system in the form of meaningless motivational pump up sessions. They walk around with slightly drooping shoulders, hands in their pockets and an opaque flatness in the color of their eyes. Since they don't know how to succeed if they meet someone who has they usually go on the defensive with passive aggressive behavior (or worse accuse you of being passive aggressive) since they have to justify their life in the system. What the bright side of all of this you ask? We all know the answer to that. Since 97% of people are stuck in the system… there is no competition for you… They are busying being emotionally hyped up with inspirational videos by people who don't care about them.

****

How to Have a Killer New Years Eve

How to Have a Killer New Years Eve

Most people are amped up heading into the New Year. If you've been running full speed ahead all year, you likely had 2-4 days (even a week!) to recover from the effort you put into the year. Instead of doing what the masses do, expending excess energy on "partying" you should spend your time coming up with a game plan for 2016. On a serious note, mentally, we're already in 2016.

The books are closed on the year so here is what we would recommend.

1) No Goals. Goals are not useful. They cause emotional highs and lows that make it much more difficult to take advantage of the enormous *momentum* you have built within that aspect of your life. Lets say your goal is to make $200K next year, and you hit that "goal" by September… Do you simply quit? Do you have an emotional high followed by a let down of "what's next"? This is not healthy.

Instead you want to get "better" in every important aspect of your life: Health, relationships, finance and anything else that is important to *You*.

If you're interested in having an emotional up and down roller coaster, just go and waste your money at a motivational seminar where everyone gets hyped up about all the "crazy cool stuff" they are going to accomplish. Come to think of it, the count down on New Years Eve is tantamount to an emotional peak and valley!

2) Review 2015 Expectations: We do this every year. If you write in a journal you will have clear remarks every single month on how your progress shaped up. In our case, it was extremely *non-linear* (real improvement is always non-linear). We saw a boring first three months, a massive event in month four followed by a chaotic next five months followed by an abrupt easing and settling at a higher level than 5 months prior.

In stock terms it was flat for 3 months a gap up and away followed by a flattish tape.

Here is how your 2015 wrap up should look.

Step 1: Review the items you wanted to improve upon. If you did not make *any* progress on all of them you can safely say it was a failed year. We doubt anyone like that reads this blog, but if so, that's definitely the queue to exit. You should rank each item you wanted to improve upon with a 1-5 ranking system (five being the best) and see how you did.

Step 2: Why was the progress better or worse than you expected? Write out the real reasons, both the good and the bad to keep yourself accountable. What did you actually do, what actually happened and why did it work or not work.

Step 3: Write down what you learned from the ones that did not go well. If you want to win, you're going to lose a lot. Remind yourself that you didn't really lose by trying, you just found one way that *doesn't work* and will find a new way that *does*.

Step 4: Do an expense and income recap, we recommend **Personal Capital.** A full year view. You've already reviewed your entire year, now it is time to tie up loose ends by looking at the entire financial performance since you have numbers to back up the data. Once you know where all of your money was spent you can make a few thematic changes to reduce costs and increase revenue. This does not mean you become a frugal person. You simply want to know where you're money is going and see if you can make basic changes to save time, save money and more importantly *free you up to make more money*.

3) Listed Action Steps for 2016: Now that we've broken down the goal myth, that's in the gutter, lets move onto the "getting better" section. In order to get better you need to have specific things you are going to *do*. It is not intelligent to simply say "I will have X".

We don't sell dreams over here.

How are you going to obtain X? Lets brainstorm some ideas:

Financial: You are selling your fitness product in Canada and it is doing extremely well. An easy similar demographic is the USA… Well then step one for the new year is to expand your marketing into the USA. You don't know how much revenue you will bring in but it *should* increase. Then you have step two of targeting a new demographic, say people in ages of 18-25 when you primarily focused on people in their thirties. So on and so forth. **Come up with five steps.**

Health: Some of you guys are already in great shape, even then there is room to improve. The biggest room in the world is always the room for improvement. If you're already where you want to be weight wise and diet wise… Then you may need to improve your efficiency. How many hours did you spend working out last year? Can you condense the hours and minutes but see a 0% drop off in your actual looks and performance? Try it. If you can do that, then you should choose a new segment to improve upon. Such as flexibility, endurance and exercises performed perfectly (to keep your brain engaged). **Come up with three.**

Relationships: "I want more friends" is not a good idea. Similarly I want more "business contacts" is not a good idea. How are you going to meet the people you want in your life? Are they going to be in the same places you frequented in 2015? Is there a specific *person* you should target? Once you answer these questions you will have **three more steps.**

This should take a decent amount of time. And. By the time you are done you will have a blueprint for success in 2016.

4) Sample Template: It may be useful for an example so here is one of ours.

Financial: **1)** Expand market outside of domestic sales (currently almost all revenue is domestic) by targeting country Z in January; **2)** Target clients named X, Y and Z (calendar invite to call them on phone) on specific dates, **3)** Sell new product XYZ to new demographic and turn a profit or break even, launch date in March, **4)** stop spending time selling to xyz demographic who do not convert after X months (learned this the hard way in 2015), **5)** launch product on blog if X users and X email subscribers are met – December 2016 at best.

Health: **1)** enroll in a yoga class beginning April 2016 given product launch will be the priority, also book three active release therapy sessions for the month, **2)** purchase five different skin care products (already researched) and see the impact over two months each, **3)** no longer eat lunch at desk, vitamin D deficiency is a real issue and common especially if you work on Wall Street, will leave email tasks for lunch held outside.

Relationship: **1)** find one more person to help, currently stand at three people per author while adding a fourth limit to 4 hours of total time spent per week **2)** fly to country X in July to personally meet a new contact for projects in the future, **3)** slight *increase* in nightlife activities as too much time was spent staring at a computer screen in 2015 (probably won't happen!), **4)** we have a basic fourth here, which is to send two personal thank you letters to guys we are modeling our lives after (instead of one)

5) Book or Girlfriend: If you're in a relationship we're happy to hear it. Go ahead and spend some time with friends/family at the end as well. If you're single we recommending reading an *entire book*. You will have a whole book under your belt right when you enter 2016. While everyone else is up late at night damaging brain cells you'll be up late at night expanding your brain cells (doing the opposite as usual).

"Books are the most undervalued assets in the world. If you learn one thing to apply to life, that is worth $10K not 10 bucks. 1,000x return." – @WallStreetPlayboys

Concluding Remarks

This is the general template we use every year, feel free to make it even more rigorous. Given that you'll have three full days, there is no reason why you can't 1) review your progress, 2) make a plan of attack and 3) read a full book.

If you're really ambitious, feel free to write out your basic outline in the comments. And. By the end of 2016… You'll look back at 2015 and say "It was all a dream…"

****

How to Help the World Evolve – Don't Volunteer a Rational Approach

How to Help the World Evolve – Don't Volunteer a Rational Approach

A terrible weekend. This will be more of a rant post after forced interactions with regular people (partially self-inflicted for fun on Twitter). Spending time trying to volunteer was undeniably one of the worst decisions (0% ROI). The good news is a lot of conclusions were made in a short period of time including one startling one at the end. They involve thoughts on talent, how to make an impact, older vs. younger generations and funny enough, the size of our audience at this point. We knew we would spend a few days interacting with regular people and even took the time to troll people on twitter regarding some of these topics. No worries, we're going to insulate ourselves again now that the few days have come to an end.

Talent: We've finally settled our own debate on hard work versus talent and concluded that talent wins. This of course refers to the area that matters: the elite. At the lower level or at the middle tier, hard work can beat talent because the difference isn't that large. This is typically true in items that are complex such as basketball, football, soccer etc. Since the event requires more than just speed/strength, many areas can improve with hard work. This is in stark contrast to a single event. Since it is specialized, talent will take over at a younger age. In short, the 10,000 hour rule to become a master at something is simply false. Give a regular guy 10,000 hours and he won't even make it to the top 10%.

We can scale this up to making money as well. Talent wins yet again. Businesses reward talent more than sports do (contrary to popular belief – look at serial entrepreneurs). A business with a competitive advantage or near monopoly can have a single person generating billions of dollars while doing literally nothing as his competition is eaten alive (see google search dominance, employees simply make sure the monopoly grows). While this seems depressing at first for any regular person who accidentally stumbles on this blog, the good news is that most people don't even work hard. So you can still get ahead on pure grit alone, our estimate came in at around $150K. If someone worked 60 hours a week, that would be around $50/hour. A reasonable number as a single trade could earn this wage without a high IQ or specialized talent as of 2018.

How to Make an Impact: As you can see by the title, we think volunteering doesn't make a difference. Instead it is better to try and make a micro-economic impact. The only way you can create an impact on a macro scale is if you're ultra-rich (probably around the $100M marker). If you're a well-off guy with under $10M or so, you should ***choose the people you help***. Your time is limited and investing all of that time (R&D and SG&A costs) into someone with limited talents is not going to do the world any favors. Forcing Elon Musk to teach a class of kindergartners how to code is just not going to help society.

Instead, cast a net around the second or third sales funnel. Let the people with $100M+ in the bank try to throw out the massive net. You? You'll deal with the people who survived the first 2-3 success hurdles. Trying to figure out where the person has talent is essentially a full time job. If you work in sales and realize that 2-3 people have a talent for this skill, then go ahead and help them. This will make you feel good when they succeed and you're not trying to fix a completely run home. Think about it like a real estate project. If you're relatively well off, taking in a few projects that need basic repairs is doable. Levering up and buying a broken down apartment complex with Section 8 housing… probably not a good idea. Be smart about how you're going to make an impact.

Be Wary of the Generational Gap: A common thread between the old and the young. Older people believe the younger generation is privileged and lazy. No worries. The people who are 60 today, were in their 20's during the 1980s/1970s and the same thing was said about them when they were in their 20s. Just take it as part of the game. Instead of trying to convince people who are older than you to turn things around in any way, put your effort into people who have the highest percentage chance of turning their lives around (people in their teens/20s/30s).

Similarly, younger people believe that older people are behind the times and are closed minded. This is exactly how a 20 year old thought back in the 70s and 80s as well (feel free to look into the free spirit/hippie movement, essentially the same thing as the EDM culture today). Since older people will unlikely ask you for help, all you need to do is find a source of rapport with a younger person that relates to the current culture. This isn't difficult and you're not going to bother with someone 20+ years younger anyway.

While the prior two paragraphs will seem obvious when we think about them, the conclusions are quite profound. First, we can see why generations tend to lose wealth over time. *It is because the older generation passes on dated information on how to succeed in life.* This type of information causes the younger generation to fail. The most obvious example would be education. Could you imagine telling your child to go study and get a job in accounting? Or to spend his time learning how to drive a car? You'd essentially waste a large portion of his time. Learning a skill that will be obsolete. Since we know that opinions become more engrained as we age, not only do they pass on this bad info… They force them to act on it! Unbelievable. It doesn't end there. The people that pass on this information are likely unsuccessful as well since the average child is not being born into money/success.

The second item is just as interesting: don't bother schmoozing with older guys. Instead of trying to fit in with an older generation you're better off creating a product that forces people to reach out to you. This causes the social dynamic to change a lot. Smart older guys are always looking to stay on top of new technology and the way the world changes. So instead of trying to sell them on any sort of idea you're better off creating something and having them come to you. Then you don't have to sell them on anything. Why? Well the only time someone older than you will approach you is if they believe you already have something that will help them! Try and think of the last time you saw an older guy approach a younger guy for advice (it practically never happens) and when it does the sale is essentially done.

The third item is to skip new unknown topics. Since you're trying to help the ~5% of people that have a shot at significant success, don't bother with unknown topics. We do that here with our Q&As as a natural feature. But. It should be applied to life as well. Nothing is worse than advice from a 40-50 year old unsuccessful guy. Not only is the guy unsuccessful but he actually thinks his advice is worth something. Since younger people have a higher chance of being impressionable, they may mistake age for success… Not related.

Putting the Concepts Into Action: With the three main items out of the way: talent, micro and generational gaps, we can find a clean sweet spot to help if you're feeling generous. It's around 5-10 years. Going further than this makes it incredibly difficult to help since there is too much change to account for. *The first step is to avoid helping people find a talent*. If they can't figure out where they have talent then you shouldn't bother with them at all. If their talent is in a field where you're extremely successful… you can proceed.

This alone has put you into a smile and nod position for about 95% of people. Instead of telling people what to do you simply smile and nod and say all of your success was pure luck. This makes it a lot easier. If you're forced to, go ahead and tell them you inherited a million dollars from a dead relative. Anything to avoid further conversation on success with someone who has no talent. You're not doing anything wrong. In fact, you are saving yourself time and they wouldn't have a shot in the first place (saving them time as well).

Impossible to Misunderstand Implications: While the prior paragraphs are clear to us we're going to utilize bullet points to drive home the rest of them. Despite the items making sense for successful people they will unlikely make sense unsuccessful people who accidentally read this article. So let's begin:

- Talent is something where your *potential* could reach up to the 1% level and is not limited to physical speed, IQ tests or strength. It includes all of those items in a basket of goods. If someone is "pretty fast, pretty strong and incredibly accurate" they might make a good three point shooter for basketball. If this same person tried to compete in the Decathalon or 400 meter dash, he would be destroyed. Both of those events require extreme speed and extreme strength and does not reward accuracy. People who believe this is false can go teach Shaquille O'Neal to shoot three pointers, we'll be waiting on the results (dexterity is without a doubt a talent that can only be learned to an extent – not rewarded in our society since the masses think it's a learnable skill at the 1% level… Laughable).
- Talent is much worse for making money. We used sports since average IQ people will be able to understand the prior paragraph (low IQs, probably not). Talent in making money is largely around synthesis, numbers and sales. None of these can be "learned" to the top 1% level. If communication skills were possible at the 1% level, anyone could become a famous comedian. Instead the person has to figure out what level he comes in at for each of those items and figure out where they overlap.
- Talent for making money is by far the most annoying as well. Some people never get it and can't make money online after 12 months of effort while others are profitable within a few months. Unsurprisingly the people who figure it out within a few months end up being successful. Instead of giving up entirely, if the task is failing, we'd look at *where* the task is failing. Perhaps the person simply can't sell to the target audience (say women age 25-50). If the person fails at selling to all age groups, genders and ethnicities despite a wide array of products… we're guessing there is a significant lack of talent.
- Hard work is still needed, it just depends on the result you're getting. If it takes you thirty minutes to accomplish what someone else can accomplish in 1 hour… that's solid but not great. It essentially means you're twice as good as the average guy (which isn't very good). If you get to a point where someone works all day long (8 hours) and you achieve more in 30 minutes…you're absolutely talented. It means they can't catch up to you even if they dedicated their life to that task. ***Hard work is only useful if it is applied to what you are talented at (Specialization).*** Otherwise the hard work is going to waste, digging a ditch with a spoon while everyone else works with John Deere equipment.
- Hard work should be effortless. This isn't a contradiction. If you're talented at something, it shouldn't require a lot of effort to get the result. This is why we say talented people make things look "effortless". Why? Because it is effortless… for them. Once you figure out the items that are effortless for you, you've found the item to work hard on. If you're getting good results with little effort, the sky is the limit on the results you'll get with significant effort. Don't worry. When you get up the chain, there will be other people with the same level of talent working just as hard. You'll find the competition to be fun
- Considering this blog has been around for around 6 years we have no doubt that all of our consistent readers understand these concepts. If you want to have some fun, try to describe these concepts to your peers and you'll quickly realize how many average people there are in the world.

Encourage Hard Work and Know the Truth: People love stories about the underdog who overcomes all odds (unsurprisingly, we dislike these feel good movies as we think they encourage irrational behavior). They'll read this article and find 1/1,000,000,000 who somehow succeeds despite their apparent lack of talent. That is great. They can spend their time betting on the 1/1 billion while you'll spend your time betting on the guys with a 2.99/3 chance of success (Hello Mayweather McGregor!). The best way to do this is to encourage hard work. By doing this you're telling everyone they have a chance (giving them hope) while saving yourself time (to look for talented people to help). It is not fun telling people they have no shot (it's depressing actually if you decided to tell them the truth). So your best course of action is to tell them to work hard. It sounds a lot better and at least it gives them a shot at making $150K+ a year. Just remember… don't invest your actual time in them. The return profile isn't good and you're not helping society advance. (Note: if any of your acquaintances always root for the "underdog" they are typically average people. This is because they associate with the underdog more *"He's kinda like me!"* Psychological.)

If you find yourself in a situation where you're forced to give advice to a large audience, we would go ahead and encourage you to lie. *Bold face lie and promote hard work*. Your downside is limited since it sounds good and your upside is positive since it simply tells people to try hard. From a micro level, you shouldn't do this. Look for people with the correct skills and invest time here. In fact, this is exactly what companies do. They cast a relatively wide net with a basic filter for talent then hire the best talent they can get. In the public eye, they simply claim that they hire hard workers (the lie).

Impact on Your Life: This is really interesting. You're essentially forced to live two lives. You're forced to lie to regular people with the work hard myth and push talented people onto the right path.

Now… We're going to tie two unrelated items together after a weekend of dealing with regular people. What we have learned is that communication with elite people does ***not*** improve your communication level with regular people. We just stated you'll be communicating differently out of the gate depending on how talented the person is.

This was a big lightbulb moment. While we always wondered why there were rich people who had their lives run by their wives. And. We always wondered why some guys could be good with women and fail at sales… it all clicked. *It is because they are different communication waves.* To think this one through, take anyone you know who is good at being popular with regular people. Now ask yourself if he is able to generate a high income (typically not!). Similarly, find a guy who is good at making cash, but fails when it comes to dating. Now we see a trend… communication with regular people improves communication with women but does not improve communication skills with elite people.

This makes a lot of sense. If you're meeting random women at a bar, restaurant, club, gym etc, it is much more likely that they are of normal intelligence. Similarly, if you generate a high income you're generally forced to interact with high IQ and cunning individuals. This type of communication is just not the same at all.

Now this leads to an even bigger conclusion on the ideal way to sell – to the masses. Think about it like this. If you have a product that sells well to the masses, you're improving your communication skills with regular people at the same time. This is a perfect cocktail. *Your work causes your social skills to improve which also causes you to make more money!* For once we settled a big debate: which market is better the high end or the masses? Our definitive answer is now the masses. In an ideal situation you run a business that sells to the masses since you can combine these skills with your regular social life. Eye opening conclusion for us and explains a lot about how the world operates. If your money making business targets the rich (that's great!) just remember that the skills you learn there unlikely translate to communication with regular people. This explains why regular people view elite people as condescending as well.

This last section was a big leap but really helped us understand why the world view can be so different for talented people. It's because the language doesn't translate. If you decide to volunteer once (for fun), you'll find that your communication dumbs down to bar/club level language. This is because it's the easiest form of messaging. Similarly, that rich guy who has his life run by his wife… never learned the communication game. What happened exactly? He ended up finding a girl that dealt with his odd behaviors and he's unwilling to lose her since it was so difficult to find a single girl in the first place! If it sounds far-fetched we'll be on the look-out for guys in the same situation that are actually smooth in social environments outside of work (we went through our list and couldn't find a single one).

Hopefully a lot of these points have stirred up some real life examples in your mind. If so, we think it is safe to say you should avoid the pain of dealing with regular people in the first place. *Instead it is a lot easier to make an impact by making sure talent does not go to waste*. Wasted talent is a tragedy, wasted time on helping un-talented people is also a tragedy and keep both of those thoughts in your mind (no need to say them out-loud… the regulars will yell at you since they want hope or an excuse for their current life position). With that said, we'll go back to more positive posts and money related activities. We thought it was important to share all of this since we think we've finally solved the riddle (rich guys with overbearing wives) after watching regular day to day communication take place.

Side Note: We'll hold our next Q&A on Sunday June 3 starting at 9am EST. It will end in roughly 12 hours as that is all the time we have to spare that day. As usual, Q&As are only for people who purchased one of our products.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). How to Hire or Buy The Best Solution

How to Hire or Buy The Best Solution

A lot of our readers are getting older so we assume this post will be more valuable. At the end of the day, if you could only choose one skill to be incredibly good at it would be "hiring the best talent". If you have a big check book, the only thing you really need is the ability to hire the best people and retain the best talent. Even top entrepreneurs will admit that they are rarely the smartest person in the Company, in fact, it is highly unlikely that they are the smartest (the real sharp ones eventually quit and work on a new start-up). You see this happen all the time. But. At the end of the day, hiring the best talent is probably the most important skill to have. We're certainly not experts in this (you'd have to talk to a billionaire who will unlikely give you real answers), but we've done well enough to give a framework if you're interested in being a multi-millionaire.

Low Headcount: Before we begin, remember that "overhead walks on two legs". This is a common saying as people cost a lot of money. You have to pay for their salary, healthcare and take on risk that they may sue you in the future. This doesn't even count their job performance where they might not be good at the tasks they are given. Doesn't sound like a proving start does it? That is also reality. Before we even jump into hiring someone, we would emphasize that you want to either 1) outsource, 2) find a technology way to do the task and 3) look at contractors first. This is simply the best way to start. With all three, if the task fails you can simply move on with no future headaches (no law suits, no future costs) just the sunk-cost of prior payments. If this paragraph sounds dire, it should. Hiring is probably the worst task and the highest return on investment as well. That's generally how life works.

Two General Strategies: We are going to assume the first paragraph was dire enough that you've found a few tasks where you absolutely *must* hire someone. This is expected as it is unlikely that you'll be able to scale by yourself past 7 figures in total revenue (in the future you will be able to do this but that is for a topic on another day). As we sit here today, there are really two rough strategies: pay up for top tier expertise or pay for an employee where you have specific knowledge on oversight. There is no real "best" answer here as we're generalizing the two strategies.

Example of No Oversight: If there is a specific task that you need done, you might not have a clue on how to do it. We don't know what type of business you're running but lets say you're terrible at product design and don't know where to start. You're an expert in advertising, landing pages, seo, traffic sources, building a brand etc. But. Designing an appealing product is just not on your list of skills. In this case, since you have no legitimate knowledge and cannot tell the difference between a "good" and "great" design, you probably want to pay up for the service. You can either hire someone to do the SKU or you can hire someone to work for you on multiple SKUs which is more likely an employee. As usual there is no "right" answer in this situation. All we can say is you shouldn't cut corners on things that are not within your core competency (more on attracting the best below)

Example of Oversight: The secondary type of hire is a person to do a task that is taking up too much of your time. Using the most annoying example: customer service and returns. If you run a clothing company you know the most annoying task on the planet is dealing with returns over and over and over again. They constantly happen and you have to deal with emails and packaging and sending items back and forth (product doesn't fit, color wasn't right, so on and so forth). In this case we would wager that you *do* know what good customer service is. After all, if you are looking to outsource this task it means that you have a successful product (congrats!). In this case, the hiring process is a lot easier as you can identify a good customer service person, put them on your payroll and move on.

We've simplified it a lot in the two paragraphs above, but it's a good general guideline for the two major issues you're going to run into. In simple terms, the second hire is typically the least risky with the least upside. The first type of hire (or company you work with) is much higher risk and much higher reward. Not much to explain there but outsourcing a task where you could take over if the person fails is a lot less risky than spending a lot of money on a task where the person could screw up (without you knowing!). With that we'll go ahead and jump into the items you should know before considering a hire.

Decide on Your Core Skills: You don't need to be an expert on everything, but you should be very good at several tasks. This is the only way to succeed. If you are amazing at ads, "good" at customer service, great at manufacturing and terrible at obtaining influencers you've got a decent skill-set. We'd say that you need to be good at a minimum of 3 of the 5 major tasks: 1) advertising/copywriting, 2) product design, 3) manufacturing, 4) branding/social media and 5) identifying talent. Of the five if we had to choose, your ideal three would be advertising/copywriting, branding/social media and of course identifying talent. Naturally, this isn't something that is guaranteed. You might be great at 3 different tasks and it won't impede your chances at success. Our point here is to make sure you're good at three tasks before moving onto other tasks. In 2018, there are too many tools to help you scale up without hiring a single person and this is only going to get better in the future.

No Oversight Solution: *"You get what you pay for"* this is essentially the mantra when you don't have experience with the task. This is the best starting answer in 90%+ of situations since you don't want to have a major error. We say 90%+ since there are situations where you may not need the best product. Sticking with the product design example, if you're selling to a lower income demographic, the "coolness" of the packaging can definitely be lower. No one raves over the design of basic white T-shirts, Hershey's chocolate bars or the colors at Mc Donald's. This is because they don't need to tailor their brand to the high end and instead focus more on large amounts of sales and making sure the colors are correct (Mc Donald's uses yellow and red since it causes people to feel hungrier – yes seriously feel free to look up the impact of colors). We assume that you're going to have a niche market so you might not need a $250,000 design job (we doubt it) but you do want to make sure the design is appealing to your core audience.

The basic steps are as follows: 1) same story of going to trade shows for your industry, 2) find the product that is selling the best and look at their design, 3) don't trust what you believe looks good – remember it isn't a core competency, 4) ask yourself if the design is tailored to the same group of people ex. women age 25-35 or men between 40-60 years of age and 5) don't be shy about picking up all the packages from high selling brands and taking a photo of the manufacturer on the back of the product. Pausing here for a second. One major common mistake is going with something you feel is "good". This is a big problem and something we've also failed at in the past. If you don't have expertise in product design, it is unlikely that your tastes will align with the core audience. In fact, it is more likely you will be wrong. If you're a rich person your tastes are already different and won't match up with a product targeted at say low-middle income families. The ability to differentiate between what you're good at and what you're not so good at is something that will help you pass up your competition over and over again. Egos are hard to overcome.

Now that you've got say three places to look all you have to do is track down both the manufacturer and the designer. If it's a well known brand a simple google search will reveal the designer. If it's a niche brand you can usually talk to someone on the manufacturing side who will eventually track down the designer. If all of this fails, you can always swing for the fences and 1) try to ask the company directly at the trade show and 2) take a bunch of photos and have someone create a similar copy. The funny thing is that many people believe they need to have some "new" way to design something. In reality, someone already has a well designed product and just like stealing a landing page and making edits you'll be doing the exact same thing in this situation.

So there you have it a basic step by step example on solving your issue with a problem that you personally can't address. After that you're going to pay up for the best quality you can get relative to the niche. Since we're using product design in this example, it shouldn't cost you more than low five figures. We're making a rough guess based on the number of item's you're selling and the high quality firm you will be hiring. It could be lower but we'll stick with that estimate since there is no way we know the number of SKUs you're going to have.

Oversight Solution: "*Praise and then Money"* one of the strange things about hiring an actual person to work for/with you, is that praise is apparently just as important as money. When you work with someone in the prior situation (not under your company) they expect to have a "client/customer" relationship. Basically, they expect you to complain and rarely give out praise since you're a customer for them. In the hiring example, the situation is a bit different. People who enjoy working for companies and don't plan on starting anything themselves simply want to feel important. This is odd since you'd think they care more about the money, but in a ton of cases they care more about feeling good. Don't get us wrong, money is important, we're just highlighting this nuance since it can help you retain people longer and reduce churn.

If you're in product sales we're going to go ahead and guess your first item to outsource is customer service/response. Anyone who has sold more than 10,000 units of anything knows this is the most annoying part of product sales. Good customer service is actually quite simple (respond quickly and be careful to phrase each email nicely). That's really what it comes down to. This is something that can be taught pretty quickly with boiler plate emails and a basic CC on all email chains (no need to go that far but if you want to do it you can for the first 6 months or so).

Putting it down into steps what you're going to do is: 1) create a basic boiler plate for common customer emails, 2) find someone who can do this basic task at a time frame when you're typically busier/unavailable, 3) try to pay slightly above market rates instead of giving out equity since it should be a hourly wage type position, 4) be sure to praise liberally on all correct tasks and 5) depending on how high strung you are, require a BCC for the first few months before taking yourself off the emails (no one likes being watched for long, so giving autonomy is key later on in the process). With this basic structure in place you should be able to find yourself high quality help in all the tasks you no longer want/need to do.

Increased Transparency: The second biggest item to be aware of is the direct incentives you give people. Without incentives it doesn't matter if you have the best or the worst employees. In fact, it's better to have a mediocre staff that is correctly incentivized than top tier talent running in the wrong direction. We don't know what your outsourced items are but for simplicity: 1) tie all sales compensation to units, 2) make sure they are not allowed to double book, pull in orders or mess with any long-term relationships for near-term pay increases, 3) find a way to incentivize people over multi-year periods – best example is investment banks giving you deferred stock so you're forced to stay, 4) make the return of the group more important than the return of an individual which forces people to work together on the same goal and finally 5) have a full transparency protocol. The last one is harder to explain in a post but we'll try anyway. Essentially, high performers don't like to be told they are wrong or messed up on anything. Despite the best people in the world failing at many different things, high performers rarely admit fault. Instead the try to "pass the buck" which means put the blame on someone else even if they are at fault.

This is probably one of the most important items to get right. You want to find a way to make sure that everyone is treated fairly and this structure continues in the future. We don't know what it's like with 100s of people, but even if you have 10 people or so this can still have issues. You can create some stability with 1) a weekly or monthly call, 2) anonymous reviews where you allow each person so send a physical version of their review in – nothing electronic will get you real results since employees will assume that they are being tracked and 3) bring up any consistent issues immediately, if it's minor just talk broadly about each item. One thing is important here, without anonymity and without direction its easy for incentives to get mis-aligned. Everyone knows how easy it is to get onto a "group" conference call only to have one guy ramble on and on about nothing. We're simply giving out the three easy ways to do it assuming you execute accordingly!

Avoid the Suck-ups: Pretty funny to mention the topic of ego given the name of the blog and the content to generate interest, but, we'll do it anyway! One of the main issues with suck-ups is that it works. We love dogs/animals because they are thrilled to see you regardless of if you're doing good or bad. Naturally, they then take up a ton of attention. In the work place though you don't want this to happen. As a note, you should never "fault" a suck-up, instead you should give the vibe that sucking up doesn't matter and it is all about performance. Get used to saying the phrase "Thanks" or "Thank you" or "Very Kind of You, Thanks!". Get this down to a point where it's automatic whenever someone gives you a positive complement.

Here is the key part, do not put this into your personal folder. Instead you want to ignore all the praise and just focus on performance. The guy who doesn't complement you consistently? Well even if he is anti-social, if his sales numbers are good and his ads always convert the most… he deserves that promotion for sure (or pay raise etc.). Even if you're doing more of the positive commentary saying "good work!" to him, he could just be a strange shy person. It doesn't mater. What matters is making sure the results are showing up and recognizing that sucking up doesn't pay any bills. As an item of warning we would say this is 1,000x easier said than done. We're just leaving it here since it needs to be said and is an important part of scaling/growing your business/project.

Q&A Update: We had a issue with hosting so we're going to do multiple posts this week. In addition, we will be hosting our Q&A on Friday for 24 hours. Thanks!

****

How to Improve at Anything Starting from Zero

[How to Improve at Anything Starting from Zero]

This year we've spent a lot of time trying new activities: different sports, some drawing/art and musical instruments. All of these items are not "important" in the sense that they are all hobbies and won't make or break the bank any time soon. Oddly enough, since we're trying to learn wide range of random skills at a "mediocre" level, we've noticed a nice pattern. Even though we aren't good at any of the new activities, we can easily spot someone who learned correctly from someone who "winged" it.

At Zero? Focus on the Fundamentals: The first thing we notice is many people jump into the fire immediately. While this is good in some cases (particularly when you're young), it is unlikely a good decision later in life. Later in life, you want to find ways to essentially "catch up" and that is only accomplished through some basic research. Two easy ways to "catch up" are 1) hiring a professional to help you learn the ropes and 2) reading high quality books on the topic you're trying to learn.

When you're trying something brand new and you're under the age of 15, jumping in feet first is probably the easiest solution (everyone in your bracket is a beginner). If you're older than 25, you'll want to follow the prior paragraph. If someone is between 16 and 24 years of age, make a judgement call. Since the majority of our readers are over 25, we'll walk through the fundamental approach in basic steps. Luckily it is quite easy to do and less than 5% of people will even think about it like this.

Step 1): if you intend on investing more than a couple of years into the hobby you'll want to hire a legitimate "coach" in the field. Notice, this works for everything except business since no smart/successful business person is going to use his valuable time giving away his bread and butter. For all hobbies/skills you would like to learn, we'd hire a high quality coach first. *Step 2)* for hobbies you're going to read 3 books on the topic written by successful people on the field. Throw all books written by "nobodies' into the garbage. This may cause you to miss a few good books. But. The return on your time is just too low. Also. If you're going to try a new business venture: online sales, switching careers, brick and mortar purchases, real estate etc… your best bet is once again the library. Always read 3 books on any topic you plan on becoming proficient in. *Step 3)* **fundamental execution *not* results.** This typically separates mediocre people from exceptional people. Exceptional people recognize that mastering fundamentals is more important than near term results. Lets say you have a better golf swing by having an award stance. This needs to be fixed today. Fix the stance because you're limiting your long-term skills by developing bad habits. For the older readers, this may be surprising since we're a results oriented blog. But. If you're new, the results are meaningless because incorrect approaches will be difficult to fix many years down the line. Like replacing the foundation for a home. *Step 4)* find visual proof of progress. This is easier with a physical activity but can be applied to any activity. Once you believe you have the fundamentals locked in, you'll want to put yourself into a situation where you must perform (no practicing anymore). This will result in immediate feedback (if your fundamentals break down under pressure) and in an online sales example if your A vs. B testing gives you the expected result (your revisions improve conversion rates).

Fundamentals Mastered… Increase Competition: Competition is one of those all encompassing words. Average people who have failed at everything will still compete aggressively if their "social status" is at risk. Elite people only compete with one another and ignore average people because they are too far off the radar (booing from the cheap seats because they'll never make it on stage). Naturally? The objective is to distance yourself from the pack to the point that you know the names of your real competition.

How do you do this? You do it with the two steps rule of thumb. If you're trying to improve, you're not going to get any better competing against the elite people. Why? They will be *too far ahead*. Unless you're incredibly talented, when you compete with people who are far superior in the activity, you won't learn much. Instead you'll focus on putting yourself in a situation where you're in the "third quartile". If there are 12 people in a room you want to be the number 7/8 guy. This means you're close to being average but not quite and you're not dead last unable to breathe.

An interesting note here. Most people think it is best to only hang around the top people. It doesn't work though. If you have a team sport for example and one guy is world class, he's going to essentially do all of the work (inefficient to do anything else). The idea of grabbing the best people at all times only works at the elite level. *At the intermediate level what you're looking for is more time to improve your skills in an environment that gets more and more difficult over time.* If you eventually reach "elite" level, then you'll know and change your strategy. This is also why rich people have friends that are also in the same general zip code (otherwise they end up falling into the acquaintance basket).

Find the Repeat Mistakes: At this point you should be chugging along just fine. You have a solid understanding of the fundamentals (don't make basic mistakes) and you're ramping up the competitive environment. Now its time for some self assessment. This is where (our opinion) you separate average people from successful/aware people.

Pausing for a second. The main issue with the average individual is he believes he's always the best. At everything. In fact we have no doubt average people think we have no ability to see our own flaws (we do)! This is some sort of strange human condition. In fact, we've written several posts on things we are not good at, yet everyone gets the same vibe from each other "he/she thinks he's so skilled". So. Based on this background we've noticed that successful people avoid things they are not good at and are much better at determining why they are good/bad at something.

Back to the topic. Since you're going to increase competition at this point: for sports changing the people you play against and for business you'd try and encroach and gain more market share from bigger players… it's time to improve. You're now forced to look at all the information and figure out how you're being beaten. Video clips work well for all physical activities from sports to musical instruments (you can see every time you make a mistake and why it happened to see if it repeats). Also. From a business standpoint, if you're unable to gain market share you are going to see why. Is it due to your brand image, the ads, the margins? Unlike physical activities the feedback on the business side is much more in your face since it shows a nice red negative number to represent a failed attempt.

Our guess is that you'll find at least 3-5 repeat mistakes that break some combination of a fundamental error and a skill error (execution). The lines get blurry here since basic concepts will be running smoothly but mis-execution could cause prior fundamentals to break down a bit. Think about modifying an ad or website only to have this negatively impact another fundamental item (the layout or the context). Instead of trying to solve all of the problems at once (multi-tasking is talked about but never efficient) focus on one issue and make sure there is no performance decrease in the other repeating errors. Essentially, when you solve one problem (problem A) you should still have a few other ones, but they have not gotten worse after fixing problem A.

After doing this a few times you should see a large improvement and we'd consider this stage "intermediate/excellent". When you only see one error here and there (no one is perfect) you're now in the near exceptional category. Getting into exceptional categories requires the most underestimated and hated word in the world: Talent.

Begin Creating New Processes: When any new game/market/industry opens up, people are always playing incorrectly. Think of any sport or industry that looks the same now as it did 10-20 years ago. You're unlikely to see any. We're sure there are a few exceptions. But. If we go back and look at footage that is 10 years old (certainly 20 years old) you'll see that there is someone pushing the boundaries or "rules". This is where you get to step in!

Take a look at the common "rules" that are followed to succeed. See fundamental mastery. And. Begin breaking these rules based on your gut feel/instinct. If you have a good gut/feel/instinct for the activity you'll surpass people by breaking rules previously thought of as "unbreakable". Over time if something is consistently successful for you, then you end up being copied. This is why they say "copying is the biggest form of flattery". Essentially, you've created something new that is so successful/accurate that you force your competition to do the same thing.

For those of you that work in affiliate marketing you're well aware of how quickly things change. One person makes one edit (a big name) and suddenly everyone is doing the exact same thing. Markets are efficient. If it relates to making money, make sure you try to protect the intellectual property if possible. Ideally, you'll break a few rules that go under the radar for a long period of time.

Expert Level: At this point, if you're successfully competing against people who are already talented and consistently come up with new ways to "stay ahead" or "get an edge" so to speak, you're largely an expert. This is where we would then focus on results. While many will disagree, we don't think anyone can be an expert if they don't have any results. So take a look at the people in the top (of any activity you're pursuing) and you'll notice that they consistently push the boundaries in some way. To make a public example, Amazon is a clear one where they solve difficult problems on a yearly basis and announce solutions from time to time. Betting against them from a technology standpoint over the last several years hasn't paid off (many believe they couldn't solve so many problems).

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality (***essentially the point of this post!***)… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by **Clicking Here**.

How to Invest as a Bachelor

How to Invest as a Bachelor

The most common question we receive nowadays is how to allocate cash if you're going to live the bachelor lifestyle into eternity. This is going to be the first part in a series of posts where we will cover each step in more detail. However the three main steps are broken into two pieces: 1) The initial framework to financial independence, 2) Ways to obtain higher income and 3) Ways to swing for the fences when you've got extra money on the sideline.

1) The Framework

The name of the game is matching investment income to expenses. We'll call this the relaxation point. If you're correctly living your life as a minimalist we'll earmark the number at $2,500 a month. Yes this is a low number but if you're a perpetual bachelor it means that you can live quite a nice life in Thailand while you work on your other businesses and you will be free to work any job that you would like. **We repeat, you are free to do as you please.** How much is needed to generate $2,500 a month? Lets take a look and you can decide for yourself what amount of cash flow is necessary.

chart.jpg

You've been tricked.

Look at the chart very carefully. Notice a major problem with a regular savings account? You have no chance at financial freedom with a savings account unless you have over $1.4 million in cold hard cash. If you're trying to become rich and you are putting your money in a savings account you better be a risk taking entrepreneur because even a man of above average intelligence is going to have next to zero chance at amassing $1.4 million dollars in his thirties by having an investment return of 2%.

Lets make another assumption, lets say you understand that your body is going to slow down and you know you're going to be half the man you were in your 30's by the time you hit your late 50s. Not a PC comment and do not care. We are all going to get old so your goal is to maximize your happiness when you are able to enjoy it and at the same time set yourself up for a decent lifestyle in your 50s and 60s.

Assumptions are set. You're in a race against time to obtain ~$450-550K in net worth, if you don't have it by around thirty you better start grinding hard. For simplicity, we'll use $500K as the watermark.

Obtaining $500K: Sounds like a lofty number doesn't it? Not really. Long-term returns of 7% are not out of the question. The trick is that long-term means you're ignoring your emotions by dollar cost averaging and you are not going to sell a single security or bond. **Ride it out.** Diversify, dollar cost average, diversify, dollar cost average. Play the game like a robot. Here's how quickly you get to the five handle. We will assume that you are able to increase your income by ~5% on an annual basis, generate returns of 7% and you can live on $3K per month.

Chart 2.jpg

Boom. You're already at $500K and you're only 31 assuming that you choose your career wisely. *Your first job out of college, out of trade school etc. will more likely than not determine your entire financial future.* We already know the $53K net figure will be attacked however it shouldn't. ***$53K a year net implies $80K per year gross.***

You see the path and it takes 10 years of dedication to get there.

How to Earn $80K?

No doubt many people believe this number is too high. Lets flip it around. You know that a starting salary of $80K will give you an amazing shot at early financial freedom so lets start with how someone can obtain an $80K salary instead. No you won't be working 40 hours a week and no there is no short cut to making a high income, you will pay a price: 1) mental effort, 2) endurance or 3) physical effort. If you do all three, well you'll likely beat the 31 years of age mark by a country mile. Remember, you are young and you are in your twenties, the world is yours for the taking since you should be an energizer bunny at this stage in your life.

Mental Pain (require top tier schooling and grades)

High End Finance: Investment Banking, Private Equity, Sales and Trading, Equity Research, Hedge Funds.

High Consulting: Boston Consulting Group, Bain. McKinsey

Engineer: Google, Facebook, Twitter, Salesforce.com, lets go on and on and on with hundreds of tech companies. $80K out the gate

We know you're saying "but what if I can't get any of these jobs", well how about this:

Endurance Pain (grinding out the hours)

Air Traffic Controller: Requires minimal education but is high stress

Accounting + Bartending: $50-55K a year + 2.5K a month on the side, you're at 80K

Healthcare + Online Business: Trade schools are only 2 years long and can offer starting pay in the $50-60K range, you get a full 2 year head start and in addition… you can start a simply health website that will generate a few thousand dollars a month.

Now you're saying these dual jobs are not practical or you cannot go into the top tier trades. Fair enough.

Physical Pain

Firefighters/Police Force: No risk no reward, will clear $80K. If you're complaining about a few thousand dollars in difference we'll simply respond that it won't take you four years to get the job also… government pensions anyone?

Dockworkers: Manual work. Gruelling. Notice a trend in effort and income? $80K+ out the door

Now that your spirit is uplifted simply join one of these groups. There are hundreds of ways to make $80K a year. None of them are for the following people though 1) lazy, 2) uneducated or unwilling to do manual labor and 3) negative personality types. No matter what you do you're going to have to put in that grind, it's going to come from a mental standpoint (getting to a top tier college and top grades to go to Wall Street), physical standpoint (dock workers, firefighters) or from a longevity standpoint (working multiple occupations). Anyone reading this post can make $80K a year.

Final Note: Do not take a job for minimum wage no matter what. If you're younger than 20 you can pick up a book and read how to fix iPhone screens and create a small time business fixing drunken mistakes in a major city. ***Do not work for minimum wage for anyone.***

3) The Home Stretch

You've made it to $500K: Congratulations. If you run the rule of 72, when you hit 40 you will have $1M dollars in the bank. Welcome to the top 2% in the USA (there are roughly 5 million millionaires in the USA) and well into the 1% world wide. You've won the game and you're just now hitting your stride as a man. Lets get cracking on some real wealth creation shall we?

That $5 handle is sitting on the sidelines and you won't touch it. Close the book it is time to move on to bigger ideas. You've got 4-6 years left before you can really take the pedal off the gas if you feel like it. How do you capitalize? Well here are some interesting ideas to get you started.

Venture Capital/Private Investments: Now that you are saving ~$50K a year from your current job, no matter what track you took (we simplified it to 5% increases in salary), you can take some calculated risks. With the world becoming increasingly internet driven you can begin angel funding investments or purchasing shares in the private market. What does this mean? It means you're swinging for the fences on a Mike Tyson level knock out punch. Generally speaking, most investment types will cause you to spend $25-100K to invest privately. That is fine because the goal is to take large equity swings with your annual savings since you don't need more than $500K. You're not searching for 5-7% returns anymore you're trying to 10x or 20x your investment within the decade. *No risk no reward it may go to zero.*

Silent Investor: Use your additional cash to develop high level relationships. Similar to our post on politics how do you gain trust with wealthy investors? Well you invest with them and don't pester them with questions over a long time horizon, once someone likes you the doors open a bit wider. With that said, Private Equity comes to mind as a decent idea, not to be confused with private investments (separate entirely). You create an investment consortium. You buy in as part of the takeout group and you sit and wait and wait. *You're looking for an annual rate of return in the high 20's.*

Lever Up and Fix it: Properties can be dangerous but he who takes on the headache will take on the profits. This is last on the three major ways to take a 5 figure investment and double or triple it in short order due to the level of stress involved. The premise is as follows: buy a high risk property, the risk can be associated with lower income tenants to major headaches due to a short sale or foreclosure… Put down a down payment heavy enough to move your rate as close to 3% as possible (generally a down payment at 25-33% of purchase price will do the trick)… take out a 3 year ARM you're betting on appreciation…. Roll up your sleeves, or hire someone else to do it, and fix the underlying property (commercial or residential). *Sell it, gunning for a flip of 50% of purchase price.*

Concluding Remarks: Over the coming weeks we are going to take a deeper look into each step starting with investing your first pay check. We'll walk through scenarios where things may go wrong and scenarios where you can adjust your portfolio for the future. One thing is for certain though, **if you don't get on the investment train early, it won't be stopping to pick you up any time soon.**

****

How to Live a Balanced Life

How to Live a Balanced Life

This is really the end goal of the blog. Since we do not cater to the masses, we know that the remaining people have a shot at success. A balanced life is a healthy and happy one and we believe it is obtainable if you play the game of life looking at it from a long-term perspective. With this in mind… we're going to break down a balanced life into sections. If you have no interest in a piece, do not read it.

1) Financial Success

2) Sex/Dating/Relationships

3) Common Sense vs. Thinking Differently

4) Hobbies and Interests

5) Brain plasticity

We'll start with financial success since that is where the vast majority of the questions come from and move down to what we believe are two largely ignored topics: Hobbies and Brain Plasticity.

1) Financial Success:

If you found this blog, you're ahead of your peers. This is not meant to be an ego boosting type comment. What does it mean? **You are being *honest* with yourself. You want to be rich.** Most people won't admit this. Instead they make ridiculous comments about how rich people are "unhappy". Entirely false and you know this already. In fact… if someone is angry about another person's success/happiness, this is a dead giveaway that they are broke/unsuccessful.

As we have mentioned many times in the past, most people harbor deep seeded negative beliefs about money. They think that it takes too much work to become rich (everything good takes work). They think it will make them lose "friends" (most people have a poverty mindset so you should drop these friends). They think that it will make them worse off as a "person" (whatever that means!). As you can see, regular people don't even know *how* to think.

With the backdrop out of the way, how do you become financially successful without becoming a boring type A person with no personality? The answer is simple. Kill yourself while you're young. Until you associate *with* motivational speakers (not the mediocre people in the crowd) **you're not working anywhere near hard enough.**

We get it.

Kill yourself is not a good explanation. So here is a quick outline of tangible things to do.

Develop an On Off Switch: This is incredibly important. You need to develop this skill when you are young. You are smarter than your peers. You know that money will come first and your social life will come second. Develop that on/off switch because the people you meet when you're out partying will 99/100 times be regular people. Law of large numbers.

On Switch: Your on switch is intense. When you are on, you focus and pour everything you have into the task. You continue to push, push, push until your brain gets tired. Your judgement gets cloudy. You have exhausted all of your brain cells when you find yourself becoming *forgetful*. For anyone who has actually worked hard (see any successful person) they will know exactly what the term forgetful means. You will literally forget where you put your keys, your items will become disorganized and you will start putting items in places where they shouldn't be. **You're discombobulated.** You've pushed far enough. Time to rest.

Off Switch: Your on switch is dead now. Time to run game or pick up a new hobby. Running game can be at a night club, during the day, or while doing a hobby (more on hobbies later). Most people will have a hard time switching to off mode, ***off mode means that you are living entirely in the present moment.*** Off mode means that you are not thinking about your business or your career, you are focused on enjoying life. This means you do not complain about problems in your personal life. You simply leave all of your items behind you and go out to have fun.

Note: As you get older the on and off switch will blur. The people you associate with will be both fun and successful. There are not many of them. There are even fewer when you're young so wait it out and you'll eventually connect with them later in life. Usually around age 25-27.

Tangible Daily Schedule: We're going to assume you're in your twenties and work already. We've outlined the basic rules for getting money 1) you need to start a business or 2) at minimum get into a career that generates revenue (or an *event*). There are no exceptions to those two items. If someone argues with you they simply lack common sense. No one is going to pay you a lot of money unless you make them a lot of money and ownership is the largest form of leverage (eg: business).

Any other form of high income for no actual revenue generation is likely a "hot market" which will eventually be saturated in the future. Besides, the faster you learn to produce the faster you'll get rich and the faster you'll see your income rise.

Naturally, starting a business is the most lucrative (higher risk, higher reward – unlimited upside). While getting a career is a great hedge (lower risk, lower reward – 7 figure net worth by early 30s) if you do not have any products/ideas.

Typical Weekday: Your typical weekday is going to consist of 14 hours of actual work. If you already work in investment banking as an analyst, you're not going to be a fool and stare at your computer screen during downtime (30% of the time you are there). Here is what you do:

Part 1) Do all of the tasks you need to do for your career. You need to keep your performance in the top tier. You play the politics game intelligently. You're working slightly less than you should, yet are ranked at the top. Use that extra time. If you do this correctly ~1/3 of your time will be free while others simply stare at their computer. Move on to part 2.

Part 2) You should learn how to sell online. It is as simple as that. Our suggestion is to start with copywriting. Why would you learn this? Simple, if you can sell online you can transfer this skill to selling a product later. If you don't know where to start, simply purchase a book on basic copywriting and read it at work. PDF the book and send it to yourself. Press windows + D and you can minimize the screen at any time.

Part 3) Temporary vs. recurring revenue, you have to choose one. If you're good at online sales you'll work in either *A) traffic arbitrage* or *B) micro-continuity.* If you work in traffic arbitrage you're going to be making money as an affiliate marketer. If you're going to go down the micro-contiuity route, you're going to need a couple of intelligent friends to work with. It is a lot of work up front and you won't be able to do this yourself while juggling a career. If you can? Even better. You'll get rich even faster.

Part 4) Wash rinse and repeat the above process. Particularly step two which is by far the hardest. No one is going to hold your hand through the sales process. It is up to you to learn how to connect with your audience. **There are not many people who are good at sales and sales will always be in demand.** People who believe sales is a "joke" or that sales will "go away" are all fools. Houses will be sold, real estate agents will make some sort of commission. Companies will be sold, investment bankers will make a fee every time if they are *good* negotiators. Companies need to raise money, if you have good contacts… You're quite clearly good at sales. Finally, you can always improve your salesmanship.

Concluding Remarks: If you don't want to read the above, here is the summary. If you're young and don't have any business ideas, get a *real* career. You will have downtime. During the downtime you can learn to do online sales. This can be done anywhere in the world. Once you are good at selling online you can eventually own the product. The skills are fully transferable. Once the product idea is good to go, you use your aforementioned sales skills and sell. If the product is legitimate you'll have recurring customers.

2) Sex Dating and Relationships:

Finance questions are first, dating comes in a close second. Notably, we do not believe in doing any sort of line for line approach system. This would turn you into a robot who is simply a smaller version of the person you learned from. If person A is teaching you how to pick up women and you copy everything he does, you're just going to be a lesser version of person A. You are not developing on a personal basis. You are a shadow of a different man.

Instead the basic premise is the following:

Part 1) You are going to become more attractive to women over time. Girls take you much less seriously in your 20s versus your 30s. You will simply have an easier time picking up women as you get older since men look better in their 30s versus their 20s. Knowing that this dynamic is going to help you over the next decade you should simply learn the basics of "game". We are not saying that you should shelve all of your social skills. **You simply go out twice a week (Thursday/Saturday)** and those two days will compound to immense results over a decade. You also chat up anyone you see during your day to day activities.

Part 2) **You open women up with an unoffensive assumption or question.** You can read 700 pick up books and it will be the same. The opening is always one of the two. An assumption or a question. It can be as simple as a comment on something she is wearing. If you are not socially aware enough to do this you've got a long way to go. This will work with both day and night game.

Part 3) We are in the smartphone generation. You can either complain about smartphones or use smartphones to your advantage. We suggest the latter. One thing is for sure, you are not going to rid the world of smartphones. They will eventually penetrate every corner of the earth because they are great products.

In addition, if you live a fun life, you're not going to complain about smartphones. If you are dealing with attractive girls (you should) they will likely be on SnapChat. Instead of wasting time sending text messages, send over a few cool photos of things you are doing. Videos work as well. In an ideal world you are sending a photo/video related to something you already discussed in the past.

Part 4) Until you are in your 30s, you are not ready for a serious relationship. Period. We don't believe in them in general. But. If you want to go down this route, you need to be in your 30s. When you are no where near your 30s, you don't have enough life experience both with women and life overall. Again, we do not believe in them in general, but if you really want to go down this route consider it during your 30s.

With the basic premise out of the way… you see that the real goal is to strike balance in your life over the next decade. Is your sex life going to be better at 31 versus 21? **Yes. But. This does not mean you have no sex life.** It simply means that you are prioritizing your life correctly. It also means that you *do* learn the basics of game. People who believe that you cannot have both money and a good sex life are simply haters or idiots. That is all there is to it. **Will it be easy? No.**

Concluding Remarks: This blog will have the same rough balance going forward (most readers are in their 20s). About 80-85% of your time should be focused on money and health. While the other 15-20% will be focused on "game". That is how your life should look in your 20s. When you hit your 30s, you're going to flip more towards dating since you won't be worried about money anymore.

To reiterate. Game versus money debates are stupid. Get both. From experience, getting money is significantly harder than getting women so we suggest more effort on money in your 20s. If you don't believe that money is harder to obtain than women, you likely have a personality disorder (asperger syndrome).

Ask any normal person the following question. If your life is on the line and you have one year to accumulate $1 million dollars or one year to have sex with a "7" every rational person is going to choose the "7" challenge. Please do not waste our time with "what about an 8" it means you are missing the point. Achievement with money is much harder than achievement with women.

3) Common Sense vs. Thinking Differently

This is a bit more complex than the two items above. Based on questions we are now receiving we see that some people have a hard time differentiating the two (not the majority but some). Perhaps our post on doing the opposite made people go a little bit crazy.

Instead of trying to outline the nitty gritty on how to see the difference we believe this is best served in examples.

Common Sense Example 1) This one is full idiocy: *"I am going to put my life on pause to hit on women and improve my social skills"*. This clearly lacks common sense. The only time this is a good idea is if you are **financially independent.** Improvement is not going to be linear and if you simply put in hundreds of approaches in **any environment** you are going to get better. By putting your life on hold just to meet women you are by definition putting women on a pedestal. You are saying the following to the world: *"instead of improving myself I would rather live my life for women"*. If you still have to work for a living… Do not do this. If you *are* financially independent. Carry on! Read the game posts we have here, go read other pick up forums and have a blast. You'll get the hang of it.

Common Sense Example 2) This one screams personal finance disaster: *"I am going to take on debt for the same position at the same firm."* This is a foolish move in-line with our FAQ page. While there is certainly merit to attending prestigious schools there is also a line. Learn the difference. A good target school is a good target school. Period.

In addition, **the world is not a meritocracy.** We alluded to this in our post on office politics. If you are going to be in the exact same position at the exact same firm you'd be crazy to rack up debt for no reason. People who do not understand this do not have any work experience beyond a couple of years and have no idea how real businesses work.

Thinking Differently Example 1) If something has mass influence it means that it caters to mediocre people. This a good example of thinking differently. By definition (again using common sense) if something is extremely popular across the USA it means the average bloke likes it. Average people want to be entertained so you know that popular items are for entertainment. Keep this in mind before you buy something. Ask yourself at least 10 times. Is this going to help me? If not, don't buy it.

If you cannot answer that question clearly? You are buying it based on how you "feel" and based on your "emotions". You don't want to have either when making a purchase. There is a reason that the superbowl charges a lot for advertising. They know that that it will grab the attention of regular folk **in a heightened emotional state.**

Thinking Differently Example 2) There is no set path for anyone. This even applies to Wall Street as well. We get a lot of emails about how you should go to IBD then go to PE/HFs and that's it. It is laughable. This means that the person has literally no work experience beyond the associate level. Simply switching from one industry to the next does not mean you made the right decision. Combining common sense with numbers lets take a look.

Person A – Simply goes straight to the next job offer and ignores his current position. He gets a bump in base salary to $150K and clears $300K his first associate year. Year 2 he clears $350K and is forced to go to business school ($200K post tax gone). You will not get financial aid.

Person B – Notices that someone very high up the chain is pulling for him. Say the head of the entire division has a liking for him. He runs the math. The economy has gotten better… He probably has a shot at getting into a revenue generation role. He "only" makes $250K then $300K… But? They have a sit down conversation and the group has decided he has the skills to make VP. No graduate degree needed and he'll make $350K+ (no post tax money ever paid).

Take a guess who makes more money? **Much more likely person B.** Why? This is against the "track". No… It is not. If you have a strong connection with someone with extreme power (the head of the entire division is pulling down multi-seven figures)… Then who is going to take you under their wing?

Well… if he is willing to give you a few hours of your time that is worth ***Significantly*** more than the near term pain of $40-60K.

Concluding Remarks: We realize that we cannot tell anyone *how* to think. Instead we have given some clear examples of common sense and thinking differently. The key is to make sure you draw on logic and common sense *before* you simply follow advice. This applies to this blog as well. If it is not going to hurt you go ahead and try it out immediately to see if it works. If you see that it works then you should go with it.

Remember. Don't follow the path that your peers are following for no reason. Your peers are just as lost as you are. Again, ask someone older and see what they say. Don't network at your level.

*Note: for long time readers we **refuse** to answer questions we do not know. That is exactly why we talk bluntly and to the point. Your time should be just as valuable as ours.

4) Hobbies and Interests

Most people are boring. Most people that make it onto the Street or other high paying professions are not fun. They are passive aggressive and try to cut you down. The good news is that people who back stab others have two things happen to them: 1) they become boring stressed out people and 2) they don't last very long in the profession.

If they do make it through the cracks by cutting people down, you can still sleep well at night knowing they are stressed out all of the time. How can you not be after making so many enemies.

Notably, this is another reason for creating the blog. We don't want anyone who reads it to become boring. You at least have some sense of humor if you're reading a blog with an aggressive name such as Wall Street Playboys right? Right.

So lets go through some ideas to keep you from becoming a boring person.

Idea 1 – Performing Arts: This is a catch all topic. We do not care what it is. Learn to play music, to sing, to dance, to do stand up comedy to do funny impersonations… It does not matter. As we stated above regular people want to be entertained and **women want to be entertained even more.** You should be competent with at least one of these skills. It will pay dividends for years to come. In order to become good at it, you will need to practice for a few hours a week for *at least a year*.

Do you know anyone who is boring that is good at one or even two performing arts? Neither do we. Just don't expect to get rich off of it unless you're incredibly elite.

Idea 2 – Languages: You need to learn languages. Again we do not care what it is. But. You should choose one that fills a void for you. Lets say you do a lot of business in Taiwan. Well you should probably learn Mandarin to a point of competency.

Alternatively, lets say all of your work is domestic and you like Russian women (who doesn't) then you should probably learn Russian. Again you do not need to obsess over the topic. Thirty minutes a day while in transit or sitting at the airport and you'll be competent in a year.

Idea 3 – One Team Sport: You should be athletic. While most blogs focus solely on body building, we suggest you become competent at one sport (minimum). This will prevent you from becoming an enormous guy who is un-athletic. Anyone can eventually squat 2x their weight, it is not that impressive. It is a completely different animal to have coordination, strength, speed and endurance all in one person. Again this is our opinion. If you want to focus solely on aesthetics that is your call but this is what we recommend.

Finally, if you do take this advice and become *good* at a particular team sport… You will *always* have a set of good male friends. This is exactly why you should do it. Weight lifting is an individual sport and team sports will give you a chance to meet new people. Besides, if you meet a guy who is good at XYZ sport, he is probably good at other things.

Why? To become good at anything you need a baseline of hard work. You already have something in common.

Concluding Remarks: There you have it. We have three clear and broad ideas for you to consider. If you already speak a couple of languages, are a part time stand up comedian and can play doubles tennis with college athletes… You're simply nodding your head in agreement. No one can possibly live a boring life with at least three clear interests in those areas. Finally, try to mix it up if you get bored of one of them.

5) Brain Plasticity

You're likely in your 20s. You do not give two shits about brain plasticity. We'll keep it brief.

This is an important topic. As the younger readers reap the rewards of the advice here they will eventually ask about this.

Brain plasticity refers to changes in the brain from: emotion, environment, behavior, etc.

To cut to the chase… You will see that as your life changes the way you think also changes.

As you execute on the four inital items listed above, you're going to recognize major changes in how you think and what you deem to be stressful/important/un-important.

Hopefully you have a journal. Take out a pen. Sign and date the page.

1) What is a lot of money?

2) How stressed are you from 1 to 10? Why?

3) How much time should men spend approaching women?

4) What are you insecure about? Be honest, no one will read it anyway.

5) Do you believe *everyone* is angling for something? If so why? If not why not?

That is it. Five simple questions to write down and *review one year later*. We'll give you one quick hint… If your answer to at least one question did not drastically change (180 degrees) your life is not moving in the right direction.

****

How to Make Millions With Other People's Money

How to Make Millions With Other People's Money

A guide to borrowing money to buy property: Commenter OwnMyHood here. Since the Playboys gave a few of us real estate guys the open invite to drop some knowledge, I figured I'd stop back in for another post… Having read this blog for a couple years now, I see the primary takeaways as: 1) Grind it out while you're young and stack your chips, 2) Don't follow the herd, 3) Regardless of how much you work, live an interesting life, 4) Don't get hitched (legally due to penalties), 5) Avoid living in a city you hate… and the Holy Grail: Start that business and ***earn money while you sleep***

If you found this blog, the first 5 items should be pretty straight forward (and if it isn't, the WSPs were nice enough to provide instructions for you). But I'll admit it, starting that business can be a bit of a challenge.

We're lead to believe that every successful business is built around some totally novel concept. All you need is a bright idea and some garage space and before long you'll be the next Jobs or Wozniak. VC firms will be throwing money at you and growing your business and marketing your product will be a piece of cake… Well, in the real world, it doesn't quite work that way.

Let's face it, most of us don't have that novel business idea. We may have thought of something that stands a decent chance of making some money, but who is going to back us? Even if you've saved up a few hundred large, you'll likely need some outside help to to get things off the ground.

Think you're a good salesman? Walk in to a bank with no prior biz experience and ask for a loan to start that great restaurant, bar, car wash, gym, online store, propeller beanie factory, (fill in the blank) that you've always dreamed of owning. If you can convince them to give you a loan, congrats you have no need for this site.

Now for the other 99.9% who got the raised eyebrow and the "sorry, I wish I could be more help" spiel, there is another way. There is one business where you need no experience, relatively little start up capital and have the ability to leverage it by borrowing large amounts right from the get go (sometimes with government backing). What biz is this you ask? **Real Estate.**

So You Want to Buy Your First Property, Where Do You Start? Well pal, since you asked I'll lay out four of the most common loan options topped off with some tips from the trenches meant to help you maximize the amount of money you can borrow for your investment. Let's start with what is likely the most common option, good ol' residential mortgages:

Residential Mortgages

The bread and butter of the beginning real estate investor. These are the loans individuals and families have been using for decades to buy single family homes and condominiums. What you may not know is that they can also be used for multi-unit residential properties with up to 4 apartments as well, so if you're looking for income property but have no prior experience, residential loans are usually a good place to start.

You can get these types of loans from a bank or mortgage broker and your lack of RE experience isn't going to have any bearing on your chances of securing the loan. In the residential space, your personal financial situation is paramount, the key things lenders look at are: 1) You have good enough credit and 2) You have enough income

Residential mortgage lenders use the Debt to Income Ratio (DTI) as their primary metric when determining whether or not you can afford to borrow money. This is all of your monthly debt payments (mortgage, car, student loan etc) added up and divided by your income. If you are at 35% or less you are usually good to go.

To sum it up here are some Pros and Cons of this type of loan:

Pros: 1) Ease: Relatively easy to get for beginners and you can put less than 20% down with private mortgage insurance or government backed programs: FHA 3.5% down, VA 0% down, USDA 0% down etc. **2) Rates**: Lower rate with long amortization schedule (30 years) with ability to lock the rate for it's entirety, **3) Low Hurdle**: No RE experience needed, **4) Regulation**: Highly regulated, so your chances of being "taken advantage of" by the lender are low

Cons: 1) Scale: You can only use these loans to buy smaller properties (1-4 residential units), **2) Four Loan Maximum:** You can only have 4 loans per person if they are the type that are sold to Fannie Mae or Freddie Mac, **3) Underwriting:** Underwriting is standardized, so your relationship with whoever originates the loan likely isn't going to make much of a difference, **4) Red Tape:** There is a fair amount of red tape that isn't present with other loan types (multiple reviews of bank balances, employment verification, appraisals always required etc). For someone with a relatively simple financial situation, these aren't bad. For biz owners or others who's situation is more complex, these can be a headache; **5) Occupancy:** May need to occupy the property to be eligible for certain programs

Commercial Mortgages

Once you max out your residential mortgages, want to buy apartment buildings with 5 or more units or commercial properties, if you're borrowing from a bank, you'll have to get a commercial mortgage. Though on the surface, this is still a loan used to purchase real estate there are quite a few differences with the residential loans described above.

Some of the big differences are: 1) Rates and terms can vary a decent amount from bank to bank, so it is best to shop around; 2) Relationships with the banker (how much they like & trust you) and bank (how much you have on deposit) matter quite a bit; 3) Commercial loans are not governed by the same regulations as residential mortgages, so there is more likely to be some harsh clauses built into the contract (learn how read the docs and utilize a lawyer); 4) The primary concern of the bank is "will this specific property make money." Your personal financial situation matters, but only as part of the bigger picture. If you can convince the bank the property will make money and you aren't a financial basket case, you likely will get the loan

The mortgage broker who originates your residential mortgage sees your investment as a transaction: you get a loan and he gets a commission. Meanwhile the mortgage gets sold to another bank 1000 miles away while he moves on to the next deal. If you default 5 years from now, it's not money out of the broker's pocket.

When it comes to commercial lenders, relationships do matter. Commercial banks keep the loans in house, so the banker you're talking to has much more incentive to make sure you and the property you're pitching him are a good investment. Also, the person you talk to when applying for a commercial loan is usually a decision maker, so getting them on your side can only help.

When it comes to determining the risk involved in lending you money, commercial banks primarily rely on the deal's Debt Service Coverage Ratio (DSCR). This is the NOI of the property divided by the mortgage payment. Though there is quite a bit of variance across different geographic areas, property types and market cycles, usually you want a deal to have at least 1.2 DSCR when approaching a commercial bank.

Pros: **1) Range:** You can purchase a wide range of properties with these loans; **2) Trust**: If you do multiple deals with a particular bank and build a relationship with their staff, this can make future mortgages easier to get; **3) Terms**: More flexibility regarding terms; **4) Limits**: There is no limit to how many loans of this type you can have (though banks will have limits depending on their size and relationship with you)

Cons: 1) Interest: Rates and terms are usually worse than residential mortgages (shorter schedules with adjustable rates or balloon payments); **2) Complexity**: Less regulated so you want to be more careful regarding terms, banks can put some nasty stuff in there; **3) Origination Costs**: These can be quite expensive. Commercial appraisals aren't cheap and banks can charge whatever the market can bear as far as fees go

Seller Financing

Ahh now we're talking, you want to put the pedal to the metal when it comes to leverage? This is one of the quickest ways to do it. Seller financing is when an owner has equity in their property and is willing to "be the bank:" take incremental payments over time instead of one big up front payment. How is this different than the above two options? Well, for one the rate and terms are whatever you and the seller can agree on. 0% down with a 50 year schedule and a balloon after 25 years? If you can get an owner to sign on the dotted line it's all yours…………………. If only it were that easy.

Your average real estate deal involves a fair amount of haggling but in this case, in addition to the standard negotiations you've also got to convince the seller to invest in you via a mortgage. This is essentially like handing them a junk bond in exchange for what could be their most valuable asset. Needless to say it's not always an easy sale (and I'd probably use a different analogy when pitching a seller…) and though some sellers are out of touch, it's uncommon to have price and terms vary widely from the market in general. Regardless, if you can make it happen, it's seller financing that often allows ambitious RE investors to build massive portfolios in a relatively short amount of time.

Pros: 1) Can Be Cheap: This type of financing is inexpensive, oftentimes the only significant origination costs are lawyer fees (which you have to pay anyway when you utilize a bank), **2) Flexibility**: Rate, terms and down payment are whatever you and the seller can agree on; **3) Speed**: These loans can be some of the quickest to close. When you work with institution, you do a lot of waiting: waiting on the underwriter, waiting on the appraiser, waiting on finding a date when all parties can get together. With seller financing it really just comes down to when you, the seller and an attorney can meet and sign documents

Cons: 1) Regulations: There are few regulations regarding these types of loans so sellers can build all kind of stuff into their mortgages. Make sure to read thoroughly before signing; **2) Availability**: There is limited availability when it comes to seller financing: there are many sellers who can not afford it or have no interest in holding paper, it's up to you to convince the one's who are open to it that it makes sense

Private Money

You could also refer to this as "friends and family" money. Private Money in this case just means borrowing from individuals who have money to lend. If you have a rich friend or Aunt who is looking to make some money and is willing to back an up and coming RE investor, this might be worth looking into. Notably, private money has the most in common with seller financing, in that the fees to originate the loan are low and the terms are whatever you and the lender can agree on. That said there are some very important differences:

1) Loan is unsecured: In many cases the lender has no right to any collateral if the borrower defaults, so if you don't pay them back, they're SOL. Even if they do require some kind of collateral, they are usually last in line were you to go bankrupt and would likely recover only a small fraction of what they lent you (if anything at all) and **2) Lenders are oftentimes not RE investors:** With seller financing you are purchasing a building off another investor, this is someone who has at least some experience with market cycles, vacancy, the random nature of certain expenses etc. When you borrow from old Uncle Vlad who earned his money working 9-5 in the same factory for 50 years and tell him that you're going to be late next month due to having to replace a collapsing roof, he might not be so understanding.

Private money can be easy to come by if you know the right people, but I'd caution any investor before using it. As stated above your relationship with the lender usually goes beyond pure business, and this can make things tricky. In order to avoid ruining personal relationships (which often are a whole lot more important than whatever deal you're pursuing) I've put together some criteria for using private money:

Don't borrow what someone can't afford to lose: Let's say Grandma is on a fixed income but has $50k in the bank, and it just so happens there is a beautiful duplex for sale that requires… you guessed it, a $50k down payment. She would love more than anything to help her grandson get started building his future and wouldn't hesitate to write you a check. As tempting as it might be to borrow her entire net worth, tell Granny to keep her loot. Even if you make the payments on time, what if she has a large medical expense 6 months after you buy your duplex? Where's the money going to come from to pay the good doctor? When the rest of the family finds out what Grandma did with her emergency fund things are going to get awkward for you real quick.

Avoid the "active investor:" You don't want to borrow from a friend who thinks just because they loaned you some dough they suddenly get to be involved with the day to day operation of your business. Partnerships are generally unstable to begin with, now throw in the weird dynamic of having to work with someone who likely has no experience with real estate. Not a winning situation. As with many things in the RE game, this requires being a good judge of character prior to signing on the dotted line.

Don't use private money for your first loan: Now, there are plenty of successful RE investors who got started with money from daddy (last I checked one was running the country). That said, I strongly suggest saving up for your first purchase on your own. Knowing what it took to earn your money will make you think long and hard before spending it, ideally leading to a more prudent investment decision. More importantly, if you have a few deals under your belt, you'll actually know what you're doing. This will lead to more confidence and a more realistic proposal when you go approaching your old college buddies hat in hand.

Pros: 1) Inexpensive: Can be very inexpensive, usually this is just a written or handshake agreement. If the lender is well known to you its common not to involve a lawyer; **2) Flexibility**: Rate and terms are whatever you and lender agree on; **3) Speed**: You can get the money quickly, as soon as the lender hands you a check it's yours to spend; **4) Legal**: If you default, often the lender can't come after your assets. That said, if this is a major consideration when borrowing money you should see a shrink. Don't be a scumbag. Pay your bills

Con, Potential to Ruin Relationships: A wise rapper once said "Money and blood don't mix." Given all the business names with "& Sons" tacked on the end, I'd have to disagree with him. That said, one should not underestimate the power money has over personal relationships. Not only does borrowing from someone close to you expose you to the potential pitfalls described above, it will generally change dynamics in any personal relationship. Even though they're earning interest, the average person who lends to you will feel they did you a favor, and that you "owe them one." I'll let you use your imagination when it comes to how that could impact your friendship. Just make sure before you approach someone to ask them for a loan, you consider what type of personality they have and how it might change the dynamics between you, them and the rest of those around you

Tips from the Trenches… Now That We've Covered the Basics

Looking for seller financing? Target the oddballs: If you want to avoid dealing with a bank you have to find a seller who's motivated enough to invest in something extremely risky: your real estate career. Where do you find these types? While they can be found anywhere, I've noticed they're more likely to own oddball or run down properties. Oddball properties could be a weird mix of residential and commercial units at one location, buildings in less than desirable areas, specialized commercial buildings that are currently vacant, multiple single family homes on one lot, and just about any other combination of traits that make them tough to market. Obviously if the seller thinks he'll have difficulty selling, he'll be more open to sweetening the deal by holding paper. Run down properties are a sign the owner is either uninterested in maintaining them, or has no idea how to manage property. Either way these people aren't up to dealing with the challenges of property management which often makes them more motivated than your average seller.

Want to do a deal with little or no down payment? It's easier than you think: Though high leverage deals come in all shapes and sizes, the most common types usually just combine two or more of the lending options I described above. For instance, want to put only 10% down, on a 10 unit apartment building? Get a commercial mortgage for 75% and a seller second mortgage for 15%. I've done that exact deal and a few other very similar ones. Want to put nothing down on that duplex? Borrow 75% with a residential loan and get Aunt Wilma to put up the rest with private money.

When choosing a bank, go local: As I mentioned above in the commercial loans section, relationships with bankers do matter and generally speaking, the smaller the bank, the more likely you are to be treated as a valued customer instead of a number. If you do multiple deals with the same bank, are easy to work with, never miss a payment and have gotten buddy buddy with the lending officer there, it will greatly increase your odds of getting a loan going forward (and make it less time consuming as they will already be familiar with your situation). In addition to this, local banks are more comfortable with the surrounding area and will often be more likely to loan money for local properties that a big bank considers too risky. Many smaller banks even have mandates that a certain % of their lending must go toward borrowers in their city, county, etc. These factors can only increase your odds of getting the loan.

Don't throw all your eggs in one basket, or dollars in one vault: Though I recommend dealing with smaller banks, there are a few downsides. They oftentimes will only be comfortable lending you a finite amount of dollars within a given year, so while it could have been a piece of cake to get your most recent purchase approved by Main Street Bank & Trust, if you approach them with another deal two weeks after closing, they may get nervous. Also, if you do it right, there is a chance you'll outgrow the bank and your deals will be too big for them to underwrite, or you'll already have so many loans on the books that they won't be comfortable lending you any more. To get over this hurdle I suggest cultivating relationships at multiple banks so that if Maine Street Bank & Trust is cutting back on it's Commercial RE loan exposure this year, you can talk to your guy at Community Credit Union in order to get a mortgage to buy that strip mall where your two pack-a-day aunt goes tanning. The same goes for maintaining deposit accounts, as in all situations, money talks and banks will be far more open to working with you if you toss some dead presidents their way.

When starting out, don't be afraid to "live the dream:" Many RE investors get their start by occupying their first (or even first few) investment properties. The reasons being A) we all need a place to call home B) Owner occupants receive preferential treatment from lenders and can qualify for generous government backed programs. I'm not going to get into the different programs here as that would be an article in and of itself, but a simple online search will yield quite a few results.

Leverage can make you rich but only do the deal if you make money: No matter how sweet the deal is: nothing down, cash back on closing, whatever. Don't let it blind you to the most important factor: it needs to make money. Prior to signing on the dotted line, always take the time to put together an accurate projection of what you stand to make and spend on a given property. If there's red ink on that bottom line, walk away.

RealtyShares: If you're interested in investing in real estate (passive or active) we can recommend RealtyShares, a crowdfunding platform for investments around the United States. By using a crowdfunding platform run by professionals, you can potentially benefit in the following ways: 1) ability to see how professionals look at real estate by viewing multiple approved projects, 2) access to a variety of asset types including single family homes, multifamily, retail and office, 3) access to offering types including debt, equity and preferred equity offerings and 4) a range of targeted returns and holding periods to meet your personal risk-return profile. Finally, we note that minimums are as low as $5,000 allowing you to get your feet wet in real estate investing for the first time or build a large portfolio of assets that provide passive income.

Thats that. Thanks again to the WSPs for allowing me to post and thanks to all of you for reading. – OwnMyHood

How To Make Money Online Starting Today.

How To Make Money Online Starting Today.

One of the biggest excuses when trying to make online is saying "They don't know where to start". While we gave out all of the major markets in Efficiency, making it impossible to not know where to start, this will boil it down even further to prevent the incessant excuses. At the end of the day, while it's best to have recurring revenue, it's not a guarantee that you start with recurring revenue. Even people who become billionaires have typically worked some sort of hourly wage job at some point in their lives. This will start at ground zero so there is absolutely no way that you earn $0 online in 2019.

Step 1 – Decide on the Service: That is right. Since we get a lot of complaints about how it is impossible to start a product from day one, instead we're going to start a service. A service is a time for money exchange (not good long-term). But. It is also the easiest way to make money starting in month number one. Also. There is a 99% chance that you will go ahead and create a product after your first service experience. It makes logical sense as you're going from service to product due to demand. So… What is your service? Your service is your current work.

Remember. There is only one way that you'll have a job long-term. It means that you're producing *more value relative to your cost.* Would you hire someone who lost you money every week or month? No. So by definition you're earning less than you are worth since the Company needs to generate a profit. It needs to generate a profit and if you lose them money, you'll find yourself in a conference room quite soon.

Step 2 – Pricing: So. We've already instantly killed the original part "what should i do". You're going to do whatever it is that you currently do but you're going to offer it directly to the consumer. This means you're going to offer the exact same service. Now all you have to do is come up with the pricing. What is the pricing? It is = to your (current income rate) * (1 + the margin line). If your current business unit makes a 20% profit, this means you should be able to charge your hourly rate + an additional 20% on top of it. Keeping it simple, if you make $100 an hour … that means $120.

Why do you need to charge more? Well the answer is clear. First you need to prove to yourself that you are worth more than you are currently earning at this point in time. How else can someone complain about pay if they can't get anything better? If you're really worth more than you're being paid then you should certainly charge more than you're currently being paid. Simple. The second reason? You'll work a ton harder knowing that you're factually earning more for your time than you did in the past. If your current boss told you you'll get paid 20% more if you do "well" on some new project, we can all agree that you'd work harder.

Step 3 – Eliminating the Final Set of Excuses: If you work in a position that cannot be directly transferred online then we're going to kill that argument as well. If you're unable to take your current position and do the same thing (or similar) online then you're going straight into the "looks" industry. What is the looks industry? It means anything that makes people look better. People are vain, insecure and always looking for an edge (pun intended). If you think the industry is saturated we've got news for you it absolutely isn't.

There is a trick here as well. The reason why we'd recommend the looks industry is that you're forced to be in shape and look good if you're trying to sell a service into this space. It can be anything. You could become a style coach, a fitness coach, a makeup expert, a hair expert, a grooming expert. There are so many choices here that it is factually impossible to be unable to learn one of them. Don't worry. The market is so huge that there is room for another person. There are hundreds of people making money with "looks" based businesses that are not special on a relative basis. The difference is that they are actually trying and working hard to get clients. Oh and by the way. By doing this you'll earn more money as good looking people out-earn average looking people particularly in sales (unattractive sales people are rare).

Step 4 – The Boring Stuff: Don't want to risk anything at all? Okay great. All you need is a website and the name of your service. "Name + service". Just type in your last name followed by the service and that's the basic domain. Really. That is it. If you don't have the $150 to pay for the entire process which is simply website hosting and a clean wordpress domain… Then it is time to leave this website and never return. In fact, it's smarter to do everything right which will cost closer to a few thousand dollars but the point of this post is to make money *now* and figure out the rest of the stuff as you move along. What do you need: 1) website, 2) hosting, 3) social media accounts. That's really it. The first two items are at max $150 in a year and the last item is completely *free*. So nothing here that costs a penny. Cheap and free.

Step 5 – The Quick Hustle: Now you have something to offer. Who knows what it is since that isn't the point of this post (we give out the major ones we'd do in Efficiency). Now you need to get some attention/traffic to the website. All you need is "free" stuff. We are putting free in quotes since you're going to "break the rules". Create some flyers if it's going to be a local service (say fitness trainer). It could be anything but if you're doing it for work in your city it usually means (99% of the time) that people are looking for that type of work in the same city! Amazing how that works. You'll go ahead and get the flyer ready and *gasps* print it out at your current place of work. Sure you're using the color printer for a hundred prints of your flyer but we doubt anyone will notice. People print out their tax returns and other non-employee items at work all the time. So. Simply print them out and begin the distribution process.

In addition to this basic set up you're going to blast text message every single person in your cell phone about your new service. Don't want to blast message people? Then we suggest giving up and leaving this blog again. If you send one message and the person gets so upset that they complain about it then you shouldn't have them in your phone in the first place. They did you a favor by showing their cards. So simply do it once, remove the people who get upset, say "thank you!" to the ones who help out and say "no problem!" to the people who aren't interested. The only ones you "lose" by doing this are the ones you wanted to lose in the first place (the very first group that flips out over a simple 1-3 sentence message).

Step 6 – Get to 15 Hours a Week: That is the only objective here. Once you have 15 hours a week of consistent service by doing basic marketing tactics: flyers, social media and SEO on Google… You're officially "in business". No you're not making a ton of money (probably nothing relative to the amount of work it took to start all this in the first place), But. You're officially making money, cash flow positive and you haven't lost a cent. There seems to be some obsession about "never losing money" which separates the eventual winners from losers (winners are willing to risk lots of money over time if the odds are good). That said. You're making money and haven't lost anything in the process. Congrats!

Step 7 – Product Ideas Begin: After you have consistent income coming in 15 hours a week, there is going to be a "tell". This means that people will "tell" you what they want. This is essentially a fact. If someone is paying for your time, and they generate good results from your time, they will want a product from you. If you're in the looks category for example, they will ask you for product recommendations. We are keeping this broad since "looks" makes it impossible to argue that there is no market. It could be products related to hair, skin, muscles, clothing, etc. When people keep asking you for a specific type of product *write it down*. You will then enter into product sales.

Step 8 – Affiliate Marketing: Affiliate marketing is nothing more than recommending someone else's product. That is it. If you recommend that a person buys a $100 item you receive a small commission for it. By way of example lets go with $5. Congrats. You were going to recommend the product anyway so why not get paid for the recommendation in addition to helping the person. *It does not cost them money.* People get really really really upset when you talk about making money online and it's essentially unwarranted. You're not charging them more, you're not charging them less. They would have paid the exact same amount of money either way. The only difference is you get a small part of the revenue. Anyone who complains about this stuff is not someone you want to be friends with and is not someone you want to associate with. In fact, people will be thrilled that you get paid something for it. If you're helping your clients solve a problem, they are going to be extremely happy that you're making a few bucks when they buy a product that works.

Step 9 – Product Creation: At this point your "online hobby" has evolved. You're no longer selling just your time for money but you're also selling products now. After selling a service and recommending products for a year to two years you're going to realize that you could just sell your own product! Keeping it extremely basic, if people are always asking for moisturizing lotion for their skin… you can just create your own product. Why is this so easy? All you'd need to do is grab the ingredients of the product you're currently selling for someone else and create the exact same thing with a few extra bells and whistles. This same concept applies to everything: 1) clothing, 2) grooming products, 3) protein powders…. The list goes on and on and on and on. Anything that you're recommending can be recreated.

Step 10 – Scale: After doing all this you'll realize that selling a product is the best possible way to earn money. You'll wake up with more money in your account (people buying products as you're sleeping) and you'll look for ways to make the cash flows more consistent. Essentially you are going from the absolute bottom: time for money exchange to product sale to stabilizing the sales. Stabilizing the sales will include recurring billing like your cell phone bill or the numerous products offered on Amazon for weekly or monthly refills. This helps create more predictable earnings as you're no longer forced to make constant one time sales that do not repeat. A big win.

The End of Excuses: While Efficiency gives the exact markets we would target, this post now makes it possible for anyone to earn money online. Absolutely no excuses at this point in time. Everyone wants the "lowest risk" avenue and we've now given it out in 10 basic steps. Anyone who is currently employed can follow along and make money. It really is that simple. The funny part? No one is going to try. Well not no one but maybe 1% of people will even bother. We've already seen this after our product launch as we had roughly 10 people actually execute on the plan and earn multiple six-figures online. The remainder? Continuing with the same tired old excuse: "Where do I start".

Now that we've killed the lamest excuse of all time "don't know where to start", we'll have our Q&A on Wednesday. As usual for purchasers only!

****

How to Operate in Airports and… An Important Announcement

How to Operate in Airports and… An Important Announcement

We're doing a combo post since this will be more informative than anything. For fun, since we've racked up more miles than we could possibly imagine the last ~2 years, we're going to give out all the tricks you'll need for traveling. In addition, since we're selling one of our internet assets (expected close on October 30, 2017) we have a small announcement as well. We have no idea if this post will be of interest, but if you plan on making a good deal of money you'll likely be forced to travel quite a bit for at least one year of your working life. If you end up getting a good career in sales? You'll be traveling quite a bit as you move up the stack.

Airport Skills

If you have additional airport travel ideas be sure to drop a comment. That said we think we'll cover a ton of time saving tips with this post alone. After racking up hundreds of thousands of miles, you'll find multiple tricks that work and we have no problem giving them away for free. Besides. Time is something we never get back so we may as well save it starting on day one!

Step 1 – Clear, Pre-check/Global Entry and Others: The first step is to get pre-check or Clear/Global Entry. We prefer using Clear/Global Entry but the difference is relatively minimal. Unless you plan on doing a lot of international travel, going with Pre-check will work perfectly fine (otherwise go with Global Services). You'd be surprised at how much time this will save you in an airport. While the lines are perhaps a tad shorter (lots of travelers do have pre-check) *the key is that the people are organized.* Instead of dealing with swaths of people taking their shoes off, forgetting laptops and not remembering to clear out their pockets… The vast majority are **fast.** We estimate total time savings of 15 minutes by signing up for these programs. On a round trip flight that 30 minutes a trip. *Tons of recovered time.*

Step 2 – Booking: Ideally, book all flights with zero connections. It is better to fly in economy/economy plus and take a direct flight, than sit in business class and be stuck in the airport due to a missed connection. *Always book direct.* We know… This isn't possible 100% of the time. In the cases when you're forced to fly with connections, book the longest leg first and the shortest leg second. This is because there are typically more flights when you're closer to the location. Flights from NYC to Boston are quite frequent (called the shuttle) so you're better off flying into Boston then to NYC **vs.** flying into another city such as Chicago then to NYC. We think this will save you a few hours of time per year since you're less likely to miss meetings.

Step 3 – Seating & Packing: Best to take the window seat. This is obvious but the aisle is prone to issues. Aisle seats require you to potentially move if other passengers need to get up and walk around. And. The flight crew will bump into you 90% of the time. People are not coordinated and Aisle seats are actually harder to sleep in. Book the window which is the main purpose of staying organized (booking early)…. Now… When it comes to packing you already know our basic rule. Choose an international carry on bag only. This makes you more efficient and you won't need two different carry on bags for flying.

Step 4 – Time Saving Items in the Airport: Now that your trip is set up you should utilize the Airport for the most advantages. If you're not part of the club (or the airport doesn't have a club) you can still take advantage of items found in airports. The main ones are relatively cheap massages that do work (a good habit to have as flexibility goes down with age), shoe shines and places that offer juicing (vegetables). Ideally, you'll find the exact amount of travel time to minimize down-time in an airport, but keep both of these items in mind if you want to get there ~25 minutes earlier than usual. A basic massage (15-20 minutes) and a juice 5 minutes, will knock out two items you needed anyway – improved flexibility and high quality calories. Notice… If for some reason you're flying to a place with food options that are lower in quality, the answer is to get to the airport 15 minutes early to grab a healthy juice before getting on the flight!

The next time saving item is a bit more extreme. Since you'll likely get into one of the higher priority boarding groups, there is no reason to shave before going to the airport. If you're one of the first passengers on board, you can simply hop into the stall shave and sit down before the flight is fully boarded. This applies to all of your basic morning routines (excluding a shower). Add all of these items up and you should be able to save 15 minutes per trip depending on how you want to organize the day.

Step 5 – Health: Flying is terrible for your health. Do not be fooled by the "glamour" of flying a lot. Anyone who enjoys flying has never really had to fly a lot. The conditions in an airplane are not good as you're exposed to 1) more bacteria (potential to get sick), 2) cabin pressure which is terrible for blood flow and 3) the dreaded conversation with the person sitting next to you (wish we were kidding, it's typically terrible). To combat all of these items you need to be prepared for the flight with the basics.

The first thing is compression arm sleeves and compression socks. If you think we are kidding, we are not. The main problem with flying is that you're sitting down in a pressurized cabin which restricts blood flow. The reason why people feel terrible (even if they sleep the whole time) after a flight is due to this issue. Your body is not meant to sit down in a pressurized cabin for multiple hours in a row. We recommend getting at least two pairs of each (compression socks or leg sleeves) and compression arm sleeves. If for some reason you believe this is too "weird"… simply wear a long sleeve shirt and jeans. No one will notice anyway.

The second thing is also in-line with blood flow (notice a trend?!). We also recommend taking a ginger shot with cayenne pepper or taking a Baby Asprin 30 minutes before the flight. Ginger shots with cayenne improve blood blow and you can even get this at a Jamba Juice for a few bucks. Otherwise pack your bag with a small stash of baby Asprins. Taking a tiny pill a few times a month isn't going to do anything and many people take them daily to help blood flow.

The next items are common but easily forgotten. You'll need 1) a face mask for sleeping, 2) ear plugs, 3) a book and 4) a pack of gum. These are all self explanatory but to keep it all in one place, a face mask is to aid sleeping, the ear plugs prevent people from bothering you with small talk and a book is for helping your eyes get tired (no blue lights!). The pack of gum is more of an add on. When you're on a flight it is much more likely that you breathe out of your mouth due to dehydration/pressure/moisture change, this will cause you wake up feeling worse and gum helps you get back to normal steady state within 5 minutes of landing… And… To cap it all off, feel free to add a pillow if needed. We've found it unnecessary (takes up too much space) and doesn't seem to make sleeping any easier.

Step 6 – Ready for Take Off: Since you're well prepared you're now set to either sleep or read. You'll avoid all of the bad items on a flight (alcohol/carbonated drinks). You're better off staying hydrated since flights (again) are not good for your health. Drink water or an electrolyte drink before and during flight (grab some coconut water at the airport). It is likely obvious, however, if you plan to sleep you'll want to position your body at an angle with your head close to the window and your feet facing diagonally (maximizing leg room). Assuming you're not in a lay-flat seat (majority of shorter flights are not lay-flat) the goal is to maximize the angle.

Step 7 – Bonus Items: Unless you're balling out of control flying private everywhere, you'll be in this mixed position of having some business class flights and some economy flights. The main idea here is to go for business class when you can get on lay-flat beds. This is important. The value of sitting in business class is probably 100x higher if the flight has a lay-flat bed vs a standard "lazy boy" chair. If you're on a long flight that has some options for lay-flat beds and standard business class, go for the lay-flat flight if you're going to pay for business class in the first place. You'll wake up feeling a lot better with this set-up.

Personal Finance Announcement

As many of you know we started a Q&A to see if we should create a forum. Our answer has come to a resounding "no" for now. That is because 90% of the questions came around investing, how much people should aim to have and other such items. So? We're simply going to create a product to address that question. It won't take us a long time to make (likely 3 months) and we'll clean up our inbox since 90% of the questions are around this topic (was not covered in Efficiency). *Also, If you paid for a question related to personal finance (and we answered) you'll get the product for free.* The outline is below and if there are other topics please let us know and we'll crank it out over the next ~3 months. Timing was perfect since we're unloading a website (have bids at a price we'd sell for already!) and will have a month or two of downtime to focus on anything Personal Finance related. The outline is below:

1. Where to invest your first $10K after you have already started a business that is profitable?
2. How Many Income Streams to have by Age
3. How Much Money Should You Have (benchmarks through age 40)
4. Overviews of Stocks: where we are personally invested and what we see happening over the next 5-10 years
5. Overview of Crypto Currency Investing: what we own and why
6. Overview of Real Estate: where we are now investing and what we would do today depending on age
7. Overview of Bonds/CDs: how much cash and lower risk we'd have
8. Portfolio Overview by Age: how much risk is too much or too little risk
9. **If you have another topic please leave it in the comments.**

On a final note… We also saw a lot of mis-interpretation around Efficiency. We stated several times you'll need $50K to create a business *this assumes you will create the actual product.* If your goal is to be an affiliate selling products that someone else creates your cost to starting up is likely around $1K. Our post on starting a Company being the best way to get rich assumes you go the product route.

****

How to Pick Up a Sexy Latina

How to Pick Up a Sexy Latina

It has been a bit tense around here (after killing all of our haters in two simple posts!)… so lets lighten the mood.

Most information out there just isn't good enough. It is too vague and offers the same cookie cutter advice. This post is going to take an extremely deep look into the nuances of Latinas. If you believe that literally all women across all cultures are *exactly* the same… Well… you haven't traveled much.

Here is the outline:

1) Useful Items and Skills – the Basics

2) Nitty Gritty Based on Your Skills and Look

3) Interesting Traits

4) Adjustments to Make to Your Crib

5) Fun Facts to Use On Your Dates

6) The Downside

1) Useful Items and Skills – the Basics

Before we add direct value with *actionable advice* we need to comb over the basics (all actionable of course). Most people won't even get through the basics so you'll be far ahead of your peers before you even land in Mexico City, Santo Domingo, Medellin, Rio or otherwise. Lets begin:

Language: You need to obtain conversational Spanish or Portuguese. This will take you roughly one year. If you fail to do this, you're going to settle for mediocrity (not something we approve of). There is no point in showing up. If you're going to go without learning anything… Then your best bet is Rio de Janeiro. In Rio de Janeiro many people will speak fluent English and have an interest in foreigners. The second best city for someone who speaks no Spanish is Mexico City. Tinder is extremely popular there and you can get by with Google Translate if you have the right look. Again.. Tinder and showing up in Rio with no language skills are both things we would never approve of , but if your thirsty friend wants to tag along…

Logistics: This applies to any girl. We're only putting it in here because you need to do your due diligence on the city. Make sure you stay within a 5-10 minute cab ride of all your date locations. You should have a list of clubs and bars that have been vetted by friends who have been there in the past. Finally, if you're looking to break into the higher tiers, you're going to need a nice place. As stated in the past, attractive women have options and your hostel is not going to attract anything worth bragging about (unless you look like a model or some such insane circumstance).

They Play Dumb: Latin women play dumb. This is why many people complain about their "flakiness". The real defining feature of a Latina is that *she knows you're hitting on her* from hello. This is also why direct game works better. Use indirect game and she'll assume you're a little kid.

Remember, they will do everything in their power to remain happy, bubbly and girly (at least the good ones do). Make no mistake. They are playing dumb. If you want to avoid the flakiness (you won't) your best bet is to obtain solid and strong eye contact. Unlike other women, Latin girls tend to show lots of interest by holding long eye contact with you (this is across all countries).

Salsa: This is not a necessity but it will help (Brasil is excluded, they dance forro/samba, both of which are unnecessary). If you're going to the Dominican Republic work on your Bachata (Aventura, Prince Royce). If you're going to Colombia work on your Cumbia (Joe Arroyo). If you're going to Mexico work on your Mambo (Tito Rodriguez). Learn to dance "on one". If you already know how to dance on one, on two and on three… No need to learn anymore.

In short, if you're looking to gain an edge you should have *decent* salsa skills. Naturally, speaking the language is a much more needed skill. Finally, once you're competent at dancing you do the opposite… **You lie down.** Your friends who are also good at salsa are going to talk a big game and tell everyone that they are great at dancing. **Do the opposite.** Explain that you're just a "beginner". Then you can show off your intermediate skills and impress. Besides, if you talk a big game… there are literally millions of better salsa dancers in Latin America. Don't bother competing in that category. You'll get crushed.

Heightened Sense of Smell: Couldn't come up with a better tagline. Oh well. You should definitely invest in a solid cologne. Go to a store with 2-3 different girls and ask their opinions on the colognes. They don't need to be girls you're dating just bring a few girls you know as acquaintances. If you don't have any friends at all… Then go with something basic like Georgio Armani. Colognes and perfumes are extremely popular in Latin America and they will notice.

Do not ask the girl who works at the store. She just wants to make a sale and doesn't care about your sex life.

WhatsApp: Download it. We have said it before. You need this application for international communication.

Concluding Remarks: This is the bare-bones framework for doing well with Latin girls. This is also where most advice ends. If speaking the language at a basic level, knowing basic dance moves and having a good cologne is too much work… You shouldn't even book your flight. Stay at home. Go back to watching useless motivational videos and motivational text.

2) Nitty Gritty Details Based on Your Skills and Look

Before we begin… Some comments in here are going to give advice based on your race and look. Somewhat controversial. That said, we have ***zero*** respect for racist people. They always end up embarrassing themselves because they are insecure idiots.

This section is called Nitty Gritty for a reason. Some cultures have biases based on specific looks and you can utilize this based on your personality.

You decide to take your first trip. Unlike other people you have set the date a full year in advance.

You spend one year learning both the language and the basic dancing skills (congrats you're ahead of 99.5% of the pack).

We only have experience with the following countries: Mexico, Dominican Republic, Colombia, Argentina, Brazil, Peru, Venezuela (Venezuela has serious issues at this point so it will be left out). We apologize in advance if we missed the country you're going to but we don't type about stuff we don't know (you guys know this already).

In order of ease: Dominican Republic, Peru, Mexico City, Rio, Medellin, Buenos Aires

Facial attractiveness: Argentina, Medellin, Mexico City, Rio, Dominican Republic, Peru

Body type attractiveness: Rio, Argentina, Medellin, Domincan Republic, Mexico City, Peru

Feel free to make small adjustments to the order above. But. Anyone who has been to all six is going to understand the order. Facial attractiveness is not really debatable, as it is based on the symmetry of the face. Body type, however, will vary.

If you're into extremely petite girls… Rio would drop down the list and if you absolutely hate thinner bodies then Argentina and Medellin would drop down as well. Finally, just like everything else in life, the more attractive the women the harder it is to do well in that city. Not rocket science.

To get top tier girls, you need to be a top tier guy (in their eyes).

Now onto the more controversial stuff…

Where you should go based on…

Ethnicity: White – Brasil/Peru/Mexico, Black – Mexico/Dominican Republic, Asian – Brasil/Peru, Indian – Dominican Republic/Brasil

If You're Rich: Argentina, Colombia, Mexico City

If You're on a Budget: Peru, Dominican Republic, Brazil

If You're in Incredible Shape: Brasil, Peru, Some Cities in Mexico

If You're an Extremely Sharp Dresser: Mexico – you will get face controlled or dress code controlled rapidly if you do not know how to dress sharp at the top venues

If you're 100% Fluent in the Language: Colombia, Argentina, Mexico

Now that we've given you the actionable steps and the destinations here is the overview and why it is set up this way.

Basic Destination Overview:

Brasil: Generally speaking, you're not expected to know much Portuguese. So if you only have one year to prepare, it ends up being a great destination for anyone across multiple ethnicities.

Why? The major cities have had a lot of international influence so there is less racism. In many parts of Latin America, your skin color does matter and anyone who says otherwise is simply a liar and has never travelled there. That or they are socially inept and cannot tell how people are treated differently. We're here to give the truth.

Cliff Notes: 1) lower expectation of language abilities in major cities – more so outside of Rio and Sao Paulo, 2) being in shape is practically a necessity, 3) lots of exposure to many cultures, 4) expensive destination these days, 5) extremely friendly relative to other countries, a great place for a newbie

Peru: This place has a negative stigma against an Indian look or a darker skinned person. Hence why it drops off the list for black guys and Indian guys. In addition, Peru has had an Asian president so the stigma against Asian men in Peru is much lighter than other areas in Latin America. To reiterate, not trying to start a pissing battle just telling it how it is. The attractiveness of the women isn't that great but they are much more interested in foreigners relative to the other countries.

Cliff Notes: 1) basic Spanish will do fine, 2) girls are extremely receptive to foreigners, 3) downside is this is one of the least attractive of the 6 countries mentioned, 4) can take advantage of the beach, 5) this is the most racist of the 6 countries against people with an Indian type look or darker skin

Mexico: Specifically, Mexico city, has a lot of international influence. For one reason or another black guys tend to do extremely well here. Broken record. Not trying to race bait just telling you the reality and how to capitalize upon it. If you go to smaller towns you're playing roulette but Mexico city is a great destination for practically anyone given how large the population is… If you can't find a few girls who are interested in you (city of 10 million people) the problem is in the mirror.

Cliff Notes: 1) Huge city gives huge advantages if you play the numbers game, 2) tinder is extremely popular but of course… it is unnecessary, 3) Nightlife is extremely fruitful, 4) parks are great for meeting girls during the day, 5) lots of museums and art if you're into that.

Colombia: Relative to the three countries above, Spanish is pretty much a must. Unless you've got a lot going on for you… you're going to need *beyond* 1 year of basic Spanish to do well. Unless you want to go and hook up with 5s in hostels. In addition, of the countries mentioned here, money is extremely important. You're going to be paying for cab rides, strong logistics etc. It matters.

Cliff Notes: 1) more than 1 year of Spanish is a *necessity*, 2) need to have your wits about you and night game is practically a waste of time, 3) women will be receptive during the day, you'll deal with flakiness, 4) better for longer term stays, 5) much more attractive probably #2 of the six… Not good for beginners

Argentina: Social class is king here. While many will say Colombian women are notorious and shifty gold diggers… Money is practically a necessity in Argentina. It will help you immensely. There is a great stigma in both Argentina and Colombia based on "class".

Cliff Notes: 1) the most attractive overall, 2) not smart to come here for short durations, 3) class matters more than skin tone, ie: make that money!, 4) dancing will help a lot particularly if your Spanish isn't great, 5) similar to Colombia, strong Spanish is practically a necessity

Dominican Republic: This has a lot of similar characteristics as Peru. The difference is the skin tone and music choice. Bachata will help you here and you'll experience much lower levels of outright racism. Don't worry. Just like all other Latin countries they'll try to find a way to scam you for your money! Ha.

Cliff Notes: 1) one of the easier countries but lower on the attractiveness scale, 2) not expensive so it competes with Brasil as a good starter destination, 3) Bachata will help you quite a bit, 4) being in shape helps quite a bit but still ranks below Brasil if you're extremely fit, 5) no problem for a short trip, you can see the vast majority of the city in a couple of weeks due to the size

Concluding Remarks: For those that are unable to read between the lines, the clear choices for beginner countries are Mexico, the DR, Brasil and Peru. Leaving Colombia and Argentina for those with more money, Spanish skills and connections. In addition, we've given you a basic outline that you can use based on what your ethnicity is and how in shape you are. Now it's time to move onto more detailed and actionable information.

3) Interesting Traits

Unlike other countries in Latin America, it is frowned upon to be a weak man. In short, it is okay to be masculine. Hence the proliferation of "machismo" personalities across various cultures. If you would describe yourself as a hipster… you're best off avoiding Latin America in general. All else equal, you will get paved.

Responsive to Story Telling Not Sarcasm: Latin culture is not okay with sarcasm. It is a waste. You should also avoid all sarcastic women (all sarcastic women are horrifying to be around). Your best bet to create a connection is through a fun story involving something dangerous. If you don't have 5-10 interesting/somewhat dangerous stories then your life has been quite dull.

Only Sexual After Sex: There is no point in bringing up sex during any conversation. Unless of course you've already had sex. She already knows you are hitting on her (see the beginners guide on all Latin girls "playing dumb").

Generally speaking, after sex they are going to be perfectly fine walking around topless in your place. They do not play "games" anymore and once they have committed to having sex with you… you're in the clear. Finally, for some reason they prefer to be taken from the back and will even request this. If you think that sentence is odd… *don't believe us*. Ask someone you know who has slept with a lot of Latin girls. Their eyes will light up as they say *"hmm that's oddly true"*.

One last odd sexual trait. They have a strange habit of going to sleep with their bra "on". When they are really tired and about to sleep… they'll take it off and throw it to the side. Get used to it.

*They are Claustrophobic – Spanish Speaking *only*:* They do not like tight spaces. One defining characteristic of Latin America is that the nicer areas are all extremely wide and tall. Unnecessarily so. Take a look at a bathroom in Latin America and you'll find large oval or circular sinks. The clubs are also extremely large and if you are the type to get sloppy drunk and knock into people… You'll be kicked out quickly.

Notably, this claustrophobia is applicable primarily to Spanish speaking Latinas.

****This does not apply to Brasil**** In Brasil they will frequently touch you and expect a kiss extremely quickly.

First and Last or Move On: This applies quite a bit to all women. But. If you want to *decrease* the chances of a flake, the interested ones will give you both her first and last name when you grab her number. The uninterested ones, or less likely ones, only hand out a first name. You can use this to quickly get rid of junk numbers… or roll the dice. Up to you.

Happy to Admit Money Matters: Once the gloves are off, Latin girls are happy to admit they do like money. Unlike other groups, they understand that money does help get girls and they will respect men with money. They don't care how you made it (hence the laundry list of attractive women who date drug dealers).

Given this trait, the status/wealth effect is magnified. Nice cars, nice location and nice clothes are necessary for every single girl worth dating. That said, it is magnified 2x when dealing with Latin girls.

Concluding Remarks: Some of these apply to all women (no woman is going to dislike a man because he has money for example). But the remainder are odd quirks applicable to Latin girls. Now lets move on to adjustments to your home.

4) Adjustments to Make to Your Crib

After the previous traits you're probably wondering… How do I use this information to my advantage! Of course you've come to the right blog.

Bathroom Upgrade: If you're specifically looking to gain a small edge… Invest in your bathroom. Latin girls will go through your stuff. Seriously, they will. Every Latin girl has later admitted to going through the medicine cabinet etc. Just to see "what's in there".

Your bathroom should be much nicer if you are specifically interested in Latin girls. It means the following: adding girly soap, some air freshener, upgrading the sink to one of the annoyingly large sinks and perhaps putting a small amount of drugs in the cabinet (wink wink… sort of… depending on the girl you nabbed). It is up to you to utilize the knowledge that she will absolutely go through your entire medicine cabinet.

Food and Drinks: Go with the likely candidates. Most Latin girls like spicy food, citrous foods or seafood. Those three are your best candidates. You may catch a few who don't like any of those but we'll bet that 90% will love those three items. In addition, for drinks they generally do not get "white girl wasted" they are much more careful and smart about what they consume so you should have a good mix at your place.

Here are some specific ideas: 1) flaming hot cheetos – if you're a college guy, 2) fish/shrimp tacos – small sized of course, 3) mango juice for margaritas – mangoes are particularly common in Mexico, 4) the young girls tend to like jack and coke (no idea why) or moscato and 5) champagne, practically everyone likes this so it is a good last second idea.

If you have all five of those items on hand… you're good to go.

Music: As mentioned above… You're going to know basic dance moves. You will have a basic understanding of Latin music. Now the key part… What type of Latin music should you play and what type of Latin music should you avoid? Again… You've come to the right place.

Practically any song from Romeo Santos is going to be in the "okay" zone (always double check). He is well known enough for you to have knowledge of him and not *too niche* that people will think you are crazy/overly eccentric.

That was a simple example. You can go ahead and try to stick to something from Marc Anthony, but he is almost *too well known* so it won't be clear that you have some interest in Latin culture. On the flip side here is an example of going too far.

You've gone too far. Abort mission.

It was painful to even post this video! The song is too cheesy. Too much of a romantic backdrop. Not really surprising as Prince Royce is a younger singer. This song would be equivalent to playing Justin Bieber in your place… Not a good idea!

We've given you two clear examples: one good choice and one terrible one. The rest is your call. Look up the lyrics and listen to the tone and you should be able to read between the lines. It is an art not a science. But. We've handed you clear examples.

Concluding Remarks: If you have normal to good game, your apartment/home/crib is already set up with the necessary items. So we've simply added three tweaks to make if you're specifically looking to date Latin girls.

5) Fun Facts to Use On Your Dates

Lets say you run out of material. Here are some basic things to bring up in your conversations, depending on who you're talking to.

– Talk about how gangs use Banda music to communicate assassinations (it is true, this is a Mexico comment)

– Talk about different styles of dance by region (Colombia – cumbia, mexico – mambo, DR – bachata etc.)

– Talk about how all Latin people seem to defend their countries to death! Joke about how all Brasilians believe Brasil is the best place in the world and all other South American countries suck. This is a general trend in all of Latin culture.

– Joke about their favorite alcohol being garbage. This is a slippery slope because they love their country but deep down they know that aguardiente (Colombia), Mezcal (Mexico) <– these two in particular; Caipirinha (Brasil), Presidente's (DR) are wayyyy over the top.

– Make specific cultural observations: square napkins in mexico (shows you're willing to eat at some of the sketchy food carts), clavos in Colombia (sketchy cab drivers), extremely touchy behavior of brasilian girls, wine obsession in Argentina etc.

Concluding Remarks: Nothing too crazy in here but you can utilize all of those talking points if you get into a rut. Or lead the conversation to basic items like this to get the flow of the conversation going into lighthearted territory.

6) The Downside

What sounds too good to be true… Usually is! Latin girls also have a few qualities that are going to drive you nuts so you should be aware. In particular:

1) Disorganized / Written Communication Issues: Could just be a personal thing, but it's tough to communicate via text with Latin girls. Best to call. Expect a lot of emojis.

2) Consistently Late: Add 45 minutes to all activities in your brain. This is applicable to all women but more so Latin girls. Just assume she'll be 30 minutes late at minimum and again… expect flakes!

3) Extremely Jealous: If you're out at night and she says "sure go have fun talk to whoever you like" then sees you talking to an attractive girl… she's going to get mad. **It was just a test. It is always a test.** She will even send attractive girls your way to **"test you"** and see what you do. If you're there with a girl, don't fall for these tricks. If she is really just a friend, then of course go for it.

4) Extremely Aggressive Ex-boyfriends: This is not for the girls. If you are dating a Latin girl and she has an ex-boyfriend who gets jealous… he is literally going to go after you. They have no sense of regular fighting and will go full blown crazy.

None of the four items above are meant to deter you. Just be aware of them.

Summary

There you have it. Actionable steps, nuances and some "controversial" advice.

Why are we giving this away for free? Simple. Practically no one is going to put in the work.

In addition? Once you have enough connections you'll find an "in" to many groups. The world is a large place. If you have strong game, a large stack of money and maximized your looks… You're always going to do well. So there is no reason to worry about increasing competition.

Finally. If you end up making a good amount of money, having solid game and are able to do well in every country… We're more likely to be friends than competitors.

That's how the world works. Everything flows to the top. **Get to the top.**

****

How to Play Dumb

How to Play Dumb

Before we begin, everyone should take note that a smart person can play dumb but a dumb person cannot play intelligent. A smart person is simply spending 20-30 minutes to triangulate if someone is worth knowing or if they should be thrown straight into the acquaintance bucket.

There are really only three categories where you will be forced to play dumb: 1) Business/Personal Finance, 2) Friends and 3) Dating.

Unlike our other posts we're going to go straight for the jugular and explain how pretending to be dumb is going to change your life financially. In short, people are *not* created equal. Once a person reveals themselves to be of no value, drop the contact and don't bother. Life is extremely short, you don't have time to take coffee meetings with people who are not going to go anywhere in life. Will you be correct 100% of the time? Nope. Just play the odds.

Is this "mean"? Yes. It doesn't matter. *You need money not feelings.*

How to Play Dumb in Business/Personal Finance

Lying About Your Knowledge Base

This is the master key to playing dumb. Learn this skill and you'll save yourself hundreds of hours (wasted meetings/ventures). If you can obtain a baseline understanding of multiple businesses you're going to use the following as your gateway line:

"*Hey, you know*, I've never really looked at XYZ before. *I just wanted to say* you've done a good job building XYZ (type of business), I'm interested in learning more about it. I'm happy to pay $X for an hour of your time."

While the underlined sections will go overlooked to the untrained eye, they are key parts of your pitch. Ideally you can get the person's time for free, but it is usually best to offer some small change to lock in the hour.

When you make the statement "just wanted to say" or "just wanted to let you know" this is usually a phrase used by people with minimal education. You want to *appear* to be a dope in this group. (There is a reason it is used in ads all the time.)

Now… With the backdrop set, you force the person to reveal his cards. Prior to the meeting ask for the following: 1) an example of a successful transaction/business deal and 2) high level numbers for margins, average selling prices and net profit.

Once the numbers are out you're just using the triangle approach. You ask for two "unrelated" data points spread out across the meeting to get to the third point and see if the guy is a liar or if the business is worth it to you.

Example:

– Early in the conversation ask for a tax number

– In the middle of the conversation ask for a unit shipment number

– At the end, ask for a high level conversion number and to *really* make it seem like you're dumb… ask for the ASP number again as if you "forgot"

You now have all of the information you need to determine if the business is worth investing in. If the above bullets don't make sense… simply re-read them and you'll figure out how the person is trapped into giving out all of his metrics over the course of an hour.

If you really want to confirm your suspicions then you go for the tried and true "Hey I don't really know anything about XYZ you just mentioned can you explain the basics to me". You use this line when the person is extremely confident about his knowledge base on the topic. If he slips… you know he's not on the same level as you. It's time to ignore everything he says after that.

Never Reveal Net Worth

Under no circumstances do you ever reveal how much you are worth (loss of bargaining power). This seems like common sense but regular people tend to give this information out like it is their first name. Don't bother telling your best friend or even your relatives (the rule applies 100x heavier with regards to females).

The only situation where you want to use money is if you're leveraging it on dates (you can use money to seal the deal but never reveal your actual worth). That is all.

Never tell a male how much you are worth because he will try to tear you down. Why? He thinks that he is your equal because you are roughly the same age (he never is and is usually dumber than rocks as well). Men are hands down the worst because they will go out of their way to be nosy, while women will simply try to gold dig which is easily avoidable (don't give them any $$!)

When it comes to money and being around males, you simply pay 5-10% above your fair share in every situation (group tabs drinks etc.). Don't bother being the cheap guy or the rich guy. Both are hated. By setting the bar just a tad above average you're just a "nice guy".

Here are some key ways to kill conversations regarding net worth and even income.

When asked about property say:

"I haven't moved in forever still at the same place for 5 years!" (hint don't bother with house parties unless you want to lose money over time). They will assume you haven't materially moved your income over the past 5 or so years. You can move if you like.

When asked about your current job function compared to industry averages:

"I'm in a weird position where they just changed my title to keep me around, so it's not really moving the bottom line much to be honest… kinda sucks" They will believe you are well below industry averages at all times making it harder to become envious.

When asked about vacations say:

"Ah I just go to cheap places, tier one destinations get pricey"

If asked about net worth directly by an extremely nosy person:

"Honestly I don't know, a lot of student loans mess it up"

Playing Dumb in Your Career

By the time you're in your early to mid-30s you should be generating $1M+ per year or more for your Company. You already know how to play dumb but it's time to take it to the next level.

Any sales position or revenue generating position is always about *$ output versus cost*. Most people think that if they are paid $300K per year or $1M per year then that is the metric that will determine if they are up for layoffs. Entirely false.

You'll hear a lot of stories about how a "high performer" making $700K per year was replaced by two "middle level" performers at $250K. In reality? *The person was being paid a higher percentage of total compensation relative to revenue.*

For example, if you're being paid $400K it means you're usually responsible for roughly $2-4M in total revenue. Now if you're extremely intelligent, you actually want to be paid *less* than $400K so you're next in line for the "land grab" internally. What is the point in pushing for a higher percentage, say $450K, when you can wait it out for a slice of the next totem to fall in the $1.5M range?

We'll stop there because it won't make sense to a lot of people. The implied message is clear. We're in a bull market so people are attempting to increase their percentage of compensation relative to revenue (we're using a wide range of 10-20%). All of these people will be fired in the next 2-3 years.

Lets say you're currently being paid 14% of total revenue while all of your peers are being paid 17-20%. The answer is simple. When the next round of layoffs come you should attempt to "land grab" from the 20%ers that have enormous books of business. This will make it incredibly easy for you to see a hockey stick improvement in your total income.

If big wig person A is making $1.5M per year and you're cruising along at $500K while generating *more revenue on a relative basis.* You are a clear and obvious candidate to displace person A in an environment that needs to be right sized.

You only push for a higher percentage when you're ready to quit because you're next in line to be pushed out the door (regardless of your fake performance reviews).

Playing Dumb as a Manager

A good manager is a happy one who never says anything negative about his team. This is where you want to be. Never say anything negative about anyone associated with you and simply prevent them from gaining traction on your actual revenue source. Easier said than done, but it is achievable.

Most managers micromanage aggressively and attempt to "prove wrong" any work turned into them which adds additional stress to their lives. Waste of time. A smart manager will simply make tweaks by himself and let the person run with glowing reviews.

Why is it better to run like this? No one on your team will be able to honestly say you've done anything bad to them… giving you first dibs at important decisions. If someone is stellar with their work, you give them an opportunity to sabotage you on a low scale (if they don't you can promote them) and if someone is a poor performer you simply say there is "no room for promotions" until they get the hint and leave.

How to Play Dumb with Friends

You Only Want Powerful Friends, the Rest Are Acquaintances

As noted at the top of this post, people are not created equal regardless of the sewage they forced you to drink in college. There are only two groups 1) future winners and 2) current winners. The rest? They encompass the masses.

If your friends are not in either group, they are going to drop off your phone eventually. You can attempt to keep them around for sentimental value (see feelings). But. The structure will break down eventually as your lives depart into very different directions (for better or worse).

1) Future Winners: This is the most under-served market in the world. Most people attempt to suck up at all times to powerful people… when they are better off networking with future winners to have a group of good business contacts in the future. It is incredibly easy to see if they are going to be future winners. Simply ask "Can I predict what this person will be doing next year?". If you are correct, they are not worth investing in.

Future winners have the *highest* return on investment. Why? As they try to climb the ladder everyone else will try to drag them down. They'll remember who was on their side when they were at the bottom.

2) Current Winners: The biggest mistake here is building relationships across the board. Not all winners are going to help you in the future. In fact? Most are insecure and negative people who won't help you even if you deserve it. Do your best and ask "Is this person going to go to bat for me down the line?". If the answer is yes then invest heavily. You can find the no answers extremely easily (if they are 40-50 they should have at least 5-10 success stories).

Now you're probably asking… what does this have to do with playing dumb? Everything.

In a word? *Reciprocity*.

Future Winners: If you find a diamond in a pack of mediocre people (usually 1 out of every 20th student graduating from a target school) then you want to act as the information source. Provide the person with as much information as possible on all the topics he needs. In the future he's going to remember it and add your name to his own rollodex of contacts. 5 years down the line you can hire him.

Why later? He'll be ready for a promotion (likely burned once at a different firm) and the long standing history with you will create a solid foundation of trust. In short, you're investing "blindly". In reality… it's actually an incredible investment for both of you while it'll appear to be "dumb luck" in the future.

Current Winners: Similar to finding talent, finding a person in power who is willing to pull a coat is extremely rare. If you find one? The goal is to simply mirror or reflect, the person he was 10, 15 or 20 years ago in yourself. Once he sees that you're essentially a version of himself many years ago he's going to have a hard time *not* investing in your future.

The key to playing dumb in this scenario is to pretend you're less versed than he is on a particular hobby or subject. If you're actually better than he is at XYZ (lets use golf as an example), simply ask him for tips on your swing and report back later that you've improved at it *because* of his advice. The worst thing you can every do is ask for advice and not take it. Once advice is given and not taken, even once, he's not going to bother wasting his time with you ever again.

Every word in this section is going to be extremely obvious for anyone of means (lets draw the line at $1M net worth). The vast majority of people won't be able to execute on it. Pitfalls include: 1) trying to one-up people who are above them – relationship is ruined forever, 2) not handing over responsibility to future winners – need to give up control to free up time for more important items, 3) not doing background checks on the person they are networking with – wasting years of time investing in the wrong person and 4) wasting valuable time with dead weight friends – if they don't change in 1-2 years they won't turn it around ever**.

**As a side note, there are extremely rare situations where a person turns it around… But. It's not worth the headache. For every last minute success story there are 10-15 other people who are worth your time.

Playing Dumb to Maintain Friendships

With the backdrop out of the way, you also need to play dumb in order to maintain friendships in the future. People in general are nosy. If you doubt this fact, then Facebook would not exist.

Once you have a set of people who are all successful on own (regardless of business line) you should always be impressed with any accomplishment they achieve. Never for a split second do you allow them to even *think* you're not impressed.

If your friend makes an additional $5K or $20M in a year, you're going to act like the person won the lottery and never ask for anything. No exceptions. Remember, under no circumstances do you ever reveal your income or worth. Nothing good ever comes of it anyway.

How to Play Dumb When Dating

Most guys are worried about gold diggers. Naturally, this means they are *absolutely* broke. Anyone who is well off knows that a gold digger cannot get "gold" if you are 1) never married and 2) never give her any actual money. Therefore… who cares? You want to play dumb about your actual worth and let her fill in the blanks without you telling her. As they say life is "sold" not "told".

There is a material divergence here compared to the first two sections of the post. When dealing with money/business you want to lie down. Let other people show their cards before you bother proceeding and you want absolutely no one to know you're well off. In fact it is better if they think they make more than you.

Dating is the reverse. Your only goal is to flash enough money to avoid being thrown into the potential husband category. This is art not science and we have a overview in our post on doing the opposite.

Pay off the following people: 1) hostess, 2) bouncer, 3) bartender and even 4) tipping an owner of the venue.

Now you're *clearly* not a boring male who goes on dinner dates. Once that is good to go you adjust your wardrobe to be more loud and fun. Once you've established a "just for fun" vibe with a gregarious personality in a well dressed outfit… She's going to figure out the rest by herself.

Playing Dumb Review

1) To beat a dead horse. Never tell anyone how much you are worth or make. Ever. If you are forced to? Lie down well below what the person makes (the person you are speaking to)

2) Be astonished at any financial accomplishment of a peer

3) In a business setting set a "trap" where you can back solve into numbers you need

4) "You've never heard about this and want to hear more" because "you just wanted to say" how impressed you are by their business

5) Careers are about return on investment and "land grabs" or client base. This is why many high performing people are laid off. They were at the top end of revenue generation, but also at the top end of *percentage of revenue paid out*

6) You have student debt. If you don't? You do now that you've read this sentence!

7) You have lived in the same place your entire life according to everyone you meet

8) Your title is not indicative of pay because they don't like you enough to give you money only enough to give you a "title"

9) People are not created equal and you want to increase your income not your "feelings"

10) Gold diggers are fantastic!

As Usual Absolutely No Questions, No Clarifying Questions Either. They Will be Deleted with ZERO Exceptions. Interesting Value Additive Comments are Always Welcome.

How to Predict the Future: Accelerating Your Returns

How to Predict the Future: Accelerating Your Returns

Naturally our Twitter feed drops hints towards the topic of our next post, in this case we're focused on predicting the future. We'll always disclose our sports/political bets before we place them so no worries there. Instead. This post is going to act as a framework for predicting the future. This is important for anyone who wants to start a Company since you need to start the product when the market is hot and if you start too early you might be wasting your time. It'll get interesting fast and we'll start with the biggest way to predict the future and work backward in time.

Using Imagination to Form the Base Layer

People say they are not able to imagine the future and we disagree. It really isn't difficult to predict the future on a 100 year or 200 year basis. Why do we say that? You can make the comments and people will agree since a lot of the answers are obvious. Remember, since this is the starting point, we're using the future to represent many years forward. Imagine an episode of the Jetsons for example, that is a good way to think about the starting point.

If we project out that far a lot of things no longer seem to be viable. We'll name a few: cash transactions, credit cards, driving in old vehicles, taking public transportation that goes 60mph at max speed, gasoline based cars, multiple business day delivery times, vast majority of manual task such as manufacturing, rooftops not being used for solar energy, so on an so forth. The funny thing is smart and the regular people will have to acknowledge the vast majority of the items on this quick list are true. That's why we think it's actually quite easy to predict far out in the future. To be more specific we'll even tie all the items above into how it will work going forward.

Transactions: It is actually quite crazy that we have to pay 10% or so just to use a different currency. Sure there are some cheaper ways to do it but you're still going to have to pay a nice chunk. In the future, no matter what it is called, there should be a global standard currency to get rid of all of this inefficiency. To make sure we are talking about many years in the future it could be a crypto currency or we may call it something else. Essentially though, in the future the transaction costs need to go away first. After that we'll see how it shakes out. This alone will improve our lives in many ways because anyone who has done a cross border transaction knows it can take several days for the recipient to receive payment.

Cash and Credit Cards: This is a ridiculous system. First of all the money can be faked and transaction fees on credit cards of 1-3% or so is an enormous drag on efficiency. Just can't see it many years in the future. Maybe we use cell phones and we don't use crypto currencies, but there is just no way we will be using these antiquated items. Every time we have to pay with cash or credit cards we laugh since we know it's eventually going to go away. The "security chip" actually made everyone lose time and the only value in using cash is when you're trying to get out of a crowded bar quickly (ideally every transaction in the future is done with a digital tap/send even if it's done using credit!). Don't even get us started on physically changing paper into another type of paper, at maximum a digital currency would be used and that would be the only transfer into paper (and it would be done only once with practically no costs).

Delivery: Look around at the insane amount of traffic (major cities such as LA are big eye sores). This is largely because we have a lot of vehicles with a single driver going to the exact same location. It is also because people make a ton of mistakes and you have a pretty high chance of dying every time you get into a car. Unsurprisingly people are not good drivers! Self-driving taxis, rapid speed trains, etc. will be developed. This will create less congestion and allow for faster delivery times. Then you have the use of drones and other small flying objects to help aid in delivery.

Robots Over Child Labor: One of the biggest complaints is that *"China has all the manufacturing jobs"*. Well realistically it is child/cheap labor putting together those $1,100 iPhones (no one really wants to be putting together iPhones). Once we can get robots to do the entire process we're going be in much better shape since you won't need to manufacture in China anymore. You can put the robots practically anywhere (they won't complain). All of these low quality manual tasks will go away (improving society long-term). We can see the removal of manual tasks when we look at Amazon's new stores that allow for zero checkouts (simply pick up the product and walk out). This is yet another example of removing manual tasks that were inefficient. The workers should move on to higher level positions.

Energy: While we may use some oil here and there, it just doesn't make sense to waste all of the energy we currently have. Imagine if all the rooftops in Miami were set with solar panels… Yeah we would exclude the roof top night-life of course! That said the amount of additional energy we have would be enormous. Ideally you won't need to be paying PG&E bills ever again, as alternative energy resources eventually solve the problem and improve efficiency as well.

Vertical Farms: Putting all of these items together it would also make sense that we see vertical farming in the future. If you have the ability to create farms that are no longer limited by the square footage of the land, your upside is enormous. Drones could easily harvest the food 200+ feet up from the ground, robots could help organize all of it and the entire process is fueled by solar energy. Again. While this may not be the exact way that it works, the point is still clear. In the future, solutions will be found.

Work Backward a Few Decades

Now that the base-layer is set, we have a good idea of what the future will look like. Now all we have to do is work backward. If this is what the future will look like then we need to ask ourselves, "how do we get there". Imaging a world where you don't have to drive, don't have to worry about exchange rates and don't have to worry about energy consumption is quite a leap forward. Take a step back and ask "what is the first shoe to drop". This is the best way to explain it. All you're looking for is the first step in the process that gets us all the way to the extreme end.

Similar to the prior section we'll lay out some clear predictions on some of the first shoes to drop. This has much more variability of being wrong than the prior one since predicting the first shoe is not easy. For fun lets go with all of these items: 1) removal of pure payment services such as Money Gram, 2) self-driving taxi services, 3) removal of digital advertising positions, 4) removal of human manufacturing processes, 5) removal of branch bank offices, 6) decrease in need for human military soldiers/personnel and 7) infused technology and humans.

Payment Services Removal: When you look at the ability to send payments the most egregious fees and costs come from international and cross border transactions. They are ripe for disruption since there is no real operating costs but computer entry and a signed piece of paper (which will eventually be digital signatures by the way). Naturally this would be the first shoe to drop when compared to low transaction fees of a point or two (credit cards). For fun we're pretty confident in this one being the first shoe to drop from a transaction perspective since you can calculate the profit margins. The highest profit margin arena has the biggest target on its back (this is a generalization, yet useful when trying to figure out where to look).

Self Driving Taxis: This one is difficult. We're going with this as the first shoe to drop from a driving perspective because we essentially have a "global" taxi system called Uber at this point in time. This directly contradicts our point on profit margins since Uber is losing money. And. We'd call it a scale game issue. In the past, new tech would be reserved for the rich (such as the first cell phone) and that would be the starting point. In this case we think there are huge hurdles to overcome from a regulatory perspective (need to prove it is safe), once that hurdle is jumped the winner would likely prefer a taxi service over a one time sale. After all, wouldn't you prefer to own all of the trips in the future versus single one time item sales to rich people buying a self-driving car (we know we would!). In this situation we're betting on the business model over the margins.

Removal of Digital Advertising: We're biased since we're plugged in here but it also makes sense. People are making a lot of money by creating ads tailored to specific groups of people (age ranges, genders, ethnicities etc.). It actually falls into both categories: high margin and high scale. As soon as deep learning (AI – insert buzzword), is accurate these positions will no longer be useful. Imagine an interactive sales page that adjusts based on who is reading it. That's the future. You'll see increased engagement, sales numbers and decreased costs since "costs" walk on two legs. We wouldn't be trying to build a career working for someone as a digital marketer, instead learn how it works and get ready to use programming to do it for you. Besides. If you can recognize good ads you'll know which software/AI service to buy.

Removal of Manufacturing: To be clear here, we still think white collar positions that can be automated (Digital marketing example) is going to be first. This is because of margins again. The second one will likely be low end manufacturing due to scale. No reason to hire thousands upon thousands of people to do a manual task. Since this was highlighted up front we'll end here.

Bank Branch Offices: In an ideal world there wouldn't be ATMs. But. We think the bank branch office goes first. Assuming the way this develops is a digital payment system that automatically can be pulled out for money (like an ATM) then it wouldn't be the first shoe to drop. The first shoe to drop would be branch offices since there is practically no need for them. You'll be able to do the following from your home in your pajamas: 1) send wire transfers, 2) apply for mortgages, 3) deposit anything that isn't physical cash, 4) open accounts and more. Essentially there is no real reason for a bank branch office, it has high overhead (ding ding margins!) and it has a lot of employees doing redundant tasks (ding ding similar to digital advertising/manufacturing). This should be one of the first shoes to drop.

Decrease in Military Personnel: As we move forward, robots and drones will be used to fight our battles. There is no reason to line a bunch of humans up and use them to fight our wars. It's dangerous and it will be inefficient as well in the future. We're a long way from this but we should see a decline in the need for "front line" type individuals in the future. It's a good thing from that standpoint and also a bad thing from a terrorist attack standpoint. The bad news is that attacks in the future could be fast and brutal with limited abilities to defend ourselves. Nonetheless, we'll be using bleeding edge technology to help save lives and this would certainly be on that list.

Infused Humans: It sounds like science fiction but it already exists. It is possible to install chips into a human being and have the chip control the person's physical movements. This is an insane development. Essentially you could be able to talk to another person using "brain waves" in the future. This also means we'll be alerted when we may have a heart attack or a stroke as well. The sky is really the limit but it is coming. Infused humans will have polarizing effects that are both positive and negative.

Pausing for a Second: When looking at all the paragraphs above our suggestion in an overarching step by step is as follows: 1) find the high margin businesses, 2) find the most scalable way the change would show up, 3) target high expense items – like bank branches and 4) focus on life saving items. If you follow these four items you'll usually find the end-game for a new technology breakthrough. While people believe that Companies are always looking to "cut the little guy" they are really looking for the best way to improve margins and efficiencies at scale (ever notice middle level managers always get fired in recessions, now you know why). This isn't a guarantee in terms of finding a good answer but it's a good starting point. Also. We skipped the energy efficiency piece. This is because we really can't figure out how it's going to develop, we just know that relying on one single massive company for all energy is a bit ludicrous as it stands today. Maybe it's solar maybe it isn't we'll see (hopefully Elon Musk figures this out soon!)

Work Backward to the Next Decade

If it was 2008 it would not have been controversial to say that marijuana would be legalized in many states. In fact, practically everyone knew this which led to people moving to Las Vegas for example. This was simply a well-known "future" opportunity. At this point (2018) we'd say the most obvious one is socioeconomic disparity. If were to choose anything that has nothing to do with AI, machine learning, crypto currencies, blockchain, drones, marijuana, avocado toast etc. it would be "socioeconomic disparity". That's probably the biggest item to be aware of when we look at the coming decade. We're not going to say that this is "good or bad" we're simply saying that it is likely to happen. You have a student debt bubble with inflation adjusted wages going down while technology eats away at their jobs/careers (naturally technology is making the most money as this happens). If you're interested in how to profit off this future, you can look at our book Triangle Investing.

This Brings Us To Today

Welcome to 2018. Since we can't give away our paid stuff for free what we can do is give away the steps to ensure your future. Yes the classic tacky retirement type tagline "Are you on target to reach your retirement goals (ominous background music followed by plug for a Company)". In all seriousness, there are quite a few things you can do to create a bright future even if you won't be an amazing technology expert in the future. Here are the basic plans we've talked about.

Real Estate: This is the most common option since people need to live somewhere. Not going to change that any time soon. Also, if you know that income disparity will increase you should have a good idea of where to get started. You can either sell the expensive stuff (high priced real estate) or you have to make bets on demographic migration (like Texas and Florida) as the people in high expense cities get shoved out (NYC, San Jose, Los Angeles, San Francisco etc.). There is a big opportunity here and we mean today. All of our readers already know how we're involved in this (more hands off) from an investment perspective.

Selling Experiences: This is another easy one, people are moving away from material goods and into spending on "experiences". This is evident to anyone looking at Instagram. There are so many ways to "play" this side if you're young and hungry that we don't even know where to start. You could even create differentiated food companies where people go for the vibe and experience, see vegan fad, the fancy desert fad, the juicing fad and more. Another example would be crazy events like burning man, the outdoor EDM concert fad and extreme sports. This opens up an enormous market since you can make practically anything seem "cool". All you have to do is put a new spin on it since that is where the disposable income will go.

Selling Only to the Ultra High-end: This is incredibly difficult (creating a new product in this market) so we assume you want to work for a Company. In that case if you get a choice only sell the high end item since it's not going to go anywhere. The ultra-rich in our socioeconomic example are not going to care about a few extra thousand dollars on anything. This also creates job stability since ultra-rich people still buy this stuff when times are rough. Why? No one else can do it so it actually makes them stand out even more (goal of these items is to get attention).

Get Ready for the Shoes: As you're doing one of the three above to make you money, you want to have an extremely good pulse on the shoes dropping. This is a way to significantly accelerate your net worth and future. For those that were working since 2004 or so, can you imagine being able to simply avoid (not even short sell) the 2008-2009 crash? You'd be worth a lot more since avoiding massive declines is even more valuable than your standard returns. At this point it is no longer “optional” to know nothing about technology and demographic changes. These two factors are going to drive large amounts of money to flow benefitting a small subset of the population (those that take the time to follow it).

Putting it Together: Every Q&A we get the same question “what would you do differently today”. It’s kind of odd because not much has changed and it has quite a while. The same strategy we used (Investment banking à sling items online à quit career when massively profitable) still works. You can replace investment banking and selling online and use any of the high level items we used above, the result will likely be similar (big difference being luck, timing and execution). The only thing we really would change is how we tried to scale. Your ability to scale is essentially tied to your knowledge and ability to execute which was lacking many years ago. Therefore, there isn’t much we’d change that worked 15-20 years ago but doesn’t work today. People just need to be more careful about which “sub-set” they specialize in (if you read the first section of this post it gives the answers to the sub-segments to avoid).

For the newer readers… if you’re interested in learning more about making money, staying in shape and doing so without choking off your personality … You’ll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by **Clicking Here.**

How to Prepare for Your Investment Banking Job (The Truth)

We have received several requests for a “What to do now” after obtaining a job as an investment banking analyst. A lot of this can be directly transferred for an associate as well, but most associate candidates already have an understanding of the space. With that said we’ll go ahead and lay out the truth.

Introduction

Either by way of interviewing or following a summer internship, your hard work has paid off and you’ve secured a coveted full-time offer from a prestigious investment bank.

Once you’re done celebrating, you need to start thinking about how to prepare for it. You likely have a full school year ahead of you, giving you ample amount of time to take advantage of before you start living in your office. What’s the best way to use it?

It’s important to find balance in what you spend your time doing. Many of incoming analysts will make the mistake of either:

1) *Over-preparing:* To some it may sound like a good idea to sign up for advanced modeling courses, take a plethora of advanced finance accounting classes, devour a laundry list of finance text books and generally try to understand everything you possibly can about investment banking.

Some amount of financial skills will obviously be helpful, but it should not take over your life and nobody should be shelling out thousands of dollars for modeling courses (the bank does that for you during training). Many of the skills you develop will come on the job, and it’s rare that corporate finance will necessitate anything more than basic algebra and statistics, so investing too much time in trying to be the best analyst in the world is not going to be worthwhile.

or:

2) *Under-preparing:* The flip side is the student who get the offer and then assumes that they can coast and enjoy their year-long vacation. You’ve got the job offer and you’re set – no need to worry about things you’ll learn in training anyway, so why not enjoy life?.

Again, it’s certainly important to take advantage of your last year in college before entering the real world, but don’t waste it all on mismanagement of alcohol, hooking up and a drug habit.

The reason you wanted a banking job in the first place was not because you wanted a career in investment banking. The analyst gig is a stepping stone to the buy-side, so you need to think about how to maximize your chances of landing there. Now that you’ve broken into banking, it’s time to start thinking about how you’re going to get out of it.

You need to find a balance between these two extremes and focus on developing what’s important, while ignoring wasting time and resources on unnecessary preparation. Simply put, if you’re the guy who is constantly talking about the last M&A deal that was closed last week, you’re probably on the over-prepared side. Alternatively, if you’re unable to understand the importance of excel short cuts… You’re on the under-prepared side. So lets take a high level look at how you should think about your future.

Career Goals

Your first step is to think about what you want to do after banking and then work backwards from there in order to determine what you can do today that will benefit you the most based on that.

Exit opportunities for IBD analysts fall into three broad categories:

1) Buyside (PE / HF)

2) Sellside (Staying in IBD, Equity Research, Capital Markets, etc.)

3) Other Finance (Corporate Finance, Startup, MBA, etc.)

We’re going to assume you want to skip the MBA and going straight for tier one or two, so once you’ve decided which path you are going to pursue you will need to familiarize yourself with the process towards following it.

First is timeframe.

Buyside hiring, particularly for private equity positions, can move very quickly, very early. Some funds begin recruiting for their next year’s associate class as much as 18 months in advance (i.e., six months into the start of your banking gig). Once the first fund to start their process begins interviewing, all of the others will follow suit so as not to miss out on the talent grab. This means that once recruiting starts, everything will move very quickly so it’s important not to be caught off guard. Once you start working, you will have a limited amount of time outside of work, so important to do your diligence now in order to hit the ~~ground~~ desk running.

Second is knowing and understanding how the space you are targeting does their hiring. It’s likely that headhunters will play a significant role for any buy-side exits, so it can be helpful to understand the headhunter landscape (Dynamics is well known for its focus on hedge funds, for instance). If headhunters are less of a factor then familiarize yourself with what the typical hiring process is for your chosen path.

That said, you will likely get a spreadsheet detailing each HH and what they are good for from current analysts once you start, so while its important to keep in mind this is not something to spend too much time on now.

Third, and most importantly (besides, obviously, the reputation of bank you are working at), is the industry group you end up working in. Yes, M&A is the best group if you want to break into PE, but different exits exist for different groups based on what kind of work you will be doing while in IBD and what kind of work you want to do afterwards.

Positioning for Placement

Most of the time, the offer you get will be a "generalist" offer (even if you worked in a specific group over the summer at the same bank), so you will need to be able to navigate the group placement process in order to maximize your chances of getting the best exit.

Selection

The best group(s) for you to target are dependent on:

1. The people working in the group

2. The kind of work the group does (i.e., M&A, equity, debt, restructuring, etc.)

3. The groups reputation / prestige

The most significant factor influencing your choice should be the culture of the group and the people you are potentially going to be working with. While some prestigious groups may look good on paper, you don't want to end up working in one in which every MD is a psycho MD and none of the analysts or associates ever see the light of day.

Additionally, the senior members of your group are going to be one of the most valuable avenues you have to the buy-side, so you want to avoid groups where they will treat you as a resource and won't give a second thought to helping you out.

Based on what kind of exit you want to pursue, you should target industry or product groups in which you will gain the most amount of relevant experience and the most transferable skillset. Broadly speaking, here is how you should think about it:

Private Equity

PE involves a lot of transactional work (LBOs), so you want to target groups where you will get a lot of exposure to M&A, whether it be in an advisory capacity or in structuring LBOs

For industry groups that means TMT, Healthcare, FIG and Energy

For product groups, that means M&A, LevFin, and Sponsors

Avoid groups which focus heavily on capital raising, in particular those where most of the deals that come in are on the equity side (this should be obvious – *private* equity)

Hedge Funds

As we've mentioned before, hedge funds care less about specific transactional experience than they do about your thought process and ability to analyze an investment. If you want to work at a hedge fund then the networking opportunities and group reputation are should be weighted more heavily in your decision. That said, if you know you want to target a specific type of hedge fund then there are some asset classes for which it can be helpful to work in a related group.

For generalist and equity-oriented strategies such as L/S or global macro, some amount of equity market exposure is likely helpful, but again the focus for them will be on how you think about investments, not how many IPOs you've worked on

For event-driven and merger-arb funds, more M&A understanding is likely to be helpful, along with restructuring

For credit, the focus should be on debt raising, with some amount of LBO exposure being helpful, so LevFin and DCM

For Venture Capital

Healthcare or tech. Period.

Other Factors to consider

Certain industry groups will allow you to develop additional skillsets on top of the "basic IBD" framework. The caveat is that while you will arguably have a broader range of skills to market, you also run the risk of getting "pegged" in that particular silo. Therefore, if you consider groups such as FIG, Real Estate, or Power and Utilities then be aware that it may be trickier to find exits outside of those industry groups than it would be in others

Your interest in sectors themselves should obviously be a determinant of which groups you want to target

Please note, it's also important to pick a group with a good reputation, which will differ for each group based the bank that you end up at. Yes, M&A is great, but if you're at a bank with a large balance sheet then groups with more focus on capital raising are more likely to get deal flow and better reputations. Similarly, if you are at bank with more of an advisory focus then you should consider which areas they are strongest in.

All that taken into account, you should narrow down your selection to 2-3 that you feel most comfortable with. Do not focus on just one group. It is never safe to put all of your eggs in one basket – if you are dead set on TMT and go around spouting that to everyone you talk to at your bank, then when all of the TMT spots have already been taken and you end up in Industrials you will appear overzealous and unrealistic, and it will be known that they are your "2nd choice".

Official Placement

The "official" group placement process at most banks is often akin to herding cats, so don't think the world is going to end if you don't end up with your first choice. That said, there are some strategies you can adopt in order to maximize your chances of getting one of the ones you want.

Group selection is broadly going to be based on three things, only the third of which you can control now:

1. The performance and reputation you developed during your summer

Assuming your offer was the result of a successful summer internship, your options will be almost entirely dependent on your performance there. Even if you decide not to return to the same group as you interned in, HR is going to have detailed feedback that anyone in the bank can look at. People in different groups will also talk to each other about who the best incoming analysts are, so if you performed well enough then you should develop some amount of reputation across multiple groups.

For those that had internships elsewhere (either at another bank or in a different industry, such as consulting), your summer performance will obviously still matter insofar as recommendations go, but positioning yourself for your full-time spot will require more political/networking skills.

2. The number of open spots in the group

While you may be a perfect fit for XYZ group, it will not matter if all of their full-time slots have already been filled. Many groups will attempt to fill up as much of their full-time class as possible from their returning summers, so do not be surprised if your dream group does not have any room for you. Similarly, it will be easier to land a spot at a group that has more open positions to fill in the case that they didn't give out as many summer offers or have people accept them.

3. Networking / Group Selection Process

You can do little to change the past or affect the hiring needs of a specific group, so the steps you can take now in order to get the group you want are going to revolve around networking.

Banks typically have some form of selection process to determine group placement. This is similar to a super-day and typically takes place early in the calendar year of your start date. While you should know how to navigate the selection process, most of the decisions for the open spots that are available will be determined long before that based on networking.

Ultimately, selection will come down to whether or not you have anyone in the group willing to go to bat for you. In order to get the placement you want

Either way, will need someone to put you in touch with someone in the group – same thing, more senior better. Get them to like you. Demonstrate interest. Ask good questions. Ask how to get into group.

Again, for those that are returning to the same bank but trying to change groups this will be easier (assuming changing groups is okay) because they will likely know or have met someone in the group they want during their internship. From there it's about making interest known and leveraging your internal reputation to get someone on your side. If navigating out of a group then it will be helpful to have someone to help you out politically.

For those who interned at a separate bank or had another internship, you can use the people there as references, but that is going to hold much less weight than someone at the bank itself. For these, HR will usually give you the opportunity to speak to some current analysts or associate, so use that informational interview to sell yourself to the group.

Once you have people in the group on your side advocating for you, the official selection process should be more of a formality.

Always. Be. Networking

A consistent theme here is that **the most important thing for you future career is networking**. While you're still in school, this means make friends with the other kids who are going into banking and finance (if you haven't already). They will be valuable contacts down the line.

If you are at a target school, join the alumni network sooner rather than later and start getting involved in alumni groups and activities. You can find alumni in finance to talk to who, while they may not be working with you, can provide valuable career advice and potentially help you out down the line

Work on your people skills. **It is incredibly important to know how to socialize** (without alcohol). Use the time you have to have fun, work on other aspects of your life, develop interesting hobbies and interests and generally become a more well-rounded and interesting person. We have alluded to this several times but it bears repeating. No one in the world enjoys hanging out with the guy who can only talk about finance/work/school/prestige. Over the long term, you will always lose to the person who has the exact same skills but has interesting points on topics such as sports, travel, music etc.

Analytical Skills

As we have said, developing a technical skillset is important, but past a certain point it is not something worth spending too much time on, and it is absolutely not something you should thousands of dollars for, if you want to spend a few dollars to learn excel shortcuts then feel free. However. Practicing at home should suffice. The time spent trying to learn anything too advanced or complex is going to hurt rather than help you.

Every firm has their own templates, formatting conventions, models, and macros. While doing something like learning VBA now might be useful as part of your overall skillset, your knowledge of it is going to be somewhat moot once you start working. To draw a line on what is too much preparation, VBA would be going over the top as macros are pre-made, but not knowing Alt E + S +T and not knowing that F4 repeats a movement would be poor preparation.

To further complicate things, within each firm every group is going to have their own conventions and way of doing things, which you will only pickup on the job. No matter what your previous reputation or experience, the assumption from day 1 will be that you will learn most of your modeling skills on the job and in training.

It is important not to invest too much time learning skills where the marginal utility is questionable. That said, there is a certain amount of preparation you can do so that you can pick things up quickly once you do start. Additionally, since you can also use the time you have to better prepare for whichever exit opportunity you have decided to target. Below is a list of things you can do for thirty minutes per day and be well ahead of the pack.

– Learn excel keyboard shortcuts (Alt E + S, use of shift and control, F4, Alt I+E, Shift + Space + DGG, etc.)

– Teach yourself basic modeling techniques (nothing too complex). We have a three statement model for Apple. This should take you a day to complete and you can do this once or twice for two different companies from scratch to improve your speed.

– Ask current analysts in your group for training materials and what recommendations they have

– For groups such as RE and FIG where the type of work is slightly different, spend some time reading up on how those groups approach modeling, but again keep in mind that most of the specialized knowledge you will need to pickup will come on the job

– Generally, keep up with the news and trends in your sector… but don't go overboard. If there is a multi-billion dollar deal or IPO you should be aware, if the S&P is at 2,000 or 1,800 you should be aware and if your group closes a large deal… You should be aware. Keeping track of league tables for every bank on the street, however, would be overkill.

– If you want to work at a hedge fund, if you have not already then you should start developing a thought process for analyzing investments and learning how to apply it to any given transaction. Notably, you should also work to apply this process to the speculative portion of your PA or a paper trading account

– If you want to work in private equity, it would not hurt to learn some basic LBO modeling and understand what kind of factors are going to be important for different PE shops (i.e., cash flow, potential operational improvements, IRR, etc.). Instead of trying to build complex LBOs, understand the high level assumptions of improving Free Cash Flow, why a company would be purchased by a PE firm, exit opportunities etc.

Other Things You Can Do

The moment you are assigned your group, begin updating your resume with your summer internship and future job, which you can fill in with basic / template information that can be easily alternated as needed later. This way you will be able to easily have it ready to go once buy-side recruiting starts.

Take accounting and corporate finance classes if your university offers them. Anything more advanced, however, may not be worth the amount of time and effort that you will put into them. Advanced financial mathematics classes are great if you are interested in them, but they are not necessary for investment banking. IBD doesn't use anything past basic algebra and statistics. As we have said numerous times, the belief that high paid employees on Wall Street are all math nerds is entirely false. It is called the "sell-side" for a reason. If you want to run numbers all day long, the only position worth obtaining would be a Quant role on the Street.

Take the time to catch up on some reading. Additionally, there are many books which both provide insight into broader Wall Street culture and are entertaining to read if you have the time. This list is by no means exhaustive, and you should only read them if you have the time, but some may include Liar's Poker, Monkey Business, The Accidental Investment Banker, Barbarians at the Gate, When Genius Failed, The Big Short and Too Big To Fail

Again if you have the time, plan take the first level of the CFA and potentially also the GMAT (scores last for five years). The CFA is a better bet here if you're looking for market centric positions (long-only funds as an example), but the GMAT is something that is helpful to have in your back pocket.

A Note on Training

As said, many of the analytical skills you will develop will come on the job. This does not mean training.

By way of design it is catered to the lowest common denominator – i.e., kids who come in with zero skills. Assuming you have some amount of basic modeling skills and are able to easily pickup whatever firm-specific macros, you should not risk taking training too seriously.

Yes, your training program will likely have "modeling tests". No, they will not have any influence over your bonus You just need to pass them. Your bonus will not be determined for at least another 6-9 months (18 if your bank issues a stub), by which time anything you did during training will be long forgotten. No need to raise the bar to the top by getting a 99% on the test. This would be equivalent to getting 100% on the Series 7 exam, a test a monkey could pass even when drunk.

Instead, you should view your time in training primarily as a networking and as a socializing opportunity. Use it to get to know the other members of your analyst class and a build a social circle. Establishing friendships and connections during training will be much more valuable down the line when you need to ask someone in LevFin for an LBO model template or your friend who ended up at KKR after banking hears about an opening there that you'd be well suited for.

You should obviously show up and complete any required exercises, but any breaks should be spent talking to people as opposed to trying to cram and study for the upcoming module / quiz.

The training itself pass / fail and nothing more. Treat it as such.

Personal Life

Finally, while the focus here was more on preparation specific to investment banking, the time you have during your senior year should also be spent optimizing and setting up your lifestyle diet, wardrobe and personal investment strategy. Once you start working the amount of time you have for yourself is going to be extremely limited, so if you can put those things in place now then you will be much better for it.

Oh, and you should also try to have some fun and be a college student while you still can. You only get to go to college once, after all.

—-

Addendum*: For the TL;DR type you can look at the below to decide if you're correctly balancing your last shot at freedom before chasing that F-you money.

1) Can you build the AAPL model within a day? If not you're probably a bit slow (note, any major company will do)

2) Can you go into a bar/club and strike up a conversation without feeling uncomfortable? If not you're probably not social enough and should improve here

3) Are you in great physical shape? If not you've underestimated the horrors of working in Wall Street for your first 2-3 years. Get in shape.

4) Can you comfortably use the major short cuts? Alt + E + S (know the box of short cuts), F4, Shift/CTRL and Space bar functions… If not you should spend 10-15 minute practicing a few formatting drills. Note this is only 10-15 minutes not 3+ hours

5) Do you get invited out by friends constantly? If not you should spend more time building out your network

6) Do you know the basic valuation metrics for your sector? If not you're not prepared.

7) Do you know what the S&P is trading at, roughly? If not you're not interested in finance

8) Do you know at least 2-3 major deals your group has closed? If not you're not prepared to position yourself correctly

9) Did you update your resume to reflect the formatting changes from a student to an experienced hire? It takes 20-30 minutes so simply make the changes

10) Are you trying to compare your group/bank placement to all of your peers? **Chill out this is not how you make friends!**

****

How to Quit. When Throwing in the Towel is the Right Decision.

How to Quit. When Throwing in the Towel is the Right Decision.

Quitting is quite difficult for stubborn intelligent people. They will try over and over to get what they want and sometimes this is the wrong move (they just don't have the right talents/skills). This is because they have a large ego. The two fastest ways to take down your own ego is to 1) quit something and admit it wasn't for you and 2) to try new things… Becoming a beginner again. We'll focus on the first part since the "self-improvement industry" is full of lists and challenges to get out of your "comfort zone".

Before talking about things you can quit, we'll start with things you're not allowed to quit. You're not allowed to quit when it comes to your *health or your finances*. Having tip-top health at all times is a pre-requisite and when we say you can't "quit your finances" we mean you cannot lose control of your money. If you find that your health is suffering or if you find that your net worth is falling (to the point where you may have to work again)… then this is an emergency.

If your health or your finances are in disarray this is a nuclear problem. You're going to solve the issue by throwing all the resources (*time*) at both issues… solve it fast. In short, you're not allowed to quit if something terrible happens to your health or your finances since you don't have a choice.

Decreasing the Chances of Failure

Step 1) Make a Decision: Before doing any task you're going to ask if you want to be the best at it. The reality is that most tasks do not require you to be *the best*. Being in the top 20% is more than good enough for the vast majority of tasks. As an example, you don't need to be in the 1% when it comes to music, sports, art or languages. If you decide that you want to learn to play an instrument or speak a different language… This is something that can be done on your free time and will never require you to *quit* outright. These activities are like the electricity in your home, simply running in the background being accessed and used when you need it.

Step 2) Choose the Use Case: Once you've filtered through hundreds of tasks, you'll find a handful where you say "I could be the best at this" (again the best being top 1%). The key question is… what is the purpose. If you're trying to become the best language teacher in the world… there isn't much value there. Even if you learned 10-20 languages, there are programs that are sold to teach languages… and on top of that Artificial Intelligence will be able to translate paragraphs and books in one language into another language within seconds. Therefore you need to have a specific use case for being in the 1% in the activity. Being in the 1% in eating contests? Not worth the time. Being in the top 1% in terms of sales? Absolutely worth the time. Being in the top 1% in a sport? Could be worth the time… So on and so forth. All of the items that come to your mind need a *definitive* purpose. Remember, you may want to be in the top 1% for some activity that doesn't generate any $$$ and that is 100% fine. Just don't fool yourself into saying you want to be in the top 1% for something with no market when the *end-goal* was to make money.

Step 3) Choose Your Edge: The best part about regular people is how they are hyper competitive in every single area of life… a waste of time and resources. If you're truly differentiated you don't really need to "compete" you simply have a specific edge that you don't give away. As an example, trying to compete in a commodity market with sales tactics won't work since you'll be eaten alive by Amazon. You're free to "compete" but you'll be swimming up stream all day and all night long. Trying to compete with services can work since emotional connections are difficult to replicate and attempting to compete with a brand new process can 100% work as well. Remember to choose a specific competitive edge that will not be easy to replicate. Once that's set in stone, when the standard competition heats up, you'll have an edge while maintaining the ability to monitor your peers for new ideas. Without a specific edge, there is no way to make it to the top since you're fighting for the same pie so to speak.

Step 4) Tweak 1,000 Times: People say you can't become creative and that you're born with it or you're not. Naturally, we don't think that makes much sense. Creativity can mean a lot of different things. It can mean a new sales process, a new marketing angle, a tweak to an existing product and much more. Think about the car… while Karl Benz created the very first car (a German man), Germany does not have the largest number of car companies and it does not have the largest automobile manufacturer. The point? You don't need to be first, you just need to carve out a slightly different version and a new market will open up for you (Efficiency provides recent examples).

Step 5) Stare into the Abyss: This is the most brutal part. We can't emphasize enough… when you have done steps 1-4 correctly, you're going to have a firmly held belief that your idea will work. Since we focus on cash flow positive type businesses, the good news is that you'll know if you can succeed or not within a year or two. You'll stare into the abyss for at least ***1-2 years,*** this means going through step 4 over and over again… researching, trying to fix and implementing new ideas. As long as your numbers are going higher every single month (compare equivalent year-over-year growth) then you're going to stick to this plan for the foreseeable future.

Step 6) Time to Quit… Not Yet… Whenever someone says "we sell our winners", it means they built something that they can't seem to grow anymore. No one in their right mind would sell any business that is growing and outpacing their opportunity cost. As a mathematical example, if a business does $10K a month and the seller says "it worked so we want to sell it" you know that is a lie unless the owner found a way to make more than $10K a month (and grow that number doing something else). You never sell a growing business that is cash flow positive unless you have something better to do. Before quitting any rational person would: 1) try and outsource the maintenance work, 2) try to cross pollinate the brand/product into another category and 3) adjust their advertising strategy. If all three fail, then it is time to consider quitting….

Time to Wave the White Flag

Step 7) Find the Value Proposition: Before you click sell, you want to make sure you can replicate your success elsewhere. Notice… We make the assumption that it is *practically* impossible to fail at your first money making venture. This is because we take a different approach to starting out (as outlined in *Efficiency*). Since you're going to make some money, you want to figure out ***why you made that money*.** How do you figure out how you made your money? **You replicate the exact same process onto an ancillary product.** This is also why people become "serial entrepreneurs" they know what worked and are able to replicate it. Lets think about this… Before you click sell on your "failed" project that makes say ~$2,000 a month… You're going to build a similar site to $2,000 a month in a shorter time frame. Take your existing business model and overlay it onto an ancillary product. If it took you 3 years to get there, get it done in a year or two. If you can do this… it means you know what your unique edge was. (yes the first idea will start to suffer but that is fine)

Step 8) Last Step Before Calling it Quits: Go ahead and place your website up for sale… See what type of people bid on the asset. Do you get a lot of offers? Do they seem to come in fast? Are they all from a specific type of buyer (internet searches are your friend)? If so there is always a sucker in the room and in this case it would be *YOU*. If offers come in fast or from a specific type of person… it means something is seriously wrong with your website and it's time to revisit the business and talk to people in the field. Find the expertise (of the buyer) and say your website is no longer for sale. Pay a $2,000-3,000 consulting fee to get a similar person (not the same buyer) to look at your site and fix it. If they still can't do it well… Then you're fine to sell!

Step 9) Call it Quits: By the time you're calling it quits you're in fantastic shape. 1) you can replicate your success, 2) you can feel good about being unable to scale your idea and 3) your absolute worst case scenario involves you churning out websites over and over again for a profit. The same old saying *"build until you hit the knee in the curve then sell"* is the model for people with a specific knowledge niche. Go back to selling your website and monitor its health over the next year. This is an important last step once you hit sell. Chances are… there is always someone smarter buying (if it's your first successful site), so by following the changes in 12 months you'll know what they did to improve it (someone solved your problem for you!)

Step 10) Back to the Drawing Board: Lets review, by the time you've called it quits you've learned 1) what worked in the first place, 2) how to replicate another basic version of the success and 3) how to monitor all of the people who were interested in purchasing your "failed" idea. Notice… even if you end up finding a way to outsource the task and keep a thousand or so in cash flow, **we suggest quitting and selling it.** This creates a real education. By selling it, you'll see if the person was able to fix it and that knowledge will be worth significantly more than a couple of thousand dollars a month in semi-passive income.

Concluding Remarks: As you can see, quitting isn't that bad if you do it intelligently. When you quit you'll be left with more tools. These tools will then lead to more income in the future. If someone wants to start a failed idea (life advice from a 19 y/o traveling the world for example) then they didn't do steps 1-4 and deserve what they get… a mediocre life. Starting something that is flawed from the beginning (scale, no emotion/value add and easily replicated) shouldn't happen. Besides… If you really have no ideas at all there is always sales! Sell a product for someone else.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality).

****

How to Remain Happy at All Times

How to Remain Happy at All Times

With this *"one bizarre trick"* you will always be happy!… Alright… bad affiliate marketing joke. The truth is that consistent happiness is going to take years of work. Not weeks. Not months. **Years.** As we have mentioned in the past the goal is to live a balanced life and if you are unhappy this means that your life is ***out of balance.*** We are 100% certain that this is an important topic since the most commonly clicked on link is "A Guide to Rational Living" which talks about overcoming depression.

Outline below:

1) Why it is Normal to Feel Unhappy When You're in Your Early 20s

2) How to Strategically Fix Your Life and Become in Balance

3) Avoiding Junk Reading and Why We Don't Post Much

4) Avoiding Hero Worship

5) Continuing to Progress Once You've "Made it"

As usual, if you already understand a section based on the headline alone… Don't read it.

1) Why it is Normal to Feel Unhappy When You're in Your Early 20s

We get a ton of emails. We get so many emails that we *rarely* respond and only allow comments. Most of the questions? Surround happiness and imbalance… The problem with a lot of these emails and questions is that **it is normal to be unhappy/frustrated in your early 20s**

Anyone who says otherwise is likely an older *boy* who is passing on his insecurities to you. *"If I was your age I would be thrilled to be alive! I would do…."*. Congratulations, you've met a retard. Full retard. **Smile, nod, agree and ignore.** All of these older people who claim that they would be thrilled to trade places with you ***without any actionable advice*** are all insecure morons. The worst part? They probably make $150K a year and have the audacity to give life advice. What a joke. If the person cannot give you actionable steps to improve your well being starting *right now*, you should ignore him completely.

Here is why it is normal to be unhappy/frustrated in your early twenties.

Distance: The person you want to become and the person you are today are far, far, far apart. The person you want to become seems to be on a different planet and this causes a lot of *frustration* because you want to improve rapidly. The problem? **Improvement is never linear.** This is exactly why you should only make self to self comparisons. Do not compare yourself (today) to the person you want to be in 20 years. This is not fair to you and your psyche. Compare yourself to who you were *last year* and see what happened. If you didn't improve drastically, you know you're taking advice from the wrong people.

Social Life Issues: Here is a fun fact. Most people who read this blog (ones that will eventually succeed) likely have very few friends right now (introverted)! Bet you weren't expecting that. Why? If you are doing the opposite, then you are going to ostracize yourself quite a bit from "regular people". You're going to watch as many people party hard (hook-up) while you focus significantly more on building a business or pursuing a career (or both!).

Low Value: In the eyes of society, just like a brand new bottle of wine, you're not going to matter much. You're just getting started. Everyone is telling you that they are "jealous of your youth" and yet you're actually going to be jealous of the people who already have what you want! It's a conundrum. People are yelling in your face that they wish they were your age. But. Society doesn't care about you. There is nothing you can do to reverse your value in a short period of time. Instead of dwelling on this fact, simply go out and find *actionable information* to fix your issues.

Money: Even if you get an investment banking analyst job paying ~$150K a year… You're going to be broke. As we have explained many times in the past, no one gets rich making $200K a year and no one ever will. While this sounds like a lot of money to a person who is still in college… Anyone who has actually succeeded in life and is aspiring for more, knows that it is nothing.

The Truth Hurts: Finally, the ***biggest reason*** for being unhappy in your twenties is ***exposure to the truth.*** Smart people consistently look for the truth and you go through huge amounts of frustration when you recognize reality for what it is. ***You cannot change reality.*** You realize the following truths: 1) Six figures is nothing, 2) your college degree was practically useless, excluding maybe 3-5 courses, 3) real life is significantly harder than college, 4) girls do not like younger men (don't worry, it gets better as you close in on 30), 5) everyone and their mom is trying to prevent you from going up the ladder because ***no one likes to see someone below them exceed them***. That is a lot of harsh truths to swallow. **A LOT.** The only thing you can do is change your strategy. Realize the truth for what it is and grind. You will be rewarded in about 5-10 years not 2-3 years.

Concluding Remarks: It is normal to be unhappy/frustrated in your early 20s. Everyone is lying. Your colleagues are going to load up photos of their posh lives (on credit) hook ups on "tinder" (photoshop) and do everything in their power to make you feel insecure. Here's a tip. ***Know they are lying.*** Simply ignore all of it and amplify their comments back to them. "Congrats I'm glad things are going well! (smile, nod)" and move on with your life. It is going to take an immense amount of discipline and self restraint to follow the rules outlined on this blog which is exactly why we give it away for free. 99.9% of people won't follow through and would rather "read about success" than do what it takes to actually succeed. The choice is yours.

**Note: For a pro-tip, start referring to times when you're frustrated/unhappy as "annoyed" you'll find that your word choice will temporarily change how you feel. As your life improves, you'll find it easier to remain in a state of happiness. We simply used the words frustrated and unhappy because this is how most people will describe their current state.*

2) How to Strategically Fix Your Life and Become in Balance

Now that we've destroyed the myth of being happy all the time in your early 20s (if you're not grinding and pushing your limits… you won't succeed), lets move onto the more important topic of how to actually fix your issues. As always… No action steps = waste of time.

We have mentioned that the most important items in your life are as follows: Health -> Money -> Friends/Relationships. This order is 100% true. You can only make money and have friends if you are healthy. If you have a lot of money… you have time to make more friends and establish relationships. On the flip side… If your health declines rapidly… You will likely lose both money and friends. Your money goes to fixing your health and your relationships falter as people are *busy* and the world does not revolved around you. Period.

Health: First of all, you should not sleep 8+ hours per day. This is complete BS. A rule created by mediocre people who haven't accomplished anything. Throw this in the trash. You do not need more than ~6 hours of sleep on average when you're under 25 because your body can take an immense amount of stress. As you get older, you won't be able to do this, but an all night work-a-thon here and there is not going to harm you… At all.

With that myth broken down, here's a high level way to think about fixing your health. 1) maintain a healthy diet, 2) have a solid exercise schedule and 3) begin eliminating stress *after* you achieve your financial goals.

We rarely use the word must. But. You absolutely must have a healthy eating and exercise routine. No exceptions.

Since this is an overview post here are some clear steps to fixing your health: 1) get into juicing – read **Mike Cernovich's book on juicing right here** (No affiliate, we don't have the time to set it up, we read it and it's great), 2) stop stressing about things you cannot control – you will always feel bad if you think you can control the uncontrollable… stop it!, 3) exercise at minimum 5 days a week, we have a full 7 day a week schedule because it sets the bar higher and will likely result in people exercising for 5 days, 4) get more money… the more money you have the lower your anxiety levels and 5) stop taking health advice from people you don't want to look like.

That should cover the high level actionable advice. If you're juicing, eating healthy, working out and seeing your investments grow at rapid rates… Your health will improve. Finally, please do not "stress out" if you miss a workout or you can't juice for a day (life gets in the way 10-20 times a year). That defeats the entire purpose of eating healthy and working out.

Money: Stop reading "about" money and only read actionable advice about getting money. If you're one of those people who follows the Instagram account of a rich celeb such as Dan Bilzerian, you're pathetic. A complete and utter loser. Trying to *associate* with someone who is living the life is like wearing a sports jersey. You are not getting any closer to becoming an "MVP" by wearing that jersey. Stop trying to win by association. This is how losers operate.

Instead.

You are going to find your talents. You're going to do this the HARD way. You are going to try a bunch of stuff utilizing the power of 1% and you're going to see what you have a "knack" for. Maybe you're a great chef… then you need to create a business after 5-7 years of working in the restaurant industry. Maybe you are a fantastic fiction writer… Get to work on that first book. So on and so forth.

Now. Once you know exactly where your talents lie… **Start marketing/branding your talents.** Help a winner become even more successful. Reiteration. Help a winner become even more successful.

If you truly have a knack for a topic, we'll draw the line at top 5% in your industry/space, then you will find a way to add value to the guys in the top 1% or 0.5%. **No doubt about it.** Instead of spamming your "heroes" (more on this later) you are going to find a way to expand his/her bottom line. This is the path to success. Once you can successfully improve the business of the elite, you will now have an *opportunity* to succeed. Emphasis on opportunity.

The true elite will happily give you a shot if you show your worth. But. Nothing is given away for free. Stand in the limelight and do everything in your power to succeed.

There is a clear point here. If your money is not "in balance" then you need to de-emphasize other areas of your life and start going through our clear posts on how to make money (business or career).

Friends/Relationships: For some reason… Young people in their twenties think that successful people have hundreds of friends that they talk to *all of the time*. As usual… Complete BS.

Successful people have a laundry list of friends that they connect with on *rare* occasions. How can you possibly have your health and money together if you're spending 20+ hours a week talking to your friends about "life"? Not possible. This is what gossipy women do. They chit chat all day about what is going on around them. No one succeeds like this. You will have a group of people you talk to in order to grow your sales/business and then you will have a laundry list of contacts that you speak to on an "off and on" basis.

Secondly, your sex life is going to be directly proportional to 1) your value as a man + 2) your time commitment to meeting new women. You know our rules. Two days a week of night life is more than enough (Thursday/Saturday).

Think about it. If you know that your value as a man and your time commitment to "pick up", are the only factors to achieve success with women… **what's the best *long-term solution*?** The best long-term solution is to become a high value man. You cannot change the number of hours in a day.

Spending 40 hours a week day gaming and night gaming to pick up girls at the expense of your overall value is… insane. Unless you plan to make a living off of "pick up", you are going to become a deranged person.

Concluding Remarks: Prioritize correctly. Health -> Money -> Friends/Relationships. If you are lacking in one of these categories (severely) you are going to become unhappy. This is why you can find people who have 50+ girls a year that are unhappy (usually broke) and guys who have $1M + that are also unhappy (usually terrible with women). Stop and address the issue. Remember. The order of priorities are the same…If you end up having $1M+ and a fit body… You really need to work on your social skills if you are unhappy. Take time off and work on it.

3) Avoiding Junk Reading and Why We Don't Post Much

This section is also going to piss off a lot of people… A LOT of people. ***Just because you are reading something doesn't mean you're learning anything *applicable*.***

Information overload is legitimate and it is taking place all over the world. As we've said before, if the blog post or book does not have anything actionable in it… you should chuck it into the trash can (beating a dead horse). You should have a 90% action 10% consumption mentality. Reiteration. **90% action, 10% consumption.**

Example 1: Lets say you just got your first investment banking bonus of $70K. You want to reward yourself with a trip to Latin America next year. Perfect. You read the post we just linked to and then you get to work. Notice… If you do not have plans to ever visit Latin America… Then there is no need to read the post! We realize this is negative and will likely decrease page views to the post but it does not matter. **If you don't need the information then why are you reading it?!**

Example 2: Lets say you want to get into Wall Street. Great. You should absolutely stick around, read our investment banking Q&A and go through all of our Wall Street posts. The Catch? Do not read a post that does not pertain to you. It does not make sense to read our post on office politics if you have not even obtained an internship on Wall Street… correct? Correct again! Be honest about where you are in your career or business and read the posts that pertain to your situation.

Example 3: Reading for motivation. **Get out and never come back to this blog.** We have ended those posts forever. You should be able to give motivational speeches not be on the receiving end of emotional non-sense.

Example 4: Wasting the time of successful people with irrelevant questions ***after reading a post that does not pertain to you.*** If you are not in position to take action it makes no logical sense at all.

With the examples out of the way you should take a hard look at what you are consuming. Where are you today? Where do you want to be? Now choose a few select posts to read and keep track of information that you find valuable.

News flash. Anything that makes you *feel* something is not useful. Feelings are for people who want to be entertained.

4) Avoiding Hero Worship

We're getting closer to the finish line. You have read the first three sections and have a written down *game plan* of what you need to improve upon. If you are unhappy but rich… you have clearly circled "game" as a top priority. If you are doing well with women, have money and are suffering from back pain… Health is now a screaming number 1 priority. So on and so forth.

With the priorities out of the way you're only reading for ***actionable*** advice and have cut out the useless blogs/books. If it is not giving you anything you can actually use, you're not going to take the click bait.

Now… onto the avoidance of hero worship…

There are several solid blogs and books out there. It is absolutely fantastic to keep in touch with those authors and make sure you build a relationship so they answer your questions for you in the future. **But.** These authors are human beings and they are not immune to ups and downs in life. Do not beg for "retweets", "page links", "promotions" etc. **Earn it yourself (money section 2 of this post).** Once you earn your keep by delivering *value*, when you ask for signaling of a new product or special post people are going to happily oblige. Delivering no value and begging for promotions because you have been a "long time follower" is retardation.

Deliver value and signal when important issues arise.

There is a huge trend where people are thirsty for approval from their mentors. This is not healthy.

Stop sucking up and start moving up.

Everyone reading this blog is going to be talented at ***something*.** Find that talent. Build that career or business. When you're getting traction, reach out and flag it when one of your "heroes" has a problem in the same space. Since we like examples, here's a great one.

Example: You are a fantastic style consultant. You find that one of your "heroes" (see guy who has helped you in the past with his blog/book) is going on television for the first time. *Opportunity to shine*. You reach out to this person and you say you've been a style consultant for 5+ years. You then help him with his wardrobe for free and *boom* he is happy to send new business your way for the next several years! **That is how it is done.** (this may or may not be a real life example, wink wink)

Concluding Remarks: No one is a hero. Everyone fails in life. If you are gaining value from a specific person, keep them in mind as you build out *your own dreams* not a "copy cat dream". When you are following your own path and find your own niche, the opportunities are going to arise over time and you can build a much better relationship that way.

5) Continuing to Progress Once You've "Made it"

The final frontier. You have it all. So you *think*. You're healthy well off and you have no problems socially. What else is left? The answer is giving it all away (no we don't mean the money which you can give away when you're dead)

People keep asking us, why are you giving away all this information. Most people charge for interview guides, they charge for the finance advice you guys know and they charge tons of money for your sector overviews. The answer is simple, philanthropy is best served through results.

Everyone else believes that giving money away is the best way to improve a person's life. **It is not.** We're happy to donate money here and there but whenever you donate money without the person earning it? You end up creating a person who is reliant instead of ***self-reliant*.** Homeless people get money all the time and yet they end up on the same street corner 3 years later.

We teach self reliance.

Finally, for those that are wondering why we'll end up selling a product… Two reasons. 1) for fun, to prove that we can and 2) psychologically people realize a paid for product will be even better than the blog.

Conclusions and TL;DR Version: Our posts are much longer in length (an average of roughly 3,500 to 4,000 words nowadays) and if you're smart you probably want a summary of the actionable steps to become happy. Below are the tiers, clearly laid out since a lot of description was given.

1) When you're young, being frustrated (annoyed) is a ***normal part of life*.** You are in transition and you are going to go through the pain to improve. Embrace the pain. Don't complain.

2) People are unhappy when their life is not in balance which is primarily related to health -> money -> friends/relationships.

3) Find your imbalance and shift your time to that activity (summary of each piece in the section 2)

4) Stop reading junk you don't need. Don't read a post on how to take a company public if you don't even have a business. Don't ask about "hiring a sales team" if you haven't even sold 10,000 units. You're wasting time. Mental masturbation.

5) **Stop sucking up and start moving up.** Find a way to add value to a person's life and he/she is going to help you as well. This is how life works. This is why the rich get richer and you should be *happy that this is the case*. If you're not trying to suck up then you're going to move up the stack in a *non-linear* fashion.

6) When you are truly excellent at a task, you can begin giving it all away. This is far down the road. When you have everything you want you should teach the basics without ruining your life. You'll be happy when all of the successful emails come in. If anyone is counting we have now cleared over 100+ acceptances into Wall Street (still 100% placement ratio from non-targets that we have specifically worked with.)

There you have it. The truth about being happy is that you need to enjoy the process and it definitely DOES get easier. We realize the "tone" here is not "happy" because that is not reality. You have to *earn* happiness just like anything else in life. Ten years later? You'll only care about one thing.

****

How to Sell 10,000 Books as a Hobby

How to Sell 10,000 Books as a Hobby

How to become a best selling author without doing much? Not sure but somehow it worked. For fun we decided to look at our sales over the last 12 months and realized we've eclipsed 10,000 total units (product released July 23, 2017). According to random people on twitter anything over 10,000 is supposed to be a best seller. We doubt that's true considering we've done it but for fun we'll use that as a benchmark. If the number sounds pretty good to you, here's the exact strategy we had (I.E no strategy that evolved over time).

Strategy #1 – Useful Information: The first item is probably the most important. The only reason why we've made any money off this website is because the information was legitimate. When we first started we had a lot of noise "no way information is true", "no way they every worked on wall street" etc. Since we have no interest in fame, we did two things 1) disclosed exact compensation numbers each year and 2) met people privately who had no *incentive* to out us. This makes it impossible at this point to say the information is fake. This was luckily enough. The easier route is to always go public at the massive expense of being a public figure (something we'll avoid).

Strategy #2 – Differentiated Information: While we started the website as a complete joke, it does serve as a strange niche. First people know that the information is true since it's not possible to get the banking numbers *ahead of time* without being in the industry for a decent amount of time. Second, there are not many websites that are tailored to this audience as most people in the "high finance" realm are generally dorkier. They are not successful in the dating market, are much more nerdy – despite depictions in movies and they are not really all that fun to hang around. This acts a weird filter to the website since you only attract three different audiences: 1) other people in that same niche who agree/laugh/enjoy the blog, 2) people looking to get rich and 3) finance guys looking for basic advice here and there. After that it evolved quite a bit (since we quit) and added the affiliate marketing crowd as well.

Putting these items together, the only reason we've sold anything (still small money being honest here) is because all of those niche markets are difficult to fake. If someone tried to call "fake" it would be shut down in less than a few seconds of searching on the website. The other reason is the information is written differently and is quite obvious to the reader that we don't take it seriously (we just now updated the email side where it says the book is going to be released… we didn't even notice it for a year until a person commented on it a few weeks ago).

Strategy #3 – Social Media: Social media is free. You don't have to spend a cent and if you're not interested in making a lot of money off of something. Just go the social media route. We didn't buy a single follower. That's right not a single one. In fact, when you look at the numbers when twitter had it's "purge" we lost a grand total of 50 followers out of the ~33,000 (not sure where it is today).

Note, we would say our social media following is done poorly. We don't try and it shows. The right way to do it is by following significantly more people and increasing your brand. We should be following around 300 people (rough math based on current count), but instead we only have 10. The good news? Like we noted above you can still get a decent number sales while putting in bottom barrel effort.

To emphasize this point if we were doing it right: 1) we would follow more people, 2) post more money related items – cars/flights etc, 3) help promote similar people that would likely "tit-for-tat" and link to us, 4) increase presence by meeting more people and 5) of course… create ads and create products with higher price points to sell said products.

Strategy #4 – Over-Deliver: This is probably the one thing we did right. Giving out tons of information that should not be cheap or free. Our products are definitely underpriced and that's really the point. The only reason we charged for them was really two fold: 1) when people pay for something they are more liikely to act on it and 2) we may as well prove our old english teachers wrong – success! Number one is the biggest motivator. Anyone who has worked in sales knows that a paid for product will more likely be acted on. This is the same reason why guys like Tony Robbins charge more for their seminars. First they can (no idea why anyone pays). But. More importantly, it's hard to tell someone you wasted $2,000 on something. *Note: billionaires and other successful people don't write books for the money. They do it for their own joy or to build a brand/increase exposure.*

Fast forward and think about this. If you're going to *under-deliver* you should actually charge more. It makes it harder for people to admit they made a big mistake. Like getting $80K in debt for a sociology degree, or paying $100 a month for diet pills that don't work etc. We can all see how this becomes grey area in a jiffy! Like they say "a sucker is born every second"… they just don't admit to it.

Strategy #5 – Offer Something for Validated Purchases: Everything gets stolen. Expecting any sort of digital product that isn't a crypto currency to remain safe is quite crazy. Instead there is an easy way to validate if a purchase was legitimate or not and provide something useful for these individuals. We do a monthly Q&A and while some of the answers may not be "good" we're honest in all of them. If a question is solid we try and walk through the answer. If it is already answered in the book we direct them to it (not surprisingly most people who buy books don't actually read all of it). Finally, if it is something we don't know we always say we don't know. Many people try to answer everything, we avoid this by only answering if we have high certainty we have a good answer.

The odd thing in life is that if you're good at something people believe you're good at other things. Similarly if you're bad at something they assume you're bad at everything. Connecting with our prior post, this means you want to make your first impression with something *you're extremely good at*. This actually applied to the blog. We purposely chose a "regular person repellant" type name and also came out firing with primarily high-end information. Information on interviews that are usually paid for content, pay by banks (paid for content – see Glocap) and finally to affiliate marketing where we left the juicy items for the book. This was the only real strategic move we made, the rest was largely a mess.

Strategy #6 – Failing Doesn't Matter Much: Unsurprisingly, we failed at almost every angle in running this blog. We know the homepage isn't set up well. We know our social media strategy isn't good. We know that we didn't market correctly. We know that we should expand our reach.

The counter argument: "well if you know why don't you do it?". The answer is we legitimately don't have time and on top of that it wouldn't lead to a good ROI. This shows since we rely heavily on content to drive user growth. That's it. We also know that ROIs on blogs are extremely low. We're actually surprised we sold so many units of a single sku (never intended to write anything but pulled the trigger due to free time).

Anyway. The point is that you can actually sell a decent number of units without doing everything correctly. Similar to our posts on talents, you just need to focus more effort on something that will distinguish you from everyone else. The writing style here is certainly not going to be found on any professional website or mainstream news website. Leveraging that with legitimate information helps create a familiar voice/tone over time.

Strategy #7 – Having Fun: Can't believe we wrote that. But. Unlike real businesses if you're only interested in making a few bucks, you should have a lot of fun with it. If we weren't having fun writing this it would have died in the first two years. We're getting close to year 6, so much has changed and yet we're still having fun on this site. Who knows how long it will last but if we did it for the money we'd be poor and voting for a socialist at this point. Instead, if you want to sell some books making some money for a couple vacations, you can have a lot of fun doing it. One of the major benefits is you *will* attract people in your similar level. This has already proven to be true as we've met people privately and the writing style/views on life are so painfully obviously aligned that "you attract what you are" becomes reality over time. Also. We'd say that having fun means you shouldn't dedicate a lot of time to it. If you're dedicating a lot of time for it you'll feel the need to do something else and begin to resent the hobby. This has happened to us a few times and that is when you should stop writing and take a break. If a hobby takes up a lot of time you're literally losing money because you can do something else to generate more.

Strategy #8 – Set Reasonable Expectations: Our expectations were not high. If you have high expectations, then it should surround a real business activity. By setting lower expectations, you mentally treat it in-line with your time constraints. We know. The gurus will always tell you to "Set high expectations at all times! Maximize your potential!", it sounds good but doesn't work. if you focus your energy on what matters and treat your hobbies as hobbies you'll make way more money. Why? You're not spending equal amounts of time on the activities. If you can make 100x more money doing activity A versus B, you should always do activity A unless you have down time (so you switch to activity B). This also helps lower your expectations naturally. No reasonable person would put high expectations on something they are not taking seriously.

Strategy #9 – Write Even if Unrelated: If you've learned something new that is differentiated? Publish it even if it is not related to the theme of the blog. Sure it won't be your most read post, but it will expand your readership. Some people get upset when we talk about Art or other various topics like the election for a grand total of two posts. But. Ignore them. If they like your normal content they will just avoid that one and wait another week. The people who read the offshoot posts will be surprised that you've written on something completely new. Besides, if it's occupying your mind then it's likely on the minds of other people as well.

Strategy #10 – Don't Do it for Money: Anyone who has read Efficiency already knows why we don't take this blog seriously. It's not a good business. One time sales do not make people rich. Recurring revenue (subscriptions) or consumable revenue (one time use and repurchased again) make people rich. Also. If you do it for the money you'll give off an odd vibe that we've seen with other websites. No one wants to feel pressure, just use items to cover your hosting costs etc and move on. We used to run the website as a loss (typically hobbies are money losing!) and decided it didn't make any sense and decided to make sure we offset hosting costs at minimum through ads. It has worked and readership hasn't changed at all.

That's really all there is to it. There are zillions of people who have made more than us selling book online. We're definitely not going to become famous authors in the future. That said, if you have specific niche knowledge (say a blog on enterprise sales or consulting or law) then we'd bet that you can earn some cash from it. You just won't get rich. The good news? It'll be fun and exciting. If you ever come up with another idea, you can probably publish something on an annual basis or so. Oddly enough, we should seriously write a book called "life is a joke, $0 to multiple millions" and explain how most of the stuff you think won't work (does) and most of the stuff that you think will work typically fails the hardest. Then you get older and finally become more accurate.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality (***essentially the point of this post!***)… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality). As a bonus you can read a success story by **Clicking Here.**

How to Spot a Liar

There are a ton of liars on the internet (forums and websites) and in person as well of course. The best way to spot a liar is to evaluate their emotions (negatively charged) or if they are unable to deliver results when asked. Lets break down some examples of how to spot liars and some common lies:

Emotional Evaluation.

They are Not Happy: This by far is the most common trait amongst unsuccessful men and liars. Unhappiness can include cynicism and racism as well. These states of mind are far along the emotional spectrum and are a clear signal of a propensity to lie. Don't get us wrong there are many unhappy people who make money or are racist, Wall Street is certainly a great example of this, but remember that an unhappy and angry person is much more likely to sell you a lie than to tell you the truth.

They Want People to Fail: This is another great way to see if someone is likely going to sell you a bunch of lies. They don't enjoy seeing someone else succeed. If someone is truly successful, inside and out, they have no problems seeing other people succeed. Being able to distinguish between competitive and negative feelings is key.

They Always Win: The vast majority of people who are truly successful have a much longer story to tell regarding their failures rather than their success. The most successful people you meet tend to have much more interesting back stories of failure rather than a back story of complete triumph throughout. At the end of the day, everything worthwhile in life has an extremely low success rate and therefore requires large amounts of attempts and subsequent failures. Winners view failure as progress, and winners have little time to spend boasting, they want to fail more to get what they want which is usually yet another difficult worthwhile goal.

Common Lies and Inability to Deliver Results.

Women: Most guys are awful. Terrible. The way you can quickly spot their poor performance is simply by asking them how many new girls they speak to in a day or how many women they have slept with. Unless the guy is good looking be certain he is lying if he spews out any number be it 10, 40, or 500. There is a small fraction of men who actually track their performance the rest are usually the same guys who walk into clubs and put their hands in their pockets immediately. A man who boasts and pounds his chest constantly about women being "easy" is spending more time trying to win approval from his peers, this is the exact personality that will fail consistently time and time again. Notably, if you visit his hometown he sure better be able to tell you where to go on what days and at minimum give you a few pointers on what to say at the venues he recommends.

Picking Stocks: This is another common one all over the internet. Some guy or guys think they found a way to "make easy money" by trading securities. Notice the same trend… its "easy". Unless the guy shows you a 2-3 year track record with real proof, be certain the guy is either a liar or is getting lucky in a few trades here and there. Do not spend your time taking advice without proof and continue to stash your own cash and avoid the high beta risk plays. If you really got something and are broke, shoot us an email and we'll make you a multi-millionaire in less than a year, we're not holding our breath. Common stock picking myths below (assuming the person is not working in a real finance position):

1) Trading Currencies: This is by far the worst, you're in a market that never closes and if you think you can guess where all currencies are going simultaneously you're nuts

2) Options: Options have higher average returns. Why? Leverage. If you're 10-100x leveraging a bet that can either go up to infinity or down to zero, your downside is pegged at zero, you won't be going negative so the positive outliers skew you up

3) Liquidity: No one is more liquid than a trading firm or hedge fund, as an individual you are simply more liquid than companies with a large stake in a company, ex: a fund with 3%+ ownership will unlikely place a market sell on the full position

4) Technical Analysis: Yes technicals move stocks and no you will not beat a set up algorithm. With the massive amounts of quants out there, there is literally no way you're clicking buy/sell before it passes the XYZ moving average

5) Outsmarting Quants: Everyone who thinks they are faster or smarter than quants needs to read this book. If you don't want to read it? The quants figured out Bernie Madoff was running a ponzi scheme and liquidated, game over

Pay and Savings: This one is pretty much useless. Unless someone shows you their bank statement or paycheck, assume everything being said is a complete lie. It is better to err on the side of positivity (assume they are telling the truth) and simply rely on stats from legitimate resources.

Conclusion: Unsure as to where this falls in the game or finance spectrum however the above is certainly important for everyone to understand. It is the best way to weed for bad advice, losers and liars. If the person is setting unrealistically high expectations with zero contributions and does so with a negative tone, be certain you're dealing with a liar. ***If the person is rocking on all cylinders, they don't have a need to show off, people sense it.***

How to Think About Time and the "$5,000 Question"

How to Think About Time and the "$5,000 Question"

There is no way to become an expert in time. Meaning? It is difficult to know with 100% certainty if you've made the right decisions until you're 80 and look back saying "I have no regrets". If that is the case then you've absolutely made it (visit a hospital and you'll see that the vast majority are unable to say this). Time can only be understood or bucketed into segments and we'll take a stab at outlining some key things we've learned (or think we've learned) about time.

Time and Value

Time is Second Only to Health: Largely speaking, the only thing more important than time is your health. Why? It can buy you more *valuable* time. If you're eating healthy, working out and avoiding unnecessary stress (probably the most difficult of the three) you'll increase your health. By increasing your health you're elongating the amount of time you have and also increasing the *quality* of the time you have left! A year of life in a hospital bed at 40 is definitely not equal to a year of life for a man who can still play every single sport on the planet. In addition, time is certainly more valuable than money since $$$ can eventually become perpetual (Financially Independent).

Time is Not Valued Equally: Now many of you see the conundrum here! Why do we focus on making money early if time is more valuable than the money? Well, if you get rich early on you can take advantage of *more valuable time*. A full year of free time to do as you please at age 30 is not equal to a full year to do as you please at 60. There is no real debate there since the human body degrades over the years. Knowing that time is not treated equally, somewhere around 40-45 (guesstimate) is when each subsequent year is less valuable than the prior year (capacity for new life experiences). To avoid negativity, yes there are millions upon millions of things you can do at 45+. Ignoring the fact that you're less malleable when compared to 30 is preposterous.

The Masses Do Not Value Time: The masses value their time at nearly zero. They will look at the highest "hourly wage" as the best way to earn income and the best way to maximize their time. In addition, instead of looking at ways to create recurring income, they will look for ways to reduce one-time costs. This is the exact opposite of the correct way to get rich. If you're creating nothing but recurring long-term income the one-time costs become meaningless… For fun here's a quick way to see if your colleagues understand the value of time. Ask them the $5K question "Would you rather work all day today and make $5,000 or would you rather work all day and generate $1 per day forever?". The correct answer of course is $1 per day forever. At a 4% interest rate assumption (not even risk free!) $365 a year is equal to $9,125 vs. the $5,000 one time outlay. Now… ask yourself if you can work all day today and create something that makes you just $1 a day forever (if you can your "annual wage" is $3.33 million!). The fact that no one reading this blog will trade their time for money (long-term) is the greatest thing about time (others are willing to happily do so). Another way to put it? If you can really find a way to generate just $1 a day for life and do this for a year… ***Your income is $133,225 for life.***

Time Can Increase Your Long-term Value: The second greatest thing about time is that it rewards you handsomely for making the right decisions. If you made the right moves early then the rewards compound for you. This is pretty simple and the rule of 72 is the best way to do back of the envelope math. All of your assets should double in value every ~10 years assuming it gets a 7.2% growth rate. Taking it a step further, correctly used time allows your *future utility to increase* since it works in your favor to increase leisure and increase the set of items you can do with your leisure time.

Time and Risk

Risk is Almost Always Related to Time: We don't know if we'll wake up tomorrow and get hit by a bus. We don't know if we're making the right decision at all times (long-term utility). What we do know is that risk is primarily related to time since you could be doing something else. Given that backdrop, the biggest risk people take is *doing nothing*. Indecision is the worst use of your time since it leads to a 100% failure rate. The faster someone can make quick risk adjusted decisions, the more likely the person is to maximize their time over the course of 80 years.

As Time Passes Activity Risk Increases: If there is something you want to do today, we suggest doing it now if you won't be able to do it ~3-5 years from now (stated this many times in the past). This is specific to anything that won't ruin your financial life forever. The reason? Activities go away as years go by. If there is a specific recording artist you love, it is best to go and see them ASAP (their careers are shorter) similar to sports if that is your hobby.

Reliance Risk Increases: As time passes by your employment risk will increase. You're going to be earning more money (more cost effective to be fired!) and you're less likely to replace that income at another company. To put it another way… reliance risk goes up over time. Even in items outside of employment if you rely on any single item for either happiness, sense of life meaning or income, the risk of it going away goes up over time. Many people become suicidal after earning large sums of money and seeing their company go bankrupt or being let go from their high paying investment banking career. Risk related to *Reliance* on one specific item (for anything) goes no where but up over time due to a large amount of psychological factors.

Risk to Adaptability Increases: As time passes by our ability to adapt decreases. This is also due to psychological factors. If someone believes they have made the right decisions their entire lives they would have to admit they made a large mistake over 5, 10, 15, or 20 years. Stuck in their own minds. This works both ways. If we try to convince a retired millionaire that he wasted his time working a career for 50 years just to retire at 70…. It wouldn't work. Similarly, there is no point in telling him such a rude thing because there is nothing that can be done to reverse the decision in the first place! When you're in your 20s? You're a jet-ski that can move and change directions rapidly. In your 30-40s? You're a standard boat… and by 60? You're a tanker ship with the decision already made. As a rule of thumb, if someone is hard set on a belief and has maintained the same thoughts for more than 5 years… go with "smile, nod, agree" to avoid confrontation.

Unproductive Use of Time

Arguing With People: This is still prevalent on every single platform you can find from Twitter, to Facebook to internet forums etc. It takes a long time to master this skill since it requires "quitting". This is not something in the vocabulary of ambitious people, so it is rarely mastered! Arguing with people isn't a good use of time because at the end of the day around 50% of people just won't like you anyway. The presidents (Trump, Obama, Bush or Clinton etc.) all of these people don't have a 100% approval rating. Just call half of the population a wash and chalk it up to the "numbers game". There are 7 billion people in the world, it is better to find one of those 3.5 billion who will at least be neutral to you and have a real discussion on any given topic.

Doing *Everything* for Money: The best way to burn time is to focus 100% of it on money. That's a strange comment given our website draw but it is true. No one wants to be around someone who is constantly worried about earning more money from ages 20 to 50… It eventually becomes meaningless. These individuals usually have trouble socializing and making long-term friends which is not a productive use of time (there is an eventual cut off). This blog and our book are no different, earning a few bucks selling an e-book is significantly less productive (maybe we'll blow it all on throwing a party for our favorite commenters!).

Giving Up Time to Cut Costs: Re-read the first paragraph under unproductive use of time and you'll find that no frugality blogger will ever agree with us. This is fine. We won't argue. We just outline the points here which show skills are learned when you earn; no skills are learned when you do nothing. If you've already cut your costs to the bare minimum it's not going to go any lower… so why would five hours of research to save money on coffee outperform $2 spent meeting a potential customer for coffee? We give up.

Worrying About Opinions of Other People: Unless someone has what you want, their opinion shouldn't be that meaningful to you. If you admire someone's ability to earn money it makes sense to listen to their money advice. If that same person can't do a pushup, probably best to ignore his fitness advice. So on and so forth. Lots of time is wasted worrying about living up to other people's values. Create your own values and live according to those. If you're not engaging with people who dislike you and you have some fun activities outside of making money, the chips will fall into place over a long period of time that will delete opinions from people you don't respect in the first place. It's a "win win". The people who will never like you? Well they never get a chance to meet you either!

Thinking About the Past: It is one thing to learn from the past it is another thing to dwell on it. Everyone will make a wrong turn here and there. Maybe you take the wrong career or join the wrong firm. Maybe you jump at the wrong time. It doesn't really matter anymore since it's in the past. What really matters is learning if there was a "blind spot". Find the blind spot and don't let it happen again. Finally, maybe the decision was actually the *correct* move and it just didn't happen to work out! If that's the case, thinking about anything negative from the past is a colossal waste of time. Only positive things from your past should be remembered to improve your focus and emotions.

Time and Excitement

Time Spent to Achieve = Dopamine: Anyone who isn't financially independent yet (but is serious about it) will receive an enormous amount of dopamine when they cross the finish line. We're not joking when we say we're jealous of those people that are on their way and have a clear path there. Becoming financially independent can take up to 10-20 years (standard version) and there are very few things in life that take such a long time to achieve. Think about other events where an immense amount of joy is shown and they are directly related to the time it took (athletes winning championships, parents watching their kids graduate college, so on and so forth). Once you experience something like this your views on time change forever.

First Time Experience Excitement: Generally, the first time you do something new from an experience perspective it has the most value. This is different from the large amount of dopamine obtained from achievement or success since it's a repetitive task. If you go out and get drunk for the first time it's typically a lot of fun… do this 200 times and it certainly wears you down. This is seen in drug addicts as well where they need more of it to achieve the same "high". Knowing that dynamic, having a long list of interests is a great thing since you can get the "first time experience" hundreds of times over the course of your life (it also prevents you from developing a plain and boring personality as well!)

Time and Consistent Excitement: You're a lucky person if you find five things you can do every day that constantly give a baseline level of dopamine rush. This can be anything from athletics to music to travel to reading. We only say "lucky" because it takes a good amount of effort to go through many first time experiences (second point) and find one that remains relatively constant. You'll find that the main ones that create constant dopamine levels to rise rarely cost thousands of dollars to maintain.

Concluding Remarks on Time

Overall, life is a big balancing act. In order to obtain money you have to give up time (building recurring income streams of course!) and you also have to recognize that the time you're using could be spent doing other exciting things that will become harder to do as we all age. We would really summarize this into 10 key points: 1) since health can improve both time and money we'd focus on activities that maximize this – athletics, clean diet etc., 2) consistently review activities to make sure life doesn't pass you by and you don't become a boring guy, 3) always look for ways to create recurring income and realize that 99% of people will trade their time for money happily – will fail the $5,000 question, 4) fail a bunch of times as early and as often as possible, this way as risk increases in the future you'll be well positioned to avoid big mistakes, 5) diversify your life as there is no need to rely on any singular item for meaning, money or emotional support, 6) Don't bother arguing with people – easier said than done!, 7) realize that money is only a tool and eventually loses utility, 8) the amount of time it takes to achieve something is directly related to the dopamine obtained, 9) have a growing list of first time experiences – things to try and 10) unlike money, time cannot be taken back choose wisely

How to Use Big Gains vs. Small Gains. Make the Big Moves Early.

How to Use Big Gains vs. Small Gains. Make the Big Moves Early.

There are a million posts on the difference between being young and old it really boils down to a shift in recovery time along with pain tolerance. When you're young, you have the ability to recover quickly (just look at physical injuries) however your pain tolerance is lower (not enough repetition). As time goes by, after multiple painful repetitions (physical with weights/sports, mental with stress/emotional events) you're going to become *desensitized* to most forms of pain. Tolerance builds over time making the answer clear… put the pain/stress on as early as possible to become desensitized.

Big Gains

Put Physical Pain Up Front: If you look at someone who is overweight and in their 30s, the upward battle to get in shape is enormous. Muscle memory is real. If you haven't developed a solid physique in your 20s or at the latest early 30s maintaining a high level of fitness will become incredibly difficult. The reverse is also true. If you can take the physical pain up front, you're going to be in the best shape of your life and offsetting the inevitable declines will be significantly easier. Even if someone tries to take performance enhancing drugs to give themselves an edge, it just won't compare (otherwise pro-athletes would continue to perform well into their 40s). Remember, when referring to fitness we mean both looking good and feeling healthy as well. There is a tremendous difference between being physically muscular and being coordinated with cardiovascular health as well. Since health is #1 (more important than both time and money) anyone foolish enough to let their bodies go down the drain in their 20s will pay for that decision for the *next fifty years.*

Put All Financial Gains Upfront: Instead of trying to get ahead by slowly putting away money (10% is always thrown around as the norm), it makes much more strategic sense to try and put away a large amount of money early and "let it ride". This allows you to let time work in your favor and *you can even slip up a few times*. Your slips won't matter because if the principal investment is untouched you'll be set without lifting a finger. Once the math "clicks" you'll see its much more meaningful to work extremely hard when you're young to lock in the compounded gains. The table below should be an eye opener. As a simple example, if someone decides to wait for 5 years before really putting money away (think doctor/lawyer) that means you'll need over $600K+ in post tax income to catch up to someone who put away low six figures just a few years earlier. This is a daunting task when you consider that the young hungry business person will unlikely see a zero income year.

Decide to Play Catch Up? If someone decided to "take it easy" because investing smaller amounts over time is easier, you'll see a huge disadvantage appear. Even if they were to put away 45% (almost half) of the amount for 15 years (*3x more time*) they won't catch up to the big investments made by the first example! To put it into clearer terms, the last five years of investing (years 11-15) is roughly equivalent to the single $100K investment made in year 1 by the first example ($257.8K vs. $285.8K). This means five full years of effort in "out years" is equivalent to a single painful event year 10 years ago. This bears repeating. Even if someone saves approximately half as much over the course of 3x more time, they will be worth *less* than the person who put the large capital investments up front. If you want to play the game from a psychological perspective, think about tripling the number. Take any amount you have today and ask if you'd rather have triple the amount in 15 years .

Take Advantage of Being Young: Approximately 32% of the readership is just joining the workforce while the remaining consists largely of working professionals with 6-figure incomes (or better). With that in mind we would challenge any young reader to learn the art of "playing dumb" as early as possible. This means using your youth as an excuse to avoid large scale items. No one cares if a 22 year old lives with a roommate. No one cares if he can't afford a $40,000 watch. No one cares if he goes to Thailand to party instead of Monaco. No one cares if he only has two suits. No one cares if he eats a sandwich to go vs. a sit down seafood restaurant for lunch. In short, take advantage of lying down about any amount of income you're making and you won't see a material impact to your social life. When you're 30 it won't be impressive to "scrape by" and you surely won't be interested in drinking 12 shots over the course of 48 hours to party all weekend. In short, if the *perception* is that you're young, penniless and naive… You know what to do… Take advantage of the situation.

Demo

In Your 30s Not There Yet? No problem, the strategy we would deploy is the see-saw approach. One year you'll bite the bullet and focus a ton of time on generating event driven income (anything that'll allow you to potentially sock away 6 figures in a year, we'll draw the line there). Instead of trying to become frugal (see boring) you'll oscillate between putting away a large amount of income and relaxing the following year. The reason why we would suggest this route over the constant grind is that you'll avoid personality deterioration. If you've ever hung out with someone who saves 70-80% of their income for 10+ years… you'll know exactly what we're talking about. Years 25-45 or so are the prime years of your life so if you're already in your 30s it probably makes sense to switch to an oscillation framework. In addition, this guarantees you'll outperform the steady saver from the examples provided above, one year of pain is worth more than two mediocre years. So you can live it up, buckle down and oscillate to avoid burning out and remind yourself of the joys that money can bring.

Forget About the Investments: This is probably the most difficult part. In order to see the value of putting big gains up front you have to forget about the investments and avoid using the gains. This means you're doing yourself a disservice by constantly checking a personal trading account or your net worth on a daily basis. This will either 1) make you feel rich or 2) make you feel uncomfortable during a market down-tick. In addition, to avoid using the gains you'll have to *trust the process* by taking any material financial windfall and throw it all into equity + debt instruments and close the brokerage account screen.

Small Gains

While the most important section is about the value of large gains, we'd say small gains should be used as a "revolver". For those unfamiliar with finance terms, a revolving credit facility is essentially quick access cash at a low interest rate. Instead of being charged an interest rate, all small gains should be used to create a revolving cash facility for one-time charges.

Website Income: You will fail. Or you'll get lucky and hit your first idea out of the park. More likely your first 10 ideas will fail. This is a great thing because failing early in life sets you up for a great future and the small failure can actually help you. What you'll do is set up 2-3 basic checking accounts with income from all of your failed ideas. Lets say you started a niche website on the best yoga equipment for stretching (talk about a terrible idea) but… that website generates a couple hundred dollars a month. Now lets repeat this with 5 more websites and that's $1,000 a month. You can take all of the money and throw it into an "emergency" checking account. This will offset all of your one-time charges for at least 5-10 years. In five years you'll have $60,000 to either keep as a safe haven or use to fund a small idea: as noted $50K is the approximate amount we use for selling a new product: 1) $10K website design/sales page – any specialized work you need to make your website look better; 2) $5K demand check – quick demand check before you even get started with your idea (if there are zero orders you don't proceed); *3)* $35K product manufacturing and design -find a place to produce your product and design.

Small Gain High Risk: Another advantage of small gain items, you can take a huge amount of risk with it. If you have a similar situation to the items outlined above you can also throw it all into risky investments: small/micro-caps, high volatility crypto-currencies, high volatility leveraged equity products, options etc. This is a great way to get a meaningful return off of a small gain. If you've walked backward into an extra $10,000 for some reason (large gift, fortunate one time sales day etc.) you can go ahead and put an aggressive move onto the table. If you end up picking up a 5-10 bagger (500-1,000% return) that's going to make the small gain a meaningful one. Besides who want's to live their life buying nothing but boring indexes and bonds!

Hitting Singles With a Rental: The third way to make small gains is to own a couple of middle class rental properties on leverage. This means your primary goal is to get the cash flow to "show a zero". Subtracting out fees and depreciation, on a tax basis you can show 0 income on a couple of properties while benefiting from cash flow positive numbers in the mid-hundred dollar range on a monthly basis (this even includes property management if real estate isn't you're way of earning your money). While we've focused primarily on "electronic real estate" (cash flow positive websites). Diversifying into cash flow positive rentals can also be used as a small gain for high risk rewards or emergency cash accounts.

Putting it All Together

FullSizeRender

While we've put up a lot of numbers here the key is really ***decisiveness.*** We'd say the biggest mistake we see people make when trying to accumulate money is being indecisive. Once you choose your path to earning *event* or large one time gain income… You can't falter. Instead of trying to go down 3 paths at once choose one to be your primary income producer. The biggest and most lucrative ones are of course: Business, Real Estate and Career income. Once you've set down on one path to be the primary income stream *do not deviate.* You're allowed to go down two paths at maximum. Since you'll be developing two income streams one will naturally dwarf the other but your skill-set will be diversified. The rest of the money will all go to "small gain" set it and forget it type environments. If real estate is not your path to earning income, you'll need a property manager. If internet based income is not your path, then you shouldn't bother with purchasing "internet real estate" on flippa. If you've gone into sales, it does not make sense to spend your weekend doing a technology bootcamp. Decide on a path (making sure it is lucrative first).

If you're interested in learning about your specific skills you'll want to read our upcoming book Efficiency. You'll figure out the following when it comes to earning money: 1) what skills you have, 2) what industries to join, 3) how to choose the right company to work for, 4) how to start an internet company, 5) how to build a basic niche website and 6) how to do all of this without becoming that boring guy who look uncomfortable in any social setting. **Efficiency will be available in July**, subscribe to receive discounts or follow us on Twitter for the launch. Remember we can give the tools, but no one can execute on the plan but you.

****

Human Nature Will Never Change. And. How to Profit From It.

Human Nature Will Never Change. And. How to Profit From It.

Back in 2012, we used to believe that giving out the truth would lead to more competition. That people would wake up, realize their mistakes and take action. After realizing this belief was wrong we started writing here as a hobby (originally to troll the internet which later changed). The reason for this? Human nature will never change. You're not supposed to use words such as "never" and "will"… But. We don't care because it is the truth. At the end of the day people are simply animals and the vast majority will fall into the same traps over and over and over again. Fixing a person from the inside out takes a lot of time, effort, thinking and will power. All items that the typical person lacks.

Human Nature and How to Profit off of it.

Unwilling to Take Action: Pick me up motivational seminars will be around for decades. This is a natural human flaw. 95% of people are unwilling to take action and people get emotionally charged when watching ridiculous things from a Michael Jordan commercial to a Tony Robbins seminar. This is why 95% of people will never succeed. They need someone else to get them to do work. This is also why 95% of people want to be employees and believe it is "less risky". This is the biggest lie ever sold.

Since we know this human flaw will exist as long as we are alive (at least the next 100 years) we should take advantage of it. If you have a business it will be easy to hire employees and underpay them. You can justify underpaying them by treating them nicely (the exact reverse of most business models). Since you know that they don't have the capacity to work for themselves you can pay them below market but tell them they are amazing employees. This reduces churn and you get to increase your profit margins. Importantly, if you think this paragraph is "mean" this is exactly how the top companies operate. Even the biggest most important companies will fire a person instantly if they break this mold of higher profit margin per employee. Big companies are fixated on profitability and protecting operating margins.

Obsession with Homeruns: People will constantly flock to anything that could be a "life changer". This means any investment vehicle that has wild swings up and down (they will ignore the underlying fundamentals). If you see any large cap stock, crypto currency or real estate market suddenly go up 100%+…. You'll begin to hear "stories". They are all the same. Some guy someone knows gets rich off of the space and suddenly everyone is interested in investing tons of money into it. We have gotten to a point where people will focus on "what happened to the price" instead of asking "why did the price move".

This is yet another human flaw and is why the lottery exists. It is the same concept. Any "chance", no matter how slim, will attract humans looking for some sort of immediate solution to their lives. The answer of course is to start a casino if you can. If you cannot start a casino the next best thing is to sell things such as sweepstakes and contests. Set up the sweepstakes such that you'll never actually lose. For every $100 that come in say $98 go out. People will sign up. They believe in luck instead of creating it themselves.

Need for a Quick Fix: Building on the items above, since we know humans are unwilling to fix things themselves and are in love with "quick riches"… we can surmise that they are also quite interested in "quick fixes". This is why the skin care, diet and testosterone boosting industry are all alive and healthy. These industries target massive pain points since the typical person is not in shape. They will look for "remedies" for their fat loss, their muscle gains and their deteriorating skin. As our readers know, there are no quick solutions to any of these since they are all solved internally.

Now onto the more important part, since people are searching for quick fixes you should sell products that do work *temporarily*. Anything that will slightly help them will be seen as a godsend. Telling someone to overhaul their diet, exercise and work routine is just not feasible so go ahead and sell Band-Aids instead. As long as the Band-Aid works and helps stop the bleeding you'll get rave reviews. If you don't believe Band-Aids will work we'll go ahead and pose a question *"What would you call the cosmetics industry?"* Billions of dollars are spent on products that temporarily help the appearance of women. Cosmetics do not improve skin (in fact they cause damage in most cases) and yet look at the sales. If we really want to open Pandora's box, ask yourself… is the fashion industry there because people want to look better without actually changing their bodies? You know our answer to that one.

They Are Never Wrong: Now you're probably wondering, well all of this stuff makes sense but wouldn't they eventually realize they are wrong and take action? Not to worry! They won't. Why? Well they are never wrong. Instead of sitting and thinking most people backward rationalize all of their decisions. If they buy a motivational book and do five push-ups the next day because someone inspired them to do so… they'll think the purchase was worth it. This is how the human brain operates. Since they are never wrong, once they've been sold on one purchase of a meaningless product they'll justify the action later.

Since we're getting into more complex territory here is how it would work from a money making perspective. We know people don't want to do anything by themselves. *If they try and fail then their ego is destroyed and they can't have that*. So… how do you make money from it? Well your average person is going to ask for a lot of "help" and by help all you need to do is figure out what they want to do anyway. They don't want help they want to justify what they have decided they are going to do anyway. So you repeat this back to them. If they succeed they'll remember you as the supportive guy. If they fail… then you can help them rationalize by saying *"it was the right risk adjusted thing to do it just didn't work out"*. Under no circumstances do you give them an actual opinion or any advice. If you operate like this in your everyday life you'll notice that you have a ton of people who believe you're a great guy. And. All you did was tell them what they wanted to hear.

They Have Minimal Diversity in Skills: Continuing to build on all of the above, since human nature is to value "stability" which they believe revolves around working for another person (a job) the typical person will have minimal skill diversity. They will be pigeon holed into a single set of niche tasks that may or may not be useful in the future. This is an important distinction because we're not saying that people should juggle tasks. That also leads to failure. Instead one should focus on a single broad direction and learn all of the necessary tasks involved. Why? Well we can't think of a single business that operates with only one person for sales, product development, supply chain management, etc. The CEO or head of the company will certainly be well versed in the majority of those tasks.

Now to the making money part. Since most people will rely on one source of livable income, you already know what we're going to say, you'll need several. Having one source of income that pays for all of your expenses is like putting your entire life into one stock. It's just not smart. We'd say a good starting point is around four streams of livable income. If you have living wage coming from say 1) real estate, 2) your career, 3) your online business and 4) stocks/bonds… You're in good shape. If you only have a career/job… you're essentially in emergency mode. Now, if you want to hear the cynical side as well, you can also use the minimal skill diversity to improve automation. As we move into the future process oriented jobs will be taken over by AI (this has already happened and anyone in online sales knows exactly what we're talking about). If you're looking to cut costs and run a large team, you'll try to make a process out of each group. Once it's a process just have AI do the rest and cut the piece that has now been automated. If people believe the prior few sentences were "bad" this is how the majority of billionaires will operate over the next several years. Remember in any large company people are just line items and the goal of the managers is to cut that line-item without hurting the top-line… Use AI.

Three Ways to Save Time

We've now given away five ways to profit off of human nature knowing that people are: 1) unwilling to take action, 2) are drawn to big moves, 3) are looking for quick answers to problems, 4) believe they are never wrong and 5) lack skill diversity. The more important part is how to save time. Time is more important than money and knowing human nature will save you a lot of headaches. We cannot change human nature so the next best thing is to save time.

Changing an Opinion: No point here. Unless someone is completely new to a topic there is no point in changing their opinion. It won't happen and if you're right they will simply dislike you because their ego took a hit (you were right and they were wrong). This is not a good way to win at life. Instead of trying to change opinions make a decision on if the person has already made a strong opinion. This is the real trick. If someone is 100% new to a topic then feel free to provide an opinion. If they already have an opinion, just agree with it and take their side of the argument. Besides. In order to have your own strong opinion you should be able to argue the other side with ease… This will save you a large amount of time and we can't over state that enough: 1) figure out if they have a strong opinion – takes a few minutes, 2) then decide to either agree *or*give an actual opinion (if they have an opinion just agree). In addition, if you read this paragraph and disagree, we think you have a good point and things aren't black and white so there are definitely grey areas (see if you catch the joke).

The Never Ending Search: In our book, Efficiency, we covered practically every major scam there is from "T-boosting" pills to magic brain pills that make you smarter to affiliates to gym advice etc. The reality… people will *still* look for magic tricks! You can spell it out and even teach them how to spot the scams and *they will still fall for it because they are driven by emotion*. So when someone comes up to you with some new "fad" just agree with them. If someone wants to do cross fit and injure themselves don't tell them the truth. Tell them it's cool they are "getting out there to try and experience something new". This is probably the best phrase to use. "It's all about experiencing different things, just get out of your comfort zone!" and other such cliché phrases. This will make them feel good and you won't have to explain that they are on a never ending search for things that don't exist. As always logic doesn't sell so save yourself the time and get used to that standard line!

Find the Flaw and Ignore the Advice: If you find a guy who thinks he has it made, be careful. Most guys with money fail in many other categories. Don't take fitness advice from the overweight guy with $10 million dollars. Sure he made money, but he sure doesn't know anything about fitness. Similarly, you wouldn't take dating advice from a guy with an overbearing wife or someone you would never talk to in a social setting yourself. So on and so forth. This will save you a lot of time. Since we know most people only succeed in one category (niche) you'll tell them you want "advice in the other categories" to boost their ego and eventually work your way into the information you want. As they say tell an overweight guy you think he lost weight since last time you saw him and tell a smart nerdy guy you want dating advice. Once rapport is built you'll all set to get the more valuable information.

For the newer readers… if you're interested in learning more about making money, staying in shape and doing so without choking off your personality… You'll probably like ***Efficiency, Get Rich Without Giving Up Your Life***. The benefits include: 1) How to get into the top 10% physically with one hour a day of exercise; 2) How to eat correctly to be in the top 10%; 3) How to figure out what type of intelligence you have; 4) How to use this type of intelligence to choose a career and the *right* company: Wall Street, Technology or Sales; 5) How to start an online business and sell (the basics and all you need to start); 6) Clear outline of how to create and start an online product business with correct copywriting; 7) How to go into affiliate marketing if someone wants to take a stab at the competitive space; 8) Overview of how affiliate marketing operates and how to do it, 9) How to do all of this and maintain a normal social life (avoid choking off your personality).

****

Ignore What People Say Focus on What They Do – Specific Examples

Ignore What People Say Focus on What They Do – Specific Examples

One of the main concepts on this blog is to ignore what people say and focus on what they do. It is a lot easier to understand the concept vs. applying the concept as people can be quite convincing. They cry, yell, complain, jump up and down and yet their actions rarely line up with what they are saying/yelling. The good news is that you will be forced to learn this if you develop any sales skills (online or in person). So we'll outline various ways to avoid the noise and focus on the actions/implied messages that are being sent in every day interactions.

Everyone Wants a Short Cut: This is a stone cold fact. If you've worked in affiliate marketing in the past or present, you will know with certainty that everyone is looking for a shortcut. No one wants to get better at anything. They "hope" they get better. Hope is not a good strategy for anything: sports, business, dating etc. Hope is just the admission of failure since the person is unwilling to change their actions.

Once you realize this, you will no longer waste your time trying to tell people the truth. It is better to help the average person justify their faults (rationalize) and encourage them to keep fighting even if they aren't doing anything to improve their situation.

The above doesn't sound great. Your average person (who will fail) will make an excuse like *"I don't want to sell like that! I have principles"*. Well no one said the product has to be bad. The point is that you have to sell with extreme amounts of emotion. Logic is next to worthless if you're selling a product to the masses. It barely even works on people in the top 5% in terms of IQ. So. The answer is to create a product that works… And… to sell it as if you're talking to the lowest end of the IQ curve.

The general population does not have internal motivation. They are more interested in being entertained and "chilling" with other people who won't go anywhere. Therefore, they always want the short cut and they want it sold in an exciting manner. If you attempt to sell with logic and without emotion, the losses you incur will force you to quickly realize the above. Short cuts and hype are significantly better sales tools compared to logical things such as more effort = more rewards. Make everything appear to be more entertaining vs. educational, hence why movies are more popular than books. So on and so forth. If it sounds long/difficult like anything meaningful in life, you've done a terrible job with your pitch.

Convergence of Like Minds: Over a long time frame, the successful people and unsuccessful people end up hanging out together. That said… there are many situations where you'll be in a room with both groups. And. This will be short lived. In particular, if you're placed into a public school. If you're in a public school, by some force of nature, the people who end up as life's winners will be able to contact one another. The ones who end up failing constantly talk about their "past" and how they "used to be good" despite having no tangible results to show from their past success.

How does this apply to following what they do? Well… before you invest time in someone, figure out who they hang out with and what they are doing with their free time. If they are spending their time with the wrong groups, they will end up being dragged down by the low quality they surround themselves with. This is why most people who end up making it from poor backgrounds have higher levels of independence. They realized that the surrounding environment was horrible and isolated themselves from negative influences. A good way to flush out people with potential is their ability to cut ties with bad influences and simply move on (closing the door and never looking back).

Complaints on Value: This is probably the biggest tell. If someone complains that the "rich are getting richer" or that "XYZ person is overpaid" what they are really saying is that they think they deserve more.

Now the only person who thinks he deserves more is the person that isn't at the top of his game. Why? Well, if you're at or the near the top you're generating a large amount of revenue and profit. So you're not going to be upset about disparity.

Now how do we apply this one to following what people do? Again. We ignore what they are saying and focus on what actions it leads to. This tells you if they are future winners or future life long losers.

You watch how the person attempts to generate income. It's really that simple. If the person continues to simply complain, this means he's not going to make the next step. There are two strategies: 1) create another income stream or 2) generate more profits in his current profession. There are situations where #2 becomes near impossible (rare) and there is *no* situation where you cannot create another form of income.

Therefore, if someone complains about the disparity in pay and what "they think they are worth" you simply have to ask what their strategy is to fix it. If they don't say "start a second form of income" then you know you're talking to someone who will be mediocre over the long-term. If there was an interest in improvement, they would focus on solutions instead of emotional responses "I deserve more" is not an answer. No matter how compelling their argument is, words don't mean anything relative to what their actions/solutions are.

"I'm a Good Person": This is usually the exact phrase used by someone who isn't a good person. In fact, any time someone says they are "XYZ" and it cannot be verified, you should have alarm bells go off. If someone is XYZ they wouldn't need to prove it with words or bring it up at all. Have you ever met someone who was a good at anything and brought it up within the first 1-2 hours of meeting you? Unlikely. Selling yourself on second 1 usually only occurs in work environments, rarely in a social setting.

Instead of building perceptions based on what other people say, you should instead build up their character traits by their actions. There are a lot of people who are rough on the outside but their actions are fair and balanced. That's a lot better than the outwardly happy go lucky person who would sell his kids to the highest bidder (dead beat dads/moms for example). Being outwardly nice doesn't mean much relative to actions taken as that shows where their real values are.

Polls and Opinions: These are rarely good indicators of value. Why? People will answer polls based on how they feel. For example, if you poll the average person, they will tell you that iPhones are too expensive. Apple is making too much money off the phone, etc. Then… They go out and buy the newest model every year or two like clockwork. If they really believed that the phones were too expensive, the number of phones sold would decline every year.

Similarly, if you poll people about changes to a product, they are always going to say it's too expensive and it should deliver even more value. You can see this thought process from failures and losers who say "if i was rich i would give away all my hobby products for free!". This makes no sense at all for anyone with even one day of business experience. You have to charge something and ideally more because if you don't people will not use it. Generally speaking, if you give something away for free, it won't even be used or looked at. Therefore, never take polls directed at the general population seriously.

Opinions are the same, especially when the topic of dating comes up. When someone complains that girls/guys are "terrible"… they are really saying that they are terrible decision makers. There are seven billion people in the world and if you cannot find anyone who matches your standards you're certainly the problem. This is the main reason why we killed all dating questions/advice. It attracts complainers and losers. We don't know any socially competent people with money that struggle in the dating category. The ones that are rich and socially strange just need to go out more and stop being insecure about rejection. If you can succeed in the financial world, succeeding in the dating world is 100 times easier unless you're physically handicapped in some way or have extremely problematic social skills.

"I care about XYZ": This is another good one. People who claim to care about a particular cause… and yet their actions do not line up at all. People who care about climate change but then fly private constantly. People who claim to care about societal change and go to marches only to live in a gated community far away from the inner city. People who claim that they care about their health and yet they drink every day and make it up with "2 miles of extra walking".

We'd go back to the same phrase we stated earlier. Most people "hope" they get better, they don't actually "want" to get better. This same line of thinking applies to things they "care" about. Most of the time people hope things will change but don't actually want to make personal life changes to make it a reality.

Some Concluding Remarks: Hopefully these examples have created stark contrasts to some interactions you've had in the past 6-12 months. It's extremely easy to be fooled by adamant people. It will happen to you and we're sure it will happen to us in the future as well. No one shoots 100%.

That said, take a look at their actions along with their word choices. Their actions = the real answer.

For fun we'll leave you with one other hint. If you find that someone gives you a high amount of descriptive language, they are usually fooling you. This is why women are generally better liars than men. They give a lot of details to make it seem like something really happened (or didn't). Men are wired to be more direct and to the point. So if you find that a male is attempting to describe every detail of his day or his work or his background, he's typically a leech. You should say "that's impressive!" and then try to back pedal your way out of the conversation.

Keep it simple. Focus on their actions. Words mean nothing as they require no effort at all.

If you have good examples of actions directly conflicting with words/stated beliefs please leave them in the comments.

Newer Readers: For those that are unfamiliar with our blog we have three high quality products in order: 1) Efficiency, 2) Triangle Investing and 3) Spending for Maximum Return. In order, you learn how to make a good amount of money (a million liquid within 10 years or so), how to correctly invest it and finally how we'd avoid blowing it all with intelligent spending and PED use to improve quality of life. **We hold Q&As 1x a month for purchasers only.**

I'm a Failure

I'm a Failure

There is no doubt about it ever since I was born I have been a failure.

As a teenager the failures accelerated.

pop pop pop

You learn to distinguish between gun shots and backfire early in life.

The difference is that it was two in the morning. Instead of waking up and exiting the room **I decided to freeze and do nothing.** Normally, any loud gunshot noises would be attributed to my father's gun underneath his bed but for some reason… I had a feeling. Call this spiritual, call me a hippie it doesn't matter because he's dead now and there is no doubt in my mind that if I had run out to simply call 911 he would be alive. Strike one and a failure at life. Life isn't baseball so if you don't act in the moment you don't get any second chances.

"You are not a man until you fail at an event that is life changing"

What they don't teach you in school or at home is that death is quick and it is over in less than an hour. The ambulance flips in, they console the members inside for a mere 10-20 minutes pretending to use the EKG machine when everyone knows the man has passed. They move on quickly and it's over. A few days later there is a simple line in the obituary section of the local paper *"so and so died due to X"*.

What do you do at this point? Everyone decides to grieve… This means that the solution is to avoid grievance. Being young and stupid it was time to turn all of the pent up aggression into something actionable. The only place where it is appropriate to be aggressive and competitive this day and age? Sports.

Everyday. Up at 5:00am running sprints and… everyday the same nightmare would wake me up. I would be stuck in bed listening to the same sounds and instead of waking up to open the door a mere 8 feet away I would stay put. Frozen.

Luckily? When everyone is feeling bad for you they leave you alone, more time to train, more time to get better and more time to instill the right habits. This recurring nightmare lasted a few months but I can tell you I would train harder than anyone in a 100 mile radius.

—

While I will always regret not taking action when I could have… I started to realize that this may have been the best mistake I have ever made. The same father was an alcoholic, abusive and angry person. Nothing that I personally wanted to become, which makes it even more humorous that anyone would believe I am unhappy with my current life. I simply enjoy giving out the truth.

The changes that occurred over the next year were night and day. Within a mere 12 months a close family member turned to alcohol, another one barely graduated high school and the last one, myself, had a completely different set of friends by year end.

I was possessed and they were obsessed. That was the difference.

At this point high school was becoming a bit annoying. Every two weeks some kids at school would comment on their ability to pick what color shirt and pants I would be wearing (had six shirts and four pants for the record) so it wasn't really difficult. The difference was that they would eventually see me after school, in the gym, at the track, or seconds before a game started.

The color of my shirt didn't matter during those times.

Slowly things changed. I had over twenty shirts. None of them purchased but won from events and other accomplishments (still had the same ripped up pants though) until finally the phone rang.

"Hi, this is [division 1 university] and we're looking to speak with X"

I had conversations with military recruits but nothing like this. Over the next 12 months I would be flown out for recruiting sessions, all of these 5:00am extra workout sessions were paying off. Eventually signed the dotted line and thought my life was set. **Nothing further from the truth.**

—

Anyone who has been a collegiate athlete knows that you are in for a world of hurt. You may have priority registration but you have multiple team workouts (3-4 hours a day is the norm). This was fine for me. Small fish in a big pond just means more room for growth.

"The biggest room in the world is the room for improvement"

I thought I trained hard before. I was dead wrong. As usual.

I was out of breath and out of my league for several months but still a top recruit from the fresh meat. Still pushing through athletically, until… it hit me. I started to realize that many guys didn't have a career track. The seniors seemed to graduate and linger around hanging on to the good old days because they had no marketable skills for work.

For better or worse the decision would be made for me, during a freezing winter day I would suffer an injury that sidelined me for a full year. No pain no gain is an incredibly true cliche.

The downside? No way to pay for school anymore. Instead I needed to maximize my time.

—

I started applying for jobs and got nothing. Zero. Zilch. Nada. Applied to over 100+ positions and I did not get a single call back. Desperation time.

While I did everything I could to find work I eventually took an unpaid position at the bottom of the totem pole. I don't mind shoveling s*** sandwiches if it needs to be done.

What did I do for income in the mean time? Lets just say it is not something anyone would be proud of but I sold enough minty wrapping paper to get by and was relatively smart in mathematics leading to a few tutoring roles. As long as I made enough to eat and sleep it was good enough for me.

"Today is when you do what others won't so you can accomplish what they never will"

—

Deja Vu.

Like clock work. One of the resume drops hit. After being rejected by more companies than I have hair on my head… a bucket shop, chop shop, s*** cap, micro cap insert shady investment bank has decided to bring me in for an interview. When the lime light is on you better perform. I prepare for hours and land the opportunity.

For a broke failure of a human being… this isn't that bad. I clock in the most hours by intern standards… by far.

Leverage. New year and even more interviews follow.

"When you're about to give up you know it is time to push harder, you're millimeters from your goal"

—

Today? **I'm still a failure.**

Not a day goes by when I don't fail at something. I fail at doing maximum reps and maximum sprints (the injury is practically healed) and I continuously fail at trying to win new business. If I go a day without failing at something, I consider it a waste of a day.

"The difference between a failure and an idiot is if you learn from your mistakes"

Maybe this message is useless and you simply succeed at everything you do. You've never missed the game winning shot, you've never been turned down for a job, you've never had a girl give you the classic head turn, you just succeed at everything you do.

If that's true… well I feel bad for you. It means you have never attempted to reach your potential. You can do better.

"The world would be a better place if everyone reached their potential"

I will always be a failure because I learned a hard lesson early in life. **Always take action. Always maximize your potential.**

The only way to do this, is to fail, fail harder and **accept each failure for what it is… A learning experience.**

****

Improvement is Non-Linear

Improvement is Non-Linear

Previously we wrote about how change, any good change that is, occurs slowly over longer periods of time. On the same topic it is becoming increasingly common to see people quit early because their gains aren't easy anymore. In the weight room people expect to pack on pounds of muscle without seeing any sort of pull back. When dating women they say "this is the best I can get" or "I just don't get why I can't get past XYZ point with this girl". With work they believe their paychecks should skyrocket without a significant change in work responsibilities "I do so much I deserve to be treated like a 'princess'". It's sickening. If this is your belief system the below graph depicts what real gains are.

Since our society suffers from attention deficit disorder, there are three takeaways:

Improvement is Not Linear: The graph is not pretty like all those stock charts and financial jargon items you see where everything is "up and to the right", that's a fantasy. ***Real change is slow, bumpy, painful and even downright torturous***. You get to that next level and life comes back at you knocking you down a peg. Your mindset gets frazzled, you injure your arm, you lose out on that next promotion, you get moved to a new location and the list goes on.

The Jumps are Smaller: Sports are the best example for improvement. Moving from a 66 second 400 meter time to a 60 second time is infinitely easier than moving from 49 seconds to 43 seconds. There is less room for error. The big gains have been made and now it is time for a series of small gains to reach that new high. Maybe you need to sleep an extra hour a day to gain those 2 extra pounds, maybe you have to give up alcohol, maybe you have to sleep less to get that promotion, whatever it is there is ***one thing for damn sure. You're not going to like it***. This brings us to the final point.

Are you Quitting? Notice that for each high there is a subsequent prolonged low under the "quitters" line, time spent below the line is longer than the previous low. The point? To get to your next high you must suffer. A lot. Do you lift until you're in tears to get that next 1 pound of muscle? If so get ready to do it 2x as much. Do you work 12 hours a day? Get ready for 15. Do you find yourself denying your own abilities? Get ready to sign up for psychiatric therapy and practice meditation. No matter what, ***the longer you spend trying to figure out how to get what you want, be certain that it will be 40x more satisfying than the work you put in.***

Conclusion: Hopefully the problem is clear, people are unwilling to suffer and maintain longer and higher levels of pain. Conversely, the sickening part, once you realize the pain is going to repay you 40x more than what you suffered through. ***The pain will feel good, you'll get there.***

****

Improving Communication

Improving Communication

We're still in the process of reorganizing the blog. That said, we have already made another major change. We've shut down the Ask Us Anything Section. Why? The questions have become redundant and blog traffic has increased… Materially. While most would view this as a positive… it is certainly not. We want the quality of both questions and comments to be high, while limiting the number of useless questions from average people. If we keep the quality high, other writers can promote their blogs/businesses in the comments section and we can continue to solve problems.

Below is a detailed walk through on how to improve communication on the blog. Note, direct and to the point communication is not good for building friendships/relationships with women. This is entirely related to obtaining more value from this blog. We do not want to invest more than a few hours a week, so lets improve the efficiency.

Questions on the Blog

To reiterate, we shut down the ask us anything section since we have answered most of the questions in the past. This means that the reader was too lazy to dig up the information. There are only ~150 posts and it would take less than 15 minutes to track down the information you need on the blog. We are happy to answer intelligent questions, not redundant ones. Finally, to make your life easier we are going to create a more organized archives (again this is a process) and update the FAQ to replace the ask us anything section.

How to ask smart *career* questions: Some of our readers make $100K a year in the oil sands and others are already millionaires. There is no point in comparing these two groups of readers. Instead, the more important question to ask is "how do you get value from this blog?" The answer is to outline your situation is 2-3 sentences… *Max.*

Example of a Dumb Question: "Hi, should I start my career as an accountant?"

Example of a Smart Question: "Hi, I currently have $10K in student debt and my best job offer is to become an accountant for now. I want to work in Investment Banking. Should I take the position or wait it out and try to break into a front office Wall Street Role?"

The first question is a waste of time and we won't answer them going forward. First of all, accounting is not a career since it does not generate revenue and second, the person did not bother to offer context. The second question is significantly better because it offers context in an extremely *concise* manner. For the second question, we would tell the reader to take the position *for now*, ask to be placed into transactional services (most related to Investment Banking) and continue interviewing on the side.

Notice, if it is your best option, you have to take it. This blog is about maximizing your options and potential not about useless discussions surrounding "prestige".

How to ask smart *dating* questions: Similar to the career layout, we don't have an interest in answering questions that are uninformed or laced with complaints. If you are going to ask a question you need to have a baseline of experience in the field.

Example of a Dumb Question: "How do I approach a girl at a bar?"
